UPPER MISSISSIPPI RIVER PROJECT
MASTER PLAN

APPENDIX C

LAND ALLOCATION and LAND
CLASSIFICATION PLATES

UPPER & LOWER SAINT ANTHONY FALLS AND POOLS 1 – 10
RIVER MILES 854.0 – 614.0
MINNESOTA, WISCONSIN, AND IOWA

August 2020
GIS information in the main report:

The landforms and topographic data were updated in this 2020 Master Plan to reflect the changing shoreline and islands. A concurrent review of real estate parcels and federal ownership boundaries has enhanced the accuracy of the 2020 Master Plan. The calculated acreages for land classifications shown in this 2020 Master Plan are based on GIS polygon data and more accurate legal survey, when available. Though GIS technology has improved, there are inherent errors in the calculations.

GIS information in the EA:

With this Master Plan update, the maps or plates associated with the 2011 LUAP would also be updated. The Corps conducted a project involving the refinement of real estate fee and easement lands in 2019. The updated Corps and USFWS tracts were cross-walked with the United States Geological Survey (USGS) Upper Midwest Environmental Sciences Center’s (UMESC) 2010 land classification dataset and 2015 leaf-off imagery (0.5 meter) of the Project. This update resulted in a more accurate depiction of both Corps and USFWS land classifications and a more accurate land-water distinction. The nature of this update has resulted in a difference in acreage totals per land classification that cannot be linked to land acquisition or a change in fee-title for both the Corps and USFWS. For this reason, it is difficult to compare land classifications from the 2011 LUAP and the 2020 Master Plan update verbatim.
