1. INTRODUCTION

The Final Environmental Impact Statement (FEIS) for the NorthMet Mining Project and Land Exchange was published in the Minnesota EQB Monitor on November 9, 2015 and the Federal Register on November 13, 2015. A public comment period followed publication of the FEIS, ending December 21, 2015. This document summarizes the process used by the Minnesota Department of Natural Resources (MDNR), U.S. Army Corps. Of Engineers (USACE), and U.S. Forest Service (USFS), collectively known as the Co-lead Agencies, to organize and consider the comments received on the FEIS.

2. OPPORTUNITIES FOR PUBLIC COMMENT ON THE FINAL EIS

The FEIS was made available to the public for download on MDNR's Project-specific website, <http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html>. Paper copies of the FEIS were also sent to Cooperating Agencies and other entities that requested them. Public review copies of the FEIS were also placed in public libraries in Minnesota: St. Paul, Grand Rapids, Hibbing, Hoyt Lakes, Babbitt, Duluth, and Minneapolis. A limited number of paper copies and multiple CD-ROMs were distributed by MDNR upon request.

In accordance with MEPA (*Minnesota Rules*, part 4410.2800, subpart 2) and NEPA (40 CFR 1503.1(4)(b)) at publication of the FEIS, the Co-lead Agencies announced that public comment would be accepted via a project-specific MDNR email address or via mail through 4:30 p.m. CST December 14, 2015. On December 10, 2015, the MDNR announced that it had extended the public comment period by 7 days through 4:30 p.m. CST on December 21, 2015.

3. SUBMISSION RECEIPT AND MANAGEMENT PROCESS

The Co-lead Agencies received e-mails, and hard copy written and typed letters, CDs, and postcards (henceforth referred to as *submissions*) during the public comment period for the FEIS. All comments received during the FEIS public comment period were considered. Management of these submissions is described below.

3.1 RECEIPT OF EMAIL SUBMISSIONS

The vast majority of submissions were received in email form sent directly to the official MDNR project email account. However, some email submissions were sent directly to agency staff in addition to, or separate from, the official MDNR email account. In those cases, agency staff forwarded the email to the official MDNR account and/or to staff responsible for managing the submissions. This ensured that all email submissions were considered.

Although the official comment period ended at 4:30 p.m. CST on December 21, 2015, emails received until 5:30 p.m. were accepted as being on-time. This buffer time allowed for instances of electronic delay. Emails received within the comment period were tagged for database entry and coding (see Section 3.3). Emails received after 5:30 p.m. were tagged as late (see Section 7).

Emails that were forwarded by agency staff to the official email account were reviewed to identify duplicate receipts where the same email was also received directly by the official email account. Duplicate emails were set aside. Because some emails were forwarded by agency staff after the official comment period ended, the time stamp on each original email was used to determine if the email was submitted on time or not.

Each original email received (i.e. non-duplicates) was converted to PDF and filed electronically in a database and e-folder for consideration.

3.2 RECEIPT OF HARD COPY AND CD SUBMISSIONS

Hard copy and CD submissions were received by agency staff by mail or hand delivery. Documents received with a postage date stamp on or before December 21, 2015 were accepted as on time, submissions postmarked after December 21 were tagged as late.

Upon receipt, CDs were uploaded, and hard copy documents were scanned to PDF format. Hard copies that were hand written were transcribed – the transcription was then attached electronically to the back of the original submission. The CD and hard copy submissions were then filed electronically in a database and e-folder for consideration.

3.3 SUBMISSION IDENTIFICATION AND NAMING CONVENTION

As described above, one copy of each original submission (i.e. non-duplicate submission) was converted to PDF format and filed in a database and e-folder for consideration. Each was given a submission number for unique identification.

Using the database technology and additional review, the sender of each submission was identified (where possible). Some submissions were sent by a delegate or representative of a group or other individual. In those cases, the actual person who delivered the submission is named as the sender, and where possible, the supplemental information such as organization was tagged separately. If the name of the individual was not clear, the email address or other identifying information was used. A list of the senders and any discernable organizations or agencies represented by that sender is attached (Section 8).

Each submission was identified as unique or as being associated with a form letter. Unique submissions are characterized as being unique in content from any other submission. Form letters are typically drafted by an organization that encourages individuals to make a submission using their drafted text. This results in multiple submissions with identical or substantively identical content. Form letter templates were identified at their source (typically a website) or as identified through submission review. The submissions were evaluated using a computer algorithm to determine the similarity of a submission against a known form letter template. The algorithm's results were confirmed through a manual review of a statistically significant sample of submissions. Submissions that were identical to the base form letter were classified as non-variant form letters. Submissions that used a form letter as its base, but were edited with deleted or added text were classified as variants of a form letter. One copy of each form letter template was prepared for consideration on behalf of all submissions made under that form letter.

The PDF of each submission was named using the following file naming convention:

SubmissionID#_Date_SenderName_UniqueORVariantORNon-Variant.pdf

For submissions that were form letter variants or non-variants, the form letter code is also indicated in the file name.

4. AMOUNT AND TYPE OF SUBMISSIONS RECEIVED

The Co-lead Agencies received 30,441 original submissions (non-duplicates) during the public comment period for the FEIS (ending December 21, 2015).

These submissions were sent by 24,969 different commenters comprised of federal, state, and local representatives; members of the public; American Indian tribes; non-governmental organizations (NGOs); and other interested groups and stakeholders. *Table 1* summarizes the number and type of submissions received. Copies of each submission are available as an Attachment (Section 8).

Table 1 *Number and Type of Public Comment Submissions on the FEIS*

Submission Type	Definition	Number	Percent of Total
All Submissions		30,441	100%
Form Letters	Identical or substantively identical submissions	29,648	97%
Form Letter Variants	Standard form letter text that was altered by the sender by deleting standard text and/or by adding sender-composed text	388	1%
Form Letter Non-Variants	Standard form letter text was not substantively altered.	29,260	96%
Unique Submissions	Submissions composed entirely by the sender.	793	3%

Of the 30,441 submissions received, 793 were unique. Unique submissions ranged in length from one sentence to hundreds of pages with additional attachments.

The vast majority of submissions received were classified as non-variant form letters. As shown in *Table 2*, 9 different form letters templates were identified. The form letter templates and list of people who submitted each form letter is attached (Section 8).

Some of the form letter templates were identified as having multiple versions that individuals could sign. For the purpose of review and coding, each version of a form letter template was linked to the original template (counted as a different version of the same form letter).

Form Letter 2 was originally anticipated from the Water Legacy website; however, no form letters resembling the template were received. Instead, form letters associated with Water Legacy came through as a version of Form Letter 1. Water Legacy also delivered a number of hand signed form letters. These were split into individual submissions and linked to Form Letter 1.

Table 2 **Form Letters Templates**

Form Letter	Organization / Source / Notes	Number of Submissions
1	Mining Truth/Conservation Minnesota/Water Legacy/MEP	12,716
3	Mining Minnesota	3,016
4	Center for Biological Diversity	2,843
5	YMCA Camp Menogyn	22
6	Izaak Walton League	101
7	League of Conservation Voters	6,202
8	League of Women Voters MN	26
9	Sierra Club	4,718
10	Building Trades	4

Submissions received by the Co-lead Agencies after the close of the comment period are not included in the analysis of comments presented above. Refer to Section 7 for a discussion on these submissions, which were tagged as late.

5. COMMENT IDENTIFICATION AND CONSIDERATION PROCESS

Each PDF of the unique and variant form letter submissions, and a representative copy of each form letter template, were reviewed. Non-variant form letters were not coded because they were identical to the form letter templates that were coded. The review identified and coded discrete comments within each submission. Comments were defined as being one or more sentences that capture the point of the commenter. Individual thoughts were grouped as a single comment if they were necessary to understand a larger point.

For the variant submissions, only new or altered text was coded because much of the submission text was identical to a form letter template (coded separately). In some instances the variant form letters, although edited in part from the form letter, did not offer any additional comments.

Each comment was highlighted in the PDF and coded based on its content and the outcome of the Co-lead Agency consideration for that comment. The comment code applied the following convention:

Comment#:Issue:SubstantiveORNot:OldORNew:Response#:Reference (+)

Comment #: Each comment was assigned two numbers: a sequential submission-specific number, which is shown in the annotated coded in the PDF, and a unique identifying number in the database for tracking purposes, not indicated in the PDF.

Issue: The most relevant issue (or topic) area that the comment pertains to was identified. The issue codes, listed in *Table 3*, are based on the issue codes used in consideration of the comments received on the Supplemental Draft EIS (SDEIS) with some additional edits for this phase of the project.

Substantive (S) or Non-substantive (NS): The comment was identified as being substantive (S) or non-substantive (NS) based on the following:

Substantive: 36 CFR 215.2: "Comments that are within the scope of the proposed action, are specific to the proposed action, have a direct relationship to the proposed action and include supporting reasons for the Responsible Official to consider." Substantive comments are those that suggest the analysis is flawed in a specific way. They challenge the accuracy of information presented, the adequacy, methodology or assumptions of the analysis (with supporting rationale), present new information relevant to the analysis, or present reasonable alternatives (including mitigation) other than those analyzed in the record.

Non Substantive: Value-type comments that don't include justification or facts to back up the statement, or comments that don't pertain to the project. Other comments may require action/response, but not a response in the EIS (e.g., "Change my address", "Send me a copy of X document", "Extend the comment period", "Don't approve the project", "The project will create 100s of jobs; approve it").

New (N) or Old (O), or not applicable (X): Comments were identified as either raising a new (N) or old (O) point or issue. If the comment was non-substantive (NS) it's new or old status is not applicable, so NS comments were coded with an "X". Old (O) issues or points are those that were raised in DEIS or SDEIS comments, or have otherwise been addressed in the EIS, or its supporting documentation. If the comment hasn't been raised before or isn't specifically addressed in the EIS or its supporting documentation, it was characterized as being new (N).

Response (consideration for the record): Following consideration of the comment content, a response code was selected from the list provided in *Table 4*. The response codes are based on NEPA and MEPA requirements at this phase of the project. Different to agency requirements for comments on a Draft EIS, the Co-lead Agencies are not required to respond to comments made on the FEIS.

Reference: The reference captures where in the FEIS record the points raised in the comment were previously addressed. References leveraged responses to SDEIS comments, FEIS sections, or other supporting documentation relied on for the FEIS. All comments identified as being substantive (S) and old (O) were supported with a reference. Where possible, substantive (S) new (N) comments were also supported by cross reference to where the points in the comment had previously been considered. In some cases the reference part of the code offers customized text to address the specific comment.

(+): In instances where the reference or response text is too long to fit legibly within the PDF, the annotation includes a (+) symbol to indicate that additional reference text is provided on that comment and is provided separately in the full comment matrix (see Section 8).

Table 3 **Issue Codes for Public Comments on the FEIS**

Issue	Issue Code	Description (Comments related to...)
Air Quality	AIR	The Project's impacts on local and regional air quality and visibility.
Alternatives	ALT	Alternatives to the proposed Project such as underground mining, as well as the No Action Alternative.
Aquatic Species	AQ	The Project's effects on aquatic species, including threatened and endangered species..
US Army Corps of Engineers 404 Permit	COE	The USACE permit issued under Section 404 of the Clean Water Act.
Cultural Resources	CR	The Project's impacts on historic and cultural resources, including Tribal resources, as well as the process for interacting with the Bands and other Tribal entities.
Cumulative Effects	CUM	The project's consideration for potential cumulative effects
Editorial	EDIT	Comments indicating editorial errors within the FEIS text
Financial Assurance	FIN	The Co-lead Agencies' approach to, and/or the proponent's ability to provide sufficient financial assurance for potential impacts of the Project.
General Topics	GEN	General statements regarding the Project that are substantive (i.e., that express more than simple approval or disapproval), but that are too general to belong in other issue areas.
Geotechnical Stability	GT	The geotechnical stability of the stockpiles, mine pits, Tailings Basin, and other elements of the NorthMet Project Proposed Action.
Hazardous Materials	HAZ	Hazardous materials used, generated, transported, and/or disposed of as part of the NorthMet Project Proposed Action.
Human Health and Safety	HU	The Project's effects on human health and safety.
US Forest Service Land Exchange	LAN	The nature, extent, and/or appropriateness of, and/or the process for defining the Land Exchange Proposed Action
Land Use, Recreation, and Visual Resources	LU	The Project's effects on private land use, recreational resources and activities, and visual resources (except for regional visibility issues addressed in AIR).
MEPA Adequacy	MEPA	Comments pertaining to the MDNR's determination on MEPA adequacy of the EIS
Mercury	MERC	The generation, removal, management, and consequences of mercury from the NorthMet Project Proposed Action.
Noise and Vibration	N	The nature, extent, and impacts of noise and vibration generated by the NorthMet Project Proposed Action
NEPA and MEPA Topics	NEPA	Purpose and Need statements, the public engagement process, and the FEIS's adherence to NEPA and MEPA requirements, guidelines, and principles.
Other	O	Other comments, generally in support or against the project
Project Description	PD	The description of the NorthMet Project Proposed Action and/or Land Exchange Proposed Action, including suggested revisions to the proposed actions.
Permitting and Regulatory Considerations	PER	The type and appropriateness of permits that the Project would need (except for the USACE 404 Permit), as well as the relationship of the Project and FEIS process to existing regulations.
U.S. Forest Service Draft ROD	ROD	Comments pertaining specifically to the U.S. Forest Service Draft ROD

Issue	Issue Code	Description (Comments related to...)
Socioeconomics and Environmental Justice	SO	The Project's impacts on economic factors (such as employment, income, public tax revenues), as well as public services, housing, and the SDEIS's evaluation of Environmental Justice considerations under Executive Order 12898.
Vegetation	VEG	The Project's impacts on vegetation, including threatened and endangered species.
Water Resources	WAT	The Project's impacts on water quality, water quantity, and the modeling of water resources conditions and effects.
Wetlands	WET	The Project's impacts on wetlands (except for comments related to the USACE 404 Permit).
Terrestrial Wildlife	WI	The Project's impacts on terrestrial wildlife, including threatened and endangered species.
Wilderness and Special Designation Areas	WILD	The Project's impacts on the Boundary Waters Canoe Area Wilderness (BWCAW), national, state, and local parks, portions of Superior National Forest designated for environmental conservation, and other special-designated areas.

Table 4 *FEIS Comment Response Codes (consideration for the record)*

Response Code	Response	Comment Type	Notes
1	Comment: 1) communicates a value judgement; 2) does not provide enough specificity for a meaningful response; 3) does not pertain to the NorthMet Mining Project and Land Exchange FEIS; or 4) does not provide supporting rationale and is unreasonably speculative.	Non-Substantive (NS) comments	No reference or custom response required
2	FEIS document addresses this comment	Substantive Old (S:O) , or Substantive New (S:N) comments	Reference required for S:O comments only. References for S:N comments as available.
3	Data relied upon for the FEIS is adequate to support analyses and conclusions contained in the FEIS		
4	The alternative or mitigation has been considered in the EIS process		
5	The EIS has complied with the procedural requirements of MEPA and NEPA		
6	Proposed analysis is outside the scope of the EIS		
7	Analyses and data acquired during the FEIS process supports the geographic scope of the FEIS		
8	Analysis in the FEIS is adequate to describe potential environmental effects for purposes of environmental review.		
9	Information identified as lacking is not essential to the disclosure of potential environmental impacts, is beyond the state of the art, or the cost in obtaining it is excessive		
10	The issue was previously considered by the Co-lead Agencies, but eliminated from further analysis	Substantive New (S:N) comments	Custom response required
11	Comment requests detail beyond that necessary in the environmental review process to understand potential impacts and available mitigation. Comment will be provided to Regulators and the Proposer		
12	Received Further Consideration		

6. AMOUNT AND TYPE OF COMMENTS RECEIVED

The submission review identified a total of 4406 of comments from the unique submissions, the variant form letter submissions, and the form letter templates. The characterization of those comments, based on the coding described above, is shown in *Table 5* and *Table 6*. The non-variant form letters are counted only once per form letter template.

In addition to the annotated PDF submissions, the comments are shown with full coding and reference information in the comment matrix attached (see Section 8).

Table 5 *Number of Comments on the FEIS*

Comment Type	Number of Comments
NS:X	2784

7. SUBMISSIONS RECEIVED AFTER END OF PUBLIC COMMENT PERIOD

As of January 31, 2016, 127 submissions had been received after the official FEIS public comment period which ended on December 21, 2015. These submissions are not included in the submission and comment counts described in the section above; however, they are included in an attached DVD (Section 8).

The submissions received after the comment period were retained and reviewed for new and substantive comments.

8. ATTACHMENTS

The following files are provided separately.

- Comment Management and Analysis (1 CD)
- Original Submissions (2 DVDs)
- Annotated Submissions (2 DVDs)
- Late Submissions (1 CD)

8.1 COMMENT MANAGEMENT AND ANALYSIS (1 CD)

All comments and the record of their consideration as identified from the annotated submissions are provided in an Excel file on a CD. Information provided includes the submission number, name of commenter, comment number (database derived) and PDF comment number (linkage to the annotated PDF submission), comment, coding and response. The comment identification and the coding are consistent with the respective annotated submission PDF provided separately.

The CD also includes a list of the names, affiliation (e.g. organization), and submission ID of each commenter on the FEIS. This information relies only on the information provided with the submissions.

8.2 ORIGINAL SUBMISSIONS (2 DVDs)

The original submissions received on the FEIS during the formal comment period are provided in PDF format on two DVDs as follows:

DVD 1:

 FL01
 FL03
 FL04

DVD2:

 FL05
 FL06
 FL07
 FL08
 FL09
 FL10
 Unique

Each submission has a unique submission number, and is identified as either being related to a form letter, or as being unique based on their content. Submissions that contained several documents (e.g. attachments to emails) are included within the single PDF where possible.

There are two unique submissions that included many attachments that are provided in a zip file within the “Unique” folder.

Refer to section 3 above for a description on the types of submissions and their file naming convention.

FL Folders

The folders marked by “FL” include form letter submissions as listed below:

FL01: Mining Truth, Conservation Minnesota, Water Legacy, and Minnesota Environmental Partnership (MEP)

FL03: Mining Minnesota

FL04: Center for Biological Diversity

FL05: YMCA Camp Menogyn

FL06: the Izaak Walton League

FL07: League of Conservation Voters

FL08: League of Women Voters MN

FL09: Sierra Club

FL10: MN building Trades Council

Form Letter 2 was originally anticipated from the Water Legacy website; however, no form letters resembling the template were received. Instead, form letters associated with Water Legacy came through as a version of Form Letter 1.

Each FL folder includes a copy of the form letter template, as well as a folder each for non-variant form letters (unchanged from the template), and variant form letters (where the template had been used but edited). If for a particular form letter there were no variant, or non-variant submissions, the respective folder was marked by “(none)”. For example, see the folders for form letter 6 (FL06 folder) below:

 Non-Variant

 Variant (none)

 FL06_TheIzaakWaltonLeague.pdf

Unique Folder

The unique folder contains all of the submission identified as being unique.

8.3 ANNOTATED SUBMISSIONS (2 DVDS)

Annotated versions of the original submissions are provided in PDF format on two DVDs in the same manner as for the original (unannotated) submissions described above. Each submission is annotated within the PDF to identify the comments and codes for each respective submission. Refer to section 5 above for a description on the coding.

Non-variant form letters are not annotated as they are identical to the form letter template.

8.4 LATE SUBMISSIONS (1 CD)

Late submissions received through January 31, 2015 are provided in PDF format on a CD. These were reviewed but not annotated or included with the official comment counts.

Spread Sheet Containing Comments and Agency Responses to Comments on the FEIS

Pages 18 - 290

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
27822	Unique			AIR	Anita Tillemans		2159	5	The FEIS did not adequately address the potential effects of fossil fuels on the atmosphere surrounding the NorthMet Project. Fossil fuel needs will escalate at LTV and the mining site, fuel and coal needs for the plant and mine, fuel for the vehicles, the crushers, the earthmovers and trains. Acid rain will emerge as an even greater problem, and the FEIS did not address this issue sufficiently. Repercussions will be felt in the Boundary Waters Canoe Area Wilderness, most certainly, from atmospheric effects alone. Coal fired plants have provided energy to mines along the Mesabi Range for decades and, in the last 50 years, signs of acid rain have degraded foliage and forests in the path of their plumes. Witness dying birch, and mountain ash (that have all but entirely disappeared along the North Shore of Minnesota). The effects of a copper mine in this fragile ecosystem will reach far beyond the boundaries of the plant and mine sites with potentially devastating effects.	NS	X
30061	Unique			AIR	Anita Tillemans		4319	6	The FEIS did not adequately address the potential effects of fossil fuels on the atmosphere surrounding the NorthMet Project. Fossil fuel needs will escalate at LTV and the mining site, fuel and coal needs for the plant and mine, fuel for the vehicles, the crushers, the earthmovers and trains. Acid rain will emerge as an even greater problem, and the FEIS did not address this issue sufficiently. Repercussions will be felt in the Boundary Waters Canoe Area Wilderness, most certainly, from atmospheric effects alone. Coal fired plants have provided energy to mines along the Mesabi Range for decades and, in the last 50 years, signs of acid rain have degraded foliage and forests in the path of their plumes. Witness dying birch, and mountain ash (that have all but entirely disappeared along the North Shore of Minnesota). The effects of a copper mine in this fragile ecosystem will reach far beyond the boundaries of the plant and mine sites with potentially devastating effects.	S	O
29735	Unique			AIR	Dana Bloom		3889	3	Vehicle track out might seem minor, but the ore dust is re-entrained on passing vehicle tires, washes into our water supply, and some is airborne and readily inhaled. In addition, some residents of Keewatin had to have their homes repainted due to the airborne red iron ore dust. Mine workers laundry rooms accumulate iron ore dust. Iron ore dust might not pose a potential risk for family members, but what are the environmental and health effects of liberated copper nickel mine waste/dust? I have logged rock core from the Duluth Complex, and identified minerals that have asbestos-like crystals/fibers; I have pictures of these fibers. Has the state reviewed images of, or core samples containing, asbestos-like fibers from the Duluth Complex? If not, it strikes me as an inadequate review of environmental impacts. Mine operators are supposed to reduce vehicle track out, and they make efforts to do so; however, despite their efforts, and despite government rules and regulations, highway 169 is frequently is stained red. If the state cannot currently prevent iron ore dust from leaving mine sites, how is the state going to prevent possible asbestos-like materials from leaving mine sites? What obstacles have prevented regulators from effectively addressing these environmental impacts?	S	O
29801	Unique			AIR	Daniel Pauly		4194	30	Efforts to reduce atmospheric precipitation, especially from coal burning sources, will likely diminish background mercury loading dramatically in coming years, leaving the NorthMet Tailings Basin as a larger relative source of mercury to the Embarrass River and St. Louis River watersheds. At the present time significant mercury loading into the Embarrass River and St. Louis River watersheds occurs as a result of atmospheric deposition, much of it from coal plants. In fact, an estimated 70 percent of atmospheric mercury deposition in Minnesota comes from anthropogenic sources, including burning coal and improper disposal of fluorescent lights. Efforts are underway in Minnesota, the broader United States, and outside the U.S. to reduce mercury emissions. Reductions in coal burning will likely lead to significant reductions even in the near term as increasing amounts of electricity generation switches from coal to natural gas. It is likely that atmospheric mercury deposition reductions will continue for many decades, and the amount of atmospheric deposition of mercury in the Embarrass River will decline. What may not decline, due to the tremendous amounts of mercury now held within the existing tailings basin at the NorthMet site, is the amount of mercury discharged from the Tailings Basin in coming centuries. Without adequate efforts to prevent mercury seepage and release at the Tailings Basin, the likely result will be a circumstance where in coming decades and centuries the NorthMet project becomes a larger and larger share of mercury contamination in the Embarrass River and St. Louis River watersheds.	S	O
10777	Unique			AIR	Darrell Godbout	Ironworkers Local 512	2920	3	The topic of air quality has raised a few flags in terms of greenhouse gasses and chemical dust emissions. The Minnesota Pollution Control Agency has declared PolyMet will be well within the strict criteria set by the National Ambient Air Quality Standards and Minnesota Ambient Air Quality Standards by using state-of-the-art technology such as high efficiency air filters and dust suppressants. Electric power is encouraged to reduce the use of diesel engines. It has been ensured that areas such as Voyageurs National Park, Grand Portage National Monument, the Boundary Waters Canoe Area Wilderness and neighboring communities' air quality will not be effected.	NS	X
27685	Unique			AIR	Dennis Szymialis		2037	192	-the PolyMet project will emit more than 10 tons of HAP in amphibole fibers.	S	O
27685	Unique			AIR	Dennis Szymialis		2038	193	no relevant BACT demonstration is attainable.	S	O
27685	Unique			AIR	Dennis Szymialis		2039	194	as indicated on page 5-531 there are sources of hydrogen sulfide gas that should be added or considered alone as exceeding the 10 ton HAP or 25 ton HAP cumulative standard. Potassium amyl xanthate will be converted to some extent to hydrogen sulfide gas as indicated with a total potential conversion of 1075 tons per year with the only requirement for conversion being heat and moisture.	S	O
27685	Unique			AIR	Dennis Szymialis		2040	195	additionally fugitive lime dust needs to be treated as hazardous waste.	S	O
27685	Unique			AIR	Dennis Szymialis		2041	196	even though it will not directly emit green house gas it will indirectly generate green house gasses and contribute to hazing in the boundary waters through its usage of power generated from Minnesota Power which will exceed 100,000 tons per year. The lack of attainment in the boundary waters should require PolyMet to be treated as if it were in a non-attainment area and a general conformity determination should be required.	S	O
27685	Unique			AIR	Dennis Szymialis		2042	197	these sources and other should qualify PolyMet as a major source emitter. relevant, reliable, and valid modeling needs to be conducted for these sources.	S	O
27685	Unique			AIR	Dennis Szymialis		2043	198	At the Mine Site, emissions were estimated for material handling sources associated with excavation, portable crushing and screening operations, blast hole drilling, use of unpaved roads, and vehicle exhaust. -it appears that modeling was based on PolyMet fabricated and self-serving data.	S	O

29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4081	144	Second, the FEIS at best is confused on the issue of carbon sequestration and at worst is misleading. The science is undisputed that the best carbon sinks on the planet are peatlands. Globally, peatlands represent just 3 percent of all soils but contain more than one-third of all soil organic Carbon. A preliminary inventory of peatlands in Minnesota estimates that the 5.73 million acres of peatland in the state contain 4,250 megatonnes (million metric tons) of C, or approximately 745 metric tons of stored C per acre. Moreover, drying of peatlands from water drawdown increases emissions of both carbon and methane, creating a feedback loop and increasing fire risk—another source of carbon emissions.	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4082	145	The Response to Comments, while acknowledging the loss of carbon sequestration, claims that restoration elsewhere will compensate.311 This statement comes with no support. There is no independent science to support the claim that the carbon sequestration benefits of the mixed, old peatlands at the PolyMet site will be mitigated with wetlands at any of the three mitigation sites (especially since two of them are south of the project site and don't propose to replace coniferous bog habitat.). Also, even if some mitigation occurs, there is no mitigation for the very big one-time release of the destruction event itself, much less the over-time release that is bound to happen from some indirect effects over time. There is no discussion in the FEIS of the loss of sequestration, or the effects of that loss on the environment. The published research makes clear that avoiding impacts to peatlands is the only way to ensure that they continue their function as a carbon sink and serve as a refuge from future climate change impacts.	S	O
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4124	184	The FEIS fails to assess the potential impacts of mineral fibers on public health. The FEIS discussion of fibers misstates the current state of knowledge and scientific methodology for virtually every element that is needed for an assessment of the potential impacts of mineral fibers on public health. The FEIS must disclose and base its conclusions on the best evidence and methods available, rather than continuing to repeat the outdated position that nothing is known or can be known about the toxicity of fibers or the level at which a new facility will emit them. This issue was raised in our comments on the SDEIS at CBD 87-99 and Friends 74-75, which along with reference material cited in those comments is attached and incorporated herein.	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4125	185	The FEIS assessment of mineral fibers appears to be based on information from before 2009. Scientists have done a great deal of work in the past six years developing the ability to assess the toxicity of fibers of all kinds. As the FEIS puts it, "[E]xisting credible scientific evidence, with additional research, may one day provide guidance for future development of a human health based standard for amphibole mineral fiber. There is an ongoing effort in the environmental health community to develop the scientific tools and expertise to arrive at such a standard in the future."510 These tools and expertise have advanced significantly in the past few years.	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4126	186	On October 6 and 7, 2015, the conference on Asbestos-like Mineral Fibers in the Upper Midwest: Implications for Mining and Health was held at the U.S. EPA Mid-Continent Ecology Division in Duluth (hereinafter "Duluth Conference"). The work of EPA research scientist Phil Cook on the toxicity of fibers was presented along with other research and information indicating that it is now possible to estimate the potential health impacts from mineral fibers such as those from Northshore Mining's Peter Mitchell Pit and surrounding mines. The Co-lead Agencies should investigate the current potential for estimating toxicity rather than simply deeming the likely toxicity of fibers from the Duluth Complex as unknown and unknowable.	S	N

29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4127	187	It is also untrue that estimates of emissions of fibers cannot be made. While it may be true that the emissions level cannot be pinpointed with certainty, the same is true of both emissions and discharges of all the other substances that will be released at this mine. The agencies must perform the appropriate studies and calculations of mineral fibers emissions and toxicity at the level of accuracy allowed by existing science, and provide that assessment in the FEIS.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4128	188	As in so much of the FEIS, the discussion on amphibole mineral fibers begins by minimizing the issue. The first sentence states that the Duluth Complex “may” contain amphibole mineral fibers, as though the very presence of amphibole fibers is still unknown. ⁵¹¹ This is contradicted by the text in the FEIS itself. ⁵¹² The introduction goes on to state that taconite ore from the Northshore Mine “has received public attention with regard to potential releases of amphibole mineral fibers.” ⁵¹³ There is nothing “potential” about these releases; the Minnesota Department of Health and Pollution Control Agency have reams of data stretching over forty years indicating high levels of amphibole mineral fibers emitted from the Peter Mitchell Pit and the Northshore Mining processing plant.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4129	189	The debate over the toxicity of mineral fibers released by mining in Northeastern Minnesota has long rested on the premise that because these fibers are not “asbestos,” nothing is known about their toxicity; the NorthMet FEIS follows in this vein. Rather than designing studies to look at the toxicity of these fibers, industry has tried to keep attention on the toxicity of “asbestos” fibers and the alleged impossibility of correlating the information.	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4130	190	In the meantime, Phil Cook and a number of researchers studying the fibers that have cost so many lives in Libby, Montana, have set aside the argument over what is and is not “asbestos” or “asbestiform” and have instead looked at toxicity studies of a range of fibers with variable factors such as particle dimensions, mass, shape, surface area, and material type. As some of these researchers point out in a 2011 journal article, “For regulatory and health assessment purposes, it is microscopical morphology that counts: there is no evidence that potentially affected cells can distinguish between ‘asbestiform’ and ‘nonasbestiform’ fibres having the equivalent dimensions.” ⁵¹⁴ The EPA put together a database of 70 mineral fiber samples used in biological studies and characterized by transmission electron microscopy (TEM). ⁵¹⁵ The database includes fibers from the Peter Mitchell Pit, several types of UICC asbestos fibers, and other mineral fibers not classified as asbestos. ⁵¹⁶ This work was done in response to the understanding that although non-asbestos fibers (including “cleavage fragments”) may not be as toxic as asbestos, that does not mean that they are benign. As Dr. Roberts pointed out in his report to MDH, The current approach for evaluating risk from airborne asbestos dates back to 1986 and is based upon measurement of fibers of a specified size and aspect ratio (i.e., length-width ratio) using phase contrast microscopy (PCM). There are a number of problems with this approach related to the technology for fiber detection and measurement [PCM], the way in which mineral fibers of interest are defined, and the assumption that a single toxic potency value is adequate to characterize risk from all relevant mineral fiber types. Further, there is also concern mineral fibers that pose cancer risk by inhalation may be defined too narrowly, and that a single potency value for asbestos is too simplistic to adequately cover the variety of fiber sources and exposures that exists. Dr. Roberts was tasked with assessing whether the EPA database provided sufficient information to allow estimates of toxicity of a range of mineral fibers, wholly aside from their categorization as “asbestos.” Specifically, Dr. Roberts was asked to answer three questions: 1. Can the available data be used to provide fiber potency estimates? 2. Are available data adequate for dose-response modeling? 3. Is physiologically-based pharmacokinetic (PB-PK) modeling feasible? The answer to all three questions was “yes.” ⁵¹⁸ At the time the report was written (2010), Dr. Roberts noted that although PB-PK modeling was feasible, it did not yet exist, but that it was being developed through the Libby Action Plan and would likely be available in the near future. ⁵¹⁹ That work has now been done, and was reported on at the Duluth Conference. Thus if the statement in the NorthMet FEIS that “[t]he Co-lead Agencies believe that there is currently incomplete and unavailable scientific information to characterize the health risk to the public from exposure to mineral fibers and that the means to obtain such information are not known” is true, it is only because the agencies have failed to investigate and inform themselves of the current state of the science. At the Duluth Conference, Acting Division Director Dale Hoff presented the late Phil Cook’s work on calculating fiber potency estimates. The framework was to set the toxicity of UICC amosite asbestos at a potency of 1.0, and to estimate the relative potencies of other fibers as indicated by modeling based on the data in the EPA database. To our knowledge this material has not yet been published, but the methodology and database are available. The EPA estimates that 0.0004 UICC amosite asbestos fibers per cubic centimeter in ambient air will result in one additional cancer per 10,000 people. ⁵²¹ While the discussion below relates to cancer risks, non-malignant health risks can be of even greater concern.	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4131	191	We recognize that the sum of the various types of fibers that are emitted by the mining industry in Northeastern Minnesota is likely less toxic than amosite asbestos. However, any assessment of the impact on public health has to include a discussion of the level of fibers in the ambient air, both before and during operation of the proposed mine. Information on existing fiber levels is available from MPCA and MDH. This information should have been included in the FEIS, along with a comparison to levels in a non-impacted area.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4132	192	We are submitting two exhibits containing monitoring data for ambient air in Silver Bay, Beaver Bay, and Babbitt. The most recent data we have for Silver Bay (F1) and Beaver Bay (F7) is contained on an Excel spreadsheet prepared by MPCA staff and provided to Le Lind on January 24, 2007. ⁵²³ The average amphibole fiber count in the ambient air in Silver Bay (F1) in 2006 was 4,998 fibers per cubic meter. ⁵²⁴ The average amphibole fiber count in the ambient air in Beaver Bay (F7) in 2006 was 5,823 fibers per cubic meter. This translates to 0.0050 fibers per cc in Silver Bay and 0.0058 fibers per cc in Beaver Bay. If these fibers were as toxic as amosite asbestos, this would translate to an increased cancer risk of 12.5 and 14.5 in 10,000. We are also submitting three sampling data sheets for monitoring in Babbitt in 2008. ⁵²⁵ One had a result of zero; the average of the other two samples is 8,806 amphibole fibers per cubic meter, or 0.0088 fibers per cc. This would amount to an estimated increased cancer risk of 22 in 10,000 for amosite asbestos. Thus even if the sum of toxicity of fibers from Minnesota mines is only one-tenth the toxicity of amosite asbestos, the ambient air in Minnesota mining communities is already above the EPA benchmark, which is regarded as an indicator of an acceptable level of risk. ⁵²⁶ The Minnesota Air Toxics Study published in 2005 reported on monitored levels of listed air toxics between 1996 and 2001. Although the study found that a few substances were present in ambient air at above the benchmark for an additional 1 in 100,000 increased cancer risk, no substance was present above the benchmark for an additional 1 in 10,000 increased cancer risk at any location. This indicates that even if the sum of toxicity of fibers from Minnesota mines is one-hundredth the toxicity of amosite asbestos, it is still one of the most serious air toxics health issues in Minnesota. This situation is allowed to continue in part because the State focuses attention on epidemiological studies in regard to mineral fibers from mining, while for every other toxic substance (and for mineral fibers from any other industry), allowable levels in the ambient air are based on toxicological studies. Limitations based on toxicological studies protect the public at a level that is not measurable in the local population by epidemiological studies. Given the size of the local population, it would be impossible to detect an increase of one additional cancer in 10,000 people on the Iron Range, much less assign a cause. And yet discussions of the toxicity of fibers in the ambient air on the Iron Range and North Shore invariably center on epidemiological studies such as the Minnesota Taconite Workers Study. The NorthMet FEIS repeats this pattern. ⁵²⁷ Minnesota agencies apparently will not require that amphibole fibers in the ambient air in Northeastern Minnesota remain below a certain level until the increase in cancer in the general population is measurable, despite the fact that MDH consistently rejects such an approach as insufficiently protective of public health. Standard agency practice for protecting the public from airborne toxins is nowhere to be found in the public discourse.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4133	193	Turning to the proposed NorthMet project, any additional health risks from fiber emissions would add to an ongoing problem. The current situation does not allow for permitting a new facility and then monitoring to find out if the fiber level in ambient air in local communities increases. We are already past that point. As the NorthMet FEIS acknowledges, amphibole fibers are present in the NorthMet ore. The discussion of the levels of fibers in the ore attempts to minimize concern without telling us anything about what the level actually is. The text states that “amphibole mineral fibers were found to represent a relatively small percent of the mineral fibers associated with the processing of NorthMet Deposit ore; approximately 9 percent of the fibers identified from all collected samples of ore, tailings, and process water.” ⁵²⁸ But the text does not tell us the total number of fibers identified or the volume of ore, tailings, and process water that they were identified in, so 9 percent means absolutely nothing. The text goes on to say that “It is not possible to accurately quantify the amount of fibers that might be emitted from the facility.” This is a curious statement in light of the quantification of emissions of virtually every other possible pollutant. ⁵²⁹ The FEIS provides no explanation or reference for this judgment. This statement appears to set up a hurdle for the assessment of fiber emissions that is counter to both NEPA and the other analyses in the FEIS. While we agree that assessments should provide the greatest degree of accuracy possible, NEPA does not allow agencies to forego an assessment because it will not meet some undefined level of accuracy. Instead, the agency must use the best methods and data available, with explanations of the uncertainty involved. Taking an example from the FEIS itself, the water quality modeling provides variable inputs of water quality that may differ by orders of magnitude to consider a range of scenarios. For some of these estimates, there is no correlation between the modeled “continuation of existing conditions” and actual existing conditions at the site. Given the sophistication of air modeling in use today, we find it hard to believe that a similar level of accuracy is not possible for fiber emissions. Quantifying emissions involves two steps: measuring fiber levels in rock or process and waste streams; and applying emission factors and modeling to estimate levels in the ambient air. We found nothing in the record that indicates either of these cannot be done, and the FEIS does not say which of these steps makes the analysis impossible. Throughout the FEIS, analogs of other mine pits, waste rock, river systems, etc. are used where there is a lack of site-specific information. In addition, values from the Regional Copper Nickel Study are often included in analyses, and were in fact included in the discussion of fibers. Rough estimates of fiber levels in the ore and of the resulting impacts on ambient air can be drawn from these sources. In regards to measuring fibers in the ore, the study presented in Barr 2007 ¹ was done for precisely this purpose. We did not find an explanation of why this information could not be used as a basis for an estimate of the average level of fibers in the ore; if it is because the data set was not large enough, there is no explanation as to why a larger study could not be done.	S	N

29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4134	194	If PolyMet wants to perpetuate a lack of site-specific data, a report done for the Copper Nickel Study (and referenced in the FEIS) provides a comparison between the Duluth Complex and fiber levels in the Biwabik Formation, which hosts the Peter Mitchell Pit: “The Duluth Complex data show approximately 1/3 the amphibole content of the Biwabik formation. Based on this comparison, the Duluth gabbro will produce, on an average, concentrations of amphibole comparable to or less than those of Reserve Mining Company.”530 The authors of the Copper Nickel Study obviously believed that enough was or could be known about the level of fibers in ore and the fate of those fibers in processing to support modeling of fiber levels in ambient air.531 While the modeling for the Copper Nickel Study cannot be used directly for the NorthMet FEIS because the scenario modeled included a smelter and a larger volume of ore being processed, a similar site-specific modeling effort cannot be impossible for the NorthMet project. Indeed, the Copper Nickel Study explicitly expected that such an effort would be undertaken before permitting a particular project: “[T]hese estimates simply serve to highlight areas requiring further investigation. The site- specific considerations for a smelter (and tailing basin) must clearly address this question in the light of more detailed data.” 532 Furthermore, the Stevenson report combined with analog information from the communities affected by Northshore Mining provides another avenue for a NEPA-level assessment of potential impacts from the proposed NorthMet mine. We assume that ambient air fiber levels in Babbitt in 2008 stem from the Peter Mitchell Pit; LTV had ceased operating by then, and Mesabi Nuggets had not yet started. Also, the processing plant in Silver Bay is the only local source of fibers in Silver Bay and Beaver Bay, so ambient levels in those locations can also provide an analog.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4135	195	We assume that the NorthMet mine would process about 80% the amount of ore that Northshore Mining did in 2006, and we acknowledge that the best information available is that the NorthMet ore likely contains about one-third the amount of fibers as the Peter Mitchell Pit. However, at the NorthMet mine, the mine pit and the processing plant are close enough to each other that they would emit fibers to the same ambient air, which would approximately double the amount of fibers from one of the sources alone. This results in an emissions level of about half that affecting any of the mining communities in 2006 or 2008 (.8 x .33 x 2). Given the current level of fibers in the ambient air, increasing them by 50% without any attempt to assess the public health implications is unconscionable. And the planned Mesabi Nugget’s expansion would no doubt further add to the problem, depending on their source for taconite.	S	N
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4136	196	Rather than disclose this information in the FEIS to inform permitting and other agency decisions, the Co-lead Agencies propose controls for PM2.5, along with future monitoring. The levels of fibers present in the air from current mining operations reveal the fallacy of this approach. We have seen almost forty years of “regulation” of fibers at Northshore Mining, which has focused on installing supposed state-of-the-art particulate matter control technology. And while the fiber levels in ambient air are certainly lower than they would be without that technology, they still present a significant risk to public health. Are fugitive dust control measures planned for the NorthMet Mine that are not being used at Northshore Mining? If so, why isn’t Northshore Mining using them?	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4137	197	If PolyMet will in fact use the best possible PM2.5 control technology and practices, we fail to see how monitoring ambient air after the mine is built could help. If the agencies find that fiber levels have risen above a particular level, what action will be taken? What action will even be possible, if the best possible controls are already being used?	NS	X
29745	Unique			AIR	Erin Mittag	Minnesota Center for Environmental Advocacy	4139	199	If state-of-the-art controls are already being used, the decision to permit this mine is in practicality a decision to accept the fiber emissions that will result and the subsequent fiber levels in ambient air. And yet the Co-lead Agencies have not even attempted to find out what those emissions and fiber levels will be.	S	N
28547	Unique			AIR	Esteban Chiriboga	GLIFWC	3521	24	The tribal cooperating agencies believe that wind-blown dust particles containing sulfate compounds that are emitted from mining and beneficiation activities could contaminate wetlands, lakes, and streams near the project site and could cause harm to the Species of Special Concern that have been found in this area and to the animals that depend on these plants for food. The cumulative effects of these impacts are not properly characterized in the FEIS.	S	O
28547	Unique			AIR	Esteban Chiriboga	GLIFWC	3542	41	The mass balance analyses do not include mercury from air deposition, which has been quantified but is only treated independently. Appropriately accounting for the mercury reaching the Partridge and Embarrass River watersheds as a result of air deposition would increase the estimated mercury loadings to these systems calculated in the mass balance analyses.	S	O
26050	Unique			AIR	Hannah Anderson		1263	1	This mine is a terrible idea. The air pollution is stated as not having a “visual impact”. Well that’s great, too bad Sulfer dioxide is a “major air pollutant and has significant impacts upon human health,” according to the EPA; it also causes acid rain. Regarding nitrous oxide air pollution, even the EPA has several citations on the detriments and how to REDUCE Pollution. This mining project INCREASES this pollution. If this is not enough along with the greenhouse gasses that are also going to be released in the atmosphere, there are several other areas of pollution.	NS	X
29909	Unique			AIR	Harold Nordin		2715	4	It fails to sufficiently address the controls to be implemented to control risks from asbestos (and similarly related) particles and mercury released into the environment during and subsequent to mineral extraction;	NS	X
25944	Unique			AIR	Joseph Loisel		1247	3	The people and tourists living & visiting here are the cause of 50% of the air and water pollution----no controls there. At least industry--with about an estimated 11-12% cause of pollution can be controlled and improved.	NS	X
27736	Form Letter	1	Variant	AIR	Karen Eckman		2130	4	Destroying our forests for this purpose makes no sense when we are trying to sequester more carbon.	NS	X
29809	Unique			AIR	Karen Williams		2641	6	this includes risk from air pollutants, mineral particles similar to asbestos, methylmercury, arsenic, led, and manganese.	NS	X
27721	Unique			AIR	Kris Wegerson		2114	6	Asbestos is another chemical listed by the WHO as one of its 10 chemicals or groups of chemicals of major public health concern.	NS	X
29370	Unique			AIR	Lori Olinger		2523	8	Montana State University has undertaken a study of the airborne effects of pollution from the Berkeley Pit on the residents of Butte. We should consider results of this study to understand the potential impact to people living near the proposed PolyMet mine site. Butte is living with the consequences of open pit mining. Minnesota still has the ability to evaluate whether or not it would be safe. We should take the opportunity to do that rather than after the fact as is the case with Butte.	NS	X
29397	Unique			AIR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3808	98	The FEIS does not determine climate change implications of the proposed Project on the 1854 Ceded Territory (or anywhere). It only superficially discusses climate change impacts to circumpolar species.259 The FEIS also concludes that at the mine site low flow rates from the Pits to bedrock or surficial aquifers were not affected by the climate change and surface water quality won’t change much because all surface water discharged from the Mine Site would be treated by the WWTF.260 Similarly, climate change is not expected to cause significant changes in groundwater at the tailings basin, and surface water quality in the Embarrass River and its tributaries is expected to be minimally affected.261 In fact, the only real climate change effect noted is an increase in the amount of water that would need treatment at the WWTF.262 However, the Project has proposed the largest direct wetland fill ever permitted in this region and would disturb extensive areas of peat, which is known to be an important carbon and methane sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife seeks refuge as the climate warms. Nevertheless, to date, virtually all required wetland mitigation for mining impacts has been implemented out of the basin, representing a permanent loss of high quality ecological resources and functions.263 This omission undermines even the MNDNR’s own work. The MNDNR’s Moose Advisory Committee, which studies the decline of the moose population in northeastern Minnesota, has recommended preserving wetlands as sanctuaries for moose from heat stress related to climate change.264 Furthermore, underestimation of storm size and frequency is a serious problem for capture and treatment of polluted water from the Category 1 waste rock pile and tailings basin, tailings basin stability, stormwater run-off from the Overburden Storage and Layout Area (“OSLA”), and mine pit dewatering. Storm size and frequency is known to be changing. However, the mean annual precipitation used to model climate change was 29.8 in/yr instead of the current from 28.1 inches per year, a change of only 1.7 inches which is less than a 6 percent increase. These and other cumulative effects of climate change should have been addressed.	S	O
29979	Unique			AIR	Martha Morse		2753	1	The EIS on the North Met proposal does not appear to take into account the effects on air quality and grid load that will be impacted by the energy needed to support the reverse osmosis system. Reverse osmosis systems use so much energy that the NorthMet Project may require its own power plant and related infrastructure to provide the necessary energy.	S	O
26628	Unique			AIR	Mary Adams		1388	9	Electrical power consumption and greenhouse gas emissions was not addressed in the EIS.	S	O
27405	Unique			AIR	Melanie Peterson-Nafziger		1711	3	Besides the proven irresponsibility of the corporations pursuing this business in our state, this type of open-pit mining has a proven track record of permanent devastation of land and pollution of waterways. In 2015/2016 it is unforgivably irresponsible to approve new sources of sulfuric acid, which we have worked so hard to reduce since the 1980s. The EPA has designated this type of mining the most toxic-waste producing industry in the country. This industry is not welcome in Minnesota.	NS	X
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3304	69	The Band has also continued to raise concerns for amphibole fibers, and what we perceive as insufficient analysis in the FEIS. According to the FEIS, the BACT-like fine particulate controls will control the release of more than “99.9% of amphibole fibers that are emitted from controlled sources”, not “99.9% of fibers in the ore”. The second statement is incorrect, because some sources of fibers from the ore are uncontrolled, like blasting operations, or are unable to be controlled up to 99.9%, like haul roads, tailings, crushing and screening, and stockpiles.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3305	73	The FEIS assures that ambient air monitoring for amphibole fibers will be conducted following facility start-up. While no schedule of frequency or duration for amphibole fibers monitoring has been proposed in the FEIS, the Band continues to assert, as we have throughout the environmental review process, that monitoring will need to continue over the life of the mine, as no one can predict when fibers might be contacted and released. The Band cautions that several monitors may be needed to adequately protect human health in the future.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3328	68	Also from the FEIS (Table 6.2.7-6), cumulative inhalation risks for cancer are four times greater than the guideline of 1E-05. Although much of this risk comes from existing facilities, this number indicates that the area cannot sustain pollution that adds to what is already there without compromising health. Our previous comments on this issue have not been adequately addressed.	S	O

27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3343	59	FEIS (Table 5.2.7-1) is incomplete; it does not show the recently promulgated ozone standard of 0.070 ppm. This value should be added.	S	N
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3344	60	The FEIS states that the ambient air boundary for the Plant and Mine Sites (and 1,000 meters beyond) is used to define the maximum extent of NorthMet air impacts that would have the potential to affect wetlands that were not directly affected.135 The Band again asserts (as we have previously) that these property boundaries cannot arbitrarily be used for acid dust and metal deposition boundaries because there are no ambient air quality standards for these pollutants. While secondary ambient air quality standards do exist for vegetation, these are not to be used for deposition. “Deposition” is a concentration of a pollutant that settles out of the air onto a surface. Therefore, compliance with traditional ambient air quality modeling and the range where such compliance occurs cannot be used with regard to the deposition of these pollutants on the ground, water surfaces, and vegetation.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3350	70	The SDEIS stated that the Biwabik Iron Formation (which has been found to contain amphibole fibers) slopes under the Duluth Complex at the Mine Site, coming within 100 feet of the area that the company plans to mine. The Band’s previous comments regarding unexamined hydrological connections between geologic layers or formations are also applicable in this instance. With fractured bedrock present, that could establish a hydrological connection, and 100 feet would be an insufficient barrier. Additionally, these types of formations are characteristically not homogeneously distributed, meaning that pockets of fibers could be found unexpectedly. While it is true that some information on the occurrence of amphibole fibers has been gathered from the site, the drill locations were chosen with regard to studying minerals of economic interest, and did not specifically target locations where fibers may be expected to occur. The Band notes that the FEIS does not provide the same level of detail that the SDEIS did regarding this subject. Page 5-515 of the FEIS only states that “It should be noted that taconite is mined in the Biwabik Formation, whereas the ore proposed to be mined for the NorthMet Project Proposed Action is from the Duluth Complex, which is not in contact with the Biwabik Formation at the NorthMet Deposit”. This appears to be an attempt to address concerns regarding potential contact with fibers by misleading the public, i.e. simply removing any data that may cause concerns.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3352	72	The Taconite Workers Health Study concluded that: - Taconite workers had higher than expected death rates from three diseases: mesothelioma, lung cancer, and heart disease. - The length of time people worked in the industry was linked to higher levels of mesothelioma but not lung cancer. - Exposure to elongate mineral particle was linked to mesothelioma but not lung cancer - Workers with above-average exposure to dust containing EMPs were twice as likely to develop mesothelioma as workers with below-average exposures. - A screening of current and former taconite workers and their spouses revealed x-ray evidence of dust-related scarring of the lung and lung lining in workers. - There was a link from EMP exposure in workers to scarring of the pleura. - Spouses of taconite workers had comparable evidence of lung scarring on chest x-ray, to what’s been reported for the broader general public. The Band is extremely disturbed to note that the FEIS (page 5-515 through 5-516), while including some brief conclusions from the study, does not list the conclusions shown in the bullet points above. While the study concludes that “The role of a specific EMP type of exposure is not clear” it appears that the FEIS is attempting to downplay the possibility of a causal relationship between exposure to fibers and the occurrence of the diseases listed above.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3353	74	A cumulative analysis of fibers expected from the site along with fibers currently being emitted from other sources should be performed. Human health risk assessments should be expanded to include scenarios of worker exposure to amphibole fibers.	S	O
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3354	75	On October 6 and 7, 2015, a conference on Asbestos-like Mineral Fibers in the Upper Midwest was held at the EPA’s Mid-Continent Ecology Division facility in Duluth, MN. Several prominent scientists in the field presented research at this conference. Although much of the data has not yet been publicly released, it is surprising that this section of the FEIS was not updated to discuss the preliminary findings of these scientists.	NS	X
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3384	102	The Band, in its comments on the 2009 DEIS and again in its comments on the 2013 SDEIS, has repeatedly requested that the lead agencies develop a comprehensive analysis of the Project’s potential impacts on climate change beyond a greenhouse gas inventory. The FEIS fails to adequately address this critically important issue.	NS	X
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3385	103	Inadequately addressing – or just ignoring – both the potential climate change impacts of the proposed mine, as well as the affects climate change might have on the mine’s environmental impacts in the future, is directly contrary to these policies. Indeed, the CEQ has released revised draft guidance regarding climate change impacts and the NEPA process, see Revised Draft Guidance for Greenhouse Gas Emissions and Climate Change Impacts (December 18, 2014),196 which although not yet final, confirms what Executive Orders and existing federal policies already require under the NEPA review process.	S	N
27901	Unique			AIR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3386	104	A proper climate change analysis for this proposed Project would illustrate the adverse impact that the loss of wetlands will have on climate change. In addition to the broadly recognized services that wetlands provide, they also store significant amounts of carbon. It has been estimated that wetlands (only about 6% of the world’s terrestrial area) contain carbon equal to the total atmospheric carbon store (Intergovernmental Panel on Climate Change, Working Group 11: Impacts, Adaptation and Vulnerability, 5.8.1 (2001)). Much of the carbon stored in wetland soils and vegetation will be released if they are drained, and the release of carbon will exceed sequestration. Yet despite elevating this issue repeatedly to the Co-lead agencies over the course of this environmental review process, the FEIS “analysis” of climate change impacts – all three paragraphs – fails to seriously evaluate Project impacts.198 It gives a brief recitation of recent rulemaking on greenhouse gas emissions reductions, and then simply provides an estimate of Project direct and indirect GHG emissions. As with mercury, the FEIS claims: ...there are no analytical or modeling tools to reliably evaluate the incremental impact of a proposed action’s discrete GHG emissions on the global and regional climate. In addition there are not analytical or modeling tools to reliably evaluate any cascading effects, or cumulative effects, from a particular proposed action’s GHG emissions on natural ecosystems and human economic systems in a given state or region.199 This claim is particularly galling, in light of the St. Louis River ecosystem services valuation study that the Band provided to the Co-lead agencies in June, which they chose to disregard. The study explicitly analyzed the carbon sequestration capacity for the land cover classes that were evaluated for the study, including forests and various wetland types. The headwaters region of the watershed is essentially a large peatland complex, representing a vast carbon sink; loss of peatlands equals a loss of an enormous sink in the region and the release of carbon to the atmosphere. Peatlands contain greater than 3X more carbon per hectare than other ecosystems,200 and this important function (carbon storage) is so critical that its value is calculated separately from the other ecosystem services in the asset valuation. For the St. Louis River watershed, the carbon storage alone is valued between \$56 billion and \$95 billion201. The FEIS should have incorporated this information alongside the emissions estimate for a more comprehensive accounting of Project impacts.	S	O
29263	Unique			AIR	Pat Hawkinson		2471	7	What consideration has been made to the greater weather volatility being caused by climate change, which will only get worse with time? More floods and other severe weather could affect hydrology in the future.	NS	X
29019	Unique			AIR	Rev. Elton W. Brown		2392	10	Does the SDEIS adequately disclose how much fuel will be burned by the huge shovels, trucks, and machinery used in the extraction, crushing, and transportation systems? Are the emissions of these vehicles added into assessment of the impact of the project to our air quality and haze? Also, in the light of the terrible recent chemical spill that has poisoned W. Virginia water, does the SDEIS include adequate safeguards for the transportation and storage of gas and oil (as well as any other toxic agents used in the mining process)?	S	O
29019	Unique			AIR	Rev. Elton W. Brown		2393	11	Similarly, does this SDEIS adequately factor in the extra emissions put into our atmosphere by the power plants which must produce the huge electrical energy demand of the project?	S	O
28488	Unique			AIR	Shirley Huskins		2286	5	PolyMet does not address how they would handle climate change as it progresses in the coming years.	NS	X
26659	Unique			AIR	Steve Jay		1417	9	a. 4.2.7.1 Regional Climate and Meteorology. The data in this section are out of date. In the Figure data are from 2001-2005. b. 4.2.7.2 Table does not have CO2, the major air pollutant impacting weather patterns. Please add CO2 to this table.	S	N
26659	Unique			AIR	Steve Jay		1419	11	a. This section does not mention CO2, the global impacts of which are profound for forecasting meteorological changes, including air quality and catastrophic weather patterns. Please include CO2 in Table 5.2.7-1. The technical reasons for excluding CO2 should not preclude lead agencies for this FEIS from following the current science and common sense regarding this topic. Informing the public of the issues using the best evidence should be a priority of the parties.	S	O
26659	Unique			AIR	Steve Jay		1420	12	5.2.7.1.2. This sections mentions (p5.478) adverse effects on human health as determined by an Air Emissions Risk Analysis (AERA). AERA does not mention CO2 as a major driver of atmospheric change that is having major adverse impacts on human health. The science based trend projections are that human injuries, disease and death will continue to increase for the foreseeable future. Http://www3.epa.gov/climatechange/impacts/health.html. Minnesota’s gross emissions of GHGs grew by 32% between 1990 and 2005, twice the national average of 16%. (MN Climate Change Advisory Group, 2008) Projected increase in CO2 for 2025 was an increase 68% in MMt Tons of CO2e over 1990 levels. Minnesota has recognized that climate change is occurring and has developed mitigation and adaptation efforts to address the problem. Http://www.pca.state.mn.us/index.php/topics/climate-change/climate-change-in-minnesota/adapting-to-a-changing-climate.html. The EPA includes CO2 in its assessments for evaluating climate policy options. Http://www3.epa.gov/climatechange/EPAactivities/economics.html. Either the individual sections of this FEIS should be changed to reflect the recent climate change impacts or the section 6.2.7.10 (Climate Change) should be expanded to more fully inform the public about this issue. There are critically important social, legal, moral, economic and scientific dimensions to this problem.	S	O
26659	Unique			AIR	Steve Jay		1425	17	a. The statements that minimize the significance of GHG emissions from this project (“several orders of magnitude lower....” are accurate but miss the point. Rapidly changing climate conditions may alter assumptions and conclusions regarding this project impacts on the environment. This language should be modified accordingly.	NS	X

24770	Unique			AIR	Tom Thompson		1108	7	I find it objectionable that there is not more in the plan for decreasing the carbon footprint or considering the carbon footprint that Polymet will have. Mining is already one of the biggest users of electricity in Minnesota. Added mining and processing will increase this. Is this the right time for increasing Minnesota’s carbon footprint when the world is battling its disastrous effects? Does Polymet have a plan for being carbon neutral? Polymet needs a plan in its FEIS for the fossil fuels that will be burned to accommodate or eliminate them. This should also include the carbon that won’t be absorbed when wetlands are destroyed, peat bogs are torn up and forests cut down and not replanted.	NS	X
29973	Unique			AIR	William Robbins		2748	5	Here is a link to the following article: http://punapono.com/docs/Legator.pdf "Health Effects from Chronic Low-Level Exposure to Hydrogen Sulfide" Marvin S. Legator, et al, Archives of Environmental Health March/April 2001 [Vol. 56 (No.2) pp 123-131 The link above shows about eight times the incidence of anemia with low levels of of hydrogen sulfide exposure, parts per million, when compared to control subjects. Various other illnesses are also reported.	NS	X
29973	Unique			AIR	William Robbins		2749	6	All the following generate airborne dust: Removing overburden, mining, transportation, milling to reduce size preparatory to froth flotation, and tailings storage. I found little mention in the final EIS of sources of dust, design of equipment and engineering processes to minimize dust generation and remediation procedures to contain and dispose of dust.	NS	X
26780	Unique			ALT	Alaina Pilate		1455	5	We ask that alternatives be more thoroughly considered to limit the environmental harm, reduce pollution seepage from unlined permanent waste facilities, wetland destruction, and also the evaluate potential of a catastrophic dam failure.	NS	X
26780	Unique			ALT	Alaina Pilate		1460	12	Please consider alternatives such as underground mining and require clean energy practices to reduce pollution.	NS	X
24810	Unique			ALT	Alexa Douglas		1118	6	Third....check with Water Legacy for well researched and positive alternatives.	NS	X
26973	Unique			ALT	Andrew Comfort		1494	2	Minnesota Rules 4410.2300, item G states: "The alternative of no action shall be addressed." The alternative of no action is not properly addressed in the FEIS, so the FEIS is inadequate. For further discussion of this topic see the section titled "Scenarios" in Exhibit A, page 11. It is unclear (and unlikely) that the mining of Polymet and the further Duluth Complex would provide a net financial benefit to the State of Minnesota. So the alternative of not mining non-ferrous metals should be seriously studied prior to beginning a new era of non-ferrous sulfide mining in Minnesota.	S	O
27377	Unique			ALT	Beth Lewis		1703	5	Lack of consideration of alternatives to open pit, surface mining.	NS	X
4	Unique			ALT	Bob Woodbury		7	5	What happens if the project is denied. There will be other, less vulnerable sites, that will be explored and developed. Can we afford even the slightest chance for the destruction of a vital wilderness area, whose existence is at least as valuable in its own right as the proposed project - and to many, many more people. Because of its location, common sense says this project should never have been pursued in the first place. The area is revered by thousands, if not millions, of people from all over the world – an overwhelming majority over the few who want to develop this project and who will benefit from it.	NS	X
4	Unique			ALT	Bob Woodbury		8	6	Our lands are vast. This isn't the only place in our country where these metals can be found. There is absolutely no sense of urgency to mine this particular ground.	NS	X
27620	Unique			ALT	Brad Heltemes		1789	4	cancel once and for all any support for this ill-advised project and consider channeling energy and resources instead into sustainable development options for Northeast Minnesota.	NS	X
30073	Unique			ALT	Brad Sagen		4344	2	The FEIS relies upon “contingency mitigation” where water quality is “worse than expected” or as a result of “compliance issues” (FEIS, 5-239 to 5-240). The FEIS provides no information that mitigation is feasible or would be effective. The FEIS states, “The exact type, location, scale, and timing of mitigation measures are not known at this time.” (FEIS, 5-240).	S	N
30073	Unique			ALT	Brad Sagen		4345	3	Contingency mitigation may be considered a strategically chosen alternative phrase to “adaptive management.” The latter, while undefined in the SDEIS, is part of USFS regulations and policy, and would have subjected the FEIS to more systematic scrutiny. FEIS pronouncements about contingency mitigation should be subjected to analysis using USFS guidelines about adaptive management.	S	N
2113	Unique			ALT	Bruce Harten		293	2	- The project's water modeling—shows that PolyMet's treatment and mitigation plans will not prevent acid mine drainage and meet all water quality standards unless used in a Engineered Closed Loop Facility	NS	X
2113	Unique			ALT	Bruce Harten		295	4	In short, the Final EIS does not meet the requirements of todays available technology in that it does not provide a "Completly Closed Loop Facility....One enclosed facility that crushes, ball mills, rod mills, separates, extracts , smelters....reuses water and REMOVES SULFIDES....dries and compacts tailings befor retuning them to the pit ! "When the power shuts off EVERYTHING STOPS....for a minute or 500 years !	NS	X
41	Unique			ALT	Bryan Emmel		107	1	I agree with those who say that this type of extraction should be limited to dry-land areas.	NS	X

29801	Unique			ALT	Daniel Pauly		4170	4	In view of the data integrity issues and improper mercury discharge conclusions, the NorthMet FEIS should review previously discarded Tailings Basin alternatives.	NS	X
29801	Unique			ALT	Daniel Pauly		4180	14	As detailed in the attached comments, and previously raised in my SDEIS comments, the present plan for the NorthMet Tailings Basin is to reuse LTV’s 60 year old unlined tailings basin that contains decades of heavy mercury loadings. The existing LTV tailings basin has been drying out since 2001, and seepage volumes have declined. As noted in the FEIS with reference to the No Action Alternative, the LTV tailings basin should continue to dry out in coming years, with a concurrent drop in contaminated discharges. The NorthMet recommended action is to essentially build another unlined Tailings Basin on top of the current unlined and inactive tailing basin, but this time with tailings that are likely to be higher in sulfates than the existing mercury-rich tailings. Water from the new Tailings Basin will seep through the old taconite tailings, and then be discharged out the bottom into a large wetland area. In the wetland mercury methylation is likely to occur, and the methylmercury will bio-accumulate in the wetland life forms, before being carried out into the Embarrass River watershed by everything from bugs to birds. Some of the mercury, whether methylated or not, will travel to the NorthMet proposal Waste Water Treatment Plant. However, the FEIS has no plan to remove that mercury, and the FEIS documents indicate removal may not even be possible with the reverse osmosis technology planned for the waste water treatment plant. In view of the information available, two alternatives, at a minimum, should have been considered more thoroughly to see if they could have avoided the problems of perching a new unlined basin on top of an old unlined basin: either (a) putting a liner between the basins; or (b) locating the new basin somewhere other than on top of an old unlined basin. Both of these alternatives offer significant improvements in regards to preventing release of mercury from the existing LTV tailings basin, avoid the interaction of seepage water between two different types of tailings, and allow for what will likely be a significantly less complex and less expensive waste water treatment facility. These two proposals would require a much more significant up-front capital cost, but would reduce long term costs and accompanying uncertainty. To the extent long term costs are an issue to project approval, consideration of these options should be undertaken to remove that uncertainty. Overall, it seems quite possible that either of these two options could offer the mutual benefit of lower costs and improved environmental protection. These two alternatives were dismissed very early in the EIS process. From my review of the DEIS and FEIS, I believe these alternatives were prematurely dismissed because DEIS and FEIS preparers overlooked the fact that that mercury contamination would be an issue. The thorough review of these (and other) alternatives is obviously beyond the scope of these comments. However, at the end of these comments I provide a simplified matrix showing how these two alternatives compare in effectiveness and cost relative to the proposals in the FEIS. Further note that viable implementation of either of these options is really only available now, before the NorthMet project proceeds, because neither can be “retrofitted” onto the project once it has gone forward. In other words, it will be too late in 10 or 20 years, once the Tailings Basin has been filled, to find out that there might have been a better and cheaper way. Should the “adaptive engineering” approach to the WWTP prove unworkable for long term water treatment, it will be too late, or at least unfathomably expensive, to segregate the NorthMet tailings and LTV tailings.	S	O
29801	Unique			ALT	Daniel Pauly		4211	52	The failure to appreciate the potential for groundwater mercury impacts from the NorthMet Tailings Basin resulted in alternatives being improperly dismissed in the DEIS and FEIS that should have been considered. NEPA and MEPA require consideration of alternatives, as summarized below in one of PolyMet’s ERM reports: NEPA and MEPA have slightly different requirements for considering alternatives. NEPA describes the consideration of alternatives as the “heart of the environmental impact statement.” NEPA requires the consideration of all reasonable alternatives and a discussion of alternatives which were eliminated from further study. The decision maker must consider all reasonable alternatives and cannot consider alternatives not discussed in the EIS. MEPA (Minnesota Rules, part 4410.2300, subpart G) states that an alternative may be excluded if “it would not meet the underlying need for or purpose of the Project; it would likely not have any significant environmental benefit compared to the Project as proposed; or another alternative, of any type, that will be analyzed in the DEIS would likely have similar environmental benefits but substantially less adverse economic, employment, or sociological impacts.” (ERM Report, Emphasis added). In the present case, as discussed in related comments, the failure of the DEIS and FEIS process to consider mercury impacts from the NorthMet Project has resulted in potentially superior alternatives being prematurely dismissed.	S	O
29801	Unique			ALT	Daniel Pauly		4213	54	Deficiencies in Tailings Basin mercury characterization have resulted in failure to evaluate two viable, and potentially superior, Tailings Basin alternatives. In particular, TBM-3 and TBM-21 should be evaluated as better performing alternatives During the DEIS process, two specific Tailings Basin alternatives were proposed that have the potential to meet all environmental requirements and also be less expensive than the proposed NorthMet alternative. The first of these alternatives, TBM-3, would have included a full liner between new and existing tailings. The second of these alternatives, TBM-21, would have called for an alternative location of a new basin. Both of these mitigation measures were deemed to address all four of the issues identified in the Tailings Basin mitigation process (See DEIS at pages 3-56 to 3-58), but were dismissed as being economically inferior to the recommended proposal. Specifically, it should be noted that each design would meet the purpose and need, would be technically feasible, and would be regulatorily feasible. When TBM-3 and TBM-21 were dismissed, the economic viability was being compared to the original DEIS proposal, which did not include the containment system or WWTP as proposed, both of which increase the cost of the presently proposed design relative to the prior DEIS proposal. In addition, the now apparent need to also remove mercury from Tailings Basin seepage, as well to prevent it from entering wetlands surrounding the Tailings Basin, will add additional cost to the proposed Tailings Basin plan. The failure to properly conduct a WWTP pilot test adds even greater uncertainty to the potential costs of the proposed Tailings Basin alternative. In aggregate, these changes in the Tailings Basin options since the DEIS eliminated TBM-3 and TBM-21 indicate that the dismissed alternatives should be reconsidered. On the following page I have a brief summary of distinctions between the proposed NorthMet Tailings Basin Alternative compared to TBM-3 and TBM-21	S	O

				ALT	Dave Chambers	Center for Science in Public Participation	4147-1	5	3.2.3.4.1 Underground Mining Alternative In all of the EIS versions the alternative of underground mining has been screened and rejected. Underground mining offers a number of environmental benefits, and would conceivably offer a lesser number of jobs for a similar amount of time as the proposed alternative. As noted by GLIFWC in its comments in FEIS Appendix B: The document states that for an alternative to be evaluated it must meet 5 screening criteria: 1. Be technically feasible 2. Be available 3. Offer significant environmental benefits over the proposed project 4. Meet the purpose and need 5. Be economically feasible As GLIFWC points out, all of these criteria can clearly be met, with the exception of the last. The only rationale that is used to eliminate the alternative is economic feasibility. CSP2 has performed its own analysis of the possible underground mining, assuming an underground room & pillar mining cost of \$44/ton for backfill, and \$39/ton without backfill.1 We disagree with the assumption in AGP 2011 that the recovery rate for room & pillar mining would be limited to 55%. The method can be more flexible than that assumed by AGP. Mining methods tend have site-specific modifications that are made to make the method most flexible and productive at that site. For our purposes we have assumed that the mining method chosen will allow a recovery rate similar to that for open-hole stoping (90%). The assumptions/rationale for these cost assumptions are detailed in the table below: Mining Rate (tpd) Mining Cost (\$/ton) Milling Cost (\$/ton) General (Admin) & Contingency (\$/ton) Total Cost (\$/ton) Pre Production Capital Costs (millions \$) Source 7500 28 12.5 3.5 44.0 225.0 7500 23 12.5 3.5 39.0 205.0 References: AGP 2011 Appendix B Foth 2012 Foth 2013 InfoMine 2009 PEG 2009 Zurowski, Gordon, AGP Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, November 11, 2011 Appendix B Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange Environmental Impact Statement, September 27, 2013 Bornhorst, Theodore J, LLC, Economic Assessment of Conceptual Underground Mining Option for the NorthMet Project, Subconsultant to Foth Infrastructure & Environment, LLC, October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 1 Bornhorst, Theodore J, LLC, Response to USEPA Questions Regarding: Economic Assessment of Underground Mining Report Dated October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 2 InfoMine USA, Inc., 2009, Mining Cost Service, Section CM, Cost Models, cited in Foth 2012 Zurowski, Gordon, PEG Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, July 30, 2009 Similarly, the total operating and total pre-production costs are estimated based on the assumptions/rationale as detailed in the table below:		
				ALT	Dave Chambers	Center for Science in Public Participation	4147-2	5	Mining Rate (tpd) Mining Cost (\$/ton) Milling Cost (\$/ton) General (Admin) & Contingency (\$/ton) Total Cost (\$/ton) Pre Production Capital Costs (millions \$) Source 7500 28 12.5 3.5 44.0 225.0 7500 23 12.5 3.5 39.0 205.0 References: AGP 2011 Appendix B Foth 2012 Foth 2013 InfoMine 2009 PEG 2009 Zurowski, Gordon, AGP Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, November 11, 2011 Appendix B Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange Environmental Impact Statement, September 27, 2013 Bornhorst, Theodore J, LLC, Economic Assessment of Conceptual Underground Mining Option for the NorthMet Project, Subconsultant to Foth Infrastructure & Environment, LLC, October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 1 Bornhorst, Theodore J, LLC, Response to USEPA Questions Regarding: Economic Assessment of Underground Mining Report Dated October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 2 InfoMine USA, Inc., 2009, Mining Cost Service, Section CM, Cost Models, cited in Foth 2012 Zurowski, Gordon, PEG Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, July 30, 2009 CSP2 NorthMet Underground Mining Cost Estimates Room & pillar with backfill: mining cost from InfoMine 2009 / Foth 2012; p. 9, milling cost from InfoMine 2009 / Foth 2012, p. 11; general & contingency from Foth 2012, p. 8; Pre-production capital costs from InfoMine 2009 / Foth 2012, p. 11 Room & pillar without backfill: mining cost from InfoMine 2009 / Foth 2012; p. 10, milling cost from InfoMine 2009 / Foth 2012, p. 11; general & contingency from Foth 2012, p. 8; Pre-production capital costs from Copperwoodl, MI, 2009 / Foth 2012, p. 11 from: Foth 2012 / Appendix B Extracted Tonnage (million short tons) Underground Daily Rate of Production (tons/day) Productive Life of Mine (years) Total Operating Costs (\$/ton) Total Pre- Production Capital Costs (\$) 18 7,500 6 to 7 44 225,000,000 18 7,500 6 to 7 39 205,000,000 CSP2 Total Operating and Total Pre-Production Capital Cost Estimates With Backfill: Extracted tonnage from AGP 2011 p. 3; underground rate - see Foth 2012, p.9; total operating costs from InfoMine 2009 / Foth 2012, see Foth Cost Estimates; Pre-production capital costs from InfoMine 2009 / Foth 2012, p. 11 Without Backfill: Extracted tonnage from AGP 2011 p. 3; underground rate - see Foth 2012, p.9; total operating costs from InfoMine 2009 / Foth 2012, see Foth Cost Estimates; Preproduction capital costs from InfoMine 2009 / Foth 2012, p. 11 As was done in Appendix B of the FEIS, for comparison purposes both costs and revenue were based on 2012 data.		
29749	Unique			ALT	Dave Chambers	Center for Science in Public Participation	4147-3	5	The average net metal value for the amount to be mined, 18 million tons, was calculated based on the average net metal value per short ton developed in Appendix B, Foth 2012. Since a value for 18 million tons was not explicitly stated in Foth 2012, the data was extrapolated (in the graph below) to yield an average net metal value per short ton of \$57.13 (2012 US dollars).CSP2 Estimates of Average Net Metal Value (in blue) based on the data graphed above Economic Analysis of Underground Mining of the NorthMet Deposit The economic analysis of underground mining in the table above indicates that, in 2012, a case for positive net operating profit for underground mining without backfill can be made. Tweaking of assumptions for underground mining with backfill, especially of the operating costs, might also make underground mining with backfill potentially profitable. This is reasonable because all of assumptions made for these analyses are very rough, and if nothing else these calculations suggest that a more detailed analysis of underground mining is warranted. It should not be necessary to show that underground mining is profitable in every circumstance, only that it is possible under some reasonable set of conditions, like the economic climate of 2012, which was not ideal, to operate at a profit. It is also relevant to note that in this section it is stated: This alternative would involve mining the NorthMet Deposit as defined by the proposed open pit boundary. (FEIS, p. 3-159) If the phrase “as defined by the proposed open pit boundary” refers to the horizontal and vertical extent of the proposed pit, then a significant part of the ore body is being left out of the potential ore calculations.	S	N
				ALT	Dave Chambers	Center for Science in Public Participation	4150-1	8	Adaptive Management has many definitions, but for the purposes of mining it might be defined as “a structured, iterative process of robust decision making in the face of uncertainty, with an aim to reducing uncertainty over time via system monitoring (Wikipedia, Nov 2015).” PolyMet proposes to use Adaptive Management for a number of critical aspects of the proposed mining project. Adaptive management is proposed for Water Management (probably the most critical program), the Stockpile Cover System, the Mine and Plant Site Waste Water Treatment Systems, Tailings Basin Pond Bottom Cover System, Wetland Monitoring, the geotechnical stability of the Waste rock stockpiles, Tailings Basin, and Hydrometallurgical Residue Facility, the Mine and Plant Site Air Quality Management Plans, and Long-Term Post-Closure Monitoring and Maintenance. The US Department of Interior describes adaptive management as management as the interplay of decision and assessment components, in an iterative process of learning by doing and adapting based on what’s learned. Adaptive management involves key activities such as stakeholder engagement, resource monitoring, and modeling, none of which is sufficient by itself to make a decision process adaptive. The integration of these components is what defines an adaptive approach to natural resource management. (Williams and Brown 2012, p. 11) Simply monitoring activities and occasionally changing them when problems are discovered does not constitute adaptive management. The USGS notes that “Many people in the field of natural resource conservation now claim, sometimes wrongly, that adaptive management is the approach they use to manage resources (Failing et al. 2004). The current popularity of adaptive management is somewhat at odds with its rather modest record of documented success, a record based at least in part on an inadequate framing of many management problems, poorly designed monitoring, and incomplete implementation of the adaptive process itself. (Williams and Brown 2012, p. 6) This review seeks to distinguish adaptive management as a technical, substantive process from a generic definition of adaptation that encompasses lesser attempts to simply apply modifications to failed plans. While adaptive management may take many forms, to be genuine it should ensure a substantive mix of critical elements for planned and unplanned impacts that are applied over time. In the permit context, it should have clear prospective, prescriptive commitments to application and measurement.		
				ALT	Dave Chambers	Center for Science in Public Participation	4150-2	8	These should generally consider and include, but may not be limited to, defining and employing 1. Stakeholder involvement 2. Management objectives 3. Predictive models 4. Monitoring protocols 5. Decision making protocols 6. Follow-up monitoring 7. Assessment 8. Learning and feedback 9. Institutional learning for both the regulators and mines 10. Timing and costs associated with both the adaptive management and its implementation (success and failure) including post reclamation and post-bond release. (See generally Williams and Brown 2012) PolyMet proposed use of Adaptive Management is problematic because most of its applications do not include important features of adaptive management. Most of the proposed Adaptive Management Plans are in fact more akin to normal project management where project activities and plans are modified as necessary and appropriate based on changed conditions, failed activities, leaks, improvements in available technologies, etc. For example, PolyMet’s EIS Rock and Overburden Management Plan, Section 6.0, Reporting and Adaptive Management, states that Adaptive management is a system of management practices based on clearly defined outcomes and monitoring requirements to determine if management actions are meeting the desired outcomes and, if not, implementing changes that will best ensure that outcomes are met or re-evaluated. Adaptive management recognizes the uncertainty associated with estimates based on exploration drilling for a 20-year Mine Plan. Adaptive management measures will be developed through the Environmental Review process, permitting, and during operations, reclamation, and long-term closure to define when changes are needed. (PolyMet 2014h, p. 38) This seems to be a fairly self-evident definition of adaptive management – promising little more than modification of plans to implement changes in response to failure to meet previously committed outcomes. Adaptive management surely recognizes uncertainty (such as that uncertainty associated with estimates based on exploration drilling) but it requires a substantive process for dealing with that uncertainty and responding to the outcomes from that uncertainty on the ground. Much of the PolyMet plan does not commit to these steps or outcomes in terms of adaptive management – rather it commits to develop adaptive steps in the future. To be properly considered by regulators and the public, these steps should be included at the permitting stage – not as the mine, and its failures, unfold. Adaptive management can be a functional iterative tool for many situations but it could also be misused/misapplied as a means to delay planning or other steps necessary for a complete mine and reclamation plan - both of which are necessary prior to agency approval of a mining permit. The USFS (USDA 2005) has noted “adaptive management does not postpone action until “enough” is known, but acknowledges that time and resources are too short to defer some action” (Lee 1999, p. 5) Specific examples of these types of deficiencies include, but are not limited, to the following sections.

				ALT	Dave Chambers	Center for Science in Public Participation	4150-3	8	Rock and Overburden Management Plan As discussed above, the Rock and Overburden Management Plan establishes a questionable definition of adaptive management. It seems to primarily promise to modify its Plan to accommodate variances from its pre-mine estimates. (See PolyMet 2014h, p. 38). This is insufficient on many levels – the most important being that the Plan identifies only one mitigation measure that could be taken – when actual adaptive management should require considering (with regulators and stakeholders) a variety of reasonable alternatives, considering their effectiveness, and considering their costs (both for analysis purposes and for bonding). These were not done. Adaptive Water Management Plan The Adaptive Water Management Plan contains numerous components of what this review considered essential for adaptive management. An example is contingency planning and review. On the other hand, the Adaptive Water Management Plan states To achieve the specific purpose of treatment for each of the Project phases, the operating configuration and the operating requirements of individual process units within the WWTF or the capacity of the WWTF may need to be modified. Thus, the WWTF is considered an adaptive engineering control. The WWTF treatment processes can be adapted, as necessary, to meet the actual conditions encountered during the Project and estimated by water quality monitoring and continued model updating. (PolyMet 2014d, pp. 32-33) The use of the word “adaptive” in response to the need for modification does not make the plan adaptive management (or adaptive engineering). It means that the plan may need modified in response to deficiencies and the failure to meet plan objectives or regulatory guidelines/requirements. As described above, genuine adaptive management requires more than simple adaptation. The Waste Rock Stockpile Cover system (Section 3) describes select elements that are important to adaptive management. These include specific events/conditions that could trigger change, possible changes that could achieve necessary changes, etc. The discussion is deficient in other important elements such as modeling and stakeholder participation. Similarly Section 4’s Plant Site Adaptive Water Management discussion includes modeling comparison and modification – which are important adaptive management elements. This section goes further than some, with notable details for the Waste Water Treatment Plant. But it does not go far enough to include elements to differentiate it from traditional, standard mine permitting where actual and modeled conditions are compared so as to guide future modeling and plan adjustment. When discussing the potential for softening pretreatment water to improve the membrane life and process effectiveness the Adaptive Plan states that . Generally, ripple effects from this adaptive management strategy will be small compared to current impacts and could be effectively mitigated. (PolyMet 2014d, p. 84) It is insufficient to simply conclude/promise that adaptive management strategy impacts will be less than current impacts. The EIS should evaluate the components of the adaptive management plan – which will ensure that it is sufficiently robust and afford regulators and the public an opportunity to evaluate it prior to permitting. Moreover, it is insufficient to simply promise that impacts can be mitigated – they must be shown to be mitigatable and/or at a minimum the mine must make clear commitment (backed by a financial surety) that impacts will actually be mitigated or resolved. In the Section 5 discussion of Flotation Tailings Basin Pond adaptive management, the plan describes actual test projects, reporting and modifying the model, modifying the design, circumstances triggering modification, and options for modified performance. (PolyMet 2014d, pp. 94-95).		
				ALT	Dave Chambers	Center for Science in Public Participation	4150-4	8	These are important features for adaptive management and do not appear in most of the FEISs “adaptive management” sections. The Adaptive Management plan for Non-Mechanical Treatment Systems describes The Non-mechanical treatment systems are adaptive engineering controls because they will be designed and operated based on site-specific conditions using the knowledge that is gained during the operating and reclamation phases of the Project. The specific adaptive management approach for each non-mechanical system is outlined in the development plans (Sections 6.2.3, 6.3.3, and 6.4.3). (PolyMet 2014d, p. 104) Like the previous section, this section is more akin to normal mine operations where systems are adjusted to improve performance. However this section’s focus on site-specific conditions and using knowledge to guide operations and modifications uses language more common to adaptive management - creating a potential for more robust application. The subsequent sections do not deliver actual adaptive management. Importantly, the Plan includes provisions to help ensure that the Financial Assurance includes the costs of developing non-mechanical treatment for the Category 1 Stockpile, West Pit Overflow, and Flotation Tailings Basin. It is especially critical that adaptive management plans include adequate financial assurance development and modification to ensure that at all times the mine is operating there is sufficient bond for the state to at any time take over the site and fully operate, maintain, and close the mine. Such provision for bonding must be considered in all management planning. Water Management Plan - Mine and Water Management Plan - Plant Even reviewed together with the Adaptive Water Management Plan, as with numerous chapters, what are described as adaptive management plans for the Mines (PolyMet 2015r) and Plants (PolyMet 2015i) water management could be more accurately described as contingencies or responses to deficiencies/failures. They are not unreasonable and include important elements to respond to plan failures - but they do not contain critical elements necessary for actual, meaningful, substantive adaptive management. This includes their mitigation references to the Adaptive Water Management Plan (PolyMet 2015d). By describing plans as adaptive management plans, the EIS raises the bar on what should be included. It is not sufficient to just monitoring activities and commit to possibly implementing from a list of contingencies when a problem is discovered. This is not adaptive management - it is the mine operator responding to a problem without clear commitment to meaningful adaptive process or outcome. Air Quality NorthMet Project Air Quality Management Plan - Mine, Version 4 states 6.3 Adaptive Management The Mine Site FEC (Fugitive Emission Control) Plan includes some adaptive management provisions to address the potential need for adjustments or modifications to the plan. Data from the meteorological monitoring system will be integrated with the data from the Mine Management System (water/chemical application, road usage, observed dust notifications) along with daily fugitive dust observation forms.		
29749	Unique			ALT	Dave Chambers	Center for Science in Public Participation	4150-5	8	These data will be reviewed, at a minimum, on a semi-annual basis to aid in analyzing trends and to determine if FECs are effective. The Mine Site FEC Plan will be modified as needed based on these reviews or other improvements that have been identified. 6.4 Available Mitigations Additional mitigations are available if necessary to achieve compliance, including - revision to Mine Site FEC Plan - planting of trees or other vegetation along unpaved roads or around other potential dust generating activities to aid dust settling before reaching the ambient air boundary. (PolyMet 2014m, pp. 12-13). The concept that “some adaptive management provisions” could constitute adaptive management implies that adopting selected provisions somehow satisfies having a complete plan. These steps do not constitute adaptive management so much as they indicate a willingness to fix problems that evolve. To truly be adaptive management the above, limited provisions need to be part of a full adaptive management scheme. As written it is unclear that the mine will do what it promises or what is necessary for effective implementation. NorthMet Project Air Quality Management Plan - Plant, Version 7, Issue Date December 5, 2014 states that 7.0 Reporting and Adaptive Management One time and periodic reporting will be required by the air emission permit. Specific reporting requirements are dictated by applicable federal and state air quality rules, Attachment A, and any other requirements anticipated in the permit. The subsections below provide a reasonable initial proposal for reporting requirements, based on knowledge of applicable regulations and professional experience and judgment. The final operating and maintenance requirements will be agreed upon between PolyMet and MPCA, during the permitting process and include public comment where applicable. (PolyMet 2014n, p. 31). The Plant plan does not contain or commit to meaningful adaptive management. It appears to be a fairly typical (non-adaptive management) mine regulatory proposal. Flotation Tailings Management Plan As discussed above, review and modification of plans does not alone constitute adaptive management. The Flotation Tailings Management Plan (PolyMet 2015n) describes a list of possible mitigation measures but otherwise fails to include other essential adaptive management components. An essential umbrella over these steps is a clear analysis that the measures proposed can accomplish what they purport to accomplish, an assessment of their likely effectiveness, and the costs associated with their implementation, failure, modification, and related bonding. Without these elements the EIS’s proposed adaptive management is more a plan to plan than an “observational method of adaptive management.” (PolyMet 2015n, pp. 5, 34)	S	O
				ALT	Dave Chambers	Center for Science in Public Participation	4162-1	8	Adaptive Management has many definitions, but for the purposes of mining it might be defined as “a structured, iterative process of robust decision making in the face of uncertainty, with an aim to reducing uncertainty over time via system monitoring (Wikipedia, Nov 2015).” PolyMet proposes to use Adaptive Management for a number of critical aspects of the proposed mining project. Adaptive management is proposed for Water Management (probably the most critical program), the Stockpile Cover System, the Mine and Plant Site Waste Water Treatment Systems, Tailings Basin Pond Bottom Cover System, Wetland Monitoring, the geotechnical stability of the Waste rock stockpiles, Tailings Basin, and Hydrometallurgical Residue Facility, the Mine and Plant Site Air Quality Management Plans, and Long-Term Post-Closure Monitoring and Maintenance. The US Department of Interior describes adaptive management as management as the interplay of decision and assessment components, in an iterative process of learning by doing and adapting based on what’s learned. Adaptive management involves key activities such as stakeholder engagement, resource monitoring, and modeling, none of which is sufficient by itself to make a decision process adaptive. The integration of these components is what defines an adaptive approach to natural resource management. (Williams and Brown 2012, p. 11) Simply monitoring activities and occasionally changing them when problems are discovered does not constitute adaptive management. The USGS notes that “Many people in the field of natural resource conservation now claim, sometimes wrongly, that adaptive management is the approach they use to manage resources (Failing et al. 2004). The current popularity of adaptive management is somewhat at odds with its rather modest record of documented success, a record based at least in part on an inadequate framing of many management problems, poorly designed monitoring, and incomplete implementation of the adaptive process itself. (Williams and Brown 2012, p. 6) This review seeks to distinguish adaptive management as a technical, substantive process from a generic definition of adaptation that encompasses lesser attempts to simply apply modifications to failed plans. While adaptive management may take many forms, to be genuine it should ensure a substantive mix of critical elements for planned and unplanned impacts that are applied over time. In the permit context, it should have clear prospective, prescriptive commitments to application and measurement. These should generally consider and include, but may not be limited to, defining and employing 1. Stakeholder involvement 2. Management objectives 3. Predictive models 4. Monitoring protocols 5. Decision making protocols 6. Follow-up monitoring 7. Assessment 8. Learning and feedback 9. Institutional learning for both the regulators and mines 10. Timing and costs associated with both the adaptive management and its implementation (success and failure) including post reclamation and post-bond release. (See generally Williams and Brown 2012) PolyMet proposed use of Adaptive Management is problematic because most of its applications do not include important features of adaptive management.

				ALT	Dave Chambers	Center for Science in Public Participation	4162-2	8	Most of the proposed Adaptive Management Plans are in fact more akin to normal project management where project activities and plans are modified as necessary and appropriate based on changed conditions, failed activities, leaks, improvements in available technologies, etc. For example, PolyMet’s EIS Rock and Overburden Management Plan, Section 6.0, Reporting and Adaptive Management, states that Adaptive management is a system of management practices based on clearly defined outcomes and monitoring requirements to determine if management actions are meeting the desired outcomes and, if not, implementing changes that will best ensure that outcomes are met or re-evaluated. Adaptive management recognizes the uncertainty associated with estimates based on exploration drilling for a 20-year Mine Plan. Adaptive management measures will be developed through the Environmental Review process, permitting, and during operations, reclamation, and long-term closure to define when changes are needed. (PolyMet 2014h, p. 38) This seems to be a fairly self-evident definition of adaptive management – promising little more than modification of plans to implement changes in response to failure to meet previously committed outcomes. Adaptive management surely recognizes uncertainty (such as that uncertainty associated with estimates based on exploration drilling) but it requires a substantive process for dealing with that uncertainty and responding to the outcomes from that uncertainty on the ground. Much of the PolyMet plan does not commit to these steps or outcomes in terms of adaptive management – rather it commits to develop adaptive steps in the future. To be properly considered by regulators and the public, these steps should be included at the permitting stage – not as the mine, and its failures, unfold. Adaptive management can be a functional iterative tool for many situations but it could also be misused/misapplied as a means to delay planning or other steps necessary for a complete mine and reclamation plan - both of which are necessary prior to agency approval of a mining permit. The USFS (USDA 2005) has noted “adaptive management does not postpone action until “enough” is known, but acknowledges that time and resources are too short to defer some action” (Lee 1999, p. 5) Specific examples of these types of deficiencies include, but are not limited, to the following sections. Rock and Overburden Management Plan As discussed above, the Rock and Overburden Management Plan establishes a questionable definition of adaptive management. It seems to primarily promise to modify its Plan to accommodate variances from its pre-mine estimates. (See PolyMet 2014h, p. 38). This is insufficient on many levels – the most important being that the Plan identifies only one mitigation measure that could be taken – when actual adaptive management should require considering (with regulators and stakeholders) a variety of reasonable alternatives, considering their effectiveness, and considering their costs (both for analysis purposes and for bonding). These were not done. Adaptive Water Management Plan The Adaptive Water Management Plan contains numerous components of what this review considered essential for adaptive management. An example is contingency planning and review. On the other hand, the Adaptive Water Management Plan states To achieve the specific purpose of treatment for each of the Project phases, the operating configuration and the operating requirements of individual process units within the WWTF or the capacity of the WWTF may need to be modified. Thus, the WWTF is considered an adaptive engineering control. The WWTF treatment processes can be adapted, as necessary, to meet the actual conditions encountered during the Project and estimated by water quality monitoring and continued model updating. (PolyMet 2014d, pp. 32-33) The use of the word “adaptive” in response to the need for modification does not make the plan adaptive management (or adaptive engineering). It means that the plan may need modified in response to deficiencies and the failure to meet plan objectives or regulatory guidelines/requirements. As described above, genuine adaptive management requires more than simple adaptation.		
				ALT	Dave Chambers	Center for Science in Public Participation	4162-3	8	The Waste Rock Stockpile Cover system (Section 3) describes select elements that are important to adaptive management. These include specific events/conditions that could trigger change, possible changes that could achieve necessary changes, etc. The discussion is deficient in other important elements such as modeling and stakeholder participation. Similarly Section 4’s Plant Site Adaptive Water Management discussion includes modeling comparison and modification – which are important adaptive management elements. This section goes further than some, with notable details for the Waste Water Treatment Plant. But it does not go far enough to include elements to differentiate it from traditional, standard mine permitting where actual and modeled conditions are compared so as to guide future modeling and plan adjustment. When discussing the potential for softening pretreatment water to improve the membrane life and process effectiveness the Adaptive Plan states that . Generally, ripple effects from this adaptive management strategy will be small compared to current impacts and could be effectively mitigated. (PolyMet 2014d, p. 84) It is insufficient to simply conclude/promise that adaptive management strategy impacts will be less than current impacts. The EIS should evaluate the components of the adaptive management plan – which will ensure that it is sufficiently robust and afford regulators and the public an opportunity to evaluate it prior to permitting. Moreover, it is insufficient to simply promise that impacts can be mitigated – they must be shown to be mitigatable and/or at a minimum the mine must make clear commitment (backed by a financial surety) that impacts will actually be mitigated or resolved. In the Section 5 discussion of Floatation Tailings Basin Pond adaptive management, the plan describes actual test projects, reporting and modifying the model, modifying the design, circumstances triggering modification, and options for modified performance. (PolyMet 2014d, pp. 94-95). These are important features for adaptive management and do not appear in most of the FEISs “adaptive management” sections. The Adaptive Management plan for Non-Mechanical Treatment Systems describes The Non-mechanical treatment systems are adaptive engineering controls because they will be designed and operated based on site-specific conditions using the knowledge that is gained during the operating and reclamation phases of the Project. The specific adaptive management approach for each non-mechanical system is outlined in the development plans (Sections 6.2.3, 6.3.3, and 6.4.3). (PolyMet 2014d, p. 104) Like the previous section, this section is more akin to normal mine operations where systems are adjusted to improve performance. However this section’s focus on site-specific conditions and using knowledge to guide operations and modifications uses language more common to adaptive management - creating a potential for more robust application. The subsequent sections do not deliver actual adaptive management. Importantly, the Plan includes provisions to help ensure that the Financial Assurance includes the costs of developing non-mechanical treatment for the Category 1 Stockpile, West Pit Overflow, and Floatation Tailings Basin.		
				ALT	Dave Chambers	Center for Science in Public Participation	4162-4	8	It is especially critical that adaptive management plans include adequate financial assurance development and modification to ensure that at all times the mine is operating there is sufficient bond for the state to at any time take over the site and fully operate, maintain, and close the mine. Such provision for bonding must be considered in all management planning. Water Management Plan - Mine and Water Management Plan - Plant Even reviewed together with the Adaptive Water Management Plan, as with numerous chapters, what are described as adaptive management plans for the Mines (PolyMet 2015r) and Plants (PolyMet 2015i) water management could be more accurately described as contingencies or responses to deficiencies/failures. They are not unreasonable and include important elements to respond to plan failures - but they do not contain critical elements necessary for actual, meaningful, substantive adaptive management. This includes their mitigation references to the Adaptive Water Management Plan (PolyMet 2015d). By describing plans as adaptive management plans, the EIS raises the bar on what should be included. It is not sufficient to just monitoring activities and commit to possibly implementing from a list of contingencies when a problem is discovered. This is not adaptive management - it is the mine operator responding to a problem without clear commitment to meaningful adaptive process or outcome. Air Quality NorthMet Project Air Quality Management Plan - Mine, Version 4 states 6.3 Adaptive Management The Mine Site FEC (Fugitive Emission Control) Plan includes some adaptive management provisions to address the potential need for adjustments or modifications to the plan. Data from the meteorological monitoring system will be integrated with the data from the Mine Management System (water/chemical application, road usage, observed dust notifications) along with daily fugitive dust observation forms. These data will be reviewed, at a minimum, on a semi-annual basis to aid in analyzing trends and to determine if FECs are effective. The Mine Site FEC Plan will be modified as needed based on these reviews or other improvements that have been identified. 6.4 Available Mitigations Additional mitigations are available if necessary to achieve compliance, including - revision to Mine Site FEC Plan - planting of trees or other vegetation along unpaved roads or around other potential dust generating activities to aid dust settling before reaching the ambient air boundary. (PolyMet 2014m, pp. 12-13). The concept that “some adaptive management provisions” could constitute adaptive management implies that adopting selected provisions somehow satisfies having a complete plan. These steps do not constitute adaptive management so much as they indicate a willingness to fix problems that evolve.		
29749	Unique			ALT	Dave Chambers	Center for Science in Public Participation	4162-5	8	To truly be adaptive management the above, limited provisions need to be part of a full adaptive management scheme. As written it is unclear that the mine will do what it promises or what is necessary for effective implementation. NorthMet Project Air Quality Management Plan - Plant, Version 7, Issue Date December 5, 2014 states that 7.0 Reporting and Adaptive Management One time and periodic reporting will be required by the air emission permit. Specific reporting requirements are dictated by applicable federal and state air quality rules, Attachment A, and any other requirements anticipated in the permit. The subsections below provide a reasonable initial proposal for reporting requirements, based on knowledge of applicable regulations and professional experience and judgment. The final operating and maintenance requirements will be agreed upon between PolyMet and MPCA, during the permitting process and include public comment where applicable. (PolyMet 2014n, p. 31). The Plant plan does not contain or commit to meaningful adaptive management. It appears to be a fairly typical (non-adaptive management) mine regulatory proposal. Flotation Tailings Management Plan As discussed above, review and modification of plans does not alone constitute adaptive management. The Floatation Tailings Management Plan (PolyMet 2015n) describes a list of possible mitigation measures but otherwise fails to include other essential adaptive management components. An essential umbrella over these steps is a clear analysis that the measures proposed can accomplish what they purport to accomplish, an assessment of their likely effectiveness, and the costs associated with their implementation, failure, modification, and related bonding. Without these elements the EIS’s proposed adaptive management is more a plan to plan than an “observational method of adaptive management.” (PolyMet 2015n, pp, 5, 34)	S	O

				ALT	Dave Chambers	Center for Science in Public Participation	4159-1	5	3.2.3.4.1 Underground Mining Alternative In all of the EIS versions the alternative of underground mining has been screened and rejected. Underground mining offers a number of environmental benefits, and would conceivably offer a lesser number of jobs for a similar amount of time as the proposed alternative. As noted by GLIFWC in its comments in FEIS Appendix B: The document states that for an alternative to be evaluated it must meet 5 screening criteria: 1. Be technically feasible 2. Be available 3. Offer significant environmental benefits over the proposed project 4. Meet the purpose and need 5. Be economically feasible As GLIFWC points out, all of these criteria can clearly be met, with the exception of the last. The only rationale that is used to eliminate the alternative is economic feasibility. CSP2 has performed its own analysis of the possible underground mining, assuming an underground room & pillar mining cost of \$44/ton for backfill, and \$39/ton without backfill.1 We disagree with the assumption in AGP 2011 that the recovery rate for room & pillar mining would be limited to 55%. The method can be more flexible than that assumed by AGP. Mining methods tend have site-specific modifications that are made to make the method most flexible and productive at that site. For our purposes we have assumed that the mining method chosen will allow a recovery rate similar to that for open-hole stoping (90%). The assumptions/rationale for these cost assumptions are detailed in the table below: Mining Rate (tpd) Mining Cost (\$/ton) Milling Cost (\$/ton) General (Admin) & Contingency (\$/ton) Total Cost (\$/ton) Pre Production Capital Costs (millions \$) Source 7500 28 12.5 3.5 44.0 225.0 7500 23 12.5 3.5 39.0 205.0 References: AGP 2011 Appendix B Foth 2012 Foth 2013 InfoMine 2009 PEG 2009 Zurowski, Gordon, AGP Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, November 11, 2011 Appendix B Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange Environmental Impact Statement, September 27, 2013 Bornhorst, Theodore J, LLC, Economic Assessment of Conceptual Underground Mining Option for the NorthMet Project, Subconsultant to Foth Infrastructure & Environment, LLC, October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 1 Bornhorst, Theodore J, LLC, Response to USEPA Questions Regarding: Economic Assessment of Underground Mining Report Dated October 2012, Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange EIS, Appendix B, Attachment 2 InfoMine USA, Inc., 2009, Mining Cost Service, Section CM, Cost Models, cited in Foth 2012 Zurowski, Gordon, PEG Mining Consultants, Memo to Jim Tieberg re High Level Underground Costs, July 30, 2009 Similarly, the total operating and total pre-production costs are estimated based on the assumptions/rationale as detailed in the table below: Mining Rate (tpd) Mining Cost (\$/ton) Milling Cost (\$/ton) General (Admin) & Contingency (\$/ton) Total Cost (\$/ton) Pre Production Capital Costs (millions \$) Source 7500 28 12.5 3.5 44.0 225.0 7500 23 12.5 3.5 39.0 205.0 References:

The average net metal value for the amount to be mined, 18 million tons, was calculated based on the average net metal value per short ton developed in Appendix B, Foth 2012. Since a value for 18 million tons was not explicitly stated in Foth 2012, the data was extrapolated (in the graph below) to yield an average net metal value per short ton of \$57.13 (2012 US dollars).CSP2 Estimates of Average Net Metal Value (in blue) based on the data graphed above Economic Analysis of Underground Mining of the NorthMet Deposit The economic analysis of underground mining in the table above indicates that, in 2012, a case for positive net operating profit for underground mining without backfill can be made. Tweaking of assumptions for underground mining with backfill, especially of the operating costs, might also make underground mining with backfill potentially profitable. This is reasonable because all of assumptions made for these analyses are very rough, and if nothing else these calculations suggest that a more detailed analysis of underground mining is warranted. It should not be necessary to show that underground mining in profitable in every circumstance, only that it is possible under some reasonable set of conditions, like the economic climate of 2012, which was not ideal, to operate at a profit. It is also relevant to note that in this section it is stated: This alternative would involve mining the NorthMet Deposit as defined by the proposed open pit boundary. (FEIS, p. 3-159) If the phrase “as defined by the proposed open pit boundary” refers to the horizontal and vertical extent of the proposed pit, then a significant part of the ore body is being left out of the potential ore calculations.	S	N
27053	Unique			ALT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2966	1	The Revised Final EIS is inadequate because there are two major and fundamental flaws with the described current PolyMet NorthMet Project plan for preventing and treating wastewater (in order to prevent significant water pollution). Importantly, both flaws are easily remedied. Although ore and tailings wastewater discharge is expected from the start of mining operations, treatment of the pollution and potential for future pollution characteristic of these wastewaters is delayed for decades, while it is (hopefully all) collected and stored in various locations. It is exactly such wastewater storage decisions (e.g. delayed treatment) that have led to both increased levels of pollution, and to the catastrophic site failures that have plagued hard rock mine sites in the USA and worldwide, and continue to do so where treatment is postponed. The membrane technology (reverse osmosis etc.) which has been often cited as the insurance of water pollution prevention that the pubic and regulators should accept, is not planned for use until decades into the future. This is a major planning error. Further, membrane technology is not even mentioned as a possible treatment to prevent acid mine drainage, which is admitted as a possibility. It is a major omission to not address this as an alternative treatment - by continuous treatment of the relatively low volume of ore and tailing seepage expected from the start of operations. This is a relatively low cost and feasible alternative Nor is it addressed for future impounded wastewater treatment of heavy metal bearing ore and tailings, should acid mine drainage accumulate as it has at a majority of sulfide bearing hard rock mines. These are both serious planning oversights, which ignore an efficient and proactive solution while postponing treatment. This is a major planning error because of simple risk-cost principles.	S	O
27053	Unique			ALT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2968	3	To summarize our point and the problems of the RFEIS: It would involve only an incremental cost to use the same technology that the EIS relies on to assure compliance by actions on the future, but in a proactive manner which would greatly reduce the chance for environmental degradation. That is, use reverse osmosis and related membrane technology at the start of mining operations to remove pollutants and purify waters, and plan for its use for treatment of any AMD that does accumulate, which is certainly a statistical possibility. Although addressed nowhere in the RFEIS in discussion or alternative actions cited, both of these uses are proven in the industry in mine sites that are similar to NorthMet.	S	O
27053	Unique			ALT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2969	4	Importantly, if membrane technology were employed proactively on all “seepage” from the ore and tailings, and other wastewater that is acknowledged and anticipated, the potential damage from metals and other pollutants, and future acid mine drainage –should it occur – would not only be better mitigated. But such actions would also prove from the start of mining operations that the pollution control technology actually works as planned, allowing time to test, revise and refine the technologies and their specific use at the site. A positive pollution control outcome would be more likely by a very high degree. This approach would go much further to assure the realization of several promises made in the RFIES, AND would proactively prove the plans for water pollution mitigation are sound, AND would reduce future clean-up costs which are the subject of negotiations for bonding costs.	S	O
27053	Unique			ALT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2972	7	Many or most of the scores of known failures of treatment or impoundment at sites with AMD, and related pollution, would have been prevented by such proactive treatment. Many were catastrophes that would have been prevented by deploying membrane technology at the start of mining activities, not delaying treatment until after closure. That strategy has failed in sores of documented cases.	S	O
27053	Unique			ALT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2974	8	Membrane technology (specifically RO) has repeatedly cited by both the PolyMet Project and the regulators who have addressed it. However, they have missed describing two beneficial uses at this site. Various other uses are described in the EPA Reference Guide to Treatment Technologies for Mining-Influenced Water, #EPA 542-R-14-00. Given the cost of the project, a relatively small-scale investment in using membrane technology at the start can make the mine a zero liquid discharge site. These technologies’ full potential may not be understood by the engineers and technologists in these organizations. The evidence for this statement is that this option has been ignored in all EIS drafts, plus ignored in the “Fact Sheets”. To not even list this approach as an alternative is an omission that may indicate an ignorance of the modern mine sites currently operating with proactive treatment, instead of impoundment, storage and treatment plans postponed for decades and predicated on optimistic water chemistry projections and storage basin stability outcomes.	S	O
25385	Form Letter	1	Variant	ALT	David Witt		1167	9	The PolyMet FEIS is adequate under federal and state laws and regulations because: - It adequately considers alternatives to minimize environmental harm, reduce polluted seepage from unlined permanent waste facilities, mitigate wetlands destruction, and reduce the threat of catastrophic dam failure. 30753	Unique			ALT	Dennis Good		2896	8	In essence, the USFS has and the other Co-Lead Agencies are going to put a bar code on the Superior National Forest. But there's a way out of this. This isn't my idea; it was in a letter to the editor of one of the state newspapers. I'll call it Amendment A to the No-Build Alternative. Staffing levels at this mine are projected to be around 360 employees. Set up some criteria (disabled veterans and/or unemployed veterans should go to the head of the line) and pay these 360 people \$ 50,000.00 dollars a year for 20 years. Since this will be a scab operation and the median income for St. Louis County is around \$ 45,000.00 a year, \$ 50,000.00 will work out nicely and is a nice round number. Since the "Financial Assurance" will consist of worthless paper, no matter what the amount is, the state and its taxpayers will come out of this smelling like a rose. This is a No-Lose Alternative; simple yet brilliant and I commend the person whose idea it was. And it has the added effect of allowing the Co-Lead Agencies to step back from the brink before it's too late.	NS	X
27685	Unique			ALT	Dennis Szymialis		1893	48	p. 3-139 "The purpose of the alternatives process is to allow for the identification and consideration of other reasonable alternative means to achieve the project Purpose and Need and that could also improve environmental and/or socioeconomic benefits." -Does the alternatives process include releasing PolyMet from environmental regulation and financial assurance to achieve the so called project purpose and need and socioeconomic benefits? Is this the Mesabi Nugget catchall exemption?	S	O
28915	Unique			ALT	Donald Schreiner		2376	3	The PolyMet Final EIS should be rejected as incomplete because it fails to examine an important alternative which could greatly reduce the hazard of future tailings dam failure and environmental damage: dry stack storage of tailings. Instead, the FEIS rejects examining this alternative in depth, because seepage would be reduced, concentrating pollutants into the remaining waters, making it difficult to meet water quality standards. This implies that PolyMet's solution to pollution is dilution – clearly an unacceptable approach. (pp 3-156- 158.)	S	O
25350	Form Letter	1	Variant	ALT	Elizabeth Heck		1154	2	2) The FEIS has not sufficiently explored alternatives to minimizing environmental harm.	NS	X
27836	Unique			ALT	Ellen Hawkins		2200	24	As described in the FEIS, toxic discharge and wetland destruction would negatively impact aquatic life, other wildlife, human health and quality of life, environmental justice issues, and municipal water supplies. Moreover, the proposal is not the Least Environmentally Damaging Practical Alternative and in fact it does not seriously consider alternatives that could reduce environmental degradation.	S	O
6861	Unique			ALT	Emily Steil		519	2	There is a fairly simple solution to this complex issue. This would be that Polymet fills in the west pit with what was taken out at some predetermined point, and covers it, which would end poisoning the water. At present the state has written the agreement with Polymet to allow them access to any minerals under what they presently plan to remove in the west pit. It would seem to be a simple step to get them to commit to a set time to end any more mining on the site. Then the state would have a finite term to monitor water quality, not for an indefinite term as this EIS proposes.	S	O
8708	Form Letter	4	Variant	ALT	Eric Eng		600	1	So much of our land is in flat open areas, but little of it is near beautiful water byways and adjacent to the best asset we have to Minnesota. The North Shore, and Lake Superior and the water ways that feed it for the welfare of the lake, and wildlife that it supports please work to find an alternative spot in a more rural flat area as there are very many.	NS	X
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3942	16	The estimates that Foth 2012 later uses for processing and "general and contingency" costs are \$13 and \$3.50 per ton, respectively. ³⁴ If these are subtracted from the AGP total operating costs, the AGP estimate for mining costs alone is \$22.50 to \$33.50 per ton at the 5000 ton-per-day level.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3949	17	Foth 2012 also included cost estimates from InfoMine. ³⁵ InfoMine estimates the cost of long-hole stoping with sand backfill at \$20 per ton for 5000 tons per day; adding 20 percent to that for cemented backfill gives \$24.00 per ton, very much in line with the AGP report.	S	N

29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3953	18	Finally, Foth 2012 included one comparison mine, Podolsky/Levack/McCreedy West in Sudbury, Ontario, which has mining costs of \$38 for 2250 tons per day.36 Scaling that to 5000 tons per day would come to about \$26 per ton. These are all of the estimates provided, and they agree to a remarkable extent. And yet Foth 2012 sets the estimate for 5000 tons-per-day at \$40 per ton. This cost estimate has no support in the record.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3954	11	NEPA requires agencies to “study, develop, and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources.” “An agency must look at every reasonable alternative, with the range dictated by the nature and scope of the proposed action.” MEPA similarly requires that an EIS “compare the potentially significant impacts of the proposal with those of other reasonable alternatives to the proposed project.” Additionally, the Clean Water Act prohibits the discharge of dredge and fill material “if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem.” Where a proposed action is not “water dependent,” practicable alternatives that avoid special aquatic sites are presumed to be available, unless clearly demonstrated otherwise. In other words, the permit applicant bears the burden of showing that no practicable alternatives with less adverse impact are available. The alternatives section is considered “the heart” of an EIS. The Co-Lead Agencies are expected to “[r]igorously explore and objectively evaluate all reasonable alternatives” and “[d]evote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.”	NS	X
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3955	12	The NorthMet environmental review process identified underground mining as an alternative for assessment, but the Co-lead Agencies ruled it out. They concluded “that the Underground Mining Alternative is not . . . a reasonable alternative because it would not be economically viable and therefore it would also not meet the Purpose and Need.” This conclusion rests on errors and discrepancies in the estimates of mining costs, as explained below. Furthermore, the FEIS states that “the geology outside of the open pit has not been characterized enough to support a mine plan and is beyond the boundaries of the NorthMet Project area, so it is not reasonable to include for consideration of the Underground Mining Alternative.” This statement is not true. While PolyMet may not yet have prepared a mine plan or assessed the economic viability of resources outside of the pit envelope, the geology for at least some of these resources is characterized enough to support a mine plan should PolyMet choose to prepare one. And while we do not find a specific definition of the “NorthMet Project area” in the FEIS, it is generally treated as including the entire area designated as the “mine site.” At least some of the additional mineralization that is well-characterized is found within what the FEIS shows as the project area. The determination that an underground mine is not a reasonable alternative is not supported by the evidence. This issue was raised in our comments on the SDEIS at MCEA 2, 33-35, Friends 2, 48, 51-52; and CBD 108-110. It was also raised in a supplemental letter to Forest Supervisor Brenda Halter on October 8, 2015.21 All of these materials are incorporated herein.	S	O
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3956	13	The basis of the FEIS’s economic analysis is quite simple: a value was calculated for the amount of ore to be mined on the one hand, and for the total costs of mining that ore on the other. If the costs were greater than the value of the ore, the mine was deemed not economically viable. The FEIS analyzed five mining rates ranging from 2000 tons per day to 15,000 tons per day.22 To simplify the following discussion, we focus on the 7500 tons-per-day scenario because that is the scenario with the most positive economics according to the FEIS analysis.23 The Co-lead Agencies presented an overall loss for this scenario of \$168 million.24 It appears that all of the numbers used in the Co-Lead Report were taken directly from Foth Infrastructure & Environment, LLC, Economic Assessment of Conceptual Underground Mining Option for the NorthMet Project (Oct. 2012) (hereinafter, Foth 2012), which was prepared on behalf of PolyMet and is also provided in Appendix B of the FEIS.	NS	X
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3957	14	The FEIS divides total estimated costs of mining into operating costs and pre-production capital costs.26 Operating costs on a per-ton basis are provided in Table 1 of the Co-Lead Report. At the 7500 ton-per-day level, total operating costs are estimated at \$49.00 per ton, and pre-production capital costs are estimated at \$250 million total. Foth 2012 divides operating costs into three components: mining costs, processing costs, and general and contingency costs.28 The Foth 2012 report estimates costs for the 2000 and 5000 ton scenarios, and then adjusts these for the larger scenarios.29 To arrive at its estimates, Foth drew from several sources, including InfoMine (an online model commonly used by the industry), examples from other mines drawn from 43-101 reports filed on SEDAR, and a memo prepared for this purpose by AGP Mining Consultants Inc. (AGP), which has done much of PolyMet’s engineering work.	NS	X

29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3958	15	For mining costs, the Foth 2012 report provides cost estimates for both room-and-pillar mining and long-hole open stoping. Many of the estimates did not include cemented backfill, although Foth states “Cemented backfill typically represents roughly 20 percent of mining costs.” ³¹ The report settles on a mining cost of \$40 per ton for the 5000 tons-per-day scenario. This amount is significantly higher than any estimate from any source used in the Foth 2012 report. The only source that estimates mining costs above \$30 per ton for the 5000 tons-per-day scenario is the AGP Memo, which Foth reports as \$44 to \$52 at 5000 tons per day for long-hole stoping. ³² However, the AGP Memo provides this figure for total operating costs (including processing and administrative), ³³ while the Foth 2012 report uses it for mining costs only. The Foth 2012 analysis then goes on to add processing and administrative costs again to reach a total operating cost, which doubles the estimated processing and administrative costs included in the total operating cost estimate.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3959	19	The \$40 figure seems less inflated for room-and-pillar mining, but is still questionable. The only source cited by Foth 2012 is InfoMine, which gives a \$32 per ton cost at 5000 tons per day, without backfill. ³⁷ Adding 20 percent to that gives \$38.40.	S	N

29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3960	20	However, the Foth 2012 report fails to mention that AGP estimated room-and-pillar mining without backfill at \$22 to \$28 per ton, which with 20 percent added would be \$24.40 to \$33.60. ³⁸ The Foth 2012 report provides no comparison mines for room-and-pillar mining. At any rate, the alternative of underground mining should not be eliminated from NEPA review based on economics if any environmentally acceptable underground mining method shows a profit in the screening analysis; more expensive methods should be irrelevant to this analysis.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3961	22	Capital costs are also significantly overstated because they fail to account for the savings that PolyMet will achieve due to the use of an existing processing plant. Rather than using PolyMet-specific information, estimates were based on industry costs drawn from InfoMine. Foth provides separate InfoMine estimates for mine capital costs and processing plant capital costs. The Foth 2012 report estimated mine capital costs at 7500 tons per day at \$125 million for room-and-pillar mining without backfill (adding 20 percent gives \$150 million) and \$115 million for long-hole stoping with sand backfill (adding 20 percent gives \$138 million). ⁴⁶ For the processing plant, Foth 2012 provides an InfoMine estimate for a three-concentrate flotation mill of \$98 million at the 7500 tons-per-day level, which Foth adopts as its estimated processing plant cost. ⁴⁷ However, PolyMet provides an estimate of its own processing plant at 32,000 tons per day, which is \$63 million. ⁴⁸ The significantly lower cost is the primary savings that PolyMet will achieve by using an existing processing plant. Again there are scaling considerations; the total capital cost at 7500 tons-per-day should be lower than the cost at 32,000 tons per day. However, again solely for the purpose of this discussion we will use the \$63 million estimate. Foth also added a contingency amount of approximately 10 percent to the mine and process plant capital costs to calculate the total capital costs. ⁴⁹ Adding 10 percent contingency gives a total capital cost of \$234 million for long-hole stoping. This is in comparison to a \$250 million estimate used by Foth and the Co-lead agencies.	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3962	21	Using its \$40-per-ton estimate for the 5000 ton-per-day scenario, Foth estimated \$33-per-ton for a 7500 ton-per-day scenario. This amounts to a 17.5 percent reduction. Using the same percentage reduction for the maximum cost estimate from any source (\$33.50, the maximum amount in the AGP memo) gives a figure of \$27.64 per ton. Once again, in the context of eliminating an alternative from NEPA review based on economics, the lower (or at least average) cost estimates should be used, and this estimate is still on the high end of the various figures given by Foth 2012. We also point out that AGP does not provide a basis for its estimates; as far as we can tell, there is no support for its estimates in the record. Nonetheless, for the sole purpose of showing that the economic analysis included in the FEIS does not indicate an operating loss for at least one scenario, we will use \$27.64 as an estimated mining cost. The second of the three categories of costs included in total operating costs is processing costs. Foth adopts the InfoMine processing cost for a three-concentrate flotation mill of \$13 per ton at 5000 tons per day, after noting comparable values at Copperwood in Michigan (\$11.75 per ton) and Lac des Iles in Thunder Bay (\$14 per ton). It goes on to scale this to \$12.50 per ton for the 7500 tons-per-day level. Remarkably, the report ignores PolyMet’s own processing cost estimate for processing ore from the open pit, which is \$6.99 per ton.42 We were unable to extrapolate this to a smaller operation because of unknown scaling factors, but would expect this to be considered in a legitimate economic analysis. The last of the three categories of operating costs is administrative costs. Because different mines label this category differently, it is difficult to compare the numbers from various sources. Foth does not provide an InfoMine estimate for this cost. The examples provided include \$3.30 for general and \$2.00 for contingency per ton at Lac des Iles (presumably for a total of \$5.30 per ton); and \$3.35 per ton for general and administrative at Copperwood. The report settles on an estimate of \$3.50 per ton.43 This cost apparently does not change based on tonnage; the same cost-per-ton is used in all scenarios. Again, the report completely ignores PolyMet-specific information, which estimates “general and administrative” cost for the open pit mine at \$0.66 per ton. Using the numbers discussed above, Foth 2012 reaches a total of \$56.50 per ton for total operating costs at the 5000 ton-per-day level, and \$49 per ton at the 7500 ton-per-day level. Based on the above discussion, these estimates are clearly inflated. Even if the processing and administrative costs are not adjusted based on PolyMet’s own estimates, and the only correction made is for the discrepancy in the AGP figures, the estimate at the 7500 ton-per-day level would be \$42.64.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3963	23	To be clear, we are not arguing that the amount presented here is an appropriate estimate of underground mining. We think that that estimate would be significantly less based on a number of factors described above for which we have made no adjustment. Our only purpose here is to show that after correcting only the two most obvious discrepancies in the economic analysis prepared by Foth, the analysis does not show a loss at the 7500 ton-per-day level. Using an operating cost of \$42.64 per ton and a total pre-production capital cost of \$234 million results in a net profit of \$39 million.	S	O
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3965	25	As a final note, we object to the lack of documentation of the figures provided by Foth and accepted by the agencies. We do not object to the use of InfoMine for estimated costs; in fact we think that it is a more reliable source than analog mines chosen at the discretion of PolyMet’s contractor, who has every reason to identify the costliest mines possible for the analysis. However, it is unclear how or why the InfoMine figures that were included were chosen. For example, underground mine cost data available from InfoMine includes production rates up to 45,000 tons per day.68 The analysis needs to explain why Foth limited its InfoMine estimates to the 5000 ton-per-day level and used its own scaling factors (which also need explanation) for the larger scenarios. Throughout the exercise, the Foth cost estimates are given with no explanation as to why any particular number was settled on. For each parameter, the Foth 2012 report lists figures from different sources, and then comes up with a number without any explanation or reasoning. It justifies those numbers by comparisons to other mines, but provides no explanation of why the mines used were chosen. The costs from analog mines are consistently higher than those from InfoMine, which is commonly used by the industry and would provide a less biased assessment. It is also unclear what information either Foth or the agencies rely on for statements relating to characterization of the ore body. For example, where is the data indicating that the NorthMet deposit is a “shallow” ore body, or that less than 10 percent of the measured and indicated resource is below the open pit? If the Co-lead agencies in fact did any independent evaluation of the Foth report, they need to make their analysis transparent. NEPA requires that the underlying data that forms the basis of conclusions in the FEIS be made available to the public.69 The obfuscations and biased analysis of PolyMet’s contractor and the failure of the Co-lead Agencies to properly review the contractor’s work or perform their own independent analysis has resulted in the summary rejection of an alternative that could result in significantly less environmental harm than the proposed project, in violation of NEPA, MEPA, and the Clean Water Act. Before going forward toward permitting an open pit mine and all the destruction that entails, the agencies must take an honest, hard look at the possibility that an underground mine might be a viable option.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3966	26	The Co-Lead Agencies failed to take a “hard look” at this alternative, instead eliminating it as an alternative without substantive analysis.70 (MCEA 2, 33, 35–39; Friends 2, 49–52; CBD 110–111) Under NEPA, the FEIS must: examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is “reasonable” rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant.71 The Co-Lead Agencies claimed that the West Pit backfill would not provide substantial environmental benefits. Yet they concede that “the opportunity to reclaim wetlands vegetation at the Category 1 Stockpile footprint area and not having to treat seepage from the Category 1 Stockpile” would be “measurable environmental benefits offered by backfilling the Category 1 Stockpile into the West Pit.”72 Nevertheless, the Co-Lead Agencies eliminated the alternative for consideration based on several factors, which are addressed below:	NS	X

29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3967	27	Backfilling would affect the water quality in the West Pit by increasing constituent loads, so additional mechanical treatment of water in the West Pit may be required for a certain timeframe following backfilling. However, there would be no effect on surface water quality discharged to the environmental because mechanical treatment of water from the West Pit would still be required in the long term. Response: Backfilling may actually decrease required mechanical water treatment at the site because it eliminates the Category 1 stockpile, currently identified as an indefinite source of pollution. It is hard to imagine how the treatment in the West Pit as a result of a backfill could be longer than the projected time for treatment of the Category 1 stockpile. Additionally, the potential for additional mechanical treatment is speculative at best, as the Co-Lead Agencies did not attempt any modeling to support this hypothesis. Submerging the Category 1 stockpile would remove the last permanent stockpile on the site, improving aesthetics and potentially allowing greater recreational use of the site after closure. ● Moving the waste rock from the stockpile into the West Pit would result in prolonged dust, air, and noise emissions, but these would be unlikely to exceed the respective maximum years modeled during operations. Response: Noise, dust and air emissions are only an issue during operations; perpetual active water treatment and the aesthetics of the site remain for centuries after closure. Any advantages in the latter would certainly outweigh this minimal impact.● Backfilling the West Pit would encumber private mineral resources that are deeper than the proposed West Pit. Such an encumbrance is in conflict with the terms of PolyMet’s current private mineral leases. The PolyMet lease agreements could be renegotiated, which might involve monetary compensation for the mineral owners if the minerals are encumbered. Response: As Conservation Organizations noted in 2014, PolyMet has not provided any support for this claim, including a copy of any lease or other contract. PolyMet has also not provided any support for the notion that this pit could or would be remined, something that is quite unusual.75 It would be far more likely that PolyMet or another entity would choose to expand the proposed mine deeper, perhaps into an underground mine, rather than close and reclaim the site, if the minerals underneath were found to be economically desirable. Moreover, PolyMet’s current reclamation plan also encumbers deeper mineral rights, probably beyond reach without extraordinary expense. Dr. Myers notes that to access these minerals after reclamation, “the large volume of pit lake water will need to be entirely pumped and treated to meet the 10 mg/l sulfate requirement, and the cost and time required for pumping and treating the entire pit lake prior to remining effectively eliminates this as a possibility.”76 The presence of polluted water that must be pumped and treated before discharge may be a greater burden than simply digging out additional rock. ● [B]ecause of the temporal effect that the stockpile would have, the [wetlands and vegetation at the Category 1 Stockpile footprint area] would be required to be mitigated regardless of future backfilling or not. Response: The Co-Lead Agencies are confusing benefit to the company with benefit to the environment. There is still an environmental benefit to reclaiming wetlands at the site, even if the company cannot claim mitigation credits for it. There is value to wetland restoration within the same watershed, which PolyMet only partially proposes, and on-site mitigation. Additionally, as the FEIS noted, such wetland reclamation credits may be used for contingency mitigation,79 perhaps for the significant indirect wetland impacts this project is likely to have. These wetlands would offer a financial advantage to PolyMet, allowing it to save the cost of restoration for contingency mitigation elsewhere or, if PolyMet does not need the credits, it could establish a wetland bank and sell the credits to other entities, perhaps other mining companies that need wetland credits within the St. Louis River watershed.80● [T]he costs associated with backfilling, additional water treatment rates, and encumbrance compensation determined in revised lease agreements may affect the ability of PolyMet to secure financing. Response: As noted by the Conservation Organizations in 2014, this is an assertion by PolyMet offered without any support whatsoever. It is speculative and the agencies are abdicating their duty to independently verify statements by the company.82 Moreover, it gives a project proposer extraordinary and unjustified control over the alternatives analyzed if an alternative is dismissed based on an unsupported statement by the company that an alternative “may affect the ability” of the company to secure financing. The Conservation Organizations are only asking at this stage that the West Pit Backfill be given consideration as an alternative in the FEIS, not that it necessarily be adopted. The approach taken to this alternative is to speculate on its comparative benefits and drawbacks without any real information, rather than gathering the information first and then making the comparison. The Co-lead Agencies reject this alternative prior to obtaining the very information that they purport to be using to judge it.	S	O
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3968	29	Industry standard for dry stacking includes the use of a basin liner. Construction of a basin liner on the existing LTVSMC tailings basin has been evaluated and determined not to be feasible. Response: As observed by Dr. Chambers, the reason that a basin liner is not feasible is because the tailings basin is not a stable structure, which should bear more heavily on the Co-Lead Agencies’ decision.88 Moreover, this comment ignores the fact that a dry-stacking facility could be built somewhere other than the existing LTVSMC tailings basin. ● Use of dry stack technology would require a new tailings basin to be constructed in a different location as a lined dry stack basin. A separate dry stack tailings basin would increase footprint effects of the project. Response: The impacts of this could potentially be minimal. Unlike an open-pit mine, where some impacts on wetlands, streams and other natural features may be unavoidable due to the precise location of a mineral deposit, a dry-stack tailings facility has more flexibility when it is sited. The Co-Lead Agencies must investigate potential sites for a dry-stack facility that could minimize impacts. It may even be possible to site it elsewhere on the LTVSMC property in an area that is already mining-impacted.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3972	31	As with the West Pit backfill alternative, the Co-lead Agencies have inappropriately prejudged this alternative, making assumptions about the benefits and drawbacks that are the very things that an alternatives analysis is designed to reveal.	NS	X
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3974	37	Effectiveness of mitigation measures. In addition to the potential for errors, accidents, and failures, an important factor in assessing the risk of unexpected consequences is the uncertainty of mitigation measures designed to prevent those consequences. To use the tailings basin seepage containment system as an example, a risk assessment must account for the extent to which the actual performance of the system in the field remains an unknown. As discussed below, the record contains no examples of similar systems achieving the level of capture assumed by the FEIS. While the design may work perfectly in a software model, conditions and events in the real world rarely conform to theoretical designs. Established mitigation measures have a history that can be used to estimate the uncertainty and risk that outcomes will not match the theoretical or modeled expectations. The fact that success rates for a mitigation measure are not available does not provide a reason to assume that it will work perfectly. To the contrary, it increases the uncertainty that the measure will perform as designed. The FEIS must disclose and discuss the unknowns of the systems and mitigation measures proposed for this project, and what that uncertainty means in terms of risks to the environment.	S	N
29745	Unique			ALT	Erin Mittag	Minnesota Center for Environmental Advocacy	3977	33	The EIS must provide information on what can be expected under the “no action” alternative in such a way that it can be compared to the impacts of the proposed mine. The FEIS does not adequately assess the “no action” alternative. This issue is presented at MCEA 40 and CBD 107–108, which along with cited exhibits and references are incorporated herein. An EIS must include “no action” as one of its alternatives.93 “No action” in situations like the proposed NorthMet mine and land exchange could mean either that the mine would not be permitted or implemented, or that the land exchange would not occur.94 Importantly, when the choice of no action by the lead agencies would result in “predictable actions by others,” this consequence of the no action alternative needs to be considered and included as part of the no action analysis in the FEIS.95 Although the NorthMet FEIS purports to do this, it does not provide adequate information about the environmental conditions that would be expected under the No Action Alternative. This violates 40 C.F.R. § 1502.14(b), which requires the FEIS to “devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits.” The FEIS does not contain sufficient detail on the predicted water quality at the Plant Site and in the Embarrass River watershed under the No Action Alternative to allow an evaluation of the comparative merits of the Proposed Action. In fact, the FEIS completely fails to provide any information on the expected water quality at the Plant Site and in the Embarrass River watershed under the No Action Alternative. Instead, the predicted water quality under the Proposed Action is exhaustively compared to a modeled “Continuation of Existing Conditions” (CEC) scenario, which ignores the existing responsible party (Cliffs Erie)’s legal obligation to clean up and manage the site consistent with state and federal environmental laws. In addition to the violation of 40 C.F.R. § 1502.14(b), this violates the requirement that the FEIS provide a “hard look” at the impacts of the Proposed Action. By repeatedly comparing the polluting effect of the Proposed Action with an already polluted situation that is presumed to continue (but which in reality would not and could not continue under existing law), the FEIS presents an inaccurate assessment of the impacts of the Proposed Action. Furthermore, the “Existing Conditions” that were modeled by PolyMet and disclosed in the FEIS do not actually reflect currently existing conditions, because Cliffs Erie has already taken steps to address water quality issues at the site as required by a consent decree with MPCA. Cliffs Erie and MPCA entered into a judicially enforceable consent decree in March 2010, with Cliffs Erie agreeing to take corrective actions to resolve “all alleged violations” of its NPDES permits at these locations.96 Pursuant to the consent decree, Cliffs Erie was required to submit “Short-Term Mitigation Evaluation Plans” for each of the three locations.97 Cliffs Erie was also required to submit “detailed Field Studies Plan Outlines” for each location.98 And, “Long-Term Plans” were required to identify mitigation strategies to address elevated concentrations of sulfates and other parameters of concern at each location.99 Each of these corrective actions were required to be approved by MPCA, and would then become “an integral and enforceable part” of the consent decree.100 If Cliffs Erie fails to comply with the consent decree, it is required to pay monetary penalties to MPCA.101 In addition to failing to adequately address and disclose the corrective actions that have already been taken by Cliffs Erie at the LTV sites in its analysis and disclosure of “existing conditions,” the FEIS also fails to assess the additional corrective measures that will continue to be undertaken by Cliffs Erie in the event the no action alternative is chosen. The very purpose of the consent decree is to bring Cliffs Erie into compliance with the NPDES permit requirements at the LTV tailings basin and mine site, along with the Dunka Pit. Cliffs Erie coming into compliance with the Clean Water Act is not only “predictable” and “reasonably foreseeable,” but also legally required under both the consent decree and the Clean Water Act. Thus comparing in the FEIS the proposed action with a no action alternative where pollution would continue indefinitely at the plant site is both inaccurate and unlawful under NEPA.	S	N
28547	Unique			ALT	Esteban Chiriboga	GLIFWC	3498	1	The FEIS has adopted the term “adaptive management” to describe monitoring and potential future mitigation actions that would be implemented on an as needed basis. We agree that adaptive management is an important part of a mine project but it is intended to address unforeseen impacts only.	NS	X
28547	Unique			ALT	Esteban Chiriboga	GLIFWC	3499	2	The FEIS uses adaptive management for areas for areas in which the FEIS does not make reliable predictions about environmental impacts. As we have repeatedly stated, monitoring does not prevent mine related environmental impacts. Monitoring can only detect impacts after they have begun to occur and the adaptive management activities that are listed in the FEIS would only be a reaction to an impact that has already begun to occur.	S	O

28547	Unique			ALT	Esteban Chiriboga	GLIFWC	3535	53	During the NEPA process, a number of alternatives were proposed to eliminate the deposition of ore dust along the rail corridor. One of these alternatives included sealing the gaps in the rail cars and another was the purchase of new rail cars that would be completely sealed. GLIFWC staff have advocated for the purchase of new rail cars to eliminate the possibility of dust spills along the rail line. However, the FEIS is only describing a tightening of hinges which would be completely ineffective. The permit to mine must include a permit condition requiring PolyMet to purchase sealed rail cars for ore transport. This is the only method for preventing releases of ore dust and violation of water quality standards.	NS	X
28547	Unique			ALT	Esteban Chiriboga	GLIFWC	3536	54	Underground Mining and West Pit Backfill Alternatives GLIFWC staff believes that the underground mine and west pit backfill alternatives were prematurely eliminated from consideration for the NorthMet project. We believe that there is potential for significant environmental benefits to these alternatives when compared to the proposed action. The discussion in the FEIS is inadequate because cost is ultimately the reason for exclusion of these alternatives. Furthermore, the co-lead agencies have not conducted independent investigations into the feasibility of the alternatives. Rather the lead agencies took the technical response memo presented by the applicant and adopted it as their own. Underground Mine Alternative. The Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange Environmental Impact Statement document dated February 5th 2013 provides the lead agency rationale for eliminating the alternative from further analysis in the FEIS. The document states that for an alternative to be evaluated it must meet 5 screening criteria: 1. be technically feasible 2. be available 3. offer significant environmental benefits over the proposed project 4. meet the purpose and need 5. be economically feasible The co-lead agency position paper correctly states that the underground alternative would offer significant environmental benefits over the proposed action. In some areas these benefits would be substantial. The roughly 1000 acre wetland fill could be almost completely eliminated and the amount of tailings and waste rock generated by the project would be significantly reduced. The water quality and quantity impacts on surface and groundwater would be mitigated. This is particularly important given the probability that the NorthMet project is likely to violate water quality standards and the certainty that the project would require perpetual water treatment. In addition to the environmental benefits the document correctly states that underground mining is technically feasible and available at the site. It is important to note that with underground mining the land exchange with the Superior National Forest would not be needed therefore environmentally sensitive areas like the 100 mile swamp and essential lynx habitat would remain in the federal estate. The only rationale that is used to eliminate the alternative is economic feasibility. However, no detailed economic information is provided to support that claim. All other objectives of the purpose and need statements in section 1.3.2.1 of the FEIS are met. Therefore, the question on further analysis is determined by the applicants’ assessment of the economics of the alternative. In addition, no information on the economic benefits of an underground mining alternative are mentioned. These benefits include: • An underground mine would not require a land exchange with the United States Forest Service. • Economic benefits (environmental goods and services) provided by wetlands that would not be excavated (see ecosystem valuation section). • Economic impact of perpetual maintenance and water treatment at the site. Of note, there is no discussion on the cost of wetland mitigation activities that are needed with an open pit mine. An underground mine would not require extensive wetlands mitigation costs for wooded swamp and bog sites that could reach between \$35,460,000-\$110,205,000 (i.e. 1200 acres x 1.5 rate x \$19,700/acre ACOE source and 1200 acres x 1.5 rate x \$61,225/acre MN Department of Transportation – (Environmental Law Institute, 2007 and US ACOE, 2010). The Underground Mining Alternative Assessment relied heavily on an InfoMine model to determine economic feasibility. However there is no detail on the model itself, the model assumptions or how the model calculates its results. For a complete evaluation of the alternative, a review of this model should have been done by the co-lead agencies. Finally, it appears likely that the project as proposed is likely to violate applicable water quality standards. This means that the current proposal is not likely to be permitted. Furthermore, underground mining would not result in excavation of overburden and would not result in mercury and methylmercury emissions at the mine site. Because of this, it seems reasonable that an underground alternative be considered as an additional mitigation measure.	S	O
28547	Unique			ALT	Esteban Chiriboga	GLIFWC	3552	55	West Pit Backfill Alternative. Based on the lead agency memorandum titled Co-lead Agencies’ Consideration of a West Pit Backfill Alternative dated April 11, 2013 it is clear that this alternative meets the purpose and need, is available, is technically feasible, and is economically feasible. The document argues that environmental benefits are unclear. However, because of the screening level analysis used by the co-lead agencies the full effect of the alternative on the environment is not known. Page 3 indicates that there is no information to determine water quality projections under this alternative. Therefore the primary potential benefit of this alternative is not addressed. Until this information is developed, GLIFWC staff maintain that backfill of the west pit may provide long term water quality benefits. Given that the current project is likely to violate water quality standards, additional mitigation is needed and this alternative should be more fully analyzed. The proposed NorthMet project proposes to mine a relatively small portion of the ore body. Figure 3.2-10 of the FEIS indicates that an upper mineralization zone and a portion of the Unit 1 mineralization are the targets. This mine plan appears to leave behind a substantial portion of ore. GLIFWC staff has argued that the remaining ore could be accessed through underground mining methods. According to the co-lead Agencies’ document “Consideration of a West Pit Backfill Alternative” dated April 11, 2013, a major reason for the development of an open pit mine plan is that there is a lease agreement between PolyMet and the owners of mineral rights immediately southwest of the toe of NorthMet’s west pit. These private lease agreements apparently include using the west pit as a portal for future mining activities. In addition, tribal cooperating agencies have provided the lead agencies with PowerPoint presentations from PolyMet staff to their investors that tout the potential for future mining of these mineral resources southwest of the west pit. If the west pit is to be used as a portal for this future mining, then that should be described in the FEIS and the environmental consequences assessed. The Evaluation of Backfilling the NorthMet West Pit (December 2012) states on page 2 “mineralization on the western end is much more flat laying, dipping at about 15 degrees and could be developed in the future via expansion of the proposed open pit mining operation and/or underground mining from the base of the west pit.” It appears that the FEIS is describing a project that is not complete in that future mining is not included. What are the implications of developing an underground mine that extends from the west pit to surface and groundwater resources of the Partridge River watershed? Another stated reason for avoiding backfill for the west pit is the lease requirement of not encumbering the mineral resources to the southwest. The assertion that backfilling the west pit would encumber minerals is ludicrous. We disagree with the notion that the only way to access minerals at depth is through the bottom of the west pit. These minerals could be accessed through other standard underground mining techniques from other locations. In fact, these minerals are accessible now and would continue to be accessible even if the NorthMet project is never built. Taking advantage of an existing pit may provide economic benefits to a mining company but it is unclear why a regulatory agency would prefer this method without first conducting an analysis. If the co-lead agencies are taking the position that the preferred alternative of a future underground project includes a portal through the west pit, then they need to provide a scientifically defensible reason for that decision. Finally, the co-lead Agencies’ Consideration of a West Pit Backfill Alternative dated April 11, 2013 provides several reasons for the conclusion that backfill would not provide significant environmental and socioeconomic improvements over the proposed action. Page 3 of the document clearly states that there has been no analysis done to support these conclusions. It appears that economic considerations of a future mine expansion are the only concrete reasons for not conducting an analysis of the environmental and socioeconomic benefits of backfilling the west pit. The NorthMet project as proposed is a perpetual maintenance and water treatment facility. It seems logical that every available option that might improve the long term impacts of the project should be explored regardless of the commitments that applicant may have made on their mineral lease. GLIFWC staff suggests that this alternative has been eliminated prematurely and that a full analysis is needed.	S	O
29229	Unique			ALT	Gail C. Roberts		3609	2	There still remain significant issues associated with FEIS and all alternatives were not examined fully.	NS	X
29229	Unique			ALT	Gail C. Roberts		3623	13	VEG01,WI01, WI02, WI03, WI10 – The importance of the mine site and tailing basin areas as part of a significant wildlife corridor has not been adequately addressed and mitigation measures have not been proposed. The underground mining alternative was not fully examined to determine if the effect on wildlife and eco-systems could be lessened.	S	N
29965	Unique			ALT	Gary Glass		4238	6	Additional Alternatives are needed to address need for a new tailings disposal site which does not leak water into the ground water aquifer, does not prevent future beneficiation of existing iron ore tailings currently located on the chosen plant site; a new site that is capable of not contaminating the existing iron ore tailings and preventing their future extraction for useable iron ore (see my Comment #18 SDEIS). The same may be true for the new Cu/Ni ore tailings that, in future, may be reprocessed to recover additional elements, and should be stored separately (see my Comment #19 SDEIS).	S	O
29965	Unique			ALT	Gary Glass		4242	7	Additional Alternatives should be proposed to accelerate, not retard, the chemical reactions of the reactive sulfide ore components with oxygen, water, and heat, and thus neutralize the reactive sulfide components. The present approach is to delay the reactions and store the reactive hazardous producing material in containment structures that can leak, and push treatment of toxic reaction products into long-lasting future care, requiring constant monitoring at greater expense, and creating a threat of probable damage to future aquatic resources. By speeding up the reactions of sulfide to creating sulfate, the acid can be neutralized and the resultant waste products, such a gypsum, might be recoverable and converted into a useful products, assuming the acidic and toxic components are removed. The amounts of sulfide to be mined are fairly well determined and no less than 1.5 pounds of sulfate will be produced for every pound of copper extracted, as a minimum. And more likely, up to ten pounds of sulfate will be produced for every pound of copper extracted, if solids are left mainly to convert to sulfuric acid over the long term. This will result in a Additional Alternatives to the permanent storage of all reactive sulfide-containing ores and related solid materials should be given to being stored in containment structures that do not leak water under any circumstances. The proposed mine pits are not leak-proof structures and are expected to allow some flow of groundwater, at will, regardless of the wishes of the owners. Existing pit lakes show direct water flow connections to ground water aquifers out to several thousand feet. The thousands of blasts of explosives used to pulverize the ore body will surely cause structural damage to the adjoining, adjacent rock structures making up the mine pit walls. Then add air and water exposure, and freeze-thaw cycles for the number of years planned before being filled with waste rock, soil, and finally water. In addition, the numbers of drill holes used to sample the ore body will surely also facilitate the movement of groundwater through the mine pit walls and adjacent areas allowing the flow of ground water to be in contact with the reactive sulfide in the pit walls, and waste rock; all to be flushed out by gw flows into the adjoining watersheds, i.e., the Partridge and Embarrass Rivers. This is one of the major flaws in the approach to permanently store the reactive sulfides in mine pit lakes where it is not possible to control gw water flows.	S	O

29965	Unique			ALT	Gary Glass		4243	8	Additional Alternatives for meeting the objectives in the Statement of Purpose and Need for the NorthMet Project. If the need for the metal copper is the primarily driving force behind the proposed project, and if this need could be fulfilled by an alternate approach, then the project as proposed should be revised to process more available sources of copper. The value of copper used in the underground mining assessment is \$3.56 per pound, and that the underground mining cost for its recovery would exceed that value. The market price for gathering used copper is today ranges from \$1.56. to \$1.65 per pound(Azcon Metals, Bayshore Recycling Corp., both Duluth Mn). If the re-processing costs add a few more cents to used copper price, then the re-processed, recycled copper would be the best way to satisfy the present and future needs for this commodity, and not by a proposed project that produces copper costing more than two times the cost of recycled copper. The best way to satisfy the stated need is to pursue different objectives, those focused on improving the gathering and re-cycling all copper containing products, and leave the forests and wetlands to support their present productivity - lumber and firewood production, hunting, fishing, wild rice gathering, and recreational activities on the 7,600 acres to continue to be productive forever.	S	O
29965	Unique			ALT	Gary Glass		4266	29	The potential future recovery of residual mineral resources from NorthMet tailings must be protected and maintained for re-processing to recover residual metals expected to be in the tailings (Ni, 510; Cu, 547; Cr, 310; Zn, 548; Mn, 1400; all ppm), uncontaminated by mixing with LTVSMC tailings. NorthMet tailings require a more secure and leak-proof basin, and should not be located in an area of uncertain dam stability or where aquifers are connected or at risk. The NorthMet tailings basins should be kept isolated in their own specifically designed enclosure to assure all possible future acid and toxic generation of sulfuric acid and resultant metal mobilization including gaseous emissions are permanently captured to prevent any possible exposure outside of secured containment areas. Other safer, proper, more controllable and less hazardous options must be found and evaluated.	S	O
29965	Unique			ALT	Gary Glass		4286	49	Comparison of Anticipated Impacts for Each Alternative, Tab. 5.1-1. Fish and Macroinvertebrates (pg 5-11) entry in the table states "no significant effect." is incorrect and a significant omission do to the admission that increased mercury emissions and concentrations would be created further contributing to contaminated waters (4.1-24, -29, -30, -31) (pg. 5-8) and mercury mobilization and methylation rates would be increased by further sulfate increases (5-12), the causative reactant in methyl-mercury formation and mobilization (Tab. 5.1-1 Mercury and Bioaccumulation (pg 5-12). Mercury in precipitation exceeds state water quality standards and reflects unacceptable, polluting sources of emissions from upwind sources including mining operations and constitutes the major source of contamination for Minnesota surface waters and fishery resources. All mercury additions from the proposed project will contribute to increasing the contamination already at unsatisfactory levels, and every means possible must be taken to reduce existing conditions and not add increases directly or through mobilization to methyl-mercury by sulfate concentration increases. Impact from mercury additions and sulfate-stimulated methylmercury in receiving waters from the proposed project should be computed and added to the final EIS.	S	O
29240	Unique			ALT	Henry V. Mott		3638	11	In the spirit of "leave no trace" PolyMet should be required to investigate incorporation of its sulfide tailings into the east/central pit backfill or perhaps the west pit backfill. Sulfide-rich conditions therein will provide absolute control on the mobility of metals that might otherwise leach from the tailings pile over the next several centuries. Long-term protection that is as risk-free as possible should be afforded Minnesota's sensitive northern watersheds.	NS	X
29240	Unique			ALT	Henry V. Mott		3640	13	As with the tailings, these hydrometallurgical wastes, containing large quantities of potentially toxic metals (RS33/RS65, 2007), belong isolated in pit backfill where the predominant form of sulfur will be sulfide. The sulfides of most metals (certainly those of interest here) are so insoluble that in the presence of sulfide, the aqueous concentration of the metal ion is on the order of a few molecular units per liter of water (i.e., ~10-23 molar, or, for example, in the case of copper, ~10-19 mg/L). Incorporation of these hydrometallurgical wastes into pit backfill, in the presence of an organic electron donor and sulfide minerals and with fully-saturated conditions supporting isolation by bentonite modified soils would be a very close approximation of the degree to which they are currently isolated from atmospheric oxygen in their native state.	NS	X
28494	Unique			ALT	Ivan Weber		2302	10	Dry disposal of tailings offers much better prospects, though northern Minnesota is a difficult challenge for it execution. 4. The old LTV plant does not seem to be the appropriate location for still more degradation. Environmental restoration would appear to be the much better strategy. Instead of perpetuating the description of the former LTV plant as 'impaired' or 'derelict,' why not make it an industry to restore this place to an acceptable, functional ecological balance? We have dozens of photographs in digital formats of the worst of Kennecott's acid mine drainage, and some available from the Tar Creek case, but any and all of these cases could be remedied by diligent application of water management, soils management, wetlands design and construction, and responsible wetlands plant community manipulations. Wetlands really are that impressive and effective in their benefits, which we must recognize as being due to the microbiological systems with which they are interlinked.	S	O
36	Unique			ALT	Jack Parker		101	1	we are being misled into thinking that only the huge open pit mine is feasible. I doubt that, and I doubt that they have seriously considered underground mining of portions showing higher grade, same as the neighbors have - same as Messrs Cherry and Donahue set up at the Eagle mine.	NS	X
10	Unique			ALT	Jana Guseynova		17	2	I still feel the risks posed by the proposed mine are too great to the state of Minnesota, and know that this type of mining cannot be done safely.	NS	X
7393	Form Letter	4	Variant	ALT	Jane Beattie		541	8	There has been no worthwhile consideration of alternatives to reduce harm to wetlands and water quality.	S	O
23365	Unique			ALT	Janet Keough		940	3	The Polymer Final EIS should be rejected as incomplete because it fails to examine important alternatives to reduce the hazard of future tailings dam failure and environmental damage. Dry stack start of tailings is a technique to prevent precipitation and groundwater from interacting with the tailings to product acid and sulfate laden runoff. The FEIS rejects examining this alternative in depth, because seepage would be reduced and concentrate pollutants, requiring even more expensive water treatment. This implies that the FEIS plan depends upon dilution of pollution - clearly an unacceptable approach.	S	O
23365	Unique			ALT	Janet Keough		943	6	The FEIS is incomplete and insufficient in discussing alternatives to the huge environmental impacts that are likely from this project. We don't need the few jobs and huge environmental impacts of the Polymet project now or in the future.	NS	X
27883	Unique			ALT	Jay Newcomb		2212	2	The option of a dry-land, lined dump site was not considered	NS	X
27785	Unique			ALT	Jenny Gamer		2142	4	Globally metals markets are tanking, I've read. We know that we need to move into a future where we are recycling materials and healing our water and land bases as well as figuring out how to live in a carbon negative way. These mines do none of that.	NS	X
5	Unique			ALT	John-Marilyn Rossi		9	1	It is my understanding that returning the area affected by the mining operations to its full, natural state once mining is concluded is also an option...Full Reclamation. I also understand that doing so would presumably eliminate the need for ongoing water treatment because any remaining waste rock at the site would be placed back underground and covered with overburden and reforested to re-establish habitat. Was full reclamation ever considered...and if not why?	S	O
5	Unique			ALT	John-Marilyn Rossi		10	2	Why is the state of Minnesota not requiring full reclamation? The cost of full reclamation would assuredly be higher, and that might make the project less profitable. Yet if the project isn't economically viable without full reclamation, it should not be up to Northern Minnesota's Environment to pay the price for this and other projects.	S	O
28739	Form Letter	1	Variant	ALT	Jon Ridge		2339	4	The Prospecting Draft EIS fails to consider alternatives needed to protect the Superior National Forest and the adjacent Boundary Waters Canoe Area Wilderness, such as limits on the season of drilling and limits on the density of impacts on resources.	NS	X
26854	Unique			ALT	Kenneth Swanson		1477	5	Ive been told that copper is one of the best metals to reuse since it recycles easily and works just as good the second or third or thousandth time so why make more use what we got!	NS	X
23643	Unique			ALT	LeRoger Lind	Save Lake Superior Association	2933	2	The document continues to describe a series of short-term "mitigation schemes" that are designed to bring the toxic pollutants within the weakened or non-existent state and federal standards in order to gain permits to mine, pollute water and air, destroy natural habitat and wetlands, increase sulfate and mercury emissions and otherwise negatively affect the watershed, its inhabitants and Lake Superior itself.	NS	X
23643	Unique			ALT	LeRoger Lind	Save Lake Superior Association	2938	7	The pollution mitigation schemes such as reverse osmosis, subaqueous storage, sorting and stacking, bacterial treatment, taconite tailings filtration, and others would not be affordable, let alone effective in preventing this environmental and social disruption.	S	O
29740	Unique			ALT	Lori Andresen	Save Our Sky Blue Waters et. al.	3897	8	The FEIS is relying too heavily upon "adaptive management" as the solution to potential problems with pollution. This acknowledges that unexpected and unforeseen pollution will occur, but does nothing to project them.	NS	X

29740	Unique			ALT	Lori Andresen	Save Our Sky Blue Waters et. al.	3900	15	The FEIS does not incorporate filling of the West Pit upon closure, thus rendering the FEIS incomplete.	S	O
29740	Unique			ALT	Lori Andresen	Save Our Sky Blue Waters et. al.	3903	18	The FEIS does not adequately address the stability of the former LTV tailings basin purchased by PolyMet and the amount of additional tailings that will be piled onto the basin due to the low grade character of the deposit. Even after the disastrous Canadian tailings basin breach at Mount Polley, the FEIS does not take into consideration the conclusions of the Canadian Chief Inspector of Mines, or the dry stacking of tailings.	S	O
29740	Unique			ALT	Lori Andresen	Save Our Sky Blue Waters et. al.	3910	25	An underground mine option is not adequately addressed, especially in regard to the true costs to the environment of an open pit mine. PolyMet must show us that selective mining underground is not feasible and prudent; PolyMet has not shown us a thorough evaluation of that possibility.	S	O
29740	Unique			ALT	Lori Andresen	Save Our Sky Blue Waters et. al.	3932	47	The FEIS fails to adequately consider alternatives to minimize environmental harm, reduce polluted seepage from unlined permanent waste facilities, mitigate wetlands destruction, and reduce the threat of catastrophic dam failure.	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3772	65	Paste tailings placed on a liner and covered could have a profound, minimizing effect on pollution reaching the Partridge and Embarrass River watersheds wetlands and the Embarrass River and Second Creek. But the FEIS, without justification, does not even mention this modern technique, despite the fact that it is used by many mines in U.S. and around the world,161: Converting to paste tailings technology from conventional slurry tailings at most mines makes sense both environmentally and economically. Paste tailings use less water; require less land; do not require engineered containment dams; generate less acid and contaminants; reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.162	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3774	67	In response to comments about this defect received on the SDEIS, the Co-Leads state only: “[a] thickened tailings (paste tailings) alternative (A1) was considered but eliminated in the DEIS and post-DEIS, as it was found not to offer significant environmental benefits when compared to the NorthMet Project Proposed Action.168 One of the DEIS and post-DEIS claims paste tailings were not given the NEPA required “hard look”. Of “no significant environmental benefits” used to dismiss paste tailings was the re-use of a brownfield site (the LTVSMC tailings basin) instead of disturbing an existing natural site. However, in the final scoping decision documents for the project, several brownfield sites were identified as alternative locations for tailings disposal169 rendering that argument moot. Due to the overestimation of seepage capture possible, and possible mitigation strategies to prevent catastrophic tailings dam failure for the LTVSMC tailings basin, the environmental benefits of	S	O

29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3775	68	The FEIS does not require the use of perpetual pumping, a proven mitigation method. But perpetual pumping of the mine pits to prevent formation of a pit lake is required by the State of New Mexico, Office of Natural Resource Trustee, for the Chino and Tyrone copper mines expressly to protect groundwater and waterfowl. ¹⁷⁰ Numerous western mines have discharged plumes of polluted water into the bedrock aquifer from leaking mine pits, tailings basins and waste rock piles, a problem that is not only difficult but expensive to fix. ¹⁷¹ Requiring perpetual pump out of the mine pit would minimize leakage of contaminated water into the surrounding bedrock aquifer thereby protecting groundwater that the State is required to as source of drinking water.	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3776	69	Suggesting that encumbrance compensation may affect the ability of PolyMet to secure financing is a completely unsubstantiated comment used to deflect the environmental benefits that could be gained by backfilling the west pit. Backfilling all of the mine pits with waste rock would reduce the surface footprint of the mine and make possible 526 acres of wetland an unlined waste rock pile, as proposed in the preferred alternative, that would have to work at an above optimum capture rate in perpetuity. Capping and re-vegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation. In combination, perpetual pumping and backfilling the Category 1 waste rock pile would substantially reduce the risk of polluting groundwater and wetlands in the Partridge and Dunka River watersheds. Restoration where the Category 1 stockpile is now proposed to be stored without a liner in perpetuity. This alternative would prevent the need for a separate seepage capture system around	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3777	70	The FEIS also fails to require engineered liners. Engineered liners for the Category 1 waste rock stockpile and the Overburden Storage Layout Area (“OSLA”) would ensure that seepage would not migrate into fractures below the storage facilities and increase the effectiveness of seepage capture. The OSLA will contain peat that has sequestered mercury. When water flows through the OSLA the seepage will transport some of the mercury from the peat. By lining the OSLA, less mercury will escape into the environment. If the Category 1 Stockpile were lined, seepage capture efficiency would increase and less water carrying pollution would migrate from the pile into the fractures below the storage area thereby protecting groundwater.	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3778	71	After operations, the FEIS contemplates that the RO plant would continue to treat tailings basin seepage and begin treating tailings pond water. The treated water would be used for augmentation of streams near the plant site. Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations—these are 200 years at the Mine Site and 500 years at the Plant Site. The duration of the simulations ensured that peak groundwater concentrations at the locations of release to surface water would occur during the model simulations. ¹⁷³ As the Project is currently proposed, after operations, the mine site wastewater treatment plant will be converted to RO to treat the west mine pit lake and Category 1 stockpile seepage for discharge to the west pit outlet creek that flows into the Partridge River. ¹⁷⁴ An alternative that was not considered in the SDEIS would use RO at the plant site from the start to treat stormwater, mine infiltration, and waste rock pile seepage. Using RO-treated water for stream and wetland water augmentation in the Partridge River watershed would provide mitigation for the some of the adverse effects of mine pit dewatering.	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3781	74	The Band has long cited this defect in its comments, and EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS. Although the SDEIS and FEIS were revised to reflect the Project proponents’ preferred action, still, the only alternative analyzed in any detail concerns the acreage of the proposed land exchange. This does not represent rigorous exploration and objective evaluation of potential alternatives and is a serious violation of NEPA that has not been remedied. Exacerbating the problems that have persisted throughout the DEIS and SDEIS, the adaptive management concepts listed below (grout curtain, pit lake depression, groundwater extraction wells, artificial recharge) represent new MDOs regarding potential alternatives that were not even disclosed in the FEIS. In sum, the FEIS, SDEIS, and DEIS have all failed to substantively consider many alternatives that may provide mitigation for, or prevent long-term environmental damage. If the mitigations that have been listed above had been given the “hard look,” as least some of them would have been considered Project alternatives. However, as plainly stated in chapter 3, “[u]ltimately, the NorthMet Project No Action Alternative was the only alternative evaluated in detail in this FEIS.” Instead, “adaptive management concepts” appear to have replaced the alternative analysis—but these do not comply with NEPA or replace a true alternatives analysis. Many of the adaptive management concepts should have been rigorously explored and objectively evaluated to determine the cost and associated potential environmental benefits. These concepts appear in the FEIS text as “strategies” or “plans.” In chapter 5, adaptive management is defined as “a system of management practices, based on clearly defined outcomes and monitoring requirements, that assesses whether management actions are meeting the desired outcomes, and, if not, prescribes potential actions that would ensure the defined outcomes are met.” But even in the adaptive management plans provided the potential actions that “would ensure the defined outcomes are met” haven’t been rigorously evaluated to determine if they could actually be implemented, and if so, whether the desired results would be attained. There are no “trigger points” for implementation; instead the FEIS states that “periodic assessments would be carried out to ensure continuous protection of groundwater and surface water quality and compliance with water quality-based effluent limits.” ¹⁸⁰ This is troubling because periodic assessments (if measurements are required) are indications of water quality. Modeling may be used if an up-tick in concentrations is identified prior to an exceedance of water quality standards. However, without trigger points in the adaptive water management plan (“AWMP”), “periodic” seems to indicate that opportunities to apply adaptive water management to prevent pollution will only mitigate pollution once it has occurred.	S	O
				ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3782-1	75	The MNDNR and USACE considered underground mining as an alternative to the proposed open pit(s) for the DEIS in 2009, but eliminated it because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” ¹⁸³ Even though underground mining was reconsidered for the SDEIS, the Co-Lead Agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” ¹⁸⁴ when analyzing this (or any other) alternative. The Project proponent eliminated the alternative based solely on an economic decision that underground mining would not be as profitable as open pit mining. The Co-Leads stated in the SDEIS that “it was not possible to undertake a quantitative, side-by-side assessment of the underground mining alternative.” ¹⁸⁵ Thereafter, the FEIS concludes an underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. ¹⁸⁶ Conversely, although the underground mining alternative would offer environmental benefits, the SDEIS included no economic analysis of those benefits. Still, the Co-Lead Agencies determined that underground mining would result in reduced socioeconomic benefits, and “PolyMet would not move forward with an unprofitable project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.” ¹⁸⁷ Although underground mining was considered technically feasible, the Co-Leads further provided that: PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. Using underground mining would result in most of the NorthMet Deposit left unmined because of its low metal value (i.e., less value than the cost of mining and mineral processing). Other material would have to be left in place for safety reasons, to prevent collapse. ¹⁸⁸ Therefore: ...the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS. ¹⁸⁹		
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3782-2	75	An additional purpose for re-assessing the underground mining alternative became known during consultation with the Bands under Section 106 of the National Historic Preservation Act: avoidance of adverse impacts to a traditional cultural property, the Lake Vermillion Beaver Bay Trail (“BBLVT”), which transects a portion of the proposed east pit. Even though avoidance is supposed to be the first consideration before mitigation can be considered for cultural resources, this benefit, along with numerous environmental benefits that an underground mine would afford, were not given adequate consideration and the underground mining alternative remains eliminated from consideration in the FEIS. In no way does this constitute an appropriate level of detail. The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis. ¹⁹⁰ It is not even a sufficient cost-benefit analysis. The CEQ regulations require that, only where a cost-benefit analysis is “relevant to the choice among environmentally different alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,” ¹⁹¹ in addition to other CEQ alternatives rules. Here, the FEIS does not consider the economic impact of perpetual treatment, and the economic analysis provided by the Project proponent summarily concludes that underground mining is “[n]ot economically viable”—while contradictorily claiming that backfilling the west pit would create encumbrances not allowed in their lease due to minerals located below the west pit that can only be accessed through underground mining. This is not the appropriate use of a cost-benefit analysis for purposes of analyzing an EIS alternative. As the Band already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS and the FEIS offer no new discussion of the reasons for rejecting the alternative. An appropriate analysis of the economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings, and waste rock disposal. In fact, a study of this particular deposit was performed by the prior owner of the site, U.S. Steel, which actually recommended underground mining. ¹⁹³ PolyMet is well aware of this study, given that the company included it in a 2003 filing with the Securities and Exchange Commission. ¹⁹⁴ In fact, by examining cross-sections showing the distribution of ore by depth, ¹⁹⁵ it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense—and there are clearly economic considerations that would cut in favor of underground mining. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, and the costs associated with perpetual treatment and adaptive management concepts should have been evaluated to determine the viability of this alternative.	S	O
29397	Unique			ALT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3784	77	One of the AMCs is pit lake depression, which would prevent a northward flow of groundwater if the water levels in the PolyMet pits were kept at an elevation below the Northshore Peter Mitchell Pit. However, flooding the pits is a critical component of the proposed action because in order to comply with MN WQS the most reactive waste rock and pit walls must be covered as quickly as possible. Yet this is not part of the AMC. Even PolyMet admits that, without pit flooding, a higher capacity wastewater treatment facility and additional treatment processes may be needed and additional expenses would be incurred. At closure, discharges to the Partridge River would need to be increased and construction of a wetland in the east pit would not be possible. This is an inadequately developed AMC that would have cascading adverse environmental impacts and demonstrates the lack of “rigor in exploration and objectivity in evaluation” when it was proposed. And this concept introduces a very different project than the proposed action which has not been evaluated and therefore cannot be permitted without restarting the environmental review process.	S	N

30426	Form Letter	1	Variant	ALT	Mary Theresa Downing		2864	1	No independent analyses have been done to prove PolyMet's claims. The alternatives to a less than perfect result have not been explored, even though a perfect result is very highly unlikely. And the liklihood of drinking water pollution is much too high to risk.	NS	X
29319	Unique			ALT	Maya Batres	The Nature Conservancy	3660	4	The FEIS analysis of the Land Exchange fails both of the first two requirements since it does not present alternatives that address the issues of critical habitat loss and loss of ecosystem services and it fails to respond to comments seeking an alternative which fully compensates for loss of such habitat;	S	N
29319	Unique			ALT	Maya Batres	The Nature Conservancy	3665	9	The FEIS acknowledges that the proposed Land Exchange ⁴ would result in a significant loss of mature upland conifer forest, forest in long rotation classification, and three native plant communities that are either imperiled or at risk of extirpation. Despite the Conservancy's previous comments urging the proposed Land Exchange to expand the portfolio of non-federal tracts to be acquired to address these environmental losses, no Land Exchange alternatives have been added. Under the proposed Land Exchange, upland conifer forest would decrease by at least 1, 172.5 acres, and forest land in older growth stages (US Forest Service category "General Forest - Longer Rotation) would decrease by 5,662 acres. This result is directly contrary to the United States Forest Service ("USFS") goals for the Superior National Forest of restoring long-lived conifer species and maintaining and increasing older forest growth stages. ⁶ Three at risk native plant communities occur within the federal lands: jack pine-black spruce woodland, white pinered pine forest, and rich black spruce swamp. The jack pine-black spruce woodland makes up a large proportion of the 1, 172.5 acres of upland conifer forest on federal lands, and much of this occurs in large (> 100 acres) intact patches. A complex of large patches of rare plant communities such as jack pine-black spruce woodland provide critical habitat for conifer dependent species. It is generally accepted that the proportion of such large forest patches has declined dramatically in the past century resulting in a loss of critical habitat. ⁷ In the Laurentian Uplands Subsection, 35 birds that are Species of Greatest Conservation Need (SGCN) and are associated with upland conifer habitats. Increasing the area of rare native plant communities is stated as a desired vegetation condition for the Superior National Forest. ⁸ The FEIS acknowledges these losses but fails to develop or address an alternative that will compensate the federal estate. The habitats lost are critical, rare, and difficult to replace, home to a number of SGCN species, and important to the Superior National Forest vegetation objectives. ⁹ Therefore, the FEIS fails to discuss an alternative with appropriate mitigation measures for these losses, does not respond to substantive comments asking for compensation for the loss and should be found inadequate.	S	N
27405	Unique			ALT	Melanie Peterson-Nafziger		1715	7	If you want to support the increased abundance of platinum metal groups, please pressure the Minnesota Legislature and governor to require increased capture and recycling of platinum metal groups minerals rather than destroying bogs, forests and wetlands. There are many electronics items that could be diverted from the waste stream with clearer, more aggressive state and federal regulations, which would result in the same capture of platinum metal groups without turning Minnesota's 4 billion-year-old granite into 20-story piles of sand and Minnesota's watersheds into toxic cess pools.	NS	X
29546	Form Letter	1	Variant	ALT	Michael Lein		2549	2	I specifically object to the practice of open pit mining and the archaic practice of wet storage of waste. Alternatives to these should be thoroughly examined - they were not in these documents.	NS	X
N/A	Form Letter Template	6	Non-Variant	ALT	Multiple	Izaak Walton League	FL35	2	The Final EIS should also be rejected as incomplete because it fails to examine an important alternative: dry stack storage of tailings, which could greatly reduce the hazard of future tailings dam failure and environmental damage. Instead, the FEIS rejects examining this alternative in depth, because seepage would be reduced, concentrating pollutants into the remaining waters, making it difficult to meet water quality standards. This implies that PolyMet's solution to pollution is dilution - clearly an unacceptable approach (pp 3-156-158).	S	O

27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3332	46	Cliffs Erie (now Cliffs Natural Resources) was party to a Consent Decree and approved work plan(s) with MPCA regarding their remedial responsibilities, but there is little information in the FEIS for the public to be assured regarding the need for PolyMet to enter into a legally binding agreement and develop approvable work plans to address their responsibilities. We understand that PolyMet has been coordinating with Cliffs on the reissuance of the Tailings Basin NPDES permit (and variance too, apparently), and incorporating corrective actions in their Project design, but the FEIS is virtually silent on the other AOCs. It seems reasonable to expect PolyMet to clean up all legacy contamination as quickly as possible; in fact, remedial actions should be integrated with the 'refurbishing' actions they plan to do to re-tool the taconite processing facilities to accommodate their processing needs. The FEIS should clearly acknowledge in its analysis of the No Action Alternative that, under the existing Consent Decree, Cliffs Natural Resources is required to complete remediation and reclamation/closure activities on the identified AOCs, and absent the NorthMet Mining Project, these requirements would not be deferred for 20 years. The Project Proponent has frequently touted the redevelopment of a 'brownfield site' as evidence of its environmental sensitivity, but the public may not realize that the actual cleanup of LTV's legacy contamination may be deferred until reclamation and closure of the NorthMet Project. In fact, four of the AOCs identified in Table 4.2.1-2 as PolyMet liabilities stipulate in the "status" column to "Further investigation at PolyMet closure." This timeline is not acceptable, and the FEIS should not be vague about the pace of fulfilling remedial requirements. Instead, the Co-lead agencies should stipulate in the FEIS a clear requirement that PolyMet will provide an approved Work Plan and expedited remedial timeline for all 23 remaining AOCs on their property, as a condition of the DNR Permit to Mine.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3404	125	Contrary to the explicit requirements of the Council on Environmental Quality (CEQ) rules, the FEIS does not evaluate or examine in any substantive way potentially viable Project alternatives. Even the no action alternative, which is the only alternative to the NorthMet Project Proposed Action evaluated in the FEIS, is lacking in detail and analysis. Tribal cooperating agencies identified this deficiency in the 2009 DEIS, consistently brought it forward for discussions throughout the SDEIS process, and US EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS. Although the SDEIS was revised to reflect the Project proponent's preferred action, and the FEIS includes several new modifications and mitigation measures, the only alternative analyzed in any detail concerns simply the acreage of the proposed land exchange (Alternative B). This is contrary to the CEQ regulations that require federal agencies to evaluate in detail the reasonable alternatives in an EIS.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3405	126	Nor is there any evaluation or identification in the FEIS of the 'least environmentally damaging practicable alternative' ("LEDPA") as required before approving a CWA §404 wetlands permit. 40 CFR § 230.10(a) specifies that "no discharge of dredge or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." In addition, the CEQ guidance clarifies that "Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant."231 For the reasons set out below, and as discussed in Section 5, infra, the Project is not the least environmentally damaging practicable alternative and the application for a section 404 permit should be denied.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3406	127	Multiple mine plan alternatives exist that could provide mitigation for or prevent long-term environmental damage, but none are considered in the FEIS. Examples of alternatives and their resultant environmental benefits include: - paste or dry tailings disposal to reduce the Project footprint, use less water, and minimize longterm treatment and maintenance (decreasing the risk of surface and groundwater pollution); - back-filling all waste rock into the east, central and west mine pits (reducing the mine foot print at closure, reducing contaminant runoff to surface and groundwater, reducing volume of water requiring perpetual treatment, restoring additional mine site wetlands); - provide reverse osmosis treatment at the mine site immediately rather than waiting until year 40 (augmenting water loss in adjacent high quality wetlands in the Partridge River watershed), and; - underground mining (multiple and substantial environmental benefits). 27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3407	128	Dewatered or paste tailings placed on a liner and covered could substantially minimize the mass and concentration of pollutants reaching the Embarrass River watershed wetlands and the Embarrass River. This is a modern mine waste management technique used by many mines in the US and around the world,240 yet it has never been adequately evaluated as an alternative for improving this Project. “Converting to paste tailings technology from conventional slurry tailings at most mines makes sense, both environmentally and economically. Paste tailings use less water, require less land, do not require engineered containment dams, generate less acid and contaminants, reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.” Despite specific comments on the SDEIS and preliminary FEIS, any acknowledgement, consideration or discussion of the substantial environmental benefits of paste or dry-stack tailings is completely missing from Table 3.2-17 in the FEIS. This is a significant deficiency in the analysis of alternatives, as it would provide substantive environmental benefits.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3408	129	In the 2009 DEIS, the Co-lead agencies maintained that all waste rock should be considered reactive. FEIS Table 3.2-8, Waste Rock Categorization Properties242, acknowledges that the Category 1 waste rock (rock that is <0.12% sulfur), which constitutes 70% of the volume of waste rock, has a “low potential to generate acid, but may leach metals.” Back-filling all of the mine pits with all of the waste rock would reduce the final surface footprint of the mine at closure, and make possible 526 acres of wetland restoration where the Category 1 stockpile is now proposed to be stored in perpetuity. This alternative would prevent the need for a permanent separate seepage capture system around an unlined waste rock pile, as proposed in the Project, which would have to perform at an above-optimum capture rate in perpetuity to comply with Minnesota Water Quality Standards (“MN WQS”). Capping and re-vegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation and reduce mobilization of toxic metals.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3409	130	The FEIS inexplicably removes the stockpile liner described in the 2009 DEIS for Category 1/2 waste rock in the current Project proposed action. A comparison of Table 3.2-16 as set out in the 2009 DEIS, and the subsequent elimination of the liner for the stockpile in the SDEIS and FEIS is as follows: DEIS: “Category 1 and 2 waste rock would be stored in a permanent lined/covered stockpile (Category 1/2 Stockpile) north of the west pit (years 1-11)” SDEIS, FEIS: “Category 1 waste rock mined from years 1-13 would be stored in an unlined, permanent stockpile north of the West Pit. The stockpile would have a geomembrane cover system at completion and surface water and groundwater collection system would encompass the entire stockpile and direct water to the Mine Site WWTF.” (emphasis supplied). The Band maintains that, if not backfilled, the Category 1 waste rock stockpile must be lined.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3412	131	The Minnesota Department of Natural Resources (DNR) and US Army Corps of Engineers (USACE) superficially evaluated and subsequently dismissed underground mining as an alternative to the proposed open pit Project for the 2009 DEIS. The Co-lead agencies eliminated this alternative from further evaluation because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” Tribal cooperating agencies urged the Co-lead agencies, now including the US Forest Service (USFS), to do a more robust analysis of the underground mining alternative for the SDEIS, but the Colead agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a Project.” when analyzing this alternative. This alternative was eliminated by the Project proponent based purely on an economic decision that underground mining would not be as profitable as open pit mining. The Co-lead agencies claim that “it was not possible to undertake a quantitative, side-by-side assessment of the underground mining alternative.” An underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. Although the underground mining alternative would offer substantial environmental benefits (significantly less wetland destruction, less mine-generated waste, less groundwater and surface water pollution generated and requiring perpetual treatment and control, less reclamation and closure activities, less nuisance and reactive dust to be controlled, less noise and vibration impacts, less visual impacts), the economic and intrinsic value of those benefits are not even estimated. In addition, an underground mine Project would not require a federal land exchange, resulting in lower start-up costs and avoiding the permanent loss of high quality resources (as discussed in later comments on Land Exchange impacts). Based upon an incomplete analysis of the benefits of an underground mine, the Co-lead agencies determined that this alternative would result in reduced socioeconomic benefits, and; “PolyMet would not move forward with an unprofitable Project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.”	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3415	132	The Co-lead agencies determined that underground mining was considered technically feasible, but concluded that “PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. An underground mining Project would leave most of the NorthMet Deposit unmined because of its low metal value relative to the cost of mining and mineral processing. Other material would have to be left in place for safety reasons, to prevent collapse.”248 Therefore, “the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS.”249 The SDEIS did not contain the appropriate level of detail required to eliminate this alternative. The conclusion that underground mining is neither viable nor preferable remains substantially unjustified, despite repeated requests by the tribal cooperating agencies for further analysis.250	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3416	133	The Project Proponent, without considering the economics of perpetual treatment, the purchase of thousands of acres of land for the federal land exchange, direct and indirect wetland mitigation costs, etc., concludes in their economic analysis that underground mining is “[n]ot economically viable” while simultaneously claiming that backfilling the west pit would create encumbrances not allowed in their mineral lease due to mineral resources located below the west pit that could only be accessed through underground mining. This is not the appropriate rigor in a cost-benefit analysis for thoroughly evaluating an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is “relevant to the choice among environmentally different alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,”251 in addition to other CEQ alternatives rules.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3417	134	Further, as consultation with tribal cooperating agencies under §106 of the National Historic Preservation Act has continued, an additional reason for re-examining the underground mining alternative emerged: avoidance of adverse impacts to a traditional cultural property, the Beaver Bay Trail to Lake Vermillion Trail, which transects a portion of the proposed east pit. Yet despite the numerous and substantive environmental and cultural resource benefits that an underground mine would afford, it remains eliminated from consideration in the FEIS.	NS	X
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3418	135	As already argued in the Tribal Position,252 significant additional study of the underground mining alternative is mandated, and the FEIS offers no new discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings management, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, US Steel, which actually recommended underground mining.253 PolyMet is well aware of this study, given that the company included it in a filing with the Securities and Exchange Commission in 2003.254 In fact, by examining geologic cross-sections showing the distribution of ore by depth,255 it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3419	136	The environmental costs of open-pit mining and the requisite wetland mitigation and above-ground disposal of tailings and waste rock are immense. These environmental costs, combined with the most current understanding of deposit ore grades, reasonably potential metals prices, and the costs associated with perpetual treatment must all be evaluated to determine the feasibility of this alternative.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3420	137	The FEIS’s brief discussion of the No Action Alternative is misleading. Its statement that under the No-Action Alternation the “Mine Site would be returned to pre-exploration conditions under the requirements of exploration approvals to reclaim surface disturbance associated with exploratory and development drilling activities,” it creates the inaccurate impression that biological integrity of the mine site is somehow already damaged. The FEIS compounds this by then wholly failing to explain, in detail, that the No Action Alternative would also avoid all adverse environmental impacts of the Project. The No Action Alternative means that: there would be no direct loss of over 900 acres of high quality wetlands, no adverse indirect impacts to thousands more wetland acres, no loss of high quality forested uplands, no further diminishment of wildlife habitat, no permanent loss of treaty resources under the land exchange, no cumulative effects to resources and environmental quality.	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3423	138	Compliance with the law – the Cliffs Erie Consent Decree and the Minnesota Pollution Control Authority’s water quality standards for the impaired waters – would improve water quality, and should have been affirmatively discussed in the FEIS’s description of the No Action Alternative The failure to do so creates the inaccurate impression that the baseline conditions – a brownfield and impaired waters would continue – when, in fact a no action alternative cannot include elements that would not comply with the law. The No Action Alternative must take into account current legal proceedings and assume compliance with the law. Friends of Yosemite Valley v. Kempthorne, 520 F.3d 1024, 1038 (9th Cir. 2008); Conservation Northwest v. Rey, 674 F. Supp. 2d 1232, 1245-1246 (W.D. Wash. 2009); see also Preserve Our Island v. United States Army Corps of Engineers, 70 ERC 16222009 WL 2511953 (W.D. Wash. 2009) (Corps failed to properly evaluate the no action alternative when it incorrectly assumed that an old dock would remain and “would continue to degrade, leaching creosote into the water” – an assumption that was contrary to the lease which required removal of the dock whether or not the proposed action was approved). See also Center for Biological Diversity v. U.S. Department of the Interior, 623 F.3d 633, 643-646 (10th Cir. 2010) (BLM’s assumption that mining would occur in the same manner whether or not the proposed land exchange occurred was erroneous in light of other law that would still have applied, and resulted in an inaccurate examination of the no action alternative).	S	O
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3424	142	As a result, the FEIS does not provide a basis for determining whether the underground mine alternative is in fact “impracticable” or whether it might simply be less profitable than PolyMet’s preferred alternative. In the absence of a clear basis for finding economic impracticability, the underground mine remains a less environmentally damages practicable alternative.	S	O

27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3425	143	The FEIS also rejected modifications to the proposed Project that, if implemented, would result in other less damaging alternatives if an open pit mine were permitted. Here too, as discussed in detail in section 3 above, a number of mine plan alternatives exist that could mitigate or prevent long-term environmental damage, but none are considered in the FEIS. Examples of alternatives and their resultant environmental benefits include: - paste or dry tailings disposal to reduce the Project footprint, use less water, and minimize longterm treatment and maintenance (decreasing the risk of surface and groundwater pollution); - back-filling all waste rock into the east, central and west mine pits (reducing the mine foot print at closure, reducing contaminant runoff to surface and groundwater, reducing volume of water requiring perpetual treatment, restoring additional mine site wetlands); and - provide reverse osmosis treatment at the mine site immediately rather than waiting until year 40 (augmenting water loss in adjacent high quality wetlands in the Partridge River watershed).	NS	X
27901	Unique			ALT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3429	141	the Project here is not the least environmentally damaging practicable alternative (LEDPA).	NS	X
27988	Unique			ALT	Nick Rowse		2239	2	In comparing the pros and cons of underground mining, it is very evident that there are many more pros than cons as follows: The pros of underground mining at the proposed NorthMet mine site would: • significantly reduce adverse visual effects, • set a precedent for how to underground-mine for copper, nickel, and other highly valuable ores under a high-quality northern Minnesota forest, • eliminate almost entirely the need for excavating and disposing hundreds of millions of tons of waste rock and the need for long-term management, in perpetuity, of acid runoff from this waste rock, • create hundreds of new jobs, including mining, transportation, and local service businesses for northeast Minnesotan communities, • provide millions of new tax dollars for Minnesota and local communities, • create a stable domestic source of copper, nickel, and other rare earth minerals, • reduce adverse impacts to environmental justice-designated communities by significantly reducing air and water pollution, • significantly reduce the loss of 914 acres of contiguous wetland, including coniferous fen, which would require up to 1,800 acres of mitigation-wetlands across Minnesota, the mitigated wetlands located entirely outside of the St. Louis River watershed, • maintain protection and management of northern forest habitat, including wetlands, which are both large carbon sinks, under the ownership of the USFS, • significantly reduce adverse impacts to federally-listed species – Canada lynx (Lynx canadensis) and its Critical Habitat, northern long-eared bat (Myotis septentrionalis), and gray wolf (Canis lupus), • significantly reduce adverse impacts to state-listed species or species of special concern – moose (Alces americanus), little brown bat (Myotis lucifugus), eastern pipistrelle (Periomyotis subflavus), northern goshawk (Accipiter gentilis), boreal owl (Aegolius funereus), wood turtle (Glyptemys insculpta), eastern heather vole (Phenacomys ungava), yellow rail (Coturnicops noveboracensis), Laurentian tiger beetle (Cicindela denikei), taiga alpine butterfly (Erebia mancinus), Freija’s grizzled skipper (Pyrgus centaureae freija), Nabokov’s blue butterfly (Lycaeides idas nabokovi), and Quebec emerald dragonfly (Somatochlora brevicincta), • significantly reduce adverse impacts to 1854-Ceded Territory lands and waters, • significantly reduce adverse impacts to wild rice-designated waters in the St. Louis River drainage, • avoid need to implement complex and expensive water modeling and adaptive drainage water management from proposed surface mining, • eliminate need for exchanging 6,650-acre tract of USFS land with non-contiguous lands, • and, finally would save significant financial costs to USFS, Minnesota, Tribes, and other stakeholders by eliminating litigation.	S	O
27988	Unique			ALT	Nick Rowse		2240	3	The cons of underground mining at the proposed NorthMet mine site would: • require additional environmental analysis under both NEPA and MEPA due to lack of environmental analysis under the FEIS produced by USACE and MDNR and under a DROD published by the USFS, • require additional permitting from the USFS and probably from the Bureau of Land Management, • and, would extend time needed to implement environmental analysis and permitting.	S	O
27988	Unique			ALT	Nick Rowse		2241	4	One major flaw in the Underground Mining Alternative Assessment for the NorthMet Mining Project and Land Exchange (Appendix B), was that the screening criteria used in the FEIS was the same as in the DEIS. This assumes that the economic criterion (i.e. economic conditions have not changed over the last six years from 2009 to 2015. Appendix B relies on a Memorandum provided by Foth Infrastructure and Environment, LLC (2013). The Foth Memo overtly states that it relied upon information provided by PolyMet, AGP Mining Consultants, and other publically available documents. Foth (2013) states, “The assessment of the prospects for economically viable extraction utilizes simplifications, generalization, assumptions, and qualifications within the scope of the assignment and is believed to be substantially correct”.	S	N
28097	Unique			ALT	Noreen Tyler	Izaak Walton League Minnesota Division	3445	4	The PolyMet Final EIS should be rejected as inadequate because it fails to examine an important alternative which could greatly reduce the hazard of future tailings dam failure and environmental damage: dry stack storage of tailings. (This is the recommended “best practice” after the disaster at Mount Polley.) Instead, the FEIS rejects examining this alternative in depth, because the quantity of seepage would be reduced, concentrating pollutants into the remaining waters, making it difficult to meet water quality standards through passive treatment – which has not yet been developed! This suggests that PolyMet’s solution to pollution is dilution – clearly an unacceptable approach. (pp 3-156-158.)	S	O
29676	Unique			ALT	Paul Nasvik		2567	5	The monitoring and maintaining of this project and the risk of failure doesn't come close to the benefits they are offering.	NS	X
27085	Unique			ALT	Paula Maccabee	Water Legacy	3014	11	The Project alternatives analysis, intended by law to be the “heart” of the EIS, is a scant few pages of the FEIS, and inadequate documentation is provided to support the rejection of substantive alternatives. Other than a smaller federal land exchange to facilitate the NorthMet open-pit sulfide mine, no alternatives are considered. Although the FEIS mentions in various places that project effects would not occur under a No Action alternative, the FEIS fails to provide a No Action baseline to compare impacts on water quality, thus biasing its results.	NS	X
27085	Unique			ALT	Paula Maccabee	Water Legacy	3015	12	The FEIS repeatedly provides a list of possible mitigation options without evidence of their efficacy rather than analyzing relevant and significant potential impacts.	NS	X
27085	Unique			ALT	Paula Maccabee	Water Legacy	3036	29	WaterLegacy has previously objected to use of projections of existing conditions as a baseline to evaluate NorthMet project impacts on water quality. This concern is discussed in more detail in Section XI, infra in addressing Alternatives, including the No Action Alternative. The FEIS makes the same strategic comparison to suggest that the NorthMet project would reduce sulfate discharge to receiving waters and the resulting potential for mercury methylation, when the opposite is more likely to be true. The FEIS compares NorthMet project impacts to the Continuation of Existing Conditions (CEC) scenario, even as it admits that the CEC model “does not include future expected additional mitigation such as water quality mitigation at the existing LTVSMC Tailings Basin,” (FEIS, 5-94). The FEIS acknowledges that water quality would improve if the project did not take place: “Seepage water quality from the existing LTVSMC Tailings Basin would be expected to improve over time as a result of the Cliffs Erie Consent Decree, other permit requirements (e.g., Permit to Mine), and natural attenuation of Contaminants,” (ES-49). The FEIS states that the NorthMet project would reduce sulfate loading by more than 40 percent in the Embarrass River at PM-13. (FEIS, 6-48), relying on an unsubstantiated nearly perfect tailings seepage collection rate of 99.5 percent. The FEIS did not estimate sulfate reduction achievable through natural attenuation and seepage collection by Cliffs Erie at the existing LTVSMC as a result of regulatory controls. Failing to do so biased the analysis of the NorthMet project’s impact on increased sulfate discharge and the resulting potential for mercury methylation.	S	N
27085	Unique			ALT	Paula Maccabee	Water Legacy	3086	80	The PolyMet NorthMet FEIS uses a singular approach to environmental review. Rather than analyzing adverse environmental effects and mitigation alternatives so the permitting authority can make a reasoned decision about whether to permit the project and, if is permitted, which mitigation measures to mandate in the permit, the FEIS declines to analyze environmental impacts and then provides a laundry list of mitigation options that may or may not be effective and may or may not come to pass. This FEIS strategy may be convenient for a project proponent, but it is contrary to state and federal environmental law.	NS	X
27085	Unique			ALT	Paula Maccabee	Water Legacy	3087	81	The FEIS contains a long list of “contingency mitigation” measures that would not be financially assured or triggered by any set of findings, but might be “appropriate” should monitoring or “refined modeling” demonstrate that they are “needed.” (FEIS, 5-239). Several of these measures pertain to the likely performance failures of engineered systems, such as liners and seepage collection systems. As reflected in WaterLegacy’s SDEIS comments, PolyMet’s work plans for the mine site (FEIS ref. Barr 2012c) and plant site (FEIS ref. Barr 2012d) required that performance of engineered systems be modeled as an “uncertain” input. Rather than conduct an experiment with Minnesota’s environment, the FEIS should require upfront disclosure of risks.	S	O
27085	Unique			ALT	Paula Maccabee	Water Legacy	3088	82	References in the FEIS to “refined” modeling and “contingency mitigation” in case water quality was “worse than expected” or as a result of “compliance issues” (FEIS, 5-239 to 5-240) should be setting off klaxons. Interception wells often ameliorate pollution at Superfund sites, but their potential future use should not justify creating a new contaminant source.	NS	X
27085	Unique			ALT	Paula Maccabee	Water Legacy	3157	152	The FEIS continues to compare project seepage to an artificial “continuation of existing conditions” rather than a prediction based on the no action alternative, as is required by law (See Section XI Alternatives, infra).	S	O

				ALT	Paula Maccabee	Water Legacy	3175-1	168	The PolyMet NorthMet FEIS should have compared the impacts of the proposed action on water quality with an appropriate no action baseline. Despite its assertion quoted above, the FEIS has not evaluated the No Action Alternative, let alone done so in detail. After a 250-page chapter analyzing project impacts on water quality, the discussion of the no action alternative is cursory: “Under the NorthMet Project No Action Alternative, the NorthMet Project Proposed Action would not occur and, therefore, the environmental effects associated with the NorthMet Project Proposed Action, as described in Section 5.2.2, would not occur.” (FEIS, 5-253). Under NEPA, a no action alternative must "provide a baseline against which the action alternative" is evaluated. Ctr. for Biological Diversity v. U. S. Dept. of Interior, 623 F.3d 633, 642 (9th Cir. 2010). (Finding BLM’s approval of an EIS arbitrary and capricious due to flawed assumption regarding result of no action alternative). See also Ctr. for Biological Diversity v. BLM, 746 F. Supp. 2d 1055, 1090 (N.D. Cal. 2009) (The “no action” alternative is “the standard by which the reader may compare the other alternatives’ beneficial and adverse impacts related to the applicant doing nothing.”) Courts “not infrequently find NEPA violations when an agency miscalculates the ‘no build’ baseline or when the baseline assumes the existence of a proposed project.” N. C. Wildlife Fed’n v. N.C. DOT, 677 F.3d 596, 603 (4th Cir. 2012) (Finding EIS inadequate due to assumptions made in the “no build” data); Friends of Yosemite Valley v. Kempthorne, 520 F.3d 1024, 1037-38 (9th Cir. 2008). In evaluating the critical impacts of the NorthMet project on water quality, the FEIS explicitly compares the effects of the proposed action with a “Continuation of Existing Conditions” (CEC) scenario, rather than a no build baseline. Every table predicting water quality under the proposed action contrasts it with modeling of this CEC. The FEIS concludes that the proposed action would not cause any significant water quality impacts because “the NorthMet Proposed Action concentrations were no higher than concentrations predicted for the Continuation of Existing Conditions scenario.” (FEIS, 5-9). The CEC is not a no action alternative, but a biased construct. It is a scenario that disregards science, regulation and the proponent’s own obligations in order to compare the NorthMet project’s effects on water quality to an artificially elevated prediction of future pollution. The FEIS, in effect, admits as much. “The CEC scenario,” the FEIS explains, “is not synonymous with the No Action Alternative because it does not account for other foreseeable changes within the NorthMet Project area.” (FEIS, 5-254).		
27085	Unique			ALT	Paula Maccabee	Water Legacy	3175-2	168	The FEIS, in effect, admits as much. “The CEC scenario,” the FEIS explains, “is not synonymous with the No Action Alternative because it does not account for other foreseeable changes within the NorthMet Project area.” (FEIS, 5-254). The FEIS mentions that actions are currently underway to reduce the sulfate load to the Embarrass River from the Cliffs Erie Area 5NW mine pit. (FEIS, 5-253). But the most significant differences between the CEC scenario and a true no build alternative may involve the LTVSMC brownfield site and tailings waste facility where the NorthMet project is proposed. Under a no action alternative, the existing LTVSMC brownfield site “would be reclaimed in accordance with the Cliffs Erie reclamation/closure plan.” (FEIS, ES-49). In addition, under a no action scenario, if the PolyMet NorthMet project were not built, “the water quality of seepage from the existing LTVSMC Tailings Basin would improve over time as a result of natural attenuation and/or possible additional mitigation measures pursuant to the Consent Decree between the MPCA and Cliffs Erie.” (FEIS, 5-470). A baseline for comparing the adverse effects of a project cannot rely on a false assumption that old pollution would remain unabated if a project were not approved. Preserve Our Island v. United States Army Corps of Eng’rs, 70 ERC (BNA) 1622, slip op. 46-47 (D.C.W. D. Wash. 2009). The no action baseline comparison in an EIS also cannot properly include elements that would not comply with law. Friends of Yosemite Valley v. Kempthorne, 520 F.3d 1024, 1038 (9th Cir. 2008); Ctr. for Biological Diversity v. U. S. Dept. of Interior, 623 F.3d 633, 642 (9th Cir. 2010); Conservation Northwest v. Rey, 674 F. Supp. 2d 1232, 1245-1246 (D.C. W.D. Wash., 2009). Where an agency has ignored its duty, the result cannot be presented as a fait accompli in the baseline for an EIS. Friends of Yosemite Valley v. Kempthorne, supra, 520 F.3d at 1037-38. The LTVSMC taconite tailings plant has been closed since 2000 when the LTV Steel Mining Company declared bankruptcy. Seepage concentrations are naturally attenuating as a result of precipitation and dilution. Cliffs Erie, L.L.C., which became legally responsible for permit compliance in 2001 when it acquired the LTVSMC property, is under the legal obligation of a 2010 consent decree (attached to WaterLegacy’s SDEIS comments as Exhibit 8) to remediate tailings waste facility pollution. The failure of the LTVSMC tailings facility to control seepage and remediate pollution may, to some degree, be a regulatory lapse ⁴⁵ that cannot be considered as a fait accompli in the baseline for an EIS. In addition, under the terms of its purchase agreement with Cliffs Erie, since 2006 the PolyMet Company has indemnified Cliffs Erie for remediation obligations at the tailings site and is “working closely” with Cliffs to fulfill Cliffs’ legal obligations. (PolyMet 2015 SEC Form 20-F, Exhibit 23, pp. 18-19). It would be an improper use of the concept of “no action” to allow Cliffs’ and PolyMet’s delay in taking action to remediate tailings basin seepage to distort the baseline for determining the effects of future sulfide mine pollution. This is not an academic question. As discussed in Section I on mercury, the FEIS claims the PolyMet NorthMet project would reduce CEC modeled sulfate loads to the Embarrass River, at least under the FEIS’ assumption of nearly perfect seepage collection. But, if the NorthMet project’s sulfide tailings seepage were compared with a “no action” baseline, including attenuation and remediation under the consent decree, this evaluation could show the NorthMet action increases rather than decreases sulfate and other pollutants. The FEIS doesn’t even allow an answer to the most basic question – Would sulfate pollution be better or worse if the PolyMet NorthMet project were built? On water quality issues, the FEIS does not allow a fair comparison of environmental outcomes between the proposed action and the no build alternative.	NS	X
				ALT	Paula Maccabee	Water Legacy	3176-1	169	The PolyMet NorthMet FEIS should have compared the impacts of the proposed action on water quality with an appropriate no action baseline. Despite its assertion quoted above, the FEIS has not evaluated the No Action Alternative, let alone done so in detail. After a 250-page chapter analyzing project impacts on water quality, the discussion of the no action alternative is cursory: “Under the NorthMet Project No Action Alternative, the NorthMet Project Proposed Action would not occur and, therefore, the environmental effects associated with the NorthMet Project Proposed Action, as described in Section 5.2.2, would not occur.” (FEIS, 5-253). Under NEPA, a no action alternative must "provide a baseline against which the action alternative" is evaluated. Ctr. for Biological Diversity v. U. S. Dept. of Interior, 623 F.3d 633, 642 (9th Cir. 2010). (Finding BLM’s approval of an EIS arbitrary and capricious due to flawed assumption regarding result of no action alternative). See also Ctr. for Biological Diversity v. BLM, 746 F. Supp. 2d 1055, 1090 (N.D. Cal. 2009) (The “no action” alternative is “the standard by which the reader may compare the other alternatives’ beneficial and adverse impacts related to the applicant doing nothing.”) Courts “not infrequently find NEPA violations when an agency miscalculates the ‘no build’ baseline or when the baseline assumes the existence of a proposed project.” N. C. Wildlife Fed’n v. N.C. DOT, 677 F.3d 596, 603 (4th Cir. 2012) (Finding EIS inadequate due to assumptions made in the “no build” data); Friends of Yosemite Valley v. Kempthorne, 520 F.3d 1024, 1037-38 (9th Cir. 2008). In evaluating the critical impacts of the NorthMet project on water quality, the FEIS explicitly compares the effects of the proposed action with a “Continuation of Existing Conditions” (CEC) scenario, rather than a no build baseline. Every table predicting water quality under the proposed action contrasts it with modeling of this CEC. The FEIS concludes that the proposed action would not cause any significant water quality impacts because “the NorthMet Proposed Action concentrations were no higher than concentrations predicted for the Continuation of Existing Conditions scenario.” (FEIS, 5-9). The CEC is not a no action alternative, but a biased construct. It is a scenario that disregards science, regulation and the proponent’s own obligations in order to compare the NorthMet project’s effects on water quality to an artificially elevated prediction of future pollution. The FEIS, in effect, admits as much. “The CEC scenario,” the FEIS explains, “is not synonymous with the No Action Alternative because it does not account for other foreseeable changes within the NorthMet Project area.” (FEIS, 5-254). The FEIS mentions that actions are currently underway to reduce the sulfate load to the Embarrass River from the Cliffs Erie Area 5NW mine pit. (FEIS, 5-253).		
27085	Unique			ALT	Paula Maccabee	Water Legacy	3176-2	169	But the most significant differences between the CEC scenario and a true no build alternative may involve the LTVSMC brownfield site and tailings waste facility where the NorthMet project is proposed. Under a no action alternative, the existing LTVSMC brownfield site “would be reclaimed in accordance with the Cliffs Erie reclamation/closure plan.” (FEIS, ES-49). In addition, under a no action scenario, if the PolyMet NorthMet project were not built, “the water quality of seepage from the existing LTVSMC Tailings Basin would improve over time as a result of natural attenuation and/or possible additional mitigation measures pursuant to the Consent Decree between the MPCA and Cliffs Erie.” (FEIS, 5-470). A baseline for comparing the adverse effects of a project cannot rely on a false assumption that old pollution would remain unabated if a project were not approved. Preserve Our Island v. United States Army Corps of Eng’rs, 70 ERC (BNA) 1622, slip op. 46-47 (D.C.W. D. Wash. 2009). The no action baseline comparison in an EIS also cannot properly include elements that would not comply with law. Friends of Yosemite Valley v. Kempthorne, 520 F.3d 1024, 1038 (9th Cir. 2008); Ctr. for Biological Diversity v. U. S. Dept. of Interior, 623 F.3d 633, 642 (9th Cir. 2010); Conservation Northwest v. Rey, 674 F. Supp. 2d 1232, 1245-1246 (D.C. W.D. Wash., 2009). Where an agency has ignored its duty, the result cannot be presented as a fait accompli in the baseline for an EIS. Friends of Yosemite Valley v. Kempthorne, supra, 520 F.3d at 1037-38. The LTVSMC taconite tailings plant has been closed since 2000 when the LTV Steel Mining Company declared bankruptcy. Seepage concentrations are naturally attenuating as a result of precipitation and dilution. Cliffs Erie, L.L.C., which became legally responsible for permit compliance in 2001 when it acquired the LTVSMC property, is under the legal obligation of a 2010 consent decree (attached to WaterLegacy’s SDEIS comments as Exhibit 8) to remediate tailings waste facility pollution. The failure of the LTVSMC tailings facility to control seepage and remediate pollution may, to some degree, be a regulatory lapse ⁴⁵ that cannot be considered as a fait accompli in the baseline for an EIS. In addition, under the terms of its purchase agreement with Cliffs Erie, since 2006 the PolyMet Company has indemnified Cliffs Erie for remediation obligations at the tailings site and is “working closely” with Cliffs to fulfill Cliffs’ legal obligations. (PolyMet 2015 SEC Form 20-F, Exhibit 23, pp. 18-19). It would be an improper use of the concept of “no action” to allow Cliffs’ and PolyMet’s delay in taking action to remediate tailings basin seepage to distort the baseline for determining the effects of future sulfide mine pollution. This is not an academic question. As discussed in Section I on mercury, the FEIS claims the PolyMet NorthMet project would reduce CEC modeled sulfate loads to the Embarrass River, at least under the FEIS’ assumption of nearly perfect seepage collection. But, if the NorthMet project’s sulfide tailings seepage were compared with a “no action” baseline, including attenuation and remediation under the consent decree, this evaluation could show the NorthMet action increases sulfate and other pollutants. The FEIS doesn’t even allow an answer to the most basic question – Would sulfate pollution be better or worse if the PolyMet NorthMet project were built? On water quality issues, the FEIS does not allow a fair comparison of environmental outcomes between the proposed action and the no build alternative.	S	N
27085	Unique			ALT	Paula Maccabee	Water Legacy	3180	175	However, the argument that a separate dry stack tailings basin would increase the “footprint” of the project does not mean it would increase environmental impacts. The Co-Lead Agencies may no longer remember this, but there are many brownfield sites in close proximity to the LTVSMC processing plant. In fact, several of these sites were identified as alternative tailings locations in the 2005 Final Scoping Decision for the NorthMet project, as reflected in the Exhibit 27 map attached. It was incumbent upon the Co-Lead Agencies, based on comments, the Independent Report and their own evaluation that dry stacking would improve tailings basin stability, to review these and other nearby brownfield sites, environmental risks and life-cycle costs and rigorously evaluate best available tailings disposal technology for the NorthMet project. 27085	Unique			ALT	Paula Maccabee	Water Legacy	3181	176	Both WaterLegacy and Tribal Agencies requested consideration of an alternative to mitigate impacts on wetlands and water quality from mine dewatering and seepage by treating groundwater pumped from mine pits during operations with reverse osmosis to levels that comply with water quality standards and returning that treated water to support wetlands and dilute any seepage released to the Partridge River watershed. The FEIS doesn't mention this alternative. Although the request for consideration of this alternative is documented twice - once for the Tribal Cooperating Agencies' request and once for that of WaterLegacy (FEIS, A-134 to A-135), neither response provides any justification of the failure to evaluate the Mine Site Reverse Osmosis in Year 1 alternative. The Tribes' request, "provide reverse osmosis treatment at the mine site immediately rather than waiting until year 40 (augment water loss in adjacent high quality wetlands in the Partridge River watershed)," was reprinted in Appendix A, but no response was provided. (FEIS, A-134 to A-135). WaterLegacy's detailed proposal was deprived of content by phrasing it as "earlier use of the reverse osmosis (RO) system in year one." The response was meaningless; "WWTF would be upgraded to include a RO unit or equivalent technology during closure." (FEIS, A-313).	S	O
27085	Unique			ALT	Paula Maccabee	Water Legacy	3184	181	The FEIS has provided no justification for locating these chemicals on a site where no solid waste facility would be permitted and no rationale for attempting to compact slimes and peat rather than excavating to solid ground so that a stable base can be engineered. In the entire history of the PolyMet NorthMet project, no EIS documents have evaluated alternative sites or methods of disposal. If such consideration has taken place, it has been done outside the light of day required under both state and federal law.	S	O
27085	Unique			ALT	Paula Maccabee	Water Legacy	3188	182	The PolyMet NorthMet FEIS provides an explanation of why the Co-Lead Agencies rejected the alternative of backfilling the West Pit with Category 1 rock generated by mining. This explanation is inadequate. First, the FEIS errs in minimizing the significance of reclamation of its 526-acre surface and the restoration of wetland areas and functions: Removal of the Category 1 Stockpile would allow for reclamation of the affected surface footprint, including potential to recreate wetland areas and restore function, and, as noted above, the prior effect would have been offset through mitigation required for the initial effect. . . However, because of the temporal effect that the stockpile would have, those effects would be required to be mitigated regardless of future backfilling or not. (FEIS, 3- 161 to 3-162) Although the project proponent may see no value in future wetlands restoration if no mitigation credit is received, this perspective is untenable. Reclamation of 526 acres with wetlands within decades instead of never is a clear environmental benefit, The FEIS fails to consider a significant additional environmental benefit of the West Pit Backfill alternative. It would reduce contaminated seepage that would otherwise result from leaving the 526-acre Category 1 copper-nickel waste rock pile permanently in a 280-foot-tall unlined pile at the mine site where seepage could impact the 100 Mile Swamp and the Upper Partridge River. (FEIS, 5-119, Table 5.2.2-21). As detailed in Section II, supra, hydrogeologic conditions beneath the unlined Category 1 waste rock piles are not discussed in the FEIS. But the majority of the Category 1 waste rock pile would be located on semi-permeable Virginia Formation rock, and there are several fractures transecting the site. (FEIS, Figure 4.2.14-1, FEIS ref. Barr 2014b).	S	O
27085	Unique			ALT	Paula Maccabee	Water Legacy	3195	187	Rather than analyze alternatives and their environmental consequences to allow a choice of the least damaging alternative, the Co-Leads allow PolyMet to have it both ways. Mineralization outside the mine plan was disregarded in analyzing the Underground Mine Alternative, but yet it still can be used as the basis to deny West Pit Backfill mitigation. Backfilling waste rock can be suggest as indefinite adaptive mitigation, but cannot be considered as a project alternative to reclaim wetlands and reduce seepage.	S	O
27659	Unique			ALT	Peter Bormuth		1800	5	The USACE and the USFS both admit that the best feasible alternative to permitting the mine is to maintain the status quo with continued mitigation of existing problems (See FEIS-Chapter 3). This action must be adopted by the co-lead agencies.	NS	X
8237	Form Letter	1	Variant	ALT	Ralph Butkowski		574	3	Minnesota does not currently need the potential economic support that could be realized by undertaking sulfide mining projects. We can afford to wait until better plans and better technology comes along to extract these commodity metals.	NS	X
28922	Unique			ALT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3582	7	As mentioned elsewhere in our comments, unexpected climatic changes are leading to increased incidences of severe rainfall events. On page 120, the FEIS makes an assumption that, "An emergency overflow channel would be constructed as a backup means of controlling pond elevation, but discharge from the emergency overflow to the environment is not expected. The emergency overflow would be provided for protection of the dams in the rare event that freeboard within the Tailings Basin is not sufficient to contain all storm water." The fact that the overflow will be provided is important, but this should not be the sole protection in place to prevent a Mount Polley-type dam breach. With toxic heavy metal leachate in the tailings pond water and sediment, every effort to safeguard against a breach should be considered responsible management.	S	O
28922	Unique			ALT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3583	8	The Mount Polley disaster provides important new insight into this FEIS, since the technologies used at Mount Polley, and those planned by PolyMet are similar. One of the recommendations from the Mount Polley Review Commission was to utilize a dry stack system for tailings (see pg. 162, 3.2.3.5 Identification of New Alternatives). However, the FEIS states, "No reasonable alternatives were identified that would potentially offer substantial environmental benefits compared to the NorthMet Project Proposed Action." We believe the FEIS has missed an opportunity to not only improve environmental protections, but also reduce long-term risks to the lives of people living near the tailings basins. PolyMet and the regulatory agencies should thoroughly study and consider implementing the dry stack technology.	S	O
28922	Unique			ALT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3594	25	The land exchange proposed by the parties is much larger than the NorthMet Mine footprint, which seems larger than necessary. The FEIS states, "Under this alternative, the federal government would have conveyed only the federal land (that is 2,719 of the 3,015 acres) that would actually be used for the NorthMet Project Proposed Action." There is no suitable explanation for this difference. Instead, the FEIS says, "Environmental assessment of the NorthMet Project Proposed Action identified the potential for air quality effects at the Mine Site boundary." (i.e. Air quality regulations are enforced only at the property boundary.) "A larger land exchange area would mitigate potential air quality issues; consequently, this alternative was eliminated from further consideration because it would not provide an adequate buffer." The fact that the FEIS rejects shrinking the land exchange to only the lands necessary for the project, and rejects saving 3 square miles of the "100 mile swamp" simply because, if PolyMet owns the land they don't have to address their own air pollution, and the pollution will be diluted by a bigger ownership, seems unacceptable to us. The State should not accept this as a suitable mitigation strategy for the impacts caused by the mine's air quality issues, and should instead seek alternative mitigation strategies to control the air pollution, while at the same time preserving three square miles of wild, undeveloped land (See page 183, Section 3.3.3.3.4).	S	O
2260	Unique			ALT	rkhudnut@aol.com		315	1	It is my understanding that the EIS was prepared without the dry-filtered tailings approach, which produces one one-tenth of 1 percent of the contaminated seepage of PolyMet's wet slurry tailings waste heaps.	NS	X
29246	Unique			ALT	Ron Brodigan		2453	2	There is no discussion in the FEIS of an alternative to trying to hold all of the liquid waste behind an earthen dam, e.g., "dry-stacking" of the tailings.	S	O
29246	Unique			ALT	Ron Brodigan		2454	3	There is no serious discussion of an alternative underground mine.	S	O
10134	Unique			ALT	Ryan Clark		666	5	Obviously, this is necessary to mine on/under land belonging to the federal government, but one has to consider if the private land proposed to be exchanged for the Superior National Forest land under which this mineral formation lies would ever be developed in a way that harms the environment to the extent the EIS portrays. Currently, both the land where the mine site .is and the private land proposed to be exchanged is undeveloped forest. If the project were to be permitted, we would see a net loss of undeveloped forest land. Whether or not this alternative is relevant under any current or future land use opportunities and/or regulations on private land, it should still be considered.	S	O
26659	Unique			ALT	Steve Jay		1431	23	e. The FEIS fails to consider alternatives to decrease environmental harm, reduce polluted seepage from unlined permanent waste facilities, mitigate wetlands destruction, and reduce the threat of catastrophic dam failure, all of which have environmental and public health hazards.	NS	X
10031	Unique			ALT	Sue Ramthun		651	1	It occurred to me that there is a possible alternative process that was omitted and may help mitigate the water pollution issue citizens fear. What if the ore processing is done at an already existing processing plant instead of NE Minnesota? At the mine pit, the plan is to load railroad cars with ore and haul to be processed. What if the railroad cars haul the ore to an established processing plant outside of Minnesota, unloads ore and returns to NE Minnesota to fill up/haul again? NothMet would save money by not constructing the processing plant, reinforced storage pits and indefinite water treatment. There would still be new jobs created in NE Minnesota and possibly Mn people transferring to the processing plants to staff extended hours for the additional ore processing.	S	O
29478	Unique			ALT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3872	31	WHEREAS, PolyMet has not considered several relevant mining method alternatives such as keeping tailing dry to reduce toxic runoff (dry stack storage), underground mining to reduce wetland destruction, and alternative tailings disposal sites to reduce the risk of tailings basin leaking and collapse;	S	O

29373	Unique			ALT	William Lane		2526	2	What this all comes down to is our legacy. Our legacy should not be a limited nostalgic reconnection for the mining industry and the return of “big wheels in the driveways”. Instead, our legacy is what we protect and provide to the next generation and generations beyond. Water is what northern Minnesota is known for; pristine, drinkable, sustaining water. It is necessary for life and yet, we are moving forward with Polymet-designed models that make assumptions “nothing will go wrong” or better yet: something bad "probably" won't happen. Look at the Gold King mine in Colorado and Mount Polley in British Columbia; both "engineered and modeled" retention systems failed, leaving their legacy of undrinkable water; an introduction of chemical and mineral-toxicity into aquifers, and a tourism industry that may never recover. Those dams weren't supposed to rupture or leak but they did; my point being these are but two examples of short-term gain being traded for long-term environmental damage.	NS	X

28547	Unique			AQ	Esteban Chiriboga	GLIFWC	3545	45	A coherent conceptual model needs to be articulated, either the one previously supported by the co-leads in which surface water features are poorly connected to the bedrock aquifer and are therefore, unaffected by pit dewatering, or one in which surface water features are well connected to the bedrock aquifer and can provide abundant leakage to support a groundwater mound between the PolyMet and Peter-Mitchell pits. If the first model is accepted then wetlands and the upper Partridge River may be little affected by pit dewatering but dewatering of the Peter-Mitchell pits causes a bedrock northward flowpath to develop at closure. If the second conceptual model is accepted then a bedrock groundwater mound develops, but wetlands and the upper Partridge River are severely impacted by PolyMet and Peter-Mitchell pit dewatering.	S	N
29965	Unique			AQ	Gary Glass		4282	45	Human, animal health risk from airborne mineral fibers and mineral dust. A continuous program of air monitoring for mineral fibers (especially during times of high dust exposures during blasting, crushing, and conveying powdered minerals) is warranted to protect workers and the general population (City of Hoyt Lakes and the Boys Scout Camp, within 4 miles) given the positive identification of cancer-causing mineral fibers in test samples (Sec. 4.6.5.1., pg. 4.6-60).) A program to continuously monitor the health risk from intermittent air exposure to mineral fibers is an absolute requirement given the positive identification in test samples and the un-sampled exposure conditions which will occur over the life-time of the mine, and ore processing, from non-homogeneous pockets of fibrous minerals which will be encountered in the ore body over the lifetime of the mine. These concerns and precautions need to be added to the final EIS.	S	O
6354	Form Letter	3	Variant	AQ	Harry Melander		483	5	The Final EIS also specifically considered the project's potential effects on air quality and water quality with respect to human health, and identified no adverse health risks.	NS	X
27862	Form Letter	1	Variant	AQ	Judy Linman		2209	1	There is NO WAY this will be any different. Minnesota has a unique gem in the BWCA and wild rice alone is going to be more and more of a treasured commodity. Even organic rice today has high levels of arsenic in it and people are becoming sensitive to that rice. I suggest ALL the time, for people to try river wild harvested rice instead. THIS IS A TREASURE we MUST PROTECT.	NS	X
425	Unique			AQ	Krishna Woerheide		199	2	The Polymet project will, by their own admission, have dire consequences for the watershed and the riparian ecosystem. Multiple studies have been done that show conclusively that biota in the downstream habitat cannot withstand the stresses of Acid Mine Drainage.	NS	X
29397	Unique			AQ	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3812	100	The CEAA defined by the Co-Leads for impacts to aquatic species is overly limited. It includes only the Partridge and Embarrass Rivers from their headwaters to a point approximately 15.5 miles downstream of the Project Proposed Action Activities, where the rivers form the St. Louis River. In this Area, the MPCA has assessed and identified waterbodies that are impaired for fish and/or benthic macroinvertebrate communities based upon recent monitoring data (since 2009). But the draft 2012 Section 303(d) list prepared by the MPCA includes more headwaters streams and rivers in the St. Louis River watershed that are also impaired for aquatic communities. It is likely that the state-led stressor identification process will identify historic and existing mining operations as major causal factors for these impairments. Therefore, the appropriate spatial scale for considering cumulative impacts to aquatic species is the Dunka River sub-watershed, the entire St. Louis River watershed and Lake Superior.	S	O
28483	Unique			AQ	Mary Slattery		2278	3	The loss of fish and wild rice have also not been addressed.	NS	X
27901	Unique			AQ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3317	31	The Band has consistently raised concerns and supported our opinion that the NorthMet Project will increase mercury concentrations in fish within the St. Louis River watershed, where we exercise water quality jurisdiction, and within the 1854 Ceded Territory where Band members can exercise treaty fishing rights.	S	O
27901	Unique			AQ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3339	57	The FEIS presentation of existing conditions for aquatic communities (fish and macroinvertebrates) is deficient and potentially misleading.128 The Co-lead agencies neglected to include and consider substantial readily available biological and water quality data from the MPCA, no less, which characterizes aquatic life use impairments in several streams and rivers within the NorthMet Project area, namely the Embarrass River, Wyman Creek, and Spring Mine Creek. The intensive watershed monitoring done in 2009-2010 within the St. Louis River Watershed also included substantial physical, chemical and biological data for many other stream and river stations within the Project area, and the Stressor ID Report for the waters in the St. Louis River watershed that were assessed as ‘impaired’ also includes a list of the stream and river stations that were used to develop summary statistics and establish ‘reference condition’ for this watershed. The Band’s comments on this matter in the 2009 DEIS pointed out the limitations of relying solely upon PolyMet-collected data to base predictions of Project impacts, and that criticism is still relevant. By only presenting their evaluation of biological community condition within the limited universe of data collected by the Project Proponent, the Co-lead agencies deliberately neglect to provide important context to the public about actual baseline or reference condition and existing impairments for fish and benthic macroinvertebrate communities that are largely the result of existing mining impacts. And, more importantly, these impairments have not yet been addressed through a TMDL or watershed restoration action.	S	O
27901	Unique			AQ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3342	58	Lake sturgeon have been successfully reproducing in the estuary for several years, and Fond du Lac Resource Management Division’s successful reintroduction and tracking efforts in the upper river have been documented.130 After the construction of hydroelectric facilities on the St. Louis River in the early 1900’s, the lake sturgeon population in the upper St. Louis River was isolated from the lower estuary and Lake Superior. The remaining sturgeon population was likely extirpated due to exploitation and pollution from the wood products industry and municipal waste. In addition, many of the upper tributaries were dammed during the extensive white pine logging era (1800’s) in order to float logs down during the high water spring runoff. Pollution and degraded water quality has been identified as a factor limiting sturgeon abundance in many locations. 132 The conclusion at FEIS 4-275 that “There are no known occurrences of lake sturgeon and not likely habitat for lake sturgeon within the NorthMet Project area” neglects to consider that downstream water quality effects may result from the Proposed Project. This water quality effect is specifically what the Band expected to see addressed in the FEIS, as it represents yet another potential degradation of our downstream water quality that is explicitly relevant to our stated resource management goals for name, or lake sturgeon. A dramatic recovery in lake sturgeon abundance in Rainy River and Lake of the Woods followed improvements in water quality in the Rainy River, which resulted from substantial reductions in the amount of wood fiber and untreated chemical wastes discharged by upstream pulp and paper mills. Evidence from hatchery rearing studies show that juvenile sturgeon can only tolerate salinity < 23 ppt.134 The Band is concerned about protecting the both the habitat and water quality necessary to support our reintroduction efforts. Uncontrolled contaminant loading from existing mine facilities, added to elevated contaminants from the Proposed Project, have the potential to affect the successful establishment of a sustainable lake sturgeon fishery throughout the St. Louis River. This potential impact should have been fully evaluated in the FEIS.	S	O

27085	Unique			AQ	Paula Maccabee	Water Legacy	3095	135	The FEIS has not rectified the deficiencies previously raised by WaterLegacy regarding impacts on aquatic life resulting from polluted seepage and discharge. As discussed in previous Sections I, II and III of these comments on the FEIS, deficiencies in sampling and modeling contaminant sources, unsubstantiated assumptions regarding collection of polluted seepage, assessment of water quality using misleading “evaluation criteria” and discharge evaluation locations, and failure to scientifically assess mercury releases and increased production and transport of methylmercury result in the inadequacy of the FEIS to assess impacts on aquatic life.	NS	X
27085	Unique			AQ	Paula Maccabee	Water Legacy	3096	136	The PolyMet NorthMet FEIS completely failed to assess a pollutant that is characteristic of mining and is of particular concern for benthic macroinvertebrates and fish, the combination of ions and salts that is tested as specific conductivity.	S	O
27085	Unique			AQ	Paula Maccabee	Water Legacy	3148	143	The FEIS notes that “portions of the Embarrass River, from the headwaters to Embarrass Lake, are listed on the 303(d) list as impaired for ‘Fishes Bioassessment’” (FEIS, 4- 285), but fails to disclose that the MPCA has identified mine discharge with elevated specific conductance as a stressor for this impairment.	S	N
27085	Unique			AQ	Paula Maccabee	Water Legacy	3149	144	conductance as a stressor for this impairment. The FEIS provides limited and inadequate baseline information on macroinvertebrate populations. No aquatic biota studies have been conducted in Longnose Creek, Wetlegs Creek, or Second Creek, and no fish or macroinvertebrate community or habitat characteristics were evaluated for these creeks although they all are first-order streams proximate to the NorthMet mine site. (FEIS, 4-260).	S	N
27085	Unique			AQ	Paula Maccabee	Water Legacy	3150	145	For the Partridge River, data is either provided for a single year or with a single sample; and no data is provided at the genera level, so no assessment can be made whether invertebrates sensitive to conductivity are present. (FEIS, 4-267, Table 4.2.6-6).	S	N
27085	Unique			AQ	Paula Maccabee	Water Legacy	3151	146	FEIS notes that aerial photography review and habitat descriptions suggest that the Partridge River reference site (PR-B1) and the Colvin Creek and South Branch Partridge River sites should have quality habitat for macroinvertebrate assemblages. (FEIS, 4-258).	NS	X
27085	Unique			AQ	Paula Maccabee	Water Legacy	3152	147	For the Embarrass River, sampling numbers are not provided; data is not provided at any consistent locations over time; and, again, no data is provided at the genera level, so prevalence of pollution-tolerant and intolerant invertebrates cannot be determined. (FEIS, 4-284, Table 4.2.6-14). The FEIS states that total taxa and distribution of macroinvertebrate families (Ephemeroptera - mayflies, Plecoptera -stoneflies, Trichoptera - caddisflies) were variable, although some desirable, non-degraded stream characteristics are likely to be present. (FEIS, 4- 275) Since there is no water chemistry data for the Embarrass River, none for tailings or mine site creeks, and little benthic invertebrate data in the FEIS, with no sampling for genera, no uniform protocols over time and no data in mine site tributaries, even if monitoring were proposed to evaluate effects of the PolyMet NorthMet project on conductivity, that monitoring would be meaningless. It would neither be possible to determine if project seepage had increased conductivity levels or if those levels had begun to extirpate sensitive macroinvertebrate genera and impair aquatic life. The FEIS is completely inadequate to assess or protect aquatic life from specific conductivity pollution.	S	O
27085	Unique			AQ	Paula Maccabee	Water Legacy	3171	164	In discussing the impact of the project on aquatic life, the FEIS provides one mention of spills: a reassurance that “spill prevention plans” would be implemented. (FEIS, 5-467). The FEIS states that an emergency overflow channel would be constructed to discharge untreated tailings pond water as a back up means of controlling pond levels in the event of “a probable maximum precipitation rainfall event or some fraction thereof.” (FEIS, 3-120). The FEIS does not specify what “fraction” of a maximum rainfall event would require emergency discharge or analyze the frequency of extreme weather events given climate change; the FEIS only discusses average increases in precipitation as a result of climate change. (FEIS, 5-223, 5-254, 5-506). Yet, the FEIS asserts that discharge from the emergency overflow “would not be expected.” (FEIS, 3-120, 5-120). The FEIS does not estimate any adverse impacts of spills or discharge of untreated wastewater from the tailings pond during heavy rains. As discussed previously, despite work plans explaining the uncertainty in performance of engineered systems, the FEIS assumes certainty or nearly perfect seepage collection and provides no assessment of impacts on water quality should routine operations fail to perform as “expected.”	S	N
26780	Unique			COE	Alaina Pilate		1464	16	We also request that the U.S. Environmental Protection Agency veto and the U.S. Army Corps of Engineers deny any Section 404 permit that would allow PolyMet polluted discharge and wetlands destruction.	NS	X
26971	Unique			COE	David Herold		1492	1	This issuance of a 404 permit to PolyMet Corporation should be denied as too damaging to the public intererst in clean water.	NS	X
26394	Unique			COE	David Heupel		1306	1	I object to the issuance of a 404 permit to PolyMet Corporation, because: ? PolyMet’s proposed mitigation is insufficient and inadequate for the scale of wetland destruction they propose. More than 2/3rds of the proposed mitigation occurs outside the affected watershed. The types of wetlands lost are not the types of wetlands to be restored. ? PolyMet does not propose specific mitigation for the potential loss of thousands of additional wetland acres due to partial or complete drainage. It is unacceptable to propose a permit for this mine without a complete understanding of wetland mitigation. ? PolyMet proposes the single largest permitted loss of wetlands in Minnesota history. The high quality wetlands in questions cannot be mitigated or replaced either in type or in the watershed. This permit should be denied as too damaging to the public interest in clean water.	S	O
29745	Unique			COE	Erin Mittag	Minnesota Center for Environmental Advocacy	4076	139	For example, DNR acknowledges the validity of the modeling and criticisms from GLIFWC regarding groundwater drawdown and flows in the area between the PolyMet pit and the Northshore mine. The information in the FEIS and supplied by GLIFWC demonstrates groundwater flow in and out of the north side of the PolyMet east pit. The FEIS also acknowledges that the Cat 1 stockpile will have an effect on water flows—even if the operation is as PolyMet intends, indirect effects are likely to occur.300 This is adequate information for the FEIS to provide that some indirect effects are in fact likely to occur and make an estimate of where and what they are. This is particularly important for mitigation as mitigation is required to occur BEFORE the effects do. The co-lead agencies should make every effort to identify potential effects now and protect against them with conservative mitigation measures and ratios, not wait for the damage to occur and then scramble for a solution.	S	O
24372	Form Letter	1	Variant	COE	gloriana casey		1035	6	This is a great idea!	NS	X
9309	Form Letter	4	Variant	COE	Jane Nicholson		626	4	no Clean Water Act Section 404 permit should be issued for the proposed mine because the mine would degrade groundwater and surface water, there is no plan to adequately compensate for the thousands of acres of direct and indirect impacts to high quality wetlands, and there has been no meaningful consideration of alternatives that would reduce harm to wetlands and water quality.	NS	X
24333	Unique			COE	Joanna Schor		1022	3	No Clean Water Act Section 404 permit should be issued for the proposed mine. The mine would degrade groundwater and surface water, there is no plan to compensate for the huge impacts to high quality wetlands.	NS	X
7689	Unique			COE	LK Woodruff		567	7	In addition, no Clean Water Act Section 404 permit should be issued for the proposed mine because the mine would degrade groundwater and surface water, there is no plan to adequately compensate for the thousands of acres of direct and indirect impacts to high quality wetlands, and there has been no meaningful consideration of alternatives that would reduce harm to wetlands and water quality.	NS	X
29740	Unique			COE	Lori Andresen	Save Our Sky Blue Waters et. al.	3891	2	Re: Comments on Modification of Permit 81-172-13... Please accept these comments regarding the Modification of Department of the Army Permit 81-172-13, submitted on behalf of the Center for Biological Diversity, Save Lake Superior Association, Save Our Sky Blue Waters, the Sierra Club North Star Chapter, and the National Wildlife Federation. The Center for Biological Diversity (“Center”) works through science, law and creative media to secure a future for all species, great or small, hovering on the brink of extinction. The Center has offices in a number of states, including Duluth, Minnesota, and has more than 474,000 members and online activists. The Center has hundreds of members who reside and recreate in northeastern Minnesota. Save Lake Superior Association (“SLSA”), begun in 1969, is the oldest citizen group working exclusively to preserve and protect Lake Superior. SLSA’s mission is to prevent further degradation of Lake Superior and to promote its rehabilitation. Save Our Sky Blue Waters is an all volunteer grassroots nonprofit organization dedicated to protecting Minnesota’s waters, forests, and wildlife. The Sierra Club is a non-profit environmental organization with several thousand members in Minnesota. The National Wildlife Federation (“NWF”) is the nation’s largest conservation education and advocacy organization with more than 4 million members and supporters. NWF’s mission is to protect wildlife for future generations. The October 23, 2012 public notice regarding the modification of Permit 81-172- 13 raises more questions than it answers. As set forth in the accompanying Freedom of Information Act request, we seek the following information related to this Permit: (1) any National Environmental Policy Act (“NEPA”) analysis (42 U.S.C. § 4332), prepared by the U.S. Army Corps of Engineers (“Corps”) prior to issuing Permit 81-172-13 to the Eveleth Taconite Company; (2) any assessment prepared by the Corps, prior to issuing Permit 81-172-13 to the Eveleth Taconite Company, regarding compliance with the Section 404 Guidelines, 40 C.F.R. § 230.10; and (3) any correspondence between the Corps and Eveleth Taconite Company, United Taconite LLC, the Environmental Protection Agency and/or the Minnesota Pollution Control Agency regarding the discharge of dredge and fill material, and/or pollution, into Hammer Lake.	NS	X

29740	Unique			COE	Lori Andresen	Save Our Sky Blue Waters et. al.	3922	37	Excerpted from the EPA letter dated February 18, 2010 to USACE Re: PolyMet NorthMet Project: Wetlands "EPA finds this project may have substantial and unacceptable adverse impacts on aquatic resources of national importance (ARNI). EPA believes the coniferous and open bogs, comprising a large percentage of the approximately 33,880 total wetland acres, within the Partridge River Watershed to be an ARNI due to the values they provide in terms of unique habitat, biodiversity, downstream water quality, and flood control specifically, to the Lake Superior Watershed and the Great Lakes Basin." The loss of wetlands for the proposed NorthMet mine would be the single largest permitted loss in the history of the state. If PolyMet is permitted, these wetlands will be replaced by an open pit mine and other impacts of mining, with mine waste drainage or water seepage containing toxic pollutants, in an area that now supports plant and wildlife species listed as endangered, threatened, or species of concern within the state. The PolyMet proposal fails to quantify or provide mitigation for indirect loss of up to 8,264 acres of wetlands, and provides wholly inadequate mitigation for direct destruction of 913 acres of wetlands within the Lake Superior Basin. The ACOE must consider the cumulative effects of this wetland loss, along with taconite mining expansions and other proposed sulfide mine projects on the horizon. he Army Corps of Engineers has the authority to deny this project based upon the total impacts to state and national waters. The ACOE has not only the authority, but also the responsibility to protect our waters. We therefore ask that you refuse to allow PolyMet to destroy the high quality functioning wetlands and natural resources that are currently in place.	S	O
29397	Unique			COE	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3756	50	The Project CWA Section 404 wetlands permit with corresponding CWA Section 401 certification were put on Public Notice at the same time the as FEIS. This is problematic from a number of perspectives. As stated previously, the mitigation measures that have been identified in the FEIS, and very few alternatives, were not analyzed or evaluated using the required NEPA "hard look" so that the LEDPA could be established. Due to the lack of alternatives, the agency preferred alternative appears to be PolyMet's preferred alternative. Combined, this makes it exceptionally difficult, and meaningless to provide any input on the 404 permit or the corresponding 401 certification.	S	O
29397	Unique			COE	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3826	116	Based on all of the information contained herein, the FEIS should not be considered adequate. The lack of enforcement to require existing taconite mines to follow Minnesota's environmental laws demonstrated by both the EPA's MOA with MN, and the recent dedelegation petition submitted by Water Legacy to the EPA, must be weighed in the USACE Public Interest Determination. Therefore, we respectfully request that the USACE deny the Section 404 permit and the MPCA deny Section 401 certification of the wetlands permit. We further request that the EPA veto the Section 404 permit requested by PolyMet if the USACE does not deny the permit.	S	N
29912	Form Letter	1	Variant	COE	Michael Rota		2725	1	In addition, I oppose any federal Clean Water Act permit for PolyMet discharge and wetlands destruction.	NS	X
27901	Unique			COE	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3388	106	Including carbon storage in the §404 permit avoidance and minimization sequencing through the 'least damaging practical alternative' evaluation would be a logical step towards reducing the regional carbon footprint. Carbon sequestration services provided by forested wetlands and peat bogs must be considered in the avoidance equation alongside mitigation.	S	O
27901	Unique			COE	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3413	145	The wetlands that would be directly lost by this Project are important, scarce and sensitive. Portions of them are irreplaceable. It is undisputed that they are Sites of High Biodiversity Significance, on which there are imperiled and vulnerable plant communities which "have high ecological value, are rare in a given area, and/or could face danger of extirpation." In these circumstances, all measures should be taken to avoid their loss. The application for the 404 permit should be denied for this reason alone.	NS	X
27901	Unique			COE	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3428	140	The purpose of the Clean Water Act is to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters." 33 U.S.C. § 1251(a). The Clean Water Act generally prohibits the discharge of dredged or fill materials into waters of the United States unless authorized by a permit. Id. § 1311(a). While the Secretary of the Army is authorized to issue permits for the discharge of dredged or fill material into waters of the United States, section 404 of the Clean Water Act and the guidelines implementing it prohibit the issuance of such permits unless a number of critical criteria are satisfied. Id. § 1344; 40 C.F.R. Part 230; 33 CFR Part 320. The application here does not satisfy those requirements and must be denied.	NS	X
27901	Unique			COE	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3436	154	Fifth, the regulations governing the public interest analysis clearly "discourage as contrary to the public interest" the "unnecessary alteration or destruction of" wetlands as they "constitute a productive and valuable public resource." 33 CFR 320.4(b)(1). Given the high quality and large area of wetlands that would be directly lost if the Project were developed, this element of the public interest analysis weighs against the issuance of a permit.	S	O
10477	Unique			COE	Robert Gelles		705	1	I am emailing to request the 404 permit application for the proposed modification in public notice MVP-1999-05528-JKA for public interest review. Please let me know if you need any more information from me. Thank you!	NS	X
26479	Unique			CR	Audrey Kramer		1332	6	This in turn would cause law suits as the Fond du Lac, Grand Portage, and Bois Forte Bands of the Lake Superior Chippewa nation's rights would be trampled.	NS	X
27135	Unique			CR	Bill Latady	Bois Forte Band of Ojibwe	3239	1	Phase I cultural resource investigations for the proposed PolyMet NorthMet action should have included Band members. The co-leads have yet to acknowledge the special expertise of Indian tribes in assessing the National Register eligibility of historic properties that may possess religious and cultural significance to them. A relevant instance of this occurred when Rose Berens and Vicky Raske, at the time THPO's for Bois Forte and Grand Portage Bands respectively, accompanied Brad Johnson, USACE archaeologist, on a field review of "Trygg Trail" locations in 2010. During the field review Ms. Berens and Ms. Raske noted oak trees and east-facing overlooks on the Mesabe Widjiu, areas of cultural significance, which non-native archaeologists would have probably missed. Were Band members included in the cultural resource inventories from the outset, there may well have been numerous other places of historic importance identified.	S	O
27135	Unique			CR	Bill Latady	Bois Forte Band of Ojibwe	3240	2	A further example is continuing to describe the Beaver Bay to Lake Vermilion Trail as a "segment." This is troubling especially as the Bands have consistently objected to this characterization. To make matters even more confusing, when the term "segment" is used in trail descriptions the term is applied inconsistently. In various parts of the text the BBLV Trail is referred to as the "Partridge River Segment of the BBLV Trail," the "75 mile BBLV Trail Segment" and the "BBLV Trail Segment." Clearly the entire trail is not within the Cultural Resources APE, but as presented, it appears the Co-leads wish to emphasize the trail is a segment in an attempt to detract from its significance and deride Band concerns. In fact, the logic behind defining the BBLV Trail as segments rather than as a whole is questionable. What reason(s) did the co-leads employ to determine that the trail within the APE is a "segment" and then define the trail three different ways within the FEIS? If it makes sense to identify the trail as segments for the purposes of analysis or based on resource categories, i.e. differences in terrain or established logical end points, shouldn't the agencies validate that assessment by detailing their decision making process within the FEIS? By dividing the trail into segments the co-leads are separating a cultural resource into multiple unrelated features each of which individually may not be significant, but collectively meets criteria as a historic property. One intent of the environmental management process within NEPA is comprehensive so that long term and cumulative effects of small and unrelated decisions can be recognized, evaluated and either avoided, mitigated, or accepted as the price for the major federal action under consideration.	S	O
27135	Unique			CR	Bill Latady	Bois Forte Band of Ojibwe	3241	3	To date, the BBLVT has not been fully researched or field verified within the project area. Statements in the FEIS that sufficient work has been done to determine National Register eligibility are disingenuous as field investigations to date have occurred in the summer months when undergrowth in places is all but impenetrable and visibility for more than a few feet is very low. Additional reconnaissance is necessary in the spring or fall when vegetation does not obscure ephemeral features such as foot trails. Tribal presence is imperative during these investigations to point out culturally significant places that might otherwise be overlooked.	S	O
27135	Unique			CR	Bill Latady	Bois Forte Band of Ojibwe	3242	4	Tribal cooperating agencies consider a 216,300 acre area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources. Included within the proposed historic district are the headwaters of the St. Louis River, the site of ongoing mineral exploration. The co-lead agencies declined to consider this cultural district as an analysis area in the NEPA process.	S	O
27184	Unique			CR	Carl Sack		1678	10	Removal of 6,000 acres of biologically diverse habitat unduly impacts the hunting, fishing, and gathering rights of the Ojibwe bands under the 1854 Treaty, regardless of whether the land in question has easy public access routes. Such a large area of habitat destruction will have impacts on species that regularly move beyond the bounds of the mine area such as bear, moose, elk, and wolves. The runoff from the mine may impact the prevalence of aquatic plants and animals, including game fish and wild rice, and may increase mercury contamination in fish tissues that has a direct impact on the health and well-being of Ojibwe people and other local residents.	NS	X
27689	Unique			CR	Lea Foushee	North American Water Office	3274	4	The 1854 Treaty lands identified in harms way include the Spring Mine Lake Sugar bush, Beaver Bay to Lake Vermillion Trail, and sacred site, Misabe Widjiu.	NS	X
26935	Form Letter	1	Variant	CR	Lois Dalsin		1483	2	In a particular way, American Indian peoples who rely on wild rice, clean water and air, thriving land, for subsistence, are affected by negative consequences of sulfide mining. The well-being of their culture and spirituality is at stake.	NS	X

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3790	83	Moreover, the proposed Project is located entirely within the boundaries of the 1854 Ceded Territory. Yet despite specific and repeated requests from tribal cooperating agencies, the Co-Leads did not elect to utilize a tool developed in 2011 by the EPA in cooperation with tribes, Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands, in order to discern potential cumulative effects to resources important to the tribes who retain usufructuary rights within the 1854 Ceded Territory. And the Co-Leads rejected the Tribal Cooperating Agencies’ repeated requests to evaluate the 1854 Ceded Territory (discussed further below) as the CEAA. To the contrary, the FEIS states that: At various times during consultation for the NorthMet Project Proposed Action, the Bands have proposed using an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the CEAA. The Co-lead Agencies believe that the use of the 1854 Ceded Territory as the CEAA for cultural resources would actually diminish the significance of any cumulative effect. This conclusion flies in the face of the data. In September 2013, the Tribal Cooperating Agencies collaborated to produce a 60-page Cumulative Effects Analysis, which appears at Attachment 3 to Appendix C to the SDEIS, along with other tribal comments. Both the SDEIS and FEIS failed to take into account most of the issues cited therein. So, in addition to reasserting and incorporating again all those comments, the Band hired the University of Minnesota Duluth (“UMD”) and the Natural Resources Research Institute (“NRRI”) to analyze 1854 Ceded Territory cumulative impacts to wetlands, historic trails connectivity, public access to exercise usufructuary rights, and wildlife passage. In all four areas of analysis, the cumulative effects to the 1854 Ceded Territory resulting from mining on the Iron Range are most distinctive and welldefined. The historic trails connectivity analysis demonstrates that although there have been impacts over time most of the trail corridors are still largely intact and connected to each other throughout the 1854 Ceded Territory. The trail analysis also identified areas that are the most critical to maintain network-wide connections.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3800	92	The Co-Leads concede that the land exchange will cause irretrievable losses of resources for the Bands—but require no real mitigation or fuller analysis: “The federal lands may contain natural resources culturally important to tribal entities, including access to the land itself, which would be irreversibly lost following the Land Exchange Proposed Action and conversion of the land from public to private ownership.”251 Further, the FEIS provides that the land exchange proposal could have direct and indirect effects on tribal cultural resources by creating noise, impeding access to areas that are traditionally or culturally important to the Bands and affecting species of importance to the Bands.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3801	93	But the desire to resolve “conflict” between the USFS and Project proponent should not overshadow federal fiduciary responsibility to the Bands. The proponent wishes to develop an open pit mine but cannot due to deed restrictions on the federal estate because the surface estate was purchased by the USFS under the authority of the Weeks Act. More roads and hiking trails may provide more access to the public, but do nothing to promote habitat diversity and long-term ecosystem sustainability that are requirements for the preservation of tribal usufructuary rights. Further, habitat diversity that promotes long-term ecosystem sustainability represents a critical component of climate change adaptation to preserve and sustain tribal usufructuary rights. Although the land exchange proposed action may increase acreage in the federal estate, the loss of critical wildlife corridors, along with high quality and diverse land and water resources, directly connects the federal regulatory agencies’ trust responsibility to the Bands. The land exchange, and the Project, cannot proceed where they require the agencies to approve permits that will have impacts to treaty resources without additional evaluation and mitigation.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3802	94	As noted, there has been no analysis of the 1854 Ceded Territory as a discrete area of impact in spite of Band requests beginning with our involvement in Project review. Tribal Cooperating Agencies believe the Cumulative Effects Analysis for land use should encompass the 1854 Ceded Territory. The signatory Bands have already lost access to substantial portions of it and the resources within. The 1854 Ceded Territory encompasses 6,283,836 acres in Northeastern Minnesota. Of that, 4,095,146 acres are public lands. The remaining 2,188,578 acres are private to private industrial land. Band members generally do not exercise usufructuary rights on private lands without landowner permission, although the treaty does not hold that restriction. Lands within the 1854 Ceded Territory that have experienced urban and/or industrial development are permanently “lost” as a source of treaty resources. Cumulative impacts on the 1854 Ceded Territory should have been evaluated.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3803	95	During the EIS scoping process for the Project, the Co-Leads failed to ever identify any cumulative impact issues associated with cultural resources, and Tribal Cooperating Agencies were not invited to participate in scoping. The Band’s and other Tribal Cooperating Agencies’ comments on the June 2008 PDEIS, the 2009 CPDEIS, the 2009 DEIS, and the 2013 SDEIS detailed the nature of these substantial cumulative impacts and the need for further analysis. Instead, as discussed, Grand Portage on its own was forced to hire UMD and NRRI in 2014 to do this critical work. Even as the USACE insisted that the only trust obligation to the Bands was “access,”they refused to evaluate this cumulative effect of mining in the 1854 Ceded Territory. And as stated previously, the Co-leads believe that the use of the 1854 Ceded Territory as the CEAA for cultural resources would diminish the significance of any cumulative effect.” This approach is entirely incorrect. In 2014, as noted, the Band entered into an agreement with the UMD and the NRRI to provide a Cumulative Effects Analysis of the 1854 Ceded Territory for wetlands, historic trails, public access and wildlife passage. When the analyses were completed, the Co-Leads were invited to a presentation of the results held on November 9, 2015, at NRRI. The results of the study demonstrated that using the entire 1854 Ceded Territory as the CEAA did not diminish the significance of any cumulative effect. In fact, for each discrete area of analysis, the results demonstrated that by far the most pervasive cumulative impacts have resulted from iron mining. Cumulative wetlands impacts and public access to exercise usufructuary rights have been severely impacted by the Iron Range. Despite this detailed analysis, the Co-Leads refused to honor the Band’s requests and ignored this research, the results of which the Band outlines below, and failed to require appropriate mitigation.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3804	96	Unfortunately, the Co-Leads dismissed the Tribal Historic District, calling it “arbitrary” without rigorous exploration or objective evaluation. Furthermore, in a discussion of sacred sites, the agencies were concerned about a lack of documented use by Band members, even after Band members explained that ceremonial sites were rarely “documented,” despite the Bands preserving knowledge of their locations, in part because traditional ceremonies were outlawed in the United States for almost a century. Further, only the Bands can determine a property of cultural and spiritual significance—as federal guidance confirms. Since then, the Bands have been forced to request assistance from the Advisory Council on Historic Properties (“ACHP”) involvement in the review. Regardless, the Co-Leads’ obligations are clear under federal regulations and guidance, and the current analysis is insufficient.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3817	107	Despite almost 10 years of environmental review, the Cultural Resources chapter of the FEIS is still incomplete, and the requirements of the National Historic Preservation Act (“NHPA”) have not yet been fulfilled. The Project cannot proceed until they are.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3818	108	The Project Area of Potential Effect (“APE”) for cultural resources is based on the Project effects analysis including the flawed hydrologic characterization, incorrectly calibrated groundwater model, and analog wetland data. Therefore, the APE designated by the Co-Leads does not encompass its true extent. Instead, it represents the USACE permit area(s) within the true APE. This is also despite the fact that the Advisory Council on Historic Preservation (“ACHP”) previously advised the USACE that this is not an appropriate way to determine the APE.291 The ACHP stated that “the Corps should be mindful of its responsibility to consider the reasonably foreseeable effects, including long term and cumulative effects the expansion activities could have on historic properties.”292 It went on to reiterate that Section 106 defines undertaking as a “project, activity or program funded in whole or part under the direct or indirect jurisdiction of a Federal Agency, including . . . requiring a Federal permit, license or approval.”293 The ACHP explicitly stated: The undertaking is not the federal issuance of a permit; it is the larger project that includes components that are the specific subject of the permit. The federal agency must consider the effects of the overall project (undertaking) including the permitted components. Once the undertaking has been properly defined, only then can the APE be properly delineated.294 Tribal analysis of Project impacts suggests that the APE should include the Embarrass, Dunka, and Partridge River watersheds, and the St. Louis River from the confluence of the Embarrass River to its mouth in Lake Superior.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3820	109	To date, the BBLVT has not been fully researched or rigorously field-verified within the Project area. Although the Bands have repeatedly requested that the Co-Leads refer to the BBLVT as a corridor, the term “segment” is still used, as if this trail was not a vast overland system connecting the sugarbush, overlook, and the Mesabe Widjiu, or that it was used extensively until Ojibwe people were forced onto reservations. Although the Superior National Forest Heritage Program reviewed the Government Land Office plats and conducted field investigations on Superior National Forest land, and the USACE in conjunction with Band staff conducted some field investigations to identify pieces of the BBLVT corridor, more investigation is required. This additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.	S	O
29397	Unique			CR	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3821	110	A draft Memorandum of Agreement (“MOA”) to address mitigation for adverse impacts to the Sugar Bush, BBLVT, and Mesabi Widjiu was just provided to the Bands in November 2015. But no avoidance measures for the Sugar Bush, BBLVT, or the Mesabi Widjiu have ever been contemplated for the Project in spite of repeated requests by the Bands (and being required by law). Further, the mitigation measures identified in the draft MOA were astonishingly inadequate and did not incorporate a single suggestion that the Bands have provided since shortly after the DEIS was drafted. Again, all three properties would benefit from additional investigation. The sugarbush has not been formally recorded. The trail has not been adequately documented within the SNF proposed land exchange, requiring additional survey in the upland areas of the Project area. Mesabi Widjiu must be considered in its entirety. As part of the UMD/NRRI 1854 Cumulative Effects Analysis connectivity of all of the mapped historic “Indian” trails were evaluated. The results demonstrate a high level of connectivity leading to the Bands to determine that the trails still possess a high degree of integrity.	S	N
26628	Unique			CR	Mary Adams		1384	5	Sulfates are harmful to plant species and native wild rice, economically important to the Ojibwe people of northern Minnesota. Water running from the mine site would be hundreds of times the safe level for wild rice. 1854 Ceded Territory Treaty needs to be honored.	NS	X
27468	Unique			CR	Michael D. McNally		1754	1	As regards Chapter 8, the principal concern I saw in the SDEIS remain concerns in the FEIS, a myopic approach to the concerns of the Grand Portage, Bois Forte, and Fond Du Lac Bands of Ojibwe, the GLIFWC, and the 1854 Treaty Authority about the underestimated potential effects of the contemplated Northmet mine and Land exchange on cultural resources and the natural resources in the 1854 ceded lands to which the bands retain usufruct rights.	NS	X
27468	Unique			CR	Michael D. McNally		1755	2	My concern is that the federal agencies are obligated by Executive Order and by the federal trust relationship, and advised by their own agency best practices, to pay particular attention to concerns of federally recognized tribes, and are obligated under the terms of the 1854 Treaty of LaPointe in particular. Although clearly the Tribes, the GLIFWC, and the 1854 Treaty Authority have been engaged in the process, that engagement appears still to be a strategy of containment on the part of the federal agencies, a containment strategy that is, it seems to me, perfunctorily organized under the rubric of Major Differences of Opinion in the FEIS:	NS	X

27468	Unique			CR	Michael D. McNally		1756	3	At least this containment strategy has been taken from the bowels of the appendices, as it was in the SDEIS, and the subject of its own chapter in the FEIS, but to the reasonable reader in the public, it might as well be an appendix for the way the specific concerns of the tribes and tribal agencies were corralled into a cluster of Major Differences of Opinion, the cumulative effect of which it seems to me is “we heard you and because you oppose the project and have retained scientists that pose questions of the assumptions on which our scientific modeling are built, we’re not changing anything in the FEIS.”	NS	X
27468	Unique			CR	Michael D. McNally		1760	4	This is not a minor concern. The 1854 Treaty of LaPointe recognizes retained usufruct rights to the Minnesota tribes in ceded territories, and thus a cluster of rights to areas affected by the Northmet Project and the Land transfer that are sufficiently distinct that their concerns should receive evident careful consideration, and this consideration cannot content itself with proclaiming a major difference of opinion without providing the tribes, and the public, the reasons for rejecting the challenges to the assumptions on which the area of potential effect is established or the scientific analysis of the potential effects are based.	NS	X
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3298	64	Page 5-559 of the FEIS states that “mitigation measures would be taken to avoid or minimize effects on historic properties, to the extent practicable” but the impacts of dust on these important properties were not specifically mentioned.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3308	51	The FEIS does not adequately discuss impacts to traditional uses such as hunting and trapping, nor does it adequately discuss impacts to traditional game and furbearer populations. This is a major discrepancy in these documents as healthy wildlife populations, particularly game and furbearer species, and access to them is critical for the exercise of treaty rights for tribal members.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3367	88	While the FEIS correctly recognizes that the Band holds treaty-reserved rights to hunt, fish and gather in the area where the proposed mine would be located,168 the FEIS does not give proper consideration to the adverse impacts that the proposed mine would have on those federally-protected rights or the government’s trust responsibility with regard to those rights.169	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3368	89	Although the Final EIS recognizes and discusses the Band’s treaty rights and the federal government’s trust responsibilities, the FEIS does not give proper effect to either the protection of the treaty right or the exercise of the trust responsibility.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3370	90	But the FEIS analyzed the impact of the Project on the Bands’ treaty rights under an improper test which it then applied in a manner that is contrary to the record. The FEIS states that because of the limited accessibility to the Project area, “there is likely limited present day or recent past subsistence gathering in the NorthMet Project area” and concludes that the proposed Project is therefore “unlikely to further diminish the exercise of 1854 treaty rights in the area.” FEIS 5-569; see also FEIS at 5-572 (imposing this standard). The law says otherwise. Under well-settled law, denial of access to an area where treaty rights are reserved does not “diminish” the treaty-reserved rights. See Winans, 198 U.S. at 381 (rejecting claims by a landowner who obtained a license to use a ‘fish wheel’ – a device capable of catching salmon by the ton and totally destroying a run of fish – of a right to exclude the Indians from their treaty-reserved “usual and accustomed” fishing areas); see also Washington State Commercial Passenger Fishing Vessel Ass’n, 443 U.S. at 684-85 (“property law concepts, devices such as the fish wheel, license fees, or general regulations” cannot be used to deprive the Indians of a fair share of the fish). Further, under the law, it is enough that the rights are reserved in the treaty to be entitled to protection. The notion, expressed in the FEIS, that the tribes somehow were required to prove “present day or recent past”178 hunting, fishing or gathering activities on specific portions of the Project site in order to ensure that the natural resources on which the right depends are protected, is entirely without basis in the law.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3371	91	But even if the formulation set out in the FEIS were the test, (although it isn’t), the statement made is contrary to the record. As set out in detail in the comments provided by the Bois Forte Band, the oral testimony provided by Band members described the use of this area for gathering and hunting. Latady & Isham 2011. There is no dispute that the Spring Mine Lake Sugarbush lies within the area of potential effect of the proposed mine, and encompasses 80 acres of maple and basswood trees which may be up to 200 years old and have well documented evidence of Chippewa use for maple sugar making over an extensive period of time, including photographic evidence of Chippewa use in the 1940s. See FEIS 4- 438. It is not only eligible for inclusion in the National Register of Historic Places, but is recognized as “being integral to traditional cultural practices and beliefs.” Id. The Sugarbush is further located near to the Beaver Bay to Lake Vermilion Trail which passes through the Project area. This Trail is a major Chippewa trail (one of many) within a system of water and overland routes that crisscrossed northeastern Minnesota and extended to the border lakes long before the fur trade and continued to be used through the early 20th century. The FEIS recognizes that this trail is eligible for inclusion in the National Register of Historic Places, FEIS at 5-560, and “is significant for the role it played in the broad patterns of Ojibwe land use . . .” but “would be directly affected by the NorthMet Project Proposed Action, which would result in its permanent removal.” FEIS at 5-565. Surely, as the Chippewa travelled on this trail and gathered sap at the Sugarbush, they engaged in other hunting, fishing and gathering activities in the areas that would have been essential to their survival. Latady & Isham confirm that this was the case.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3372	92	The FEIS also incorrectly assumes that the loss of these critical areas will have no effect on natural resources outside the Project area itself. The land within the Project area serves as a vital habitat for a wide variety of resources. The land is an important wildlife corridor in a region that has otherwise been the subject of extensive iron ore mining. The history of mining in the region and the adverse environmental impacts from those mines have steadily reduced the Chippewas’ access to critical resources from the natural environment which only serves to make these remaining areas – as well as the resources they contain – all the more valuable. Indeed, careful consideration of the impacts of a proposed project on habitat and wildlife corridors is required even where the proposed project would not adversely affect treaty-protected rights.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3377	120	Recently, the Grand Portage Band contracted with the University of Minnesota Duluth Natural Resources Research Institute to analyze 1854 Ceded Territory cumulative impacts to wetlands, historic trails connectivity, public access to enable the exercise of usufructuary rights, and wildlife passage. In all four areas of analysis, the cumulative effects to the 1854 Ceded Territory resulting from mining on the Iron Range are distinctive and well-defined. But again, the Co-lead agencies declined to include this relevant technical analysis in the FEIS.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3389	107	the FEIS completely neglects to reference Executive Order 12898 (requiring agencies try to avoid disproportionate and adverse environmental impacts on low-income and minority populations, including impacts on culturally important religious, subsistence or social practice); Executive Order 13007 (requiring agencies try not to damage “Indian sacred sites” on federal land and avoid blocking access to such sites by traditional religious practitioners); the Archeological Data Preservation Act and the Archeological and Historic Preservation Act (requiring agencies to report any perceived impacts that their Projects and program may have on archeological, historic and scientific data, and requires them to recover such data or assist the Secretary of the Interior in recovering them).	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3390	108	Although clear adverse impacts to Traditional Cultural Properties have been identified through the \$106 consultation process with the tribal cooperating agencies, the Co-lead agencies, the State Historic Preservation Offices (SHPO), and PolyMet, improperly discounted all of the information that was provided, and instead demand that the Bands satisfy an unwarranted level of proof before according these resources the protection required by law.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3391	109	they fail to take into account the history of actions by federal and state officials during the early to middle twentieth century to disrupt and prevent the Chippewa from engaging in traditional cultural practices. They also fail to take into account the general reluctance to share sensitive cultural information with non-Band members in light of this history, not to mention the cultural restrictions on who (inside and outside the Band) can legitimately and safely be trusted with sensitive information.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3392	110	The FEIS’s Figure 4.2.9-5, Cultural Resources Analysis Surficial Groundwater Quality Area of Potential Effect is incorrect; the flawed MODFLOW hydrologic characterization is carried forward to an inaccurate determination of the Area of Potential Effect (APE).	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3394	112	Mesabe Widjiu is correctly identified as a sacred landform, but needs to be considered in its entirety, as the Band stated in its comments on the SDEIS. The segment encountered within the Project area is small, but integral to the property. Adverse affects to any portion impact the entire feature.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3395	113	The Beaver Bay to Lake Vermilion Trail, as a traditional cultural property, requires further clarification. The trail is one of many within a system of water and overland routes that crisscrossed northeastern Minnesota and extended to the border lakes long before the fur trade and continued to be used through the early 20th century. To date, the BBLVT has not been fully researched or field verified within the Project area. The trail needs to be better documented. There has been no rigorous attempt to research the BBLVT by the Bands or Lead Agencies, although the Superior National Forest Heritage Program reviewed the GLO plats and conducted field investigations on Superior National Forest land. Additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3396	114	The Bands remain skeptical of the Co-leads claim that there will be no effect to the Spring Lake Mine Sugarbush from the proposed NorthMet Project. Indirect effects through dust deposition and unauthorized collection are anticipated since the Sugarbush is situated immediately adjacent to the proposed plant site.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3397	115	The proximity of the plant site to the Sugarbush and the cumulative effects of dust on leaves, trees and understory flora have not been examined in detail and their long term effects may well be detrimental to vegetation, other than maples, that comprise the Sugarbush.”206	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3398	116	Tribal cooperating agencies believe the CEA for land use should encompass the 1854 Ceded Territory, as the signatory Bands have lost access to substantial portions of the 1854 CT and the resources within. The tribal cooperating agencies believe the water quality and hydrologic cumulative effects analysis should incorporate the entire St. Louis River watershed. This watershed has experienced substantial historic, current and proposed expanded mining activities, as well as other industrial, agricultural and urban development. In addition to the direct surface water and wetland impacts (loss and/or degradation) from these activities, nearly half of the watershed has experienced hydrologic alteration from extensive ditching. Tribal cooperating agencies consider a 216,300 acre area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3400	118	Neither history nor geography is used in the FEIS to determine the areas in which cumulative impacts are to be considered. Instead, the FEIS instead uses an arbitrary and narrow construct. Such an approach, which is unmoored from the topography and hydrology of the area where the Project would be located, and which does to give full consideration to past, current and foreseeable future mining activity, are contrary to NEPA.	S	O

27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3437	155	Sixth, the Fond du Lac Band, along with the Grand Portage and Bois Forte Bands, hold treaty-protected rights to hunt, fish and gather in the territory, and important cultural and historic resources that would be adversely affected by the proposed mine. In addition, the reservation established for the Fond du Lac Band by that treaty –the Band’s permanent home and a small fraction of the its aboriginal territory – lies downstream from the Project. The federal government, by the promises made in the treaty, has a trust responsibility to protect those important treaty rights and the resources on which they depend from the harms that would result if the mine were developed.	S	O
27901	Unique			CR	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3440	158	The Land Exchange Proposed Action also does not meet the federal government’s trust responsibility to protect the Band’s treaty rights and the resources on which those rights depend in the 1854 Ceded Territory. It results in a permanent loss of 382 acres, does not protect fish and wildlife habitat within the Mine Site, does not protect important cultural resources such as wild rice beds, historic trails, and a substantial portion of the Mesabi Widjiu, does not protect the Embarrass, Partridge or St. Louis River watersheds, does not consolidate mineral interests in the private parcels that would be conveyed to the federal estate, does not promote multiple-use values, or fulfill public needs.	NS	X
27085	Unique			CR	Paula Maccabee	Water Legacy	3231	218	The FEIS described and then minimized impacts to specific rare and endangered plants and animal species. (FEIS, Ch. 5.2.4, 5.25). The FEIS acknowledged that tribes have usufructuary rights to hunt, fish and gather, but offset any losses on the federal lands as offset by gains in subsistence resources on the more accessible lands proposed for exchange. (FEIS, 5- 779). Tribal Cooperating Agencies requested a more robust and less mechanistic cumulative assessment of mining impacts on their Ceded territories: The Fond du Lac, Bois Forte, and Grand Portage Bands, as well as the 1854 Treaty Authority (1854) and the Great Lakes Indian Fish & Wildlife Commission (GLIFWC), have consistently advocated for a more robust, comprehensive CEA for the PolyMet NorthMet project and other mining projects. We have observed that current, historic, and ‘reasonably foreseeable’ mining activities have profoundly and, in many cases permanently, degraded vast areas of forests, wetlands, air and water resources, wildlife habitat, cultural sites and other critical treaty-protected resources within the 1854 Ceded Territory. As we have engaged with the lead federal and state agencies for the environmental review process under NEPA and the tribal consultation process under §106 of the National Historic Preservation Act (NHPA), we have clearly expressed our concerns for the incompleteness and inadequacy of their CEA. (Tribal CEA, p. 3, FEIS autop. 3028) This request was denied. The FEIS neither recognized the cumulative impacts of mining nor the scale of tribal rights and interests. In every opportunity presented for analysis, the FEIS provided the narrowest possible approach.	S	O
27085	Unique			CR	Paula Maccabee	Water Legacy	3232	219	This deficiency is illustrated in the FEIS’ of cumulative impacts of mercury and methylmercury on fish consumption by Bands of the Lake Superior Chippewa. The FEIS recognizes that members of the Fond du Lac and Grand Portage Bands “are known to consume substantially more fish than the assumed statewide average” so that “potential increases in mercury bioaccumulation in fish tissue could therefore constitute an EJ impact for Band members and other subsistence consumers of fish.” (FEIS, 5-591 to 5-592). However, as explained earlier in this Section and in Section I, supra, the FEIS only evaluated air deposition impacts on fish mercury in selected lakes, rather than the substantial impacts of all NorthMet project impacts on mercury methylation and bioaccumulation.	S	O
27085	Unique			CR	Paula Maccabee	Water Legacy	3234	221	Even in its discussion of Fond du Lac enacted and approved water quality standards, the FEIS impermissibly limited consideration of cumulative impacts. The FEIS acknowledged that the Reservation’s reach of the St. Louis River is attaining all of its beneficial uses and meeting all applicable water quality standards with the exception of mercury and that in-stream mercury concentrations in this reach exceed the Band’s human health chronic standard of 0.77 ng/L, so “the Fond du Lac Band is especially concerned about any new or expanded discharges to the St. Louis River upstream of the Reservation that may adversely affect mercury bioaccumulation in fish in the St. Louis River.” (FEIS, 5-20 to 5-21).	NS	X
27085	Unique			CR	Paula Maccabee	Water Legacy	3236	223	The U.S. Army Corps recognized in its report on Treaty Rights and Subsistence Fishing in the Great Lakes Basin, “subsistence harvesting is a core value for these bands, and the right to fish and hunt for subsistence is cherished by all, even those who are not presently engaged in the practice. It is part of the tribes’ cultural identity and an indication of their status as sovereign entities.”57 The Treaty Rights and Subsistence Fishing report also recognized the need for an integrated view of damage to tribal resources, Tribal traditions generally include a holistic view of the natural world in which natural features and phenomena are often imbued with a life force and in which the various species and features of the natural world are bound together in a web. Damaging one part damages the whole. (Id., p. 2)	NS	X
6435	Unique			CR	Peter Bormuth		496	1	The Religious Freedom Restoration Act of 1993 prohibits the government from substantially burdening a person's exercise of religion, even if the burden results from a rule of general applicability, unless the government 'demonstrates that application of the burden to the person - (1) is in furtherance of a compelling governmental interest; and - (2) is the least restrictive means of furthering that compelling governmental interest" 42 U.S.C. Sec. 2000bb-1(a)(b). The Act defines "government" to include any department or agency of the United States (Sec 2000bb-2(1). The United States Forest Service and the Army Corps of Engineers are Departments or Agencies. The least restrictive means standard is exceptionally demanding (see City of Boerne, 521 U.S. at 532) and cannot be met by the proposal for the NorthMet mine. Mesabe Widjiu[1][1] is an acknowledged "cultural resource" and is an irretrievable resources under 42 U.S.C. 4332 Sec. 102 (2)(C)(v). As amended by the Religious Land Use Act of 2000 (RLUIPA), the Religious Freedom Restoration Act covers "any exercise of religion, whether or not compelled by, or central to, a system of religious belief.' Sec 2000cc-5(7)(A). A Court's "narrow function...is to determine" whether the asserted religious belief reflects "an honest conviction" (See Thomas v. Review Board of Indiana Employment Security Div. 450 U.S. 707 at 716). The NorthMet mine site is ceded land under the 1854 Treaty Authority. Under NEPA the human environment includes the natural and the physical, and the relationships of people to that environment. The NorthMet Project Proposed Action is considered an undertaking as defined in 36 CFR 800, the regulation implementing Section 106 of the NHPA. The area in which effects on resources are evaluated is the Area of Potential Effect (APE). The APE is defined as, “... the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist. The area of potential effects is influenced by the scale and nature of the undertaking and may be different for different kinds of effects caused by the undertaking” (36 CFR § 800.16(d)). Mesabe Widjiu is within the APE of the NorthMet mine. Mesabe Widjiu is a Traditional Cultural Property (TCPs). Beliefs or practices associated with a TCP are of central importance in defining its significance. Mesabe Widjiu is the path of the Thunderbirds. Mesabe Widjiu is a tangible property as defined in National Register Bulletin 38 as a place “eligible for inclusion in the NRHP because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community’s history, and (b) are important in maintaining the continuing cultural identity of the community” (National Register Bulletin 38:1). Since Mesabe Widjiu is adversely affected by the NorthMet mine, (see 36 CFR 800.5) the USACE and the USFS must avoid the effect by refusing to permit the land exchange, since the effect cannot be mitigated. The destruction of a section of the Mesabe Widjiu destroys the integrity of the landform and the earth energies and spiritual energies associated with the landform. As a Pagan Druid, I have taken my staff, drum, and pipe and performed ceremony on the Mesabe Widjiu (though not at the overlook at the mine site. I have never been on the proposed mine property) to ensure that the Thunderbirds continue to bring the rains to the Lake Superior/Great Lakes Basin. If this NorthMet mine is allowed to proceed, the Thunderbirds may no longer travel along their traditional path, bringing drought to the land ceded in the 1854 Treaty Authority and to the Superior Basin. Or they may stop at the mine site in their anger and flood everything and not continue on to ThunderBay. This future harm is a physical and quantifiable harm which proceeds directly from the honest spiritual conviction of the Ojibwe and Pagans that the Thunderbirds follow Mesabe Widjiu (see Sec 2000cc-5(7)(A). There is no compelling governmental interest in either the mine itself or the land exchange associated with the NorthMet mine that justifies the destruction of the Mesabe Widjiu. You cannot break the path of the Thunderbirds without spiritual repercussions. The USACE and the USFS both admit that the best feasible alternative to permitting the mine is to maintain the status quo (See FEIS – Chapter 3) and this action must be adopted by the co-lead agencies. The Religious Freedom Restoration Act prohibits you from destroying the irretrievable resource that is the Mesabe Widjiu and from burdening the religious beliefs of the Ojibwe and Pagans. The Thunderbirds follow the Mesabe Widjiu and will alter their path if you destroy this culturally significant landform.	NS	X
27659	Unique			CR	Peter Bormuth		1796	2	Mesabe Widjiu1 is an acknowledged "cultural resource" and is an irretrievable resources under 42 U.S.C. 4332 Sec. 102 (2)(C)(v).	NS	X
27659	Unique			CR	Peter Bormuth		1798	3	Mesabe Widjiu is within the APE of the NorthMet mine. Mesabe Widjiu is a Traditional Cultural Property (TCPs). Beliefs or practices associated with a TCP are of central importance in defining its significance. Mesabe Widjiu is the path of the Thunderbirds. Mesabe Widjiu is a tangible property as defined in National Register Bulletin 38 as a place "eligible for inclusion in the NRHP because of its association with cultural practices or beliefs of a living community that (a) are rooted in that community's history, and (b) are important in maintaining the continuing cultural identity of the community" (National Register Bulletin 38:1). Since Mesabe Widjiu is adversely affected by the North Met mine, (see 36 CFR 800.5) the USACE and the USFS must avoid the effect by refusing to permit the land exchange, since the effect cannot be mitigated.	NS	X
27659	Unique			CR	Peter Bormuth		1799	4	The destruction of a section of the Mesa be Widjiu destroys the integrity of the landform and the earth energies and spiritual energies associated with the landform.	NS	X
29746	Unique			CR	Sandra Wagner		353	4	I believe this proposal would violate the Treaty Rights of Native Americans.	NS	X
26659	Unique			CR	Steve Jay		1423	15	a. The project is not in the public interest, would impair tribal resources, and would result in an enormous loss of ecological services.	NS	X
29900	Unique			CR	Susan Lynn		2704	6	We have treaties with tribes that we must honor, that grant them the right to hunt and to fish. If we render the fish inedible we dishonor and eviscerate that treaty.	NS	X
29356	Unique			CR	Tara Widner		3698	4	Further, while the PolyMet enterprise may be expected to ignore the federal treaties guaranteeing the Ojibwe people’s rights to use and enjoy the area where it would locate its mine, the State of Minnesota must still observe and honor those usufructuary treaty rights.	NS	X
29356	Unique			CR	Tara Widner		3702	8	I urge you to remember that part of Minnesota that is being offered up as an ecological sacrifice is sacred to the Ojibwe and a treasure to all Minnesotans. Reject this FEIS.	NS	X
29478	Unique			CR	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3878	33	WHEREAS, the treaty rights and resources of those Native American Bands potentially affected by many of the NorthMet activities have not been adequately respected or addressed beyond simply outlining the differences in opinion;	NS	X
27061	Unique			CR	Tyler Kaspar	1854 Treaty Authority	1231	17	It is stated in the FEIS that "Since this initial effort, the Co-lead Agencies have received the results of water quality and quantity modeling. The APE has been revised based on these results" (Section 4.2.9.2.3, page 4-313). This suggests that the APE is based on, at least in part, the water modeling which is a concern. Flaws in the water modeling have been identified and brought to the attention of the Co-lead Agencies by the Tribal Cooperating Agencies and supporting analysis has been provided by GLIFWC in Appendix C. Details about the major difference of opinion (Chapter 8) over the water modeling results and how the APE would change due to these flaws (Appendix C) should be provided.	S	N

3981	Form Letter	1	Variant	CR	Virgil Sohm		396	1	My name is Virgil D Sohm, an enrolled member of the Lake Superior Band of Ojibwe, Vermilion sector of the Bois Forte Band, a federally recognized tribal government. Under the Treaty of 1854 recognized as Federal Law, you are not entitled to interfere with our usufructuary rights to hunt, fish and gather our foods and medicines. We have a responsibility as stewards of the land to protect our land for our children and grand children to the 7th Generation.	NS	X
26973	Unique			CUM	Andrew Comfort		1498	6	Polymet forecasts 4 billion tons of ore, not just on the Polymet site, but across the lease holding of several other mining companies. as well as stated in their brochure of Exhibit C: "There are more than 4 billion tons of copper+nickei+PGM resources within many deposits along ~40 miles of the edge of the Duluth Complex near Babbitt, MN. This graphic shows the locations of the deposits, the state mineral leases held by six companies and notes where resource estimates [NI 43-101 compliant] were completed." The largest iron mine pit in the world is the Hull Rust Mahoning Mine of Figures A-D. The DNR says 2 billion tons of rock have been removed (Figure A). So the mining projected by Polymet in a 40 mile stretch is two times as big a Hull Rust Mahoning. Since Polymet has a facility for processing ore and will have excess capacity and has made this brochure as a means of communicating value to investors, some of the value being from Polymet's future ability to assist in the processing of ore from other mine sites, this projected 4 billion tons of ore from Polymet to Lake One is nothing other than a "forecasted trend" that MUST be considered according to Minnesota Rules part 4410.0200. I look forward to MDNR making the FEIS adequate by properly addressing the Cumulative Impact of the removal of the 4 billion tons of ore as projected by Polymet.	S	N
26973	Unique			CUM	Andrew Comfort		1503	8	The FEIS states on page 6-21: Teck is considering operations to mine the Mesaba deposit near Babbitt, St. Louis County, Minnesota, approximately 3 miles east of the NorthMet Mine Site, for nonferrous metals (copper-nickel). The current phase is exploration and drilling. The project may require a joint State-Federal EIS. Preliminary data collection to support environmental review and permitting is underway. The Teck lease holding, however, is not 3 miles away. It immediately neighbors the Polymet site. The two sites touch. They are zero miles apart. I have layered maps from MNGS and Polymet and others and imported into CAD software for analysis and show a detail of this in Figure J. In Figure J, it is clear that Polymet (bounded iin red) and Teck (bounded in yellow) touch. Figure K shows the proposed mine pit locations as provided by Polymet. Measuring the distance between these in CAD shows they are less than% miles apart. Exhibit B, Figure 12 also shows that the current Laurentian Divide passes through this % mile gap. So, my key SDEIS comments were ignored by MDNR (ie regarding the Laurentian Divide and the likelihood that Polymet and Teck would eventually form a single Teck-Polymet Mine Pit Lake) when preparing the FEIS. But worse than just being ignored, this total inaccuracy about Teck being 3 miles away is included in the FEIS. I am just a citizen and do not have time to go through the several thousand page FEIS, particularly when we are only given 30 days for review, rather than the customary 90 days. So I have just taken a "deep dive" in this particular area and in this "deep dive" I find the wild inaccuracy ofTeck being "3 miles east" of Polymet. This undermines my confidence that any of the FEIS has been conducted with rigor- that this level of sloppiness suffuses the entire effort. So the FEIS is inadequate, additionally because it does not properly state the geographic relationship between Teck and Polymet. When the preparers focus their attention on the actual proximity of these two lease holdings, I request that they also focus their attention on the continuous band of ore that connects the two proposed pits and the many historic trends in Minnesota that strongly suggest that a band of ore will be fully mined and that Teck and Polymet will then become one mine pit and that at closure, this mine pit will drain into the Dunka River and onward to the BWCA. Minnesota Rules 4410.0200 requires that they MUST do this. CEQ guidance suggests that they should do it as well. Future Minnesotans will thank them for having done it, for I think it will lead to the conclusion that, ultimately, non-ferrous mining in Minnesota should be forever banned.	NS	X
29747	Unique			CUM	Andrew Comfort		2598	1	When assessing Cumulative Effects, Minnesota Rules 4410.0200 states that the preparers of the Polymet FEIS "must consider...whether future development is indicated by historic or forecasted trends..." The FEIS does not consider certain historic and forecasted trends and the resultant northward flow of water and its impact on the Boundary Waters Canoe Area. By ignoring these historic trends, the preparers of the FEIS (including the US Forest Service) are in violation of Minnesota Rules.	S	N

27822	Unique			CUM	Anita Tillemans		2166	13	Due to the precedent that a copper mine in Babbitt will set, if granted, the potential for mining pits and tailings basins surrounding the area of the BWCAW watershed will be greatly increased. Exploratory wells have been made well past the northern boundaries of the St Louis River Watershed, into the Rainy River Watershed, and on the boundary of the BWCAW. As a consequence, if the North Met project for a copper mine is granted, this will create the potential of a succession of mining pits and wells that move from the NE of Giants Ridge into the domain of the BWCA Wilderness. Consequently, the NorthMet Project prospect has the potential of affecting a larger area than the study proposes. Elevated levels of arsenic can be found in the BWCAW along with brackish waters from exploratory wells. These details cannot be overlooked because it foretells the real possibility of pollution from Polymet’s mine pits traversing aquifers and connecting the St Louis Watershed to the Rainy River Watershed. The potential of surficial and bedrock connectivity from the mine site to this highly diverse geology of the BWCAW region through fluid and interconnected wilderness waterways, glacial moraine and diverse geology is relevant to the discussion.	NS	X
27822	Unique			CUM	Anita Tillemans		2167	14	Relying on probabilistic outcomes that narrow the view and minimize the prospect of pollution reaching downstream seems unrealistic. The potential of downstream contamination throughout the St Louis River Watershed should be given full consideration in any responsible environmental study concerning the prospect of a copper mine in this ecologically important area at the headwaters of the greatest body of freshwater on earth. The St Louis River Watershed is composed of tilted bedrock planes that lean toward Lake Superior. Some of this can be seen in Jay Cook State Park, downstream from the prospect. The topography of the Laurentian Uplands and the swampy lowlands is diverse, including beds of wavy bedrock and washboard effects in areas like the Toimi Drumlin Field. The diversity of topography is as great as the diversity of flora and fauna. These areas are hardly flat. Consider that the final drainage of the Laurentide Ice Sheet is said to have occurred around 8200 YBP and this caused sea levels to rise between 2.6 to 9.2 feet. Can the inevitable flow of local waters to the sea be discounted in a study that truly represents the risk of pollution from a copper mine? Lake Superior is the product of glacial waters that flowed from the LIS and from glacial lakes that grew from the LIS melt. The St Louis River developed in the basin of Glacial Lake Upham. Relative to the age of this earth, the rivers in Minnesota are young, still cutting paths to the sea. If downstream effects were given due merit, the facts would be clear that the entire Arrowhead of Minnesota would eventually suffer loss and damage from the operation of a copper mine in the Laurentian Uplands. No reassurance will carry the weight of facts before our eyes, the water we drink, and the air we breathe.	S	O

17819	Unique			CUM	Dorie Reisenweber		814	2	Among the affected resources, however, are water quantity and water quality, air quality, wetlands and vegetation. Look at just one set of statistics regarding water . It is predicted that tailings seepage would find its way to the Embarrass River at the rate of 20 gallons per minute (THE DULUTH READER, 11/18/15, p. 18) (20 gal per min. x 60 min. per hour x 24 hours a day x 365 days per year = 525,600 gal.) That is 525,600 gallons of waste seepage a year with no consideration to other possible contamination problems arising. That water makes its way to the St. Louis River which is already burdened with contamination from taconite mining. Waters from the St. Louis River flow into Lake Superior the largest freshwater lake in the world. It’s not right, nor to my knowledge ever lawful, to contaminate water.	S	O

29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4091	153	The FEIS must include the off-site “indirect” impacts of this project. CEQ Regulations state that an EIS must include a consideration of “any adverse environmental effects,” including both direct and indirect effects. Indirect effects are those which are “caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable.” A “reasonably foreseeable” effect is defined as one which “is sufficiently likely to occur that a person of ordinary prudence would take it into account.” Federal courts have held that this includes “downstream” impacts such as the impacts of burning coal after it has been shipped on a new rail line. The Eighth Circuit applied these definitions to a proposal to construct new rail lines to the Powder River Coal Basin in Wyoming. Since those rail lines would increase availability of the coal and decrease its price, the Court held that increased coal consumption was a reasonably foreseeable effect of the proposal, such that its environmental impact must be included in the EIS.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4108	168	In addition to providing primarily general, non-quantified analysis, the FEIS makes a number of fundamental mistakes in its cumulative impacts analysis. The FEIS, for instance, in its assessment of past, present, and reasonably foreseeable actions, the agencies failed to include the hundreds of exploratory drilling projects taking place in the same region on federal, state, and private lands.427 The fact that these exploratory drilling projects will collectively contribute towards significant cumulative impacts on a number of resources is acknowledged by the Forest Service in the forest-wide EIS that it prepared for only a subset of these past, present, and reasonably foreseeable projects.	S	N

29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4109	169	The FEIS also limited its consideration of reasonably foreseeable future actions to only those that are included in approved planning documents and have approved funding, are permitted, or have a currently active federal or state permit or site plan application under review. 428 This definition of reasonably foreseeable actions is unreasonably narrow and violates NEPA. The United States Court of Appeals for the Eighth Circuit has more broadly held that an environmental effect is reasonably foreseeable under NEPA if it sufficiently likely to occur that a person of ordinary prudence would take it into account in reaching a decision.429 Moreover, “when the nature of the effect is reasonably foreseeable but its extent is not, . . . the agency may not simply ignore the effect.”430 The lead agencies claim that they relied on 1997 CEQ and 1999 EPA guidance in preparing the cumulative impacts analysis.431 The CEQ guidance, however, demonstrates that the approach taken by the agencies in the FEIS is impermissibly narrow and violates NEPA. As explained by CEQ: Commonly, analysts only include those plans for actions which are funded or for which other NEPA analysis is being prepared. This approach does not meet the letter or intent of CEQ’s regulations. It underestimates the number of future projects, because many viable actions may be in the early planning stage. 432 Agency must instead “use the best available information to develop scenarios that predict which future actions might reasonably be expected as a result of the proposal.”433 Similarly, “[i]f the analyst is uncertain whether to include future actions, it may be appropriate to bound the problem by developing several scenarios with different assumptions about future actions.”434 Future actions can only be excluded from the cumulative impacts analysis if the action is outside the established geographic boundaries or time frame, the action would not affect any resources, or the agency can show that including the action would be arbitrary.435 Importantly, CEQ makes clear that “reasonable forecasting is implicit in NEPA,” and therefore “it is the responsibility of federal agencies to predict the environmental effects of proposed actions before they are fully known.”436 EPA’s 1999 guidance further demonstrates that the agencies definition of reasonably foreseeable actions in the NorthMet FEIS is too restrictive and violates NEPA. As explained by EPA, “reasonably foreseeable future actions need to be considered even if they are not specific proposals.”437 As with CEQ, EPA directs agencies to utilize the best available information “to develop scenarios that predict which future actions might reasonably be expected as a result of the proposal.”438 The NEPA requirement, as explained by CEQ, EPA, and the courts, to use reasonable forecasting and to develop scenarios that predict and disclose the environmental consequences of future actions, along with the NorthMet proposal and other past and present actions, is particularly important for the NorthMet proposal due to its extremely long time-frame. The lead agencies recognize in the FEIS that the necessary maintenance, mitigation, and monitoring for the NorthMet mine will be required indefinitely, likely for hundreds of years. In light of the lead agencies current understanding of the copper, nickel and other mineral deposits within the “Duluth Complex,” along with the expressed interest of mining companies from across the globe to access and mine these minerals, it is at least “reasonably foreseeable” to anticipate additional mining proposals during this time frame. In fact, it is arbitrary and unreasonable for the agencies to assume that no additional copper nickel mines will be proposed and considered during the hundreds of years of mining activities that the agencies are considering authorizing for PolyMet’s NorthMet mine. The lead agencies must therefore consider a range of development scenarios that meaningfully assess and disclose what the cumulative impacts would be to the various resources of the region under each of these scenarios. Because the FEIS fails to do so, a Supplemental EIS must be prepared.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4110	170	The agencies unlawfully narrow definition of reasonably foreseeable future actions led the agencies to exclude the proposed Twin Metals copper-nickel mine from the FEIS’ cumulative impacts analysis.439 From its 8,800 square-foot headquarters in Ely that was constructed in 2011, to its past, ongoing, and proposed exploration throughout the region, and its proposed hydro-geologic study, along with the ongoing consideration of the environmental impacts of its proposed lease renewals by the BLM, the Twin Metals proposal and its environmental impacts are far beyond “speculative,” and are instead ongoing or at least reasonably foreseeable. Significantly, in 2014 Twin Metals completed a voluminous “Technical Report on Pre-feasibility Study” (PFS), which was prepared by a large team of engineers and describes in detail where the company plans to mine, the characteristics of the mine site, the mineral reserve estimates, the proposed mine plan, the mining methods, the recovery methods, the project infrastructure, and, environmental protection strategies, and environmental concerns and issues.440 The Twin Metals proposal includes a 30-year mine plan focused on the development of the Maturi and Maturi SW mineral deposits, located about 9 miles southeast of Ely and 11 miles northeast of Babbitt. The PFS estimates an average production rate of 50,000 tons of mineralized ore per day. The mine plan consists of four major facilities: an underground mine site, a concentrator site, a tailings basin facility, and utility corridors. The Twin Metals PFS demonstrates that there will undoubtedly be significant cumulative impacts to numerous resources that would also be affected by the NorthMet project, as Twin Metals proposes to place its massive tailings facility in the same St. Louis River watershed, adjacent to the Peter Mitchell Mine. The agencies have entirely failed to consider or disclose in the NorthMet FEIS the major impacts and issues concerning geology, hydrology, groundwater, surface water, and pollution that would result from the interactions and cumulative impacts of the NorthMet mine site, Peter Mitchell mine pit, and Twin Metals tailings basin in the same general location. Without such an analysis, that also takes into account the existing changes and predicted impacts to the Laurentian Divide, the agencies are wholly unable to predict or disclose the extent of pollution that would flow to the St. Louis River and Boundary Waters watersheds. According to Twin Metals, the details from the PFS will “form a Mine Plan of Operations (MPO) that will be submitted to state and federal regulatory agencies for environmental review.”441 Twin Metals further states that it has been conducting environmental studies and assessments of its mine proposal for “more than five years,” which will continue during the development of its Mine Plan of Operations, and “will feed into the formal, Draft Environmental Impact Study (DEIS) that will be conducted by state and federal agencies. Key environmental issues include: surface water quality and hydrology, threatened and endangered species, air quality, plant life, wetlands and socioeconomic factors.” And “[m]ore than \$250 million has been invested in exploration and project development to date.”443 In sum, there is no question that the Twin Metals proposed mine is not “speculative,” but rather “reasonably foreseeable,” and was required by NEPA and MEPA to be included in the cumulative impacts assessment for NorthMet FEIS.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4111	171	In fact, in March of 2013, the “Minnesota Minerals Coordinating Committee,” which includes the DNR, issued a document entitled “Explore Minnesota: Copper, Nickel PGEs.”444 The document stated that PolyMet, Twin Metals, and Teck American were all “active” copper-nickel projects at that time. Moreover, the document referred to the Twin Metals PFS, which was then underway, acknowledged that the PFS will be comprehensive and evaluate all project details, and then stated: “Once completed, the PFS will provide multiple state and federal agencies the information needed to conduct a rigorous and thorough environmental review of the proposed plan.” Now that the PFS is complete, and provides the agencies with hundreds of pages concerning the proposed mine’s specific details and impacts, the lead agencies still refuse to include Twin Metals in the cumulative impacts analysis for the NorthMet proposal, in plain violation of MEPA and NEPA. Considering additional future proposals, including Twin Metals, is further supported by the definition of “cumulative potential effects,” within Minnesota’s regulations: "Cumulative potential effects" means the effect on the environment that results from the incremental effects of a project in addition to other projects in the environmentally relevant area that might reasonably be expected to affect the same environmental resources, including future projects actually planned or for which a basis of expectation has been laid, regardless of what person undertakes the other projects or what jurisdictions have authority over the projects. . . . In determining if a basis of expectation has been laid for a project, an RGU must determine whether a project is reasonably likely to occur and, if so, whether sufficiently detailed information is available about the project to contribute to the understanding of cumulative potential effects. In making these determinations, the RGU must consider: whether any applications for permits have been filed with any units of government; whether detailed plans and specifications have been prepared for the project; whether future development is indicated by adopted comprehensive plans or zoning or other ordinances; whether future development is indicated by historic or forecasted trends; and any other factors determined to be relevant by the RGU.445 The lead agencies violated MEPA because they failed to address whether there is a “basis of expectation” that Twin Metals will proceed.446 Moreover, the agencies violated this regulation by further failing to consider the “detailed plans and specifications” already been prepared for Twin Metals, including its 500+ page Technical Report on Pre-feasibility Study.447 The agencies failed to consider whether “historic or forecasted trends” indicate that Twin Metals is reasonably likely to be approved.448 It does not take a serious study of the history of the Iron Range to know that virtually all proposed mining projects and mining expansions have been approved in the past, which the agencies did not consider before concluding that Twin Metals remains “speculative.” The agencies also refused to consider Teck and its leases, exploration and drilling on the Mesaba deposit, adjacent to the NorthMet site. As explained in the FEIS comments provided by Andrew Comfort, the FEIS is wrong that the Teck and PolyMet projects are 3 miles apart.449 They are instead immediately adjacent to one another, and the agencies have failed to consider the continuous band of ore that connects PolyMet’s proposal to Teck and the Mesabi deposit.450 Relatedly, the agencies’ cumulative impacts analysis in the FEIS also fails to address PolyMet’s plans for future expansion and/or for the Plant Site to be utilized for future copper-nickel mining projects in this region. Because the plant capacity is three times as large as is needed for the proposed NorthMet project, its use for other projects is likely.451 As explained in an Edison Investment Research Limited report, “there is a good chance PolyMet will be able to expand the size of its resource by 50-100% based on what we learned on a site visit.”452 Additionally, “[t]here are roughly 11 mineral properties within shipping distance of PolyMet’s mill,” and “[w]e believe there is a good chance PolyMet will decide to toll process third-party ore from some relationships with one or more local projects.”453 Of course the additional use of this Plant Site for expansions and other mining proposals would significantly increase the amount of waste that would be deposited into the tailings basin. This would also greatly increase the amount of vehicle and rail traffic and other disturbances in the immediate project area and affecting numerous resources. The agencies, however, failed to consider the “forecasted trend” for PolyMet and the NorthMet mine site, as analyzed and disclosed by Edison and brought to the agencies’ attention during the NorthMet public comment period, in violation of NEPA and MEPA.	S	O

29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4112	172	The FEIS also fails to set forth the proper geographic scope for the cumulative impacts analysis, especially concerning the potential impacts to water, wetlands, and aquatics, where the agencies refuse to extend the scope of analysis to the entire St. Louis River watershed. There can be no dispute that past and ongoing mining and related activities have resulted in major, significant impacts to the St. Louis River watershed, all the way downstream to the estuary which is formally designated as an “Area of Concern.” ⁴⁵⁴ From thousands of acres of permanent wetlands destruction, to sulfate pollution that has wiped out miles of historic wild rice, to mercury related health warnings, the agencies cannot simply ignore a century of impacts from mining and other industrial activities on this watershed. ⁴⁵⁵ As further explained by Tribal Cooperating Agencies, nearly half of the St. Louis River watershed “has experienced hydrologic alteration from extensive ditching.” ⁴⁵⁶ It is reasonably foreseeable that an additional 3000 acres of wetlands within the watershed will be directly impacted by proposed new mining projects and expansions that are in active permitting and/or environmental review: the PolyMet NorthMet project, Mesabi Nugget Phase II, US Steel Minntac expansion, US Steel Keetac expansion, United Taconite Tails Basin 3 construction. To date, virtually all required wetland mitigation for mining impacts has been implemented out of the basin, representing a permanent loss of high quality ecological resources and functions. ⁴⁵⁷ Similarly, in looking forward, the agencies cannot simply proclaim that no specific mine, by itself, will have any significant impacts on the entire watershed. First, the agencies are wrong that large-scale open-pit mining, including the proposed PolyMet mine, will not have significant impacts on numerous resources, including water and wetlands. Second, both NEPA and MEPA recognize that cumulatively significant impacts may occur as the result of a number of individually insignificant impacts taking place over time within the same watershed.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4113	173	This is an error that the FEIS makes again and again, for virtually every type of impact. From the air deposition of mercury in area lakes, to ambient air pollution and regional haze, to the loss of critical habitat, to impacts on state-listed endangered plants, the FEIS compares the level of impact from this project to the overall impact and deems the impacts from this project insignificant and thus not of concern, even in regards to the cumulative problem. The FEIS must reveal the level of cumulative impact that all sources together have on impacted resources, and acknowledge that the proposed NorthMet project would be one of many sources that together cause the impacts.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4115	174	Due to the major deficiencies in the cumulative effects analysis for the NorthMet proposal, the Tribal Cooperating Agencies prepared their own. ⁴⁵⁹ As explained by the Tribes, the lead agencies failed to consider their repeated requests to utilize a tool developed by the EPA in 2011 in cooperation with tribes entitled, “Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands.” This is despite the Mine Site and Plant Site, and resulting impacts, being located within the 1854 Ceded Territory, and upstream from the Fond du Lac Reservation. The Tribes thus undertook “a resource-specific GIS-based approach as defined in the 2011 guidance to generate an alternative [cumulative effects analysis] that more accurately accounts for cumulative impacts to resources of tribal significance.” ⁴⁶⁰ The Co-Lead Agencies, however, failed to utilize or consider this contradictory and more detailed cumulative impacts analysis in the FEIS, in violation of NEPA.	S	O
29745	Unique			CUM	Erin Mittag	Minnesota Center for Environmental Advocacy	4121	180	We also object to geographical limitations on the projects and activities considered in the cumulative impacts assessment for wildlife. ⁴⁹⁵ According to the text, The spatial CEEA [Cumulative Effects Assessment Area] for wildlife includes the portions of the Mesabi Iron Range located within the Nashwauk Uplands and Laurentian Uplands ecological subsections (see Figure 6.1.1-1). The area has been limited to the Mesabi Iron Range, as it is a definable physiographic region encompassing the region’s mining, which represents an influential land use in regards to wildlife and wildlife habitat. Figure 6.1.1-1 shows the “Mesabi Iron Range” within the “Nashwauk Uplands” and the “Laurentian Uplands” to be a very narrow band of territory with no relationship to the range of any of the wildlife species of concern. Despite the above language, the assessment is not limited to the Iron Range for anything except mining projects. For example, the scant information provided on changes to habitat in the area are given for the entire Nashwauk Uplands and Laurentian Uplands areas. ⁴⁹⁷ And in regards to non-mining projects, the impacts of both “community growth and development” and “forestry practices” are given at the “regional” level, which is undefined. Regarding impacts from mining, however, the FEIS inexplicably omits activity outside the narrow band of the Iron Range. In May 2012, the Forest Service completed an EIS for 29 federal hardrock mineral prospecting permits that acknowledged impacts to wildlife including up to 163 miles of new roads, increased traffic volume, and the increased noise from drilling. ⁴⁹⁸ Although the mineral prospecting EIS was limited to an identified number of projects where the federal government owns the mineral rights, there are many additional mineral exploration projects within and near the Superior National Forest where the mineral rights are owned by private interests or the State, along with numerous other projects that were not included in the NorthMet FEIS. ⁴ Additionally, the BLM is currently considering potential lease renewals for Twin Metals, which would result in additional exploration and other mining activities. ⁵⁰⁰ And the Forest Service recently released an Environmental Assessment for the Twin Metals hydrogeological study; the Biological Evaluation from that project is included here. ⁵⁰¹ All of these projects will have impacts on wildlife, each of which may not be significant standing alone, but are very likely to be significant in the aggregate. None of these projects, however, are considered in the FEIS cumulative impacts analysis for the NorthMet project. Defining an area for the assessment of cumulative impacts must begin by looking at the resource that is potentially affected. If viability of a species within the Superior National Forest is being assessed, the appropriate area for assessing past, present and foreseeable future activities that could cumulatively impact the species is the Superior National Forest. If viability within the state is being assessed, the appropriate area is that area of the state that provides habitat for the species. Without providing information on foreseeable threats to a species in other portions of its territory, it is impossible to know the import of threats within whatever narrow area the agencies arbitrarily choose to assess.	S	O
28547	Unique			CUM	Esteban Chiriboga	GLIFWC	3513	16	The NorthMet Project Proposed Action and Land Exchange Proposed Action are both located entirely within the boundaries of the 1854 Ceded Territory. Current, historic, and ‘reasonably foreseeable’ mining activities have profoundly and, in many cases permanently, degraded vast areas of forests, wetlands, air and water resources, wildlife habitat, cultural sites, and other critical treaty-protected resources within the 1854 Ceded Territory. Lands within the 1854 Ceded Territory that have experienced urban and/or industrial development are permanently ‘lost’ as a source of treaty resources.	NS	X
28547	Unique			CUM	Esteban Chiriboga	GLIFWC	3514	17	Tribal cooperating agencies consider a 216,300 acre area bounded by the St. Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources. Included within the proposed historic district are the headwaters of the St. Louis River, the site of ongoing mineral exploration. The co-lead agencies declined to consider this cultural district as an analysis area in the NEPA process. In addition, tribal cooperating agencies believe the relevant spatial scale for water quality and hydrologic cumulative effects analysis is the entire St. Louis River watershed. Detailed technical support is provided in Appendix C of the FEIS.	NS	X
28547	Unique			CUM	Esteban Chiriboga	GLIFWC	3519	22	Groundwater contamination from the previous mining activities is still an issue near the LTV tailings basin and mine pits more than twenty years after operations have ceased. The cumulative effects of historic mining are not properly accounted for in the FEIS.	S	N
29805	Unique			CUM	Gedicks Al		2630	3	The FEIS fails to analyze the cumulative effects of opening a sulfide mining district in the heart of Superior National Forest, and in the headwaters of both the Lake Superior and Rainy River watersheds.	NS	X
6433	Unique			CUM	Hans Olsen		490	5	Cumulative Impact: The public strongly urged the Cooperating Agencies to broaden the EIS to consider the cumulative impact of opening an entire new mining industry that will operate for a 100 years, rather than limit their scope of review to one mine for 20 years. This broader review would have allowed the DNR to make better decisions about the proposed land exchanges that are required, by considering the needs of multiple mines operating in this narrow area. It also would have allowed the EPA to better asses the pollutant load levels in the headwaters of the Partridge and Embarrass Rivers from multiple mining operations impacting the same water resources. PolyMet said no to considering these cumulative effects and the Cooperating Agencies apparently said, "Oh, okay, fine with us." It took them many words to say that, but that is essentially what is implied.	S	O
6294	Form Letter	1	Variant	CUM	Jane Koschak		465	4	Why would we take the crown jewel of the national forest system in the eastern two-thirds of our nation and turn it into what would become almost a solid and continuous industrialized zone? This is a huge flaw in the Poly Met FEIS. The cumulative effects of this type of development on the Superior National Forest were not studied by the DNR. Hard, scientific facts have been ignored, including those related to health issues from methyl mercury toxicity to the developing brain. Instead, a political document, all 3,500 pages of it, was produced, and pushed upon the citizens of Minnesota.	S	O
9309	Form Letter	4	Variant	CUM	Jane Nicholson		627	5	And what about surrounding commons such as the Superior National Forest? Is it possible that there is any consideration toward trading this away to PolyMet for other lands? Under whose authority??	NS	X
28739	Form Letter	1	Variant	CUM	Jon Ridge		2340	5	The Prospecting Draft EIS fails to evaluate cumulative impacts from drilling, road construction and mining on other lands, including State and County leases, within the project area.	S	O
2132	Form Letter	1	Variant	CUM	Jonathan Baker		303	3	Case in point, I grew up in the northwoods of Minnesota, about 25 miles southeast of Walker. What has happened, and continues to happen, to that area is an atrocity. Lakeshore has been developed with the mentality that it is an inexhaustible resource. The result: hardly a lake that isn't overrun with people.	NS	X
516	Unique			CUM	Joshua Bernstein		227	4	the resultant pollution from the mine will almost certainly disrupt waterways and lands that hold tremendous spiritual and economic significance for Native Americans in Minnesota. To destroy these resources, which have been in their possession for hundreds of years, and have represented the natural habitats of numerous species for thousands of years, is simply an affront to humanity and unconscionable on numerous levels.	NS	X
10709	Form Letter	1	Variant	CUM	Kevin Lee		716	5	But perhaps most importantly, the FEIS fails to take into account the cumulative effects of sulfide mining in the region as a whole This mine will not exist in isolation, and the environmental impacts of mining will not be limited to those caused by Polymet alone.	S	O

29740	Unique			CUM	Lori Andresen	Save Our Sky Blue Waters et. al.	3893	4	What are some possible scenarios in which the regulators are unable to effectively control environmental impacts through regulation? A. Lack of funding for adequate regulatory staff B. Staff, empowered to make decisions, who lack the interpersonal, intrapersonal, technical skill and knowledge, and material resources to carry out effective inspections and the corresponding follow-up tasks - For example, staff might lack the ability to remain unbiased after working closely with industry representatives for years, developing friendly relationships and wanting to avoid conflict and confrontation when put into a position of having to address rule infractions. Empowered individuals within government agencies, make decisions that substantially impact the environment. As individual decisions relate to government agencies abilities to regulate PolyMet, what effective procedures does the state have in place to ensure that individual regulatory employees consistently maintain congruence between the regulatory objectives and their actions, and that they are not influenced by personal agendas (like wanting to reduce personal work load or avoid conflict with colleagues or industry)? C. Poor communication between and within regulatory agencies This comment is not about asbestos or air-quality; this comment is about the state’s lack of ability to enforce existing rules, the impact on the environment of poor enforcement, and the need for the EIS to address environmental consequences of weak government agency enforcement in order to be considered adequate.	S	N
29740	Unique			CUM	Lori Andresen	Save Our Sky Blue Waters et. al.	3926	41	The agencies are neglecting to include multiple cumulative impacts, including impacts to wetlands from a United Taconite mine expansion and from the proposed School Trust Land Exchange (Boundary Waters) – see our attached comments, incorporated herein by reference. United Taconite wetland destruction must be included in cumulative impacts analysis for the NorthMet project. 1,300 Acres of Wetlands Proposed for Destruction in Northeast Minnesota For Immediate Release, November 20, 2012 DULUTH, Minn.— Conservation groups submitted comments today opposing construction of a new tailings basin by United Taconite that would destroy 1,300 acres of wetlands in northeastern Minnesota. The U.S. Army Corps of Engineers is considering modifying United Taconite’s Clean Water Act permit before construction begins on its third tailings basin near Forbes, Minn. The first tailings basin filled in a lake; the second basin destroyed another 800 acres of waters and wetlands. In addition, the processing facility at the site channels its runoff and wastewater into another lake. Found here: http://www.biologicaldiversity.org/news/press_releases/2012/united-taconite-tailings-11-20-2012.html School Trust Land Exchange (Boundary Waters) land exchange must be included in cumulative impacts analysis for the NorthMet project. In addition to the PolyMet land exchange, the US Forest Service is preparing an EIS on a land exchange proposal that would transfer over 30,000 acres of protected Superior National Forest lands into state management. The underlying purpose of this exchange would be to benefit mining companies and logging interests, by removing Federal provisions protecting the lands. Nearby deposits such as the Mesaba deposit controlled by Teck (Cominco), could be included in the School Trust lands exchange. From the USFS Superior National Forest website: This project would exchange federal Superior National Forest lands located outside the Boundary Waters Canoe Area Wilderness (BWCAW) for Minnesota School Trust land located inside the BWCAW. A Notice of Intent to prepare an Environmental Impact Statement is anticipated for publication in the Federal Register on August 28, 2015. A copy of the Notice of Intent is on this project webpage. Found here: http://www.fs.usda.gov/project/?project=45943	S	O
29740	Unique			CUM	Lori Andresen	Save Our Sky Blue Waters et. al.	3927	42	Excess capacity - PolyMet is proposing to use approximately 1/3 of its plant capacity for the proposed NorthMet project. Excess processing capacity is expected to be utilized by neighboring Twin Metals and Teck Cominco. The excess capacity of PolyMet’s processing plant is not addressed in PolyMet’s environmental review.	NS	X
29740	Unique			CUM	Lori Andresen	Save Our Sky Blue Waters et. al.	3928	43	Twin Metals Mine Project must be included in cumulative impacts analysis for the NorthMet project. The Twin Metals project near the BWCAW plan is to put much of their mine waste into the Lake Superior watershed under the pretense of protecting the Boundary Waters. It is immoral to put the toxic mine waste from the projects near the Boundary Waters, into the Lake Superior basin under the misguided premise that it will protect the BWCAW- it will not. If this is allowed, it will compromise and degrade both the Lake Superior and Rainy River (Boundary Waters) watersheds – See image below from Twin Metals Pre-Feasibility Study. The cumulative impacts to both the St. Louis (Lake Superior) and Rainy River (Boundary Waters) watershed must be included in the PolyMet EIS.	S	O
29980	Unique			CUM	Lori Andresen		4298	1	The agencies involved are pushing the PolyMet FEIS forward, even with known deficiencies. One of the largest of them is the lack of cumulative analysis that would take into account the impacts of opening a sulfide-mining district in the heart of Superior National Forest, and in the headwaters of both the Lake Superior and Rainy River watersheds. Both Teck (formerly Teck Cominco) and Twin Metals have claimed deposits adjoining those of PolyMet, and could foreseeably use PolyMet’s excess mining capacity. The pollution potentials of a sulfide mine district, exuding acid mine drainage (AMD) and toxic heavy metals into two watersheds, could replace a wilderness environment with an industrial mining zone. Cumulative health risks to downstream communities, including Duluth, Superior and Fond du Lac, are also excluded in the FEIS. These include contaminated drinking water, mercury in fish, and release of asbestos-like particles. Issues concerning loss of fish and wild rice as local food are also not addressed.	S	O
29397	Unique			CUM	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3787	80	As it has in all prior comments, the Band continues to object to the lack of a comprehensive cumulative-impacts analysis throughout the FEIS. The CEQ has issued guidelines that illustrate the breadth of the required analysis, which the FEIS purportedly relies upon.212 However, there remain a flawed hydrologic characterization, an incorrectly calibrated groundwater model, unrealistic seepage capture rates, and AMCs that have not been rigorously explored and objectively evaluated, as discussed above.	NS	X
26285	Form Letter	1	Variant	CUM	Mary Ann Cunningham		1298	2	As an environmental scientist, I am confident in saying that sulfide ore mining is all but certain to cause acidic mine drainage, groundwater contamination, air pollution, and forest destruction over a much larger area than the footprint of the mine. The mine will impact the public domain far more than the responsible parties will ever acknowledge.	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3016	13	The FEIS manipulates models to avoid consideration of cumulative impacts on water quality and potential violations of the water quality standards. The FEIS fails to analyze issues of great significance and concern, including the synergistic effects of the project on mercury methylation, contamination of fish and resulting impacts to human health and environmental justice and the indirect and cumulative as well as direct impacts of the Project on wetlands and wetlands functions.	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3192	211	The NorthMet project, in combination with other existing and reasonably foreseeable projects, would shift maintenance of water quality in the Partridge River and “from natural systems (i.e., essentially an ecosystem service) to mechanical systems (e.g., the NorthMet Project Proposed Action WWTF and WWTP).” (FEIS, 6-83).	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3193	212	Wetlands destruction and degradation, combined with replacement of natural hydrologic systems in the 100 Mile Swamp and Upper Partridge Sites that would result from the PolyMet NorthMet project required the FEIS to consider the cumulative project impacts at an ecological scale, rather than merely totting up directly destroyed wetland acres. This was not done.	NS	X

27085	Unique			CUM	Paula Maccabee	Water Legacy	3196	188	The PolyMet NorthMet FEIS does not rectify the inadequacies of the SDEIS. As detailed in the preceding Sections I through XI, the FEIS fails to evaluate and, in some cases, affirmatively misrepresents the significant potential adverse environmental effects from the proposed PolyMet NorthMet open-pit copper-nickel mine, processing facilities and waste storage facilities. These failures are compounded by the deficiencies of the FEIS’ analysis of the cumulative impacts of the project on mercury and mercury methylation, downstream water quality, wetlands destruction and impacts on tribal waters, rights and resources.	S	N
27085	Unique			CUM	Paula Maccabee	Water Legacy	3200	190	For federal agencies to rely on an FEIS that fails to analyze these cumulative impacts would also conflict with Executive Order 13045 (Protection of Children from Environmental Health Risks and Safety Risks, 1997), which requires each federal agency give high priority to the identification and assessment of environmental health and safety risks to children and Executive Order 12898, which directs each agency to “make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities” on minority populations, low-income populations and federally recognized Indian tribes. ⁴⁷	S	N
27085	Unique			CUM	Paula Maccabee	Water Legacy	3201	191	WaterLegacy’s prior comments on the SDEIS discussed additional concerns that the EIS failed to consider additionally reasonably foreseeable cumulative mining actions, including the planned expansion of the PolyMet NorthMet copper-nickel mine itself.	S	O
27085	Unique			CUM	Paula Maccabee	Water Legacy	3210	195	Section I of these comments also details the many errors and omissions in the asserted mercury mass balance. These include the failure to consider mercury seepage in any modeling, misrepresentation of leachate testing results, and the disregard of mercury air deposition to the watershed in an amount (453.6 grams per year) potentially three orders of magnitude greater than the differences in mercury loading described to exclude the St. Louis River from Cumulative Effects Assessment Area (CEAA) for the NorthMet project. The FEIS’ false precision regarding mercury loading must be rejected as inadequate due to its concealment of relevant contaminant source information, as well as due to its unsupportable handling of mercury data.	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3214	201	The FEIS’ analysis of cumulative effects of the PolyMet NorthMet project on sulfate and other pollutants is either misleading or just missing. With respect to sulfate, the FEIS’ analysis contains two critical distortions. First, as explained in Section XI, supra, the FEIS uses an improper baseline to calculate the effects of NorthMet tailings seepage on sulfate concentrations. Rather than comparing NorthMet project impacts to LTVSMC tailings seepage diluted by precipitation over time and reduced by Cliffs Eric compliance with its consent decree, the FEIS creates a biased construct comparing NorthMet pollution with “continuation of existing conditions” contradicting science as well a law. Thus, the FEIS concludes that the NorthMet sulfide mine project would have a “positive effect” on sulfate concentrations. (FEIS, 6-48).	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3215	202	sulfide mine project would have a “positive effect” on sulfate concentrations. (FEIS, 6-48). Next, in calculating the cumulative effects of the PolyMet NorthMet project on sulfate in either the Partridge or Embarrass River, the FEIS assigns to the NorthMet project an average sulfate rate of 10 mg/L. (FEIS, 6-45, Table 6.2.2-3; 6-48, Table 6.2.2-5). Like other FEIS denials of water quality impacts based on unsubstantiated assumptions (see Sections II, III, and XI.5, supra) this cumulative effects assessment is a tautology. Once the FEIS assumes that the only watershed inputs are from water treated to comply with standards its conclusion has written itself.	S	O
27085	Unique			CUM	Paula Maccabee	Water Legacy	3222	209	The direct and indirect destruction and degradation of wetlands that would result from the cumulative effects of the NorthMet mine would take place in the 100 Mile Swamp and the Upper Partridge River Site, both identified by the Minnesota County Biological Survey (MCBS) as sites of high biodiversity significance. (WaterLegacy SDEIS Comments, Exhibit 30). The 100 Mile Swamp has been rated for the high quality of its peatlands, while the Upper Partridge River Site is designated due to numerous rare plant species recorded in the site. The 100 Mile Swamp and the Upper Partridge River Site are immediately adjacent to the Headwaters Site, and together these important ecological locations form the headwaters of the St. Louis River, the largest United States tributary to Lake Superior. This spatial relationship is shown in Exhibit 35, a map contained in the MDNR’s report, An Evaluation of the Ecological Significance of the Headwaters Site. ⁵⁴ This report explains, The Headwaters Site straddles the continental divide, with water from the Site flowing both east through the Great Lakes to the Atlantic Ocean and north to the Arctic Ocean. Paradoxically, the divide runs through a peatland. Although the peatland appears flat, water flows out of it from all sides, forming the ultimate source of rivers that eventually reach two different oceans. The Site is the headwaters of four rivers: Stony River, Dunka River, South Branch Partridge River, and the St. Louis River, which is the second largest tributary to Lake Superior. (Id., p. 1)	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3223	210	Understanding the ecological context of the mine site, the FEIS’ cumulative effects assessment should have considered both the implications of other existing and proposed mines in the Partridge River and Dunka River watersheds, and the change that the NorthMet project alone would make in the peatlands and Partridge River headwaters.	S	O
27085	Unique			CUM	Paula Maccabee	Water Legacy	3225	208	The FEIS not only failed to disclose the cumulative impact of the PolyMet NorthMet project on loss of wetlands acreage in the Partridge River, the FEIS provided no ecological scale analysis to consider the importance of Upper Partridge River wetlands and the 100 Mile Swamp in relationship to the Headwaters Site and the St. Louis River downstream. Tribal Cooperating Agencies requested this type of analysis in their Cumulative Effects Assessment, suggesting that this broader and more relevant spatial reference should also assess the cumulative degradation and destruction of the landscape resulting from extensive mineral exploration. (Tribal CEA, p. 41, FEIS autop. 3066).	S	O
27085	Unique			CUM	Paula Maccabee	Water Legacy	3226	213	The FEIS failed to meet the obligations of federal agencies to fairly assess cumulative impacts of the PolyMet NorthMet project on tribal rights and resources. Federal agencies are obligated under NEPA to determine environmental justice impacts, including “the potential for multiple exposures or cumulative exposure to human health or environmental hazards in the affected population, as well as historical patterns of exposure to environmental hazards.” ⁵⁵ Army Corps’ policy specifically commits the Corps to “meet trust obligations, protect trust resources, and obtain Tribal views of trust and treaty responsibilities.” ⁵⁶ The U.S. Forest Service Superior National Forest plan states that the Forest Service has a role in protecting tribal rights “because it is an office of the federal government responsible for natural resource management on land subject to these treaties” and that, “Superior National Forest facilitates the exercise of the right to hunt, fish and gather as retained by Ojibwe whose homelands were subject to treaty in 1854 and 1866.” U.S. Forest Serv. Land and Resource Mgt. Plan, Superior National Forest 10-4, 2-37 (2004).	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3227	214	Rather than meeting these obligations, the FEIS minimized and concealed cumulative impacts of the NorthMet project on tribal rights and resources. Each failure of the FEIS to evaluate impacts on water quality, human health, wetlands and habitats has a disproportionate impact on tribes.	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3228	215	The PolyMet NorthMet project area is located on lands acquired by the United States on September 30, 1854, when the Chippewa of Lake Superior ceded ownership of the land to the United State, retaining usufructuary rights. (FEIS, 3-1) These lands are 1854 Ceded Territory lands, and any impacts on land use, historical sites, vegetation, aquatic life and wildlife in this Ceded Territory affect tribal resources and treaty rights and can disproportionately result in environmental injustice to tribes.	NS	X
27085	Unique			CUM	Paula Maccabee	Water Legacy	3229	216	The FEIS rejected the request made by Tribal Cooperating Agencies to consider a larger historic district that would encompass multiple impacts on Ceded Territory. (FEIS, 5-566; FEIS autop. 3032-3033, Tribal CEA, pp. 7-8). The FEIS also denied effects of the project for two of the three historic sites identified by tribes as impacted (Spring Mine Lake Sugarbush, BBLV Trail Segment) and proposed no project modifications to address adverse affects to the third site, the Mesabe Widjiu. (FEIS, 5-535, 5-565).	S	N

27085	Unique			CUM	Paula Maccabee	Water Legacy	3230	217	The FEIS rejected the request made by Tribal Cooperating Agencies to consider a larger historic district that would encompass multiple impacts on Ceded Territory. (FEIS, 5-566; FEIS autop. 3032-3033, Tribal CEA, pp. 7-8). The FEIS also denied effects of the project for two of the three historic sites identified by tribes as impacted (Spring Mine Lake Sugarbush, BBLV Trail Segment) and proposed no project modifications to address adverse affects to the third site, the Mesabe Widjiu. (FEIS, 5-535, 5-565).	S	N
27085	Unique			CUM	Paula Maccabee	Water Legacy	3237	224	The Co-Lead Agencies were obligated under law to assess cumulative impacts of the PolyMet NorthMet project on water quality, human health and particularly children’s health, wetlands, tribal rights, tribal resources and environmental justice. The FEIS failed to do so.	S	O
351	Unique			CUM	rachel susan		177	3	In addition, I do not feel that the EIS adequately addresses the cumulative effects likely from this project. I believe that the negative environmental consequemces and cumulative effects of this project would far outweigh the short-term miniscule employment benefits provided by the mine.	NS	X
28922	Unique			CUM	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3556	17	The people of Minnesota deserve a cumulative environmental impact assessment to determine the full environmental cost associated with existing mining and any future impacts from proposed or potential mining operations across northern Minnesota.	S	O
10464	Form Letter	1	Variant	CUM	River Point Resort Outfitting Co.		690	3	Why would we take the crown jewel of the national forest system in the eastern two-thirds of our nation and turn it into what would become almost a solid and continuous industrialized zone? This is a huge flaw in the Poly Met FEIS. The cumulative effects of this type of development on the Superior National Forest were not studied by the DNR.	NS	X
6298	Unique			CUM	Robin Vora		472	4	I think the overall net loss of high quality vegetation, rare species and wildlife habitat and corridors is unacceptable. This and all the other mines along the Laurentian Divide have resulted in a significant cumulative loss of these resources.	NS	X
29746	Unique			CUM	Sandra Wagner		2593	2	I do not believe the cumulative impacts are adequately addressed, particularly continued mining at the Peter Mitchell mine.	NS	X
29289	Unique			CUM	Sandy Sterle		2503	9	And, this project opens the door for other proposed mines, so the FEIS needs to include the cumulative impacts resulting in opening up a copper-nickel mining industry in Northern Minnesota.	NS	X
26659	Unique			CUM	Steve Jay		1410	2	Throughout this FEIS, the Cumulative Effects (CE) sections fail to provide rationale for assumptions used in estimating CE and fail to demonstrate methodology for estimating CE in highly complex systems such as NorthMet Mining Project and related human activities. For example, the most profound meteorological changes in human history have been occurring recently at increasing rates, caused primarily by CO2 emissions and related GHG pollution from burning fossil fuels, yet the FEIS appears to not have used in their projections scientific data regarding the estimates for past, current and future severe weather events and related ecological impacts of Climate Change. The NorthMet proposed project adds small but measurable emissions to the known ‘drivers’ of climate change; but more importantly, the rapidly changing meteorological conditions of climate change will impact directly and indirectly the proposed NorthMet mining activities themselves. I found no detailed systems analyses of CE that incorporate current science into projections of the potential impacts of this NorthMet project and related human activities. This is one of several deficiencies that impair one’s ability to accurately assess the extent to which the FEIS addresses both the ‘letter and the law’ of NEPA and MEPA.	S	O
26659	Unique			CUM	Steve Jay		1424	16	a. NEPA/MEPA require “assessment of potential cumulative effects” and CEQ defines it as “...reasonably foreseeable future actions regardless of...” The Anthropogenic impacts of global warming/climate change are being addressed at the highest levels of science and government world-wide. CO2 and other GHG emissions have major “potential cumulative effects.” Existing and projected increase in climate change in MN have potential for major disruption from extreme weather events of mining activities proposed in this FEIS.	NS	X
26659	Unique			CUM	Steve Jay		1426	18	The statement that “...determining the significance of any single project is beyond the capabilities of current science” suggests that wise, precautionary decisions can’t be made without case- by- case estimates of the risks. This is silly. We are in the midst of an unprecedented global challenge where an enormous body of science is being used daily by world’s leading scientists, public health and policy experts to make just such decisions. The language in this section should be changed to better reflect the realities of climate change in 2015 and the cumulative impacts of human activities that are driving the changes. (Stein Univ CO Law Review 2013)	NS	X
26659	Unique			CUM	Steve Jay		1427	19	b. More important than absolute GHG emissions projected in this FEIS is the potential impact of increasing climate instability on the project itself. (Rainfall, drought, rising water levels, snow pacts, storm patterns.) The past, present and projected future impacts of climate change on air, water, land, ecosystms, and public health have not been estimated adequately in this FEIS.	NS	X
24761	Unique			CUM	Steve Timmer		1096	2	[Mining], without question, would fundamentally change the character of this region, taking what is today the crown jewel of the national forest system in the eastern two-thirds of the country, and converting its heart into an almost continuous industrialized zone. And this is, perhaps, the biggest flaw in the just-released FEIS on PolyMet. When the DNR opted not to examine the cumulative impacts of this scale of development on the Superior, they chose to ignore the elephant in the room. They opted not to take the hard, scientific look they promised and produced a political document, instead. ¹	S	O
29900	Unique			CUM	Susan Lynn		2703	5	Half a billion dollars have been spent of the people’s tax money to clean the waste that mining has heftily contributed to in the St Louis River, and still it remains polluted beyond health. It is further endangered now by plans for sulfide mining in the Duluth Complex which stretches from north of Ely to south of Aitkin.	NS	X
29478	Unique			CUM	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3877	30	WHEREAS, the cumulative effects of the various direct and indirect activities on the resources in the immediate vicinity of the NorthMet project have, at least, been reviewed in the FEIS, but the cumulative effects of several additional speculative sulfide mines in the Duluth Complex area have been neither included nor considered for their cumulative effects;	S	O
26996	Unique			CUM	Timothy Weulander		1521	9	Also, something I have not come across lately is an up to date map of potential mines. Just because they have operations on one site, doesn't mean they won't acquire land elsewhere to mine. Or open up chances for other mines. I do remember a map that had once shown what locations mining companies had leased to drill, to see if it was viable land. One of those areas was right on the shore of Lake Vermilion. This whole mine seems like the potential for opening up a big can of worms.	NS	X
27061	Unique			CUM	Tyler Kaspar	1854 Treaty Authority	2993	20	It is further stated in the FEIS that "Construction and operation of the NorthMet Project Proposed Action is not likely to significantly reduce overall availability of 1854 Treaty resources that are typically part of subsistence activities in the 1854 Ceded Territory. Some individuals and localized populations may be affected, but overall species populations are expected to remain available. Additionally, noise and other consequences of operations would affect migration or other animal species behavior. " It is important to consider the cumulative impacts of the proposed project. The project would result in one more piece oft he 1854 Ceded Territory permanently altered and impacted. When taken in combination of all the mining operations across the Iron Range and other general development, the Ceded Territory and related exercise of treaty rights have been significantly impacted and the project would be an additional impact.	NS	X
27061	Unique			CUM	Tyler Kaspar	1854 Treaty Authority	3000	27	We believe that limiting the cumulative effects analysis area (CEAA) for water resources (Section 6.2.2), wetlands (Section 6.2.3) and aquatic species (Section 6.2.6) to the Partridge and Embarrass River watersheds is too small. These CEAA's should be expanded to include the St. Louis River watershed. Impacts associated with United Taconite's proposal for 1,200 acres of wetland destruction to build a new tailings basin within the St. Louis River watershed should be included. The NorthMet project would add to the load of pollutants in the St. Louis River and would reduce tributary flows to the river. Impacts that may occur due to the project could be underestimated (due to modeling concerns), and would not stop before reaching the St. Louis River. Further, any added impact from the project to the St. Louis River watershed would in turn impact Lake Superior. We believe that this is the appropriate scale to analyze cumulative effects for these resources.	S	O
27061	Unique			CUM	Tyler Kaspar	1854 Treaty Authority	3003	30	The FEIS appears to be missing an important section, Cumulative Forest Service Land Actions, that was included in the SDEIS as Section 6.3.2. The U.S. Forest Service identified four current and reasonably foreseeable land exchange and land acquisition actions that would be cumulative to the Land Exchange Proposed Action. These projects included the Cook County Land Exchange, Crane Lake Land Exchange, Fall Lake Land Acquisition, and Wolf Island Phase 2 Land Acquisition. The SDEIS included a brief description for each of these land exchange and land acquisition actions. We suggest adding this section to the FEIS with the addition of the proposed School Trust Lands Exchange. The project would entail exchange, purchase, or some combination of both for the Forest Service to acquire the school trust lands within the BWCAW.	S	O
29367	Unique			CUM	William K. Dustin		2511	4	The cumulative effects analysis is inadequate by definition* because it refuses to consider the other proposed mines in the Duluth Complex. There is nothing “speculative” about the mine under development by Twin Metals. This company has offices in the Twin Cities and Ely, has been collecting core samples for years, has a proposed infrastructure that ties into the PolyMet project, and it has been running a column in the Ely Echo praising the value of mining. The fact that their proposal has not reached the permitting phase does not make it any less speculative. The environmental outcome of the PolyMet project is far more speculative than the likely success of Twin Metals receiving the necessary permits to mine, and their receipt will be even less “speculative” after the PolyMet approval.	S	O
29734	Unique			CUM	William K. Dustin		2579	4	The cumulative effects analysis is inadequate by definition* because it refuses to consider the other proposed mines in the Duluth Complex. There is nothing “speculative” about the mine under development by Twin Metals. This company has offices in the Twin Cities and Ely, it has been collecting core samples for years, it has a proposed infrastructure that ties into the PolyMet project, and it has been running a column in the Ely Echo praising the value of mining. The fact that their proposal has not reached the permitting phase does not make it “speculative”. The environmental outcome of the PolyMet project is far more speculative than the likely success of Twin Metals receiving the necessary permits to mine, and their receipt will be even less “speculative” after the PolyMet approval.	S	O
25851	Unique			EDIT	David Franseen		1234	2	I hope that the MDNR has the capacity to modify the ‘passive voice constructions’ in this FEIS (for instance the use of ‘could’ in the FEIS response to MDO#7) to an active voice in the subsequent permitting process, and to use the financial assurance section to require funding of monitoring where noted in the MDO as a future possibility as a consideration of assurance. Not defining who monitors, or how often results in failure to fund monitoring to assure that the potential compliance to state law becomes a certainty.	NS	X

24810	Unique			FIN	Alexa Douglas		1114	2	Do not allow a Foreign Company, Glencore... one of the worst in the world for environmental and human rights abuse, to destroy this land and poison the earth, the animals and the people, for their own personal profit. Sure this state will make a few dollars, get a few jobs for a short time. In contrast, the long term trade off is inhumane. The toxic clean-up could take 500 years or more and even then it will never be restored to its original purity. And in those 500 years...how many children, adults, wildlife, fish will have been poisoned. There is no accountability for this kind of destruction in the proposals and no amount of money can replace this kind of death.	NS	X
26488	Unique			FIN	Allen Andrys		1338	3	When it finally comes down to it, perhaps years from now, when the toxic waste being stored indefinitely is leaked, if the company has closed shop and left with their profits...(or sometimes even if they haven't) who ends up paying for the "clean-up"? The people do. We have seen this time and time again in an alarming number of man-made disasters despite major corporations' environmental safeguard. Or lack-there-of.	NS	X
8592	Unique			FIN	Allen Frechette		585	2	Also, establishing the amount of financial assurance that Polymet will have to provide in advance of obtaining permits to cover both the preexisting AOCs that they have accepted responsibility for and those that might become evident in the future appears from the findings in the FEIS to be premature. Polymet could claim future discovered contamination, which the State alleges is Polymet's responsibility, is not their responsibility, but rather from a preexisting AOC that had not been adequately evaluated by the state. The FEIS actually acknowledges this possibility and provides Polymet an established position for denial of future responsibility for contamination.	NS	X
8592	Unique			FIN	Allen Frechette		589	3	Establishment of responsibility for preexisting ground water contamination must be addressed before a permit for Polymet can be granted, to eliminate the potential for legal problems associated with assignment of responsibility for subsequent ground water contamination should Polymet proceed. It is reasonable to assume that any claim by the state for access to financial assurance from Polymet will be challenged if Polymet can argue that such contamination is the result of preexisting conditions. This issue has been established as legitimate in previous permit considerations by the MPCA where applications for permits have been submitted in areas with preexisting contamination concerns that could complicate assignment of responsibility for contamination to the proposed project. (One example is the former Pollution Controls Incorporated (PCI) site in Scott County, where the deed for the site was even written by the MPCA's AG to exclude future development.) There are only two ways to resolve this problem – either Polymet must agree to full responsibility without the right to challenge the State's decision, for any actionable contamination found subsequent to their operation regardless of original source that is deemed by the State to be associated with their operations, or Polymet must agree to be responsible for proving to the satisfaction of the state that discovered contamination is not from their project. Both of these options are unlikely to be acceptable to Polymet. In the absence of a resolution to this issue, the FEIS must be found incomplete until all AOCs potentially complicating future assignment of responsibility for contamination can be fully examined and addressed.	NS	X
8592	Unique			FIN	Allen Frechette		591	5	A Project Proposer chooses the project site and as noted in the EIS alternatives discussion, there were no alternative sites or technologies that would satisfy the needs of the Project Proposer. With a chosen site come the preexisting assets and liabilities associated with that chosen site. Polymet appears willing to accept some of the liabilities, but in the absence of a better understanding of the preexisting AOCs, it is likely the state would be responsible for addressing contamination from both existing AOCs and those that Polymet alleges were from existing AOCs in the absence of state funded investigation to prove otherwise.	NS	X
8592	Unique			FIN	Allen Frechette		592	6	Polymet is a Limited Liability Corporation, with (at this point) financial resources that have been questioned. The proposed transaction and affiliated private agreements appear to transfer responsibility for existing contaminated properties to Polymet. As the FEIS notes (see sections below) transfer of financial responsibility from previous mining sites to Polymet appear to (should Polymet fail) result in removing responsible parties currently (apparently) cooperating with the State for remediation and transfer them to Polymet. The issue of the necessary financial assurance prudent to be required by the state appears to have not been resolved in the responses to comments on this issue presented in the FEIS. Thus, this remains an unresolved issue rendering the FEIS incomplete, or if unresolvable, cause for permit denial.	NS	X
8592	Unique			FIN	Allen Frechette		593	7	The FEIS appears to acknowledge the unresolved issues related to establishing appropriate financial assurance for the Polymet proposed project but fails to actually provide sufficient illumination to those who would rule on the permits, set the amount of financial assurance and land swaps associated with this project. As a result, the FEIS remains incomplete in my opinion. It is arguable that the effort and cost of fully resolving this important concern is beyond the scope of an EIS, and it may be so. However, in that case, this issue should be emphasized and carefully explained to subsequent decision makers so that they understand the associated risks to the State and rule appropriately. The purpose of an EIS is after all simply to illuminate the potential impacts and risks associated with the evaluated proposed project and provide the project proposer an opportunity to agree to applicable mitigation. It thus becomes the responsibility of the State staff charged with preparation of an environmental review document to effectively convey the findings to the decision makers. Because of the immensity of the documents associated with this EIS, it would be inappropriate for responsible staff to assume that decision makers would be able to read through all the complicated technical documents to obtain an appropriate level of understanding to make responsibly informed decisions. Therefore, I believe it would be of value for the technical staff from the DNR, MPCA, MDH, U. S. Army Corps of Engineers and others who have worked on this EIS to offer their professional opinions regarding risks associated with this project to the decision makers.	S	O
226	Form Letter	1	Variant	FIN	Amber Garlan		154	3	500 years of pollution damage is not worth engaging in sulfide mining.	NS	X
29843	Unique			FIN	Amy Schwarz		2660	3	Indefinite treatment of water and tailings is in violation of Minnesota rules. It is not possible to ensure that a company or even a government can keep up with this treatment indefinitely, even if sufficient funds are provided, which is highly unlikely.	NS	X
28899	Unique			FIN	Andy Johnson		2373	1	Stop the proposed PolyMet NorthMet copper-nickel sulfide mine from becoming one of hundreds of tax payer Superfund clean up sites. Do the simple research and you will find out that the chances are very, very good that after PolyMet has used up all the resources in the area they will take their money and leave, and the site will have to be cleaned up by the expense of the taxpayers.	NS	X
30061	Unique			FIN	Anita Tillemans		4241	10	As noted, FEIS confirms that due to low permeability of the bedrock, discharge could take thousands of years... and so it seems that polluted waters could do the same. Polymet would be long gone before the consequences of copper mining could be fully assessed.	NS	X
27041	Form Letter	1	Variant	FIN	Ann Santo		1637	2	The mines & the accompanying pollution would ruin this area & then after the mines play out, the companies declare bankruptcy & leave & go back to their foreign countries -- they have NO vested interest in this state or protecting it. Then we will clean up the horrendous pollution???? State of Minnesota, federal government??? It would become a Super Fund site. PLEASE DON'T approve these mines!!	NS	X
22622	Unique			FIN	Anne Uehling		874	2	Herein are my comments on the Polymet's Northmet Project FEIS. (also attached) A question is will the cost of converting to an expensive Reverse Osmosis system be included in Financial Assurance, and will any part of Polymet be around in year 52 to implement action? Note: The primary WWTF will be chemical precipitation and filtration.	NS	X
28533	Unique			FIN	Arno S. Kahn		2315	3	The requirement that a company maintain the ?holding ponds? for 500 years is crazy. Companies don't have 500 year life spans.	NS	X
26479	Unique			FIN	Audrey Kramer		1334	8	The pollutants left behind by a copper-nickel sulfide mine would require 500 years or more of constant care which would never be covered by the Canadian mining company as they would be long gone or debunked.	NS	X
29153	Unique			FIN	b4holden@gmail.com		2431	2	Will the Glencore company bank the hundreds of millions of dollars of security?	NS	X
29731	Unique			FIN	Bill Waddington		2575	3	Polymet even admits there will be at least \$300,000,000 worth of pollution left after the mine is done (this is a very conservative estimate), but at the same time does NOT agree to provide adequate clean-funds in a protected trust fund for this purpose. This proposed mine will trash the range and BWCA, and leave the clean-up bill for the people of Minnesota. And once this land is destroyed, it is destroyed for ever.	NS	X
23110	Form Letter	1	Variant	FIN	Bonnie Nelson		898	1	There is no amount that could be set aside as financial assurance which can cover an infinite clean up.	NS	X
27620	Unique			FIN	Brad Heltemes		1788	3	And though the risk of an extremely catastrophic breach may be fairly low, the clean-up attempt of damage that would result would break the Minnesota state budget and would still fall far short of adequate; consider that no insurance company would ever consider insuring the state against such an event, which should be an alarming thought for all of us.	NS	X
465	Unique			FIN	Brad Hill		219	2	Any contamination that is leaked can destroy wetlands and is reduced to the ownership of the public when the Polymet mine and it's financial backers go bankrupt. A perfect example of this is the former Dunka mine near Babbitt, MN. The Dunka mine went bankrupt sometime in the 1970's however there is still the contamination problem today and nothing is being done to clean it up. Today the public bears the financial burden of the chemicals leaching into the surrounding ground. There may be some fact that not much money is spent on the project today but why are we letting contamination leak from a former mine into the water? We are polluting ourselves and doing nothing to clean it up. The former Dunka mine may be in environmental compliance but that means nothing. The environmental compliance factor only means something like the mine has to report contamination level to the state, not to do anything meaningful to reduce the contaminates or clean them up.	NS	X
465	Unique			FIN	Brad Hill		220	3	So this proposal by Polymet would place the people of Minnesota in the same position. Once a there is a contamination leak and the mine goes bankrupt and the financial backers move out, the mine will be allowed leak continuously. Any leaking mine will come at the expense of the people of Minnesota because we are left to deal with the contamination and if we want to spend our tax money to clean it up. It's not fair to burden the people of Minnesota with a contaminated environment and the costly clean up.	NS	X
30073	Unique			FIN	Brad Sagen		4346	4	EPA, as well as several environmental organizations, have called attention to the absence of virtually any information regarding the need for financial assurance and the capacity of the proponent firm(s) to provide that assurance. While a detailed financial assurance plan may not be required prior to permitting, the capacity of proponents to provide such assurance should be considered part of a determination of FEIS adequacy.	NS	X
27672	Unique			FIN	Brian Smith		1831	3	Additionally, if Polymet is allowed to go forward with this mining project, then I think that Polymet should be required to pay a \$300 million per year oversight and watchdog tax to help ensure that all goes well for Northern MN regarding this mining. This tax to the owners of the mine should be progressive-meaning that it should be for the entire +200 years of clean-up and should increase with inflation and other possible expenses that might occur over such as large time span.	NS	X
27003	Unique			FIN	Bruce Johnson		1622	34	must be considered after mining operations this water will need to be treated for at minimum as long as the United States has been a nation. Is this practical financially or otherwise? Can the RGUs demonstrate any industry treatment for a close industry site that the same industry treatment is being operated with or without financial assurance today?	S	O

26617	Form Letter	1	Variant	FIN	Bryan Wyberg		1370	5	The full cost of five hundred years of monitoring, maintenance of containment pools and structures, and the reconstruction one would expect would just naturally be required every couple of decades would require PolyMet to pony up billions of dollars today to ensure the bond lasts five hundred years. Without that, no permit should be granted.	NS	X
25814	Unique			FIN	Carl Johnson		1225	1	Polymet Canada with an office in MN has no guaranteed source of funding on-going clean up expenses. Their "sugar Daddy" once having a potential of funds for a questionable guarantee to begin with, is fiscally broke! That is Swiss-based Glencore. Glencore is in trouble on a world wide basis. They have "a colossal net debt pile stood at 30 billion dollars as of June" and "currently busy derisking their business". Now, "Chinese copper producers to reduce production by 350,000 ton in 2016". The time has come to govern! Time to ban any/all sulfide mining in Minnesota is now!!	NS	X
27184	Unique			FIN	Carl Sack		1672	4	Structural lifespans aside, no mining company has ever cared for a closed mining facility in any way for 500 years; few have done so for 100 years, and within that timespan most mining companies have gone bankrupt, been absorbed by larger companies, or otherwise disappeared. The state’s ability to maintain treatment facilities after Polymet has ceased to exist is also not guaranteed, as future economic and/or social changes that could interfere cannot be foreseen so far in advance. “Adaptive management” in perpetuity is a comfortable myth that does nothing to prevent the widespread future contamination of area waterways with acid mine drainage.	NS	X
2759	Unique			FIN	Catherine Johnson		339	3	2) There is not a 100% assurance that this operation is capable of cleaning up a spill if it does occur (Polymet and its partner Glencore have had financial difficulties recently). More likely, a Superfund would be created with the obligation falling to the taxpayers.	NS	X
53	Unique			FIN	Cathy A. White		128	2	No company can guarantee 100% that no "accidents" will happen and that in itself is an ideal reason to reject the mining project.	NS	X
29885	Form Letter	1	Variant	FIN	Charles And Nancy Bagley		2692	2	The Plan FAILS TO NOTE that the mine tailings must be kept from leaking FOREVER! Can PolyMet supply proof that this can be done? They need to post a ONE BILLION DOLLAR BOND to provide cash for perpetual maintenance of tailings storage.	NS	X
13	Unique			FIN	christie white dauphin		30	1	Polymet makes all the required promises. We should believe them, that they will keep their promises? What sort of God is this that we believe in? The God of Science. "To be human, is to err." How long will this corporations be solvent?	NS	X
19965	Unique			FIN	Clay Williams		839	1	The notion that the mining company will exist as a viable business entity for the duration of the environmental danger has no precedent. When the toxins leach out, Minnesotans will be left to deal with it. Reject the mine proposal.	NS	X
24660	Unique			FIN	Daniel Houle		1066	2	I am a simple man, but even a simple man understands that this is bad business. You should not permit this when even the state auditor says you cant do the math. Come on.. 300years of clean up for 20 years of work,,, please, don’t insult our state. Every single mine booms and busts... You are only setting up the North Country for extreme failure in one hundred years.	NS	X
29793	Unique			FIN	Daniel Westholm		2612	1	The financial assurances of the company are not suitable for the time and geographical scale of the project. At some point in the future, a catastrophic weather event or economic collapse may destroy our ability to contain the legacy pollution.	NS	X
29793	Unique			FIN	Daniel Westholm		2613	2	After decades of effort in cleaning up pollution in the St. Louis River estuary left by long vanished industries, this project will essentially do the same thing to coming generations of this state, this time in full awareness of the risks and at the very headwaters of the same river. Knowingly bequeathing a serious environmental problem for at least the next 500 years worth of Minnesotans is morally wrong.	NS	X
29795	Unique			FIN	Daniel Westholm		2620	1	The financial assurances of the company are not adequate for the time and geographical scale of the project. At some point in the future, a catastrophic weather event or economic collapse, may destroy our ability to contain the legacy pollution.	NS	X
29795	Unique			FIN	Daniel Westholm		2621	2	After decades of effort in cleaning up pollution in the St. Louis River estuary left by long vanished industries, we will then essentially do the same thing to coming generations of this state, this time in full awareness of the risks and at the very headwaters of the same river. Knowingly bequeathing a serious environmental problem for at least the next 500 years worth of Minnesotans is morally wrong.	NS	X
6910	Form Letter	1	Variant	FIN	Danny Terry		523	4	They will Close there Doors after Looting the Land for your Gold and Assets and leave you with the Bills and the Land to pay for until the End Of Time	NS	X
				FIN	Dave Chambers	Center for Science in Public Participation	4144-1	2	The Financial Assurance for the project is not given any detailed analysis in FEIS, even though this information is available from the mining company. The rationale for this decision is given as: The level of engineering design and planning required to calculate detailed financial assurance amounts is not currently available, This is clearly not the case. Any responsible mining company will need to know what the potential financial liabilities of post-closure costs will be in order to provide a proper, and legally-required for the company's investors, financial estimate of the profitability of the proposed project. In fact, PolyMet has stated: Although NEPA and MEPA regulations do not require a discussion of financial assurance, PolyMet has provided an initial estimate of expected financial assurance needs that could be included in environmental review process (Reference (11)). (PolyMet 2015g, p. 35) The problem with presenting at least a preliminary financial assurance calculation appears to be with the agencies, not with PolyMet. The level of detail available from the company is likely more than sufficient to provide a detailed estimate of the financial assurance. This estimate would provide the public with two very important pieces of information: (1) The magnitude of the financial surety amount; and, (2) Most importantly, the methodology which will be used to calculate the final financial surety. It is an important part of the EIS process to know approximately how much money will need to be provided as a financial surety for closure and post-closure requirements, and that appropriate procedures and inclusive items are being used to estimate this amount. The financial surety clearly has the potential to affect the human financial/social environment, and is an estimate for which the information is clearly available at the EIS stage. It is noted in section 1.4.5 Financial Assurance, that: Minnesota Rules, part 6132.1200 requires that before a Permit to Mine can be granted, financial assurance instruments covering the estimated cost of reclamation should the mine be required to close for any reason at any time must be submitted and approved by the MDNR. (FEIS, p. 1-18) Even though a financial analysis is required “before a Permit to Mine can be granted” this critical element is not disclosed in the FEIS. In addition to the claim that this level of detail available is not sufficient – which is clearly not true – this is also justified by asserting: There are no applicable federal financial assurance requirements that would be incorporated into the Permit to Mine,... (FEIS, p. ES-55) The financial assurance for post-closure is a very important financial element of this project because longterm water treatment will be required. If the assumptions used in calculating the financial assurance for long-term water treatment are not inclusive of all potential costs, or if the assumptions for long-term investment return and/or inflation are not conservative enough, then the public will either be saddled with paying for the long-term water treatment with public funds, or the public will suffer the environmental impacts of not treating this contamination.		
29749	Unique			FIN	Dave Chambers	Center for Science in Public Participation	4144-2	2	These are potential significant impacts on the public. A Federal agency must prepare an EIS if it is proposing a major federal action significantly affecting the quality of the human environment (the Army Corps of Engineers and the Forest Service are co-preparers of this EIS). In 40 CFR Chapter V - Council on Environmental Quality, Part 1502 - Environmental Impact Statement § 1502.1 Purpose. The primary purpose of an environmental impact statement is to serve as an action-forcing device to insure that the policies and goals defined in the Act are infused into the ongoing programs and actions of the Federal Government. It shall provide full and fair discussion of significant environmental impacts and shall inform decisionmakers and the public of the reasonable alternatives which would avoid or minimize adverse impacts or enhance the quality of the human environment. Agencies shall focus on significant environmental issues and alternatives and shall reduce paperwork and the accumulation of extraneous background data. Statements shall be concise, clear, and to the point, and shall be supported by evidence that the agency has made the necessary environmental analyses. An environmental impact statement is more than a disclosure document. It shall be used by Federal officials in conjunction with other relevant material to plan actions and make decisions. (emphasis added) In 40 CFR Chapter V - Council on Environmental Quality, Part 1508, Terminology and Index, it states: Section 1508.14 Human environment “Human environment” shall be interpreted comprehensively to include the natural and physical environment and the relationship of people with that environment. (See the definition of “effects” (Sec. 1508.8).) This means that economic or social effects are not intended by themselves to require preparation of an environmental impact statement. When an environmental impact statement is prepared and economic or social and natural or physical environmental effects are interrelated, then the environmental impact statement will discuss all of these effects on the human environment. (emphasis added) A financial surety that is not adequately calculated could have an impact on the human environment as described in the CEQ regulations, and therefore should have been analyzed in the FEIS. The “preliminary cost estimate for closure” for NorthMet is as large as \$200 million during operation (FEIS, p. 3-142). In addition, it appears that this cost estimate is for closure costs only, and does not include post-closure water treatment. It is typical that post-closure water treatment costs are as large as the direct closure costs, and if this is the case then the amount for the current financial surety is being considerably underestimated. 27308	Unique			FIN	David A. Lien	Minnesota Backcountry Hunters & Anglers	3246	5	And the proposed mine plan does not protect Minnesota taxpayers. The plan commits Minnesota to an estimated 500 years of polluted water treatment without providing critical information about how this will be paid for and who will be responsible for it. Details about financial assurance and a "damage deposit" the company provides are not outlined in the revised mine plan. The public does not know how much 500 years of water treatment will cost, how the company will be held responsible for centuries of costly water treatment, or how the public will be protected from liability.	S	O
27308	Unique			FIN	David A. Lien	Minnesota Backcountry Hunters & Anglers	3251	10	Former state Rep. Frank Moe is a guide and outfitter on the North Shore. Moe says when his old friends in the State Legislature consider whether to grant a permit to PolyMet to operate a hardrock sulfide mine, they should consider the other jobs at stake. Not just a couple hundred mining jobs, but jobs like his: there are 30,000 people working in the Northwoods recreation economy. Moe asks the legislators and commissioners whether tourists will still come north if the rivers and lakes are polluted. Moe says, "Sulfide mining has a perfect record. A perfect record of environmental damage. There are no examples of a hardrock mining operation without serious pollution." He likes the Wisconsin model. He wants PolyMet to make upfront financial assurances that will pay for any and all cleanup costs. He doesn't want taxpayers stuck with the bill, but Polymet says the upfront assurance is a deal-breaker, which isn't a surprise. Why? Because PolyMet also says acid-mine drainage (AMD) will occur at its proposed Hoyt Lakes mine. The company's draft Environmental Impact Statement stated that: ? "Water leaching from the waste rock piles is expected to be contaminated for up to 2,000 years," ? "The West Mine Pit will overflow at Mine Year 65 (45 years after expected mine closure), contaminating the adjacent Partridge River with sulfates and heavy metals;" ? "Due to structural instability, the tailings basin has a 'low margin of safety.'"	NS	X
27308	Unique			FIN	David A. Lien	Minnesota Backcountry Hunters & Anglers	3252	11	If PolyMet and Duluth Metals officials won't agree to abide by tough, common-sense legislation that requires them to be held fully accountable for all future remediation and cleanup costs, thereby protecting taxpayers from having to pay to clean up their toxic mess, it's time to send them packing. PolyMet says new technology will virtually eliminate the threat of acid-mine drainage. If that's the case, why won't they provide up-front financial guarantees? Why is this a deal-breaker if there's no concern about creating a toxic waste site? Answer: They must not believe their own rhetoric.	NS	X
5495	Form Letter	1	Variant	FIN	David Danz		430	4	4. The promise by PolyMet to build control ponds, monitor leakage and pay for damage in the event of poisonous leaching for a period of 500 years is so ridiculous it insults the intelligence of us all. For God's sake, empires rise and fall in a fraction of this time. How can one rely on the promise of a corporation which can declare bankruptcy and dissolve itself into non-existence in the course of one day to protect us from the damage they cause for the next 500 years?	NS	X
25355	Unique			FIN	David Ellis Hollenhorst		1157	1	make sure the financial assurance after the initial mining is completed is very substantial. Mining companies tend to disappear long before the environmental damage is rectified and cost continue to escalate.	NS	X
25851	Unique			FIN	David Franseen		1235	3	use the financial assurance section to require funding of monitoring where noted in the MDO as a future possibility as a consideration of assurance. Not defining who monitors, or how often results in failure to fund monitoring to assure that the potential compliance to state law becomes a certainty.	NS	X
24599	Unique			FIN	David Hajcek		1051	3	Also, financial pressures will win over at the end and there will be no maintenance to prevent spills. Ultimately, the company will cash out, declare bankruptcy and run.	NS	X
24386	Form Letter	1	Variant	FIN	David Mykkeltvedt		1037	1	I find that it is totally unbelievable that we are expecting a private company to treat waste water for 500 years. I object to politicians being paid off to approve a project that will benefit a very small number of people. I object to the process that allows projects like this to be pushed forward even though on the basis of lies and mis-information.	NS	X
29164	Unique			FIN	Deborah Huskins		3603	9	The FEIS asserts that financial assurance, protecting Minnesotans from having to pay the costs of maintaining water treatment, conducting clean-up and remediating damage (if that is even possible), will be adequate. It also states that financial assurance provided by Polymet would ensure (the FEIS's word) that environmental management, including planned water treatment, would continue for "as long as needed." How can that be, when the costs are not known, and the duration of the need to continue water treatment is not known? It could be well beyond 500 years. Financial assurance must be sufficient to continue mechanical water treatment indefinitely.	S	O
27675	Unique			FIN	Deborah Mielke		1834	2	Companies can go bankrupt and individuals agreeing on these terms may be long gone. What contingency plans are being made if PolyMet does not meet it's obligations and is no longer an entity?	NS	X
30753	Unique			FIN	Dennis Good		2890	2	Tactics like this are not new for this project. Anyone who has been involved with it or kept tabs on it knows this. Ignoring the 10mg/l sulfate standard; trying to keep the Land Exchange out of the EIS as a connected action; St. Louis County attempting to secure wetland mitigation acreage for Polymet without environmental review or public notice; the petty revenge taken against the State Auditor for daring to question the lack of Financial Assurance details; the endless propaganda from Polymet and its supporters designed to trumpet the economic benefits (which are cruel illusions) while downplaying and minimizing the environmental impacts which are real and dangerous; the hijacking of a special election endorsement process in Northern Minnesota to ensure the election of a Polymet supporter and the recent revelations that not only did Barr Engineering botch the water modeling between the East Pit and the Peter Mitchell Pit, the Co-Lead Agencies (our "Regulatory Agencies") never bothered to run any of the water models themselves as they are required to do by law. And the fact that this water will flow north, eventually into the BWCA, is not mentioned in the FEIS. Not only does this call into question all the water modeling but it also begs the question of where the Co-Lead Agencies loyalties lie.	NS	X
30753	Unique			FIN	Dennis Good		2892	4	If you do make it to the Financial Assurance section, it's easy to get through because there's virtually nothing there. It's the same nonsense from the SDEIS; "surety bonds, irrevocable letters of credit, cash and cash equivalents, trust funds, insurance policies". There's not a tangible asset in sight. This is nothing but worthless paper and the passage of time (200+years) won't improve its worth. These are the same toxic waste products that Wall Street has been peddling since day one. The SDEIS says "the amount of Financial Assurance associated with reclamation actions cannot be estimated until these actions are understood at a more detailed level of design." The FEIS says "The level of engineering design and planning required to calculate detailed Financial Assurance amounts is not currently available but it would be evaluated in detail during the permitting process". If the SDEIS and FEIS statements are true, then Polymet and the Co-Lead Agencies are trying to bypass the NEPA process. They are also trying to conceal from the public the true costs of this project. If a "detailed level of design" is not available for Financial Assurance purposes, then how is it available for determining the impacts of the mine during operations? If detailed Financial Assurance amounts are not "currently available", then this project is fundamentally and irretrievably flawed.	NS	X

17	Unique			FIN	Diana Tapelt		52	3	There are not detailed plans for securing a damage deposit sufficient to protect taxpayers from being stuck with a massive cleanup bill. PolyMet would require treatment of polluted water “indefinitely” after closure. “Indefinitely” is a delicate way of saying “forever.”	NS	X
28915	Unique			FIN	Donald Schreiner		2377	4	The PolyMet Final EIS should be rejected as incomplete because it fails to detail future risks and costs that are necessary to determine financial assurances to protect our children from paying for the cleanup of this proposed mine.	S	O
28915	Unique			FIN	Donald Schreiner		2378	5	In addition to point three above, it is not clear how much funding will be set aside by PolyMet to address negative environmental issues as they arise. As I have written before, if this project does move forward agencies representing the citizens of the state must demand that PolyMet have the financial capacity to pay for any environmental issues as/should they arise. This is now the ethical price of doing business. The last thing we need in 50 - 500 years is a superfund site next to the BWCA! The negative legacy left by PolyMet should not have to be paid for by our children or grandchildren.	S	O
28779	Unique			FIN	Dr and Mrs Thomas G. Murn, Jr		2351	3	Sulfide mining has always left untold cleanup costs during and after mining operations. But, in many cases, mining companies have gone bankrupt, underestimated costs, or struck back room deals with politicians to avoid paying the full costs. The mining companies’ own documents show that even after a sulfide mining site is closed, the state will have to monitor and treat pollution at the site for hundreds of years in the future—at a cost to Minnesota taxpayers in hundreds of millions or even billions of dollars.	NS	X
27730	Unique			FIN	Dr. Kyle R. Crocker		2122	1	the State of Minnesota and its people would assume enormous risks in this operation – at least 100 years of potential toxic poisoned waters and millions of dollars to mitigate this.	NS	X
22356	Unique			FIN	DyAnne Korda		866	2	Given the risk of pollution, clean-up costs must be taken into account and paid for upfront before profit is considered.	NS	X
27836	Unique			FIN	Ellen Hawkins		2183	6	There are still no realistic plans for ensuring a damage deposit big enough to protect generations of taxpayers from being stuck with a massive cleanup bill.	NS	X
25185	Unique			FIN	Emy Minzel		1137	1	I am an avid nature lover and as you are aware we already are fighting global water pollution. Please consider that we may need this clean water in the Boundary Waters Canoe Area in our very near future to survive. Please put people and environment over corporate profit! Lets also look at PolyMet's history of disaster clean up and business ethics. What company has the resources or integrity to stick around for hundreds of years for environmental clean-up if there is an "accident"?! I know of none in our history. They declare bankruptcy and leave the clean-up bill to the tax payers whose land they raped and ravage for profit. Not to mention the thousands of businesses downstream that would undoubtedly suffer if there were such a disastrous tragedy. Please do your job and protect OUR environment for our future generations!!!!	NS	X
3143	Form Letter	1	Variant	FIN	Eric Ament		358	1	I don't want to pay for someone else to get rich. That is not the America I know. I will be paying, my children will be paying and for 10 generations we will be left paying for the cleanup when the problems do arise. Perpetual cleanup is not okay. We might see some brief profits but our future generations won't. Instead we are asking them to pay for us when we should be investing in them.	NS	X
3143	Form Letter	1	Variant	FIN	Eric Ament		359	2	This company will close this mine if opened. Ask yourself how this process will happen. Look at all the examples of mining companies who have closed mines. Have you researched how many of them go bankrupt? If the company goes bankrupt who will pay for the cleanup? What are the statistical probabilities of a company being around in 500 years? If they aren't around who will be paying to clean the tailing, the water? Perpetual cleanup or 500 years is too long to comprehend. The legality of the pollution that needs to be controlled is debatable. But even if it was found legal it is not the representation we need from our politicians. We need politicians who can look at the morality in this to make the right decision.	NS	X
8708	Form Letter	4	Variant	FIN	Eric Eng		602	3	Ultimately it is in our federal regulations that any contracted mining oil, or mineral search and excavation persued in the US period. These companies ARE NOT LIABLE ultimately if something happens drastic or upon moving there operations to elsewhere.	NS	X
11017	Form Letter	1	Variant	FIN	Eric Krenz		745	3	I'm concerned that when the last of the recourses are removed from the ground, they will declare bankruptcy and attempt to stick the taxpayers with the bill for an "indefinite" environmental disaster.	NS	X
26608	Form Letter	1	Variant	FIN	Eric Snyder		1362	5	There's also excellent basis for assuming that mining companies will not be held fully financially accountable for such disasters and that such environmental disasters will be remediated to the fullest possible extent.	NS	X
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	3947	6	All predictions made by the FEIS regarding activities after closure, including but not limited to reclamation, mitigation measures, water treatment, transitions to new technology including reverse osmosis (RO) at the Waste Water Treatment Facility (WWTF) are unsupported without analysis of financial assurance. This FEIS also relies to an extraordinary degree on “adaptive management” strategies—used incorrectly here as merely monitoring plans with general descriptions of potential strategies that could be used if problems arise—that will require action after Year 20, when PolyMet says it will cease mining operations. But adaptive management strategies can only be deployed if there is money to pay for them. Thus, all adaptive management strategies identified in the FEIS are also unsupported without specific financial assurance information.	NS	X
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	3948	7	Dr. Chambers elaborated on the specific legal and scientific obligations of an agency overseeing environmental review of a mining operation to provide financial assurance details. In addition, the Conservation Organizations have attached an example of an EIS with adequate financial assurance details, the FEIS for the Idaho Cobalt Mine. The Co-Lead Agencies have continually alleged that there is no obligation to provide financial assurance information until permitting.7 The FEIS states that “[n]either NEPA nor MEPA rules require that all financial assurance mechanisms be in place before the EIS is finalized.” However, the Co-Lead Agencies misstate concern here. The Conservation Organizations are not suggesting that any financial assurance mechanisms should be in place before the EIS is finalized. We are saying that details regarding the financial assurance package need to be included the FEIS in order to understand the potential impacts of the project as analyzed under NEPA or MEPA.	S	O
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	3952	10	This particular FEIS states the need for extensive work after closure, including the requirement that two active waste water treatment plants with a particularly expensive form of treatment run for an indefinite period of time. Without adequate financial assurance determined and supported in the FEIS, a foreseeable impact of any mine would be that, upon closure, whether planned or unplanned, there will be insufficient funds available and either the state or federal government will need to bear the cost of reclamation, cleanup and long-term treatment—or those activities will not take place and the site will cause significant impacts to the environment. Any agency that permits a mine without determining whether the financial assurance amount is adequate has not assessed this impact, and risks making an irretrievable commitment to a project without fully understanding the consequences, in violation of NEPA.	S	N
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	3979	39	Issues in relation to specific engineered systems are discussed below, including: errors, accidents, and failures; the uncertainty of mitigation measures; and unfounded promises of adaptive management. However, two other factors affect uncertainty and risk for all systems at the proposed NorthMet project: cost and financial assurance; and the length of time that systems will need to operate. In regard to cost and financial assurance, many problems that could occur would not surface until after mining ends and the company no longer has a source of revenue. As an example, the tailings basin leachate containment and collection system will likely need to operate for centuries after mining has ended. A series of mishaps, errors, and negligence might result in a blocked drain, a build-up of water, and a significant rupture in the containment wall. Fixing the system would no doubt be expensive. PolyMet will not be required to post financial assurance at the outset to cover this or other unplanned events, because Minnesota regulations only require financial assurance for predicted reclamation needs. If things do not go according to prediction to the extent that a permit violation may result, the DNR may require financial assurance at the time when the potential violation is discovered. In this example, because the problem would not occur until after mining has ceased, there would be no source of financing. Whether it is called “mitigation” or “adaptive management,” it is not effective if there is no way to pay for it.	S	O
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	4086	149	17.4.1 Assurance for monitoring for indirect effects. The FEIS defers the issue of indirect effects and claims that indirect wetland effects will not be mitigated prior to commencement of the mining project. Rather, the FEIS provides that wetlands that have the most probability of impacts (a questionable concept in itself, see discussion above) will be monitored and if indirect effects occur, they will be identified and mitigated. Putting aside the issue of whether this is an acceptable approach to indirect effects as a whole, there remains a serious issue regarding financial assurance to ensure the monitoring will occur at a frequency and adequate number of locations, and for a sufficient period of time after mine closure. The project proponents and the Co-Lead Agencies should disclose the cost of the proposed monitoring given that they know where they intend to place monitors (with their purported ratings approach) and they know how much monitors cost. The costs of monitoring should be extended for the period of time after mining ceases that effects are expected—at least for a length of time after the East Pit fills given the modeling showing movement of water between the East Pit and Northshore and the possibility of flows northward. This is an knowable cost estimate that should be provided to the public.	S	N
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	4088	150	17.4.2 Assurance for mitigation. The FEIS also must disclose the cost estimates for wetland mitigation. The project proponent and Co-Lead Agencies already know the sites where they propose to mitigate for direct wetland effects. Information regarding the costs associated with acquisition of those sites, either directly or through leasing or purchase of easements, is known. Also known are the bulk of activities necessary to restore those sites as demonstrated by the discussions of hydrology restoration, planting, and monitoring set forth in the FEIS. For example, PolyMet and/or the Co-Lead Agencies are fully capable of estimating labor costs, time, equipment necessary to the job and costs of seedlings to arrive at an estimate. Again, those are known quantities with known and knowable costs whereby an estimate can readily be provided. The mitigation sites will also require their own monitoring, another cost estimate that must be provided and that can be readily known with information available now. This information would also allow an estimate for the public for future mitigation needs for indirect wetland effects. It is critical that PolyMet be required to set aside funds should indirect effects need to be mitigated at some point in the future. With the information available regarding mitigation for direct effects, at least some general estimate can be given for financial assurance needs for future indirect effects.	S	O
29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	4089	151	17.4.3 Financial assurance instruments. The FEIS includes no information regarding available financial assurance options and the risks and benefits of each, information that is important to Co-Lead Agencies’ ultimate decision and certainly important to the public’s understanding and assessment of the project and its effect on Minnesota’s environment and Minnesota taxpayers. Financial assurance can take the form of cash held in reserve by the state, letters of credit, surety bonds, or insurance.320 Some of these instruments are more secure than others. In particular, only letters of credit to the benefit of the state, payable on demand upon the occurrence of a clearly-defined triggering event, are free of bankruptcy constraints and readily available should they be needed to protect the public. This analysis and these disclosures should be made now for the public to have a full understanding of the risks and benefits of various financial assurance instruments. The FEIS includes no discussion of this kind.	S	O

29745	Unique			FIN	Erin Mittag	Minnesota Center for Environmental Advocacy	4090	152	17.4.4 Project proponent financial status. The FEIS includes no information or analysis of PolyMet's (or PolyMet's parent's) financial status or credit-worthiness other than to disclose that PolyMet in fact has no assets and is entirely dependent upon its parent company. The FEIS, in connection with information regarding the amount and type of financial assurance that may be available and required for the PolyMet project, should disclose the assets and liability of PolyMet and its parent company, both current and projected through at least the beginning of the mine operation. The disclosures should be comparable to the disclosure that would be provided a bank for financing as that is essentially what is being asked of the State of Minnesota; to trust PolyMet to comply with its obligations to the state's and the nation's natural resource assets.	S	N
10132	Unique			FIN	Ernest Peaslee		655	3	The funding reserves for future problems would inevitably disappear as years and corporate shenanigans go along.	NS	X
28547	Unique			FIN	Esteban Chiriboga	GLIFWC	3505	7	The analysis conducted in support of the proposed mine is inadequate in that it fails to predict the length of time that water treatment would be required in order to avoid exceedance of water quality standards.	S	O
28547	Unique			FIN	Esteban Chiriboga	GLIFWC	3506	8	GLIFWC staff agree that the statement above is accurate however we note that it is not very informative. The bottom line is that the FEIS does not predict how long water treatment will be needed for this project. Tribal cooperating agencies and intertribal agencies requested that this analysis be done but the co-lead agencies denied that request. This lack of knowledge has serious implications on financial assurance and the logical feasibility of the project. The notion of water treatment and maintenance for hundreds of years, supported by financial assurance instruments that must also be available for hundreds of years, is difficult to justify.	NS	X
28547	Unique			FIN	Esteban Chiriboga	GLIFWC	3509	9	While the duration of water treatment is unknown, there are many engineered features proposed for this project for which perpetual maintenance is a certainty. These include the water capture and pumpback systems at the flotation tailings basin, the Category 1 stockpile cover system, the hydrometallurgical tailings facility, the overflow control structure at the west pit lake, etc. The FEIS also includes a goal to transition from mechanical water treatment (water treatment plant using reverse osmosis) to non-mechanical methods such as constructed wetlands, permeable reactive barriers, etc. The FEIS does not provide detail on the passive systems, because it states that their effectiveness would have to be demonstrated at a later date. However, it is important to note that passive systems are not maintenance free systems. Available literature indicates that non-mechanical systems require periodic maintenance and replacement. Therefore, the hypothetical transition to a non-mechanical treatment method does not eliminate the need for perpetual maintenance, in fact perpetual maintenance is guaranteed. Minnesota Rule 6132.3200, regarding closures and postclosure maintenance of mines, states that the goal of closure and reclamation is that "[t]he mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free." Because perpetual maintenance will be required at the hydrometallurgical residue facility, as well as at the numerous engineered features listed above, the project does not appear to meet this goal.	NS	X
				FIN	Esteban Chiriboga	GLIFWC	3554-1	57	The FEIS does not provide an adequate level of information on financial assurance. The FEIS lists items for which costs must be included in the financial assurance instrument (i.e. demolition of all structures and remediation of sites, fencing the perimeters, sloping and seeding the overburden, constructing outlet structures, removing culverts, etc.) yet fails to provide any estimated costs or the basis for these costs. This section also notes that reclamation and postreclamation costs are required yet fails to provide any estimated costs or the basis for their estimation (i.e. quantities, unit costs, inflation estimates). The FEIS provides an initial estimate for 3 years of operation (Table 3.2-15). However, there is no basis for their estimation or other assumptions. The FEIS failed to provide detailed costs for the physical closure and reclamation of the mine site that will need to be covered by financial assurance instruments, a detailed discussion as to how much money will be needed from financial assurance instruments and when. The basis for physical closure and reclamation costs need to be based on the private sector costs and include realistic profit margins when performing cleanup tasks. Cost to be covered by Financial Assurance need to include detailed information and cover the following areas: 1) interim operations and maintenance for agencies when a company declares bankruptcy and leaves the site, 2) water management and treatment, 3) removal of hazardous wastes and substances, 4) demolition, removal and disposal of facilities and equipment, 5) earthwork (sloping, backfill, grading), 6) re-vegetation, 7) long-term operations and maintenance, 8) Monitoring costs, 9) detailed inflation estimates, 9) provide a cash flow analysis, and 10) detail assumptions in the determination of risk and uncertainty. The FEIS should have included the lifecycle of the pollution control structures built, estimates for their original construction costs, and projections for replacement costs for timeframes of hundreds to thousands of years. In addition to providing detailed cost estimation, the FEIS should have identified and communicated assumptions regarding inflation rates, rates of return, contingencies, and labor rates. Closure and maintenance costs will need to be covered years into the future, so a net present value should have been part of the FEIS. For example, reverse osmosis is being proposed at the mine as a means of treating the mine's waste water and ensure compliance with water quality standards. Water treatment at this site is indefinite but will certainly be required for centuries.		
				FIN	Esteban Chiriboga	GLIFWC	3554-2	57	EPA has assessed reverse osmosis pollution control technology at mine sites within its Reference Guide to Treatment Technologies for Mining-Influenced Water published in March 2014 (EPA, 2014) and noted the following: • Reverse osmosis is a proven method to demineralize acid mine drainage. However, it does require significant construction and operating costs. • With pre-treatment and routine maintenance, membranes typically last two to five years and frequent membrane monitoring and maintenance are required to ensure the effective operation of a reverse osmosis system. • Management and disposal of the brine solution that is generated can require higher operating costs. In arid climates, atmospheric evaporation may offer a technique for removing water in the brine solution followed by appropriate solid waste disposal. For locations where atmospheric evaporation is not feasible, thermal treatment may be needed. The FEIS states that the atmospheric evaporation technique would be used at NorthMet. However, the feasibility of this proposal has not been evaluated. • Reverse osmosis is also in use at the Kennecott South site, which is located in the Salt Lake Valley, east-southeast of Copperton, Utah. The Bingham Canyon Water Treatment Plant (BCWTP), built as part of the site's remedy, is located in operable unit (OU) 2. Reverse osmosis is being used as the primary technology for addressing total dissolved solids- and sulfate impacted ground water.... The total cost for the BCWTP was about \$16.1 million (2013 USD). Total yearly operation and maintenance costs (40 percent of these costs represent labor and 24-hour maintenance) for the BCWTP are about \$1.3 million (2013 USD). These capital and yearly operation and maintenance costs include energy requirements, but do not reflect the costs associated with extraction wells, feed pipelines, disposal infrastructure and off-site disposal. It is obvious that reverse osmosis requires high capital costs for the purchase, installation and operation of the membrane system. For a 1-million-gpd system, the total installed cost is estimated at \$42.9 million (2013 USD). Annual operation and maintenance costs for the same system are estimated at \$3.2 million (2013 USD). However, other features of the proposed mine will need to function indefinitely and must also be financially assured.		
28547	Unique			FIN	Esteban Chiriboga	GLIFWC	3554-3	57	The FEIS provides a listing of contingencies that may have to be covered by financial instruments including: 1) physical difficulties in implementing reclamation plans, 2) escalating standards of closure, reclamation, and long-term monitoring, 3) unanticipated liabilities, 4) unplanned cessation of mining, 5) failure of the mining company, and 6) failure or limitations on the ability of third parties to pay reclamation costs. Unfortunately the FEIS provides no discussion as to any of the costs of the contingencies that are identified. The FEIS also fails to discuss how financial instruments would be structured to meet those contingencies or the assumptions made by PolyMet to ensure an adequate stream of revenue is available to meet closure and maintenance costs. What fundamental economic assumptions are being made when PolyMet proposes to use surety bonds, irrevocable letters of credit, cash and cash equivalents, trust funds, insurance policies, or a combination of these Financial Assurance Instruments? The FEIS failed to clearly state how the State of Minnesota will determine the maximum bond requirements, how it estimated direct reclamation costs, how it determined its estimates for inflation (i.e. periodic bond recalculation or calculate an Inflation factor using a common index, such as the Construction Cost Indexes (CCI) from the Engineering News Record), and how it will determine indirect reclamation costs and how it will calculate the total bond amount. Historically, mining companies are temporary entities that disband soon after a mine project comes to an end. In reality, it is likely that PolyMet will not exist during post closure. The most reasonable scenario for long term closure is that a state or federal agency will be responsible for monitoring, maintenance, and cleanup activities because a mining company cannot be held accountable if it no longer exists. Similarly, the assumption that financial assurance instruments can be developed to ensure that funds will be available centuries from now is not logical. The State of Minnesota has existed for 155 years. The United States of America has existed for 237 years. The notion that a mining company and financial assurance instruments will be available to work on a mine site 500 years from now or longer, is not believable.	S	O
29229	Unique			FIN	Gail C. Roberts		3617	5	Despite more discussion about Financial Assurance in the FEIS than was provided in the SDEIS (Section 3.2.2.4), there still is the lack of specific financial information about the financial resources of PolyMet and associates (e.g., Glencore), and no detailed risk/benefit analysis from a state perspective. Citing the reference to statute and rules that "financial assurance criteria require that funds must not be dischargeable through bankruptcy and are fully binding and enforceable under state and federal law" makes no sense if the corporations do not have sound financial resources adequate to provide financial assurance of the quality specified in the quoted rule. Financial assurance must be provided up front. This issue is basic to the adequacy of the FEIS and needs to be addressed at a stage before the permitting process.	S	O
55	Unique			FIN	Gary Geisler		136	4	Does anyone actually believe PolyMet will stick around to monitor their tailing ponds for the next several centuries? A hundred years from now, all the needed infrastructure necessary to do so probably won't even exist anymore!	NS	X
29965	Unique			FIN	Gary Glass		4287	50	Financial assurance, 3-48. Add to the final EIS: given the proposed project would leave behind a massive quantity of reactive mine wastes, it is reasonable and good public policy that a portion of the finished product from the proposed project be left behind to guarantee financial assurance that any future needs and all remaining and developing problems are properly mitigated and attended to. The problems experienced by other states (Pennsylvania acid mine drainage lasts greater than 100 years/mine) and provinces indicate that 15% of the gross annual profit would not be out of line for guaranteeing financial assurance. An annual deposit for financial assurance should be paid from the annual metals production, in native Minnesota gold, silver and platinum, and be deposited and held in the North Shore State Bank of Duluth for as long as is necessary to assure permanent protection of Minnesota's aquatic resources of the Lake Superior watershed from the impacts of the proposed project.	S	O
28301	Form Letter	1	Variant	FIN	Gary Horning		2244	1	1- Nowhere could I find anything about site clean-up and remediation funding. Poly-Met is a \$.90 stock company. They have no money to put up. Glencore has it's own financial problems. I would estimate at least \$500m would need to be put in escrow for cleanup and remediation when the mine shuts down. Mines when they cease operations have a habit of going out of business, sticking the state and taxpayers with the bill. That money needs to be guaranteed before any permits are issued, otherwise Minnesota and the taxpayers will lose big time. How much money is the DNR going to require Poly-Met to put up before issuing permits?	S	O
46	Unique			FIN	Gene R Cooper		115	2	What happens when the mine is closed in years to come and the land and water are polluted?	NS	X
27661	Unique			FIN	Gerard Snyder		1797	1	Governor Dayton is planning to examine the mining experience and financial wherewithal of PolyMet Mining Corporation to launch, sustain, and provide adequate financial assurance for its proposed mining operations. Permitting an inadequately or marginally financed mining company to undertake such operations would put Minnesota's reputation, its economy, its natural environment and its taxpayers at risk for generations to come.	NS	X

27661	Unique			FIN	Gerard Snyder		1809	3	As of its most recent Pricewaterhouse Cooper LLP audited financial statements dated January 31 , 2015, PolyMet disclosed that had accumulated a deficit of \$103.8 million [Id at 9, 16, F4] and that most of its assets consist of capitalized expenditures. Statements such as these, made by PolyMet in SEC filings containing audited financial statements and certified by PolyMet Chief Executive Officer and Chief Financial Officer, should be given greater weight in evaluating PolyMet's financial wherewithal than statements made by PolyMet without such checks and balances, such as those fragmented verbal communications, press releases, and advertisements. And statements such as those contained in the SEC filing, raise considerable doubts as to PolyMet's ability to deliver on its promises to the State of Minnesota.	NS	X
27661	Unique			FIN	Gerard Snyder		1810	4	Since PolyMet is so thinly capitalized, it has little margin of error to avoid bankruptcy.	NS	X
27661	Unique			FIN	Gerard Snyder		1811	5	PolyMet is dependent on, and controlled by its parent company, Xstrada Glencore, to fund or guarantee its financial obligations and to provide mining expertise. Declining commodity prices makes it increasingly questionable whether Glencore has the financial resources to sustain a viable operation for not only PolyMet, but also for itself.	NS	X
27661	Unique			FIN	Gerard Snyder		1812	6	Glencore is incorporated in the island of Jersey, located in the English Channel off the coast of Normandy, France, and headquartered in Switzerland. Substantially all of Glencore's assets and the majority of the assets of its directors and officers are located outside the U.S. As result, it may not be possible to effect service of process on them within the U.S. Without service of process, Glencore might not be accountable through U.S. courts or Minnesota regulators for its conduct with respect to PolyMet.	S	O
27661	Unique			FIN	Gerard Snyder		1813	7	Moreover, the legal ramifications in an open-ended requirement, "as long as needed" or "required indefinitely" (FINAL EIS) may create a problem with the rule against perpetuities. Furthermore, since the financial assurance anticipates possible future infusion of funds into the assurance program, payments might be treated as a voidable preference period by which a bankruptcy court could redirect recent funding to be paid to outstanding creditors, and not to be used for reclamation.	NS	X
27661	Unique			FIN	Gerard Snyder		1814	8	the DNR mistakenly takes comfort that money owed to the DNR for environmental corrective actions cannot be discharged through bankruptcy. Since the DNR agreements are with PolyMet, not Glencore, then this provision has no value if PolyMet has little or no tangible assets.	S	O
27661	Unique			FIN	Gerard Snyder		1815	9	If the mining Minnesota operations were undertaken by financially sound, legally based U.S. company, with quality reputations of its officers and directors, a record of environmental enlightenment, and good employee relations, then Governor Dayton might still have a hard decision, but it should not be hard to render a negative decision on PolyMet's inadequate mining permit application .	NS	X
6817	Unique			FIN	Greg Solberg		510	1	1. How much money will it cost to treat the water until it doesn't need to be treated any longer? 2. How much money does a failure cost? 3. How long do the set aside funds need to be set aside to satisfy the above two questions? The problem, as I see it, is none of the above questions can be answered with any kind of certainty. Yet someone - the State I'm assuming - is going to somehow come up with numbers and time frames. Polymet keeps saying they'll deal with the financial assurance at permitting. But how can they make any promises about this project if there's no money to pay for all the maintenance and water quality treatment after closure? Financial assurances ought to be an issue for public discussion now, not later. Is this just another end-around...much like the wild rice standard?	S	O
6433	Unique			FIN	Hans Olsen		493	8	Financial Assurance. The public seeks to know if the operating companies standing behind PolyMet can provide adequate financial assurance in the form of performance bonds or other forms of insurance to fund long term cleanup operations which could run for hundreds of years. This issue has simply been punted down the road out of the FEIS	S	O
29738	Unique			FIN	Harold Edwards		2587	10	Second, lobby with legislature to pass a law codifying the above decision in a Minnesota statute that allows the Attorney General to sue the shareholders of companies that 1) harm the environment, or 2) harm public safety, or 3) harm public health and which do not have reasonable assets to pay for the damage. The Attorney General should be able to recover damages and legal fees against any and all the shareholders. If other corporations own the tortfeasor and in turn have insufficient assets, then the Attorney General should be able to pierce their corporate veils as well. This law is fair but will not easily get through the legislature. Remember those sports stadiums? Just keep coming back at them again and again.	NS	X
29738	Unique			FIN	Harold Edwards		2588	11	We have made it all too easy for investors to create mischief and walk away from it with little thought. Once they know they have additional legal liability, they might have second thoughts about projects like Polymet. This in turn will force companies to keep bigger financial reserves and to take additional measures to keep their investors free from liability. The marketplace will now put a reasonable dollar value on the actual risk. I suggest the DNR assist the legislature in writing up the bill that allows the Attorney General to pierce corporate veils as outlined above.	NS	X
29738	Unique			FIN	Harold Edwards		2606	7	The mine is expected to produce ore for one hundred years and the environmental hazard from the waste is expected to persist for another four hundred years. Today Polymet's assets mostly consist of its plant and equipment and the value of the mining leases for the ore under the mine site. They do not own the ore outright. In the event of a environmental catastrophe these all will become worthless. Who would want to mine on a superfund site? In that event Polymet has insufficient assets to make any cleanup. Furthermore, it will have declared bankruptcy and gone out of business leaving the local population and Minnesota taxpayers holding the bag. To mitigate this possibility, Polymet has set aside a contingency fund for some cleanup.	NS	X
29738	Unique			FIN	Harold Edwards		2607	8	Consider this: in the first year there will be a large amount of ore in the ground with enormous potential to generate money. In the first year there will be little waste generated with little risk from the toxic wastes, and what there is can easily be handled by the cleanup fund. In the 100th year there is no more ore in the ground, and the mine is worthless. In the 100th year there is a large amount of toxic waste with little money to clean it up if there should be a disaster. Furthermore there will have to be an additional four hundred years of monitoring and a possible cleanup. At some point before the end of 100 years there will be too little ore in the ground and too much waste generated to make the mine profitable anymore. At that point Polymet will go bankrupt and leave the local population and Minnesota taxpayer holding the bag. It is obvious that there are insufficient funds from Polymet to cover this loss.	NS	X
29738	Unique			FIN	Harold Edwards		2608	9	Ordinarily the investors of a corporation are held harmless when the company can no longer pay its bills. However, in the case where a company has insufficient assets to cover the harm it creates the local population and/or the taxpayers of Minnesota may pierce the corporate veil and collect directly against the investors. The governing law on that is a Minnesota Supreme Court case, Victoria Elevator Co. v. Meriden Grain Co., 283 N.W.2d 509 (1979): "Factors considered significant in the determination [to hold shareholders liable] include: insufficient capitalization for purposes of corporate undertaking. . . ." Polymet has insufficient assets to cover any reasonably expected environmental cleanup. Of course the law is complicated, and in actual litigation the investors of Polymet might be held harmless. That is neither here nor there. The Sierra Club must do two things: First, conduct a media campaign threatening the investors with future litigation and liability. This is a wake-up call to them. Investor beware!	NS	X
29909	Unique			FIN	Harold Nordin		2718	7	It fails to present detailed plans for providing monetary support or insurance sufficient to cover costs associated with a long-term clean-up in the event of a pollution event, and it fails to insulate taxpayers of the state against a massive clean-up expense;	S	O
29909	Unique			FIN	Harold Nordin		2719	8	It fails to address issues and costs associated with long-term treatment and monitoring of polluted water from the site after termination of operations—forever is a long time;	S	O
29909	Unique			FIN	Harold Nordin		2721	10	It fails to adequately address the financial costs associated with post-operational site restoration and clean-up and long term monitoring of the site.	S	O
29240	Unique			FIN	Henry V. Mott		3629	2	PolyMet's geochemical modeling suggests that after a period of some 200 or so years, the water in the pit might be of quality to allow for discharge without treatment. While I am not privy to the details of PolyMet's modeling efforts, I do fully understand the combination of limnological and hydrogeochemical processes involved in converting sulfide in exposed rock to sulfate and acid. The state of quantitative understanding of the sulfate producing process in deep water bodies is in its infancy. These predictions are nothing more than educated wild guesses. Basing a vital "here and now" decision, to allow the west pit to fill and behave entirely on its own volition, on the model prediction that west pit water quality would improve significantly over the next five centuries seems overly optimistic. The west pit, like all deep lakes in the northern U.S., would be dimictic. Each fall prior to freeze over the strong summer thermocline would disappear, and then in the spring, subsequent to ice-out, the weak winter thermocline would disappear. In the absence of the thermocline the combination of convective mixing due to thermal gradients and advective mixing due to wind action would lead to a brief condition wherein the pit would be completely mixed. Oxygen from the atmosphere would saturate water at the surface and that oxygen-saturated water would then be mixed throughout the water column, replenishing hypolimnetic saturation deficits brought about by microbial activity during isolation of the hypolimnion from the atmosphere by the thermocline. As a consequence, twice per year, each and every year, the depths of the west pit would be replenished with oxygen, providing the terminal electron acceptor for the electrons obtained by microbes from sulfide for their metabolic processes resulting in conversion of sulfide to sulfate and acid. As sulfides are leached from the geologic formations, the formations themselves would deteriorate at the solid-water interface, exposing additional fresh sulfide minerals to the microbial populations responsible for the acid-production process. This process would continue as long as the lake exists. The character of the ARD filling this pit can be exemplified by the ARD filling Montana's Berkely pit. What's in store for this sensitive Northern Minnesota ecosystem is hypolimnetic water with pH ~2.5, specific conductance of ~8600 microSiemens and redox potential of ~630 mV; epilimnetic water with pH ~2.5, specific conductance of 7900 microSiemens and redox potential of ~670 mV; and, overall, water with copper and zinc concentrations between 150 and 200 and between 500 and 600 mg/L, respectively (http://www.mbmng.mtech.edu/env/env-berkeley.asp, accessed 12/19/2015). The combination of redox potential and pH define a condition for which electron acceptors more thermodynamically preferred than sulfate would be present and for which sulfide, if present and accessible by the microbial population, would be a major electron donor. As long as the electron acceptors are present and as long as the sulfide is accessible, the acidification process would continue. The character of the ARD in Montana's Berkely pit is entirely consistent with the set of cyclic limnologic processes described in the previous paragraph. This pit lake exists, it is a major problem in Montana, and the US EPA and the State of Montana have no really good plan as to how to deal with the pit waters when it fills and begins to overflow. This situation is what would be in store for Minnesota if PolyMet's west pit is left open and allowed to fill and then overflow. The only measure standing between this acid generating situation and Minnesota's sensitive water resources is PolyMet's assurances that they would be around to fund and operate a treatment plant as long as is necessary. The mining industry has a strong track record for folding up holding companies and disappearing as soon as all the profits have been made. A simple filing of a Chapter 11 bankruptcy would transfer the responsibility to taxpayers of the State of Minnesota. Mining the sulfide-laden ore and leaving this pit open would be an environmental travesty committed right under the noses of the government whose responsibility is to be stewards for the environmental resources of the State of Minnesota.	S	O

29240	Unique			FIN	Henry V. Mott		3637	10	PolyMet’s plans include a system for capture of leachate from this tailings impoundment and for treatment of that leachate by the aforementioned mechanical eventually yielding to a “yet to be defined” passive treatment system. Plans call for this tailings impoundment to exist in perpetuity, which is certainly more of the same “business as usual” approach to mining wherein the tailings will simply be strewn over the Earth and left with a protective system that may or may not assimilate acid production. The emergency treatment – the water treatment facility will provide protection only as long as PolyMet has the financial will to operate and maintain it.	S	O
29240	Unique			FIN	Henry V. Mott		3639	12	PolyMet plans to “isolate” the hydrometallurgical wastes from the environment using a 40 mil LDPE liner to prevent intrusion of rainwater and a double LDPE (80 mil and 60 mil) liner to prevent migration of leachate from the wastes into the subsurface below. Leachate formed would be collected and routed to the mechanical/passive treatment system discussed above. As with the class 1 waste rock pile, the cap would require annual maintenance to prevent woody growth and to ensure the cap remains vegetated. Of course, this liner would be subject to the same sets of environmental process as the waste rock cap. Again, PolyMet wants to assure us that this liner will isolate the contents of the hydrometallurgical waste repository from the environment in perpetuity. The same building roof argument applies here as for the waste rock pile. Eventually the cap will fail and the leachate collection system will collect leachate which will need to be treated by the water treatment system, given PolyMet has the financial will to maintain and staff the plant.	S	O
29240	Unique			FIN	Henry V. Mott		3642	15	Certainly the technology exists to treat virtually any water, no matter how contaminated, to a level suitable for discharge to surface waters or even for consumption by humans. As contaminant levels become higher and treatment objectives become more stringent, costs increase, often exponentially. PolyMet has in its proposal suggested that reverse osmosis (RO) would be a technology of choice for treatment of pit overflow water and leachates from the waste rock pile, tailings impoundment and hydrometallurgical waste repository. Water treatment using reverse osmosis requires significant pretreatment of water otherwise RO membranes fail miserably. By and large this treatment process will require a highly sophisticated operational staff and significant financial resources for materials, supplies and plant maintenance. This is all fine and well as long as PolyMet maintains the financial will to operate the plant, which, based on PolyMet’s own predictions, will likely be needed for centuries into the future. Unfortunately, historically, the mining industry is rife with examples of mining companies that have gone “belly up” at the prospect of dealing with the messes they’ve made. One need only to do a quick internet search to inform oneself of many key instances – Brohm Mining in South Dakota, Galactic Resources in Colorado, and Pegasus Gold in Montana are three recent infamous cases. PolyMet itself is a subsidiary corporation that has been formed specifically for this project, in part to limit the liability of the parent companies and associated investors from financial risks associated with the potential failure of the project. Belief that PolyMet will be around and will have the financial will to operate this treatment system long after the profits from the mining operation have been realized and banked by CEOs, top managers, and investors is akin to adult belief in the Easter Bunny and Tooth Fairy. Approval of this project based on a closure strategy relying on long-term treatment of pit water and leachate will commit the State of Minnesota and its people to the very costly cleanup of this mess that PolyMet intends to make in the interests of large monetary profits for a select few and ephemeral jobs for a few more.	S	O
29094	Unique			FIN	Holly Buchanan		2417	2	Rather, the risk and burden fall to the people of Minnesota while the profits will accrue to a foreign corporation.	NS	X
52	Unique			FIN	Holly Wells		126	4	And if any negative impact on local water resources does occur, that there are designated means for this project to clean up source of negative impact to local water supply and provide interim safe water to locals who are effected by the situation.	NS	X
26658	Form Letter	1	Variant	FIN	J.M. Alexander		1408	2	IF the mine is approved, owners of the mine should have to deposit all proceeds, less the wages of the workers, but NOT the salaries of the executives, and actual operating costs, for at least 10-20 years into a trust fund to pay for clean up. If by the time the mine closes, it has not caused environmental damage, the funds can be returned to the mining owners. If it has, the funds should be used for clean up and a penalty payable to the State for further environmental efforts. Please be advised that I consider this a dramatically inferior option to just prohibiting the mine from going forward in the first place.	NS	X
27432	Unique			FIN	Jack Buck		1742	2	Secondly, how accountable is PolyMet (in the event that the mine should fail or be abandoned) to continue paying liabilities to the state? The Reclamation and Financial Assurance Fact Sheet states, "PolyMet’s preliminary cost estimate for reclamation and post-closure activities for the proposed NorthMet project would be up to approximately \$200 million for reclamation activities, and an additional \$3.5 million to \$6 million a year for post-closure monitoring and maintenance." However, it does not address the possibility of PolyMet’s bankruptcy, however improbable, and that issue concerns me. I have heard about the Zortman-Landusky mine failures in Montana, and while I understand it faced different conditions and was a gold mine, not a copper-nickel, the fact that the state of Montana is still working to pay off repercussions from 17 years ago in my opinion speaks loudly to the gravity of something like that occurring here... How would Minnesota taxpayers and the state itself have to deal with a fallout such as that?	NS	X
10	Unique			FIN	Jana Guseynova		21	6	Each of those mines passed a similar environmental impact statement process, then left unacceptable amounts of pollution to clean up, paid for mostly by taxpayers.	NS	X
7393	Form Letter	4	Variant	FIN	Jane Beattie		537	4	How can PolyMet provide financial assurance for the hundreds of years of mechanical water treatment that will be required to comply with water quality standards?	NS	X
9309	Form Letter	4	Variant	FIN	Jane Nicholson		625	3	The FEIS is plainly inadequate, as it has still not answered fundamental questions such as which direction the pollution will flow, or how PolyMet can provide financial assurance for the hundreds of years of mechanical water treatment that would be required to comply with water quality standards.	NS	X
23365	Unique			FIN	Janet Keough		941	4	The Polymer FEIS should be rejected as incomplete because it fails to detail future risks and costs that are necessary to determine financial assurances to protect our children from paying for the cleanup of this proposed mine.	NS	X
29839	Unique			FIN	Janice Ann Smith		2655	4	Once the mines run out of ore, it is highly likely that the state of Minnesota would be left with the responsibility for the high cost of containment and clean-up.	NS	X
27411	Unique			FIN	Jared Yount		1727	2	We will end up cleaning up after this mine for many years after the mine is closed or the company that operates it goes belly up.	NS	X
29282	Unique			FIN	Jason H. Kuehn		2488	1	The funding for necessary water treatment over the next several centuries is uncertain and inadequate, as would be the funding for the reclamation and cleanup after a potential mishap.	NS	X
27686	Unique			FIN	Jason McCall		226	4	PolyMet will funnel profits to the parent company and claim bankruptcy the day after they stop mining leaving the taxpayer with the mess.	NS	X
28471	Form Letter	1	Variant	FIN	Jason Peterson		2252	2	The risk and reward for Minnesota are way out of balance. In the unthinkable event of this project moving forward, I am also very skeptical about this business concern being accountable for the proposed containment and treatment for the centuries they will be required. Once they’ve got their metal out of the ground, one or more of these companies in this complicated chain will fold up, leaving MN holding the sack and the investors shielded from their responsibilities. Sad that anyone could consider doing this to the environment and leaving others to clean up the mess, but that seems to be all too common. Too much risk, too little reward.	NS	X
27421	Unique			FIN	Jeff Bryan		1738	3	The expense of the clean up will be borne by the citizens of the state.	NS	X
26627	Unique			FIN	Jeff Schroeder		1378	7	All this risk is being taken for some state revenue and about 350 jobs? When the mines accounted for thousands of jobs, maybe the balance favored accepting more risk. I realize that an operation like this will a large but temporary economic impact on the entire Iron Range community but what about the impact over the next 200 to 500 years? The most likely winners are the owners of the mine, Good luck finding a way to stick them with paying for remediation or damages after the mine and plant are retired.	NS	X
26627	Unique			FIN	Jeff Schroeder		1379	8	Corporations have so many ways to avoid liability, give them 200 years to figure out how and they will rewrite the laws by buying off a few key legislators. Sorry for being so cynical but really do you think that the public won’t be the ones to pay for any environmental consequences, they always have.	NS	X
4557	Unique			FIN	Jeff Wehr		411	3	They just destroy our lands and they just leave it to the tax payers to fix.	NS	X
27060	Form Letter	1	Variant	FIN	Jennifer Church		1640	2	Even if it is correct to assume that there is only a 2% chance of serious breaches in relevant containment structures, it would require billions of dollars to clean up the resulting mess and it would cause untold damage to the long term health of people in the area. The company, probably long gone, is not going to cover the costs of such a catastrophe. No one has the right to risk the lives of others’ children for the sake of such short term profits.	NS	X
27067	Unique			FIN	Jennifer Church		1648	2	Even if it is correct to assume that there is only a 2% chance of serious breaches in relevant containment structures, it would require billions of dollars to clean up the resulting mess and it would cause untold damage to the long term health of people in the area. The company, probably long gone, is not going to cover the costs of such a catastrophe.	NS	X
261	Unique			FIN	Jim and Diane Malcolm		158	4	Apparently, SDEIS does not contain any credible information on actual ongoing costs. How can anyone estimate the costs for such a disaster that far to the future? This would mean perpetual clean-up.	NS	X
28475	Unique			FIN	Jim and Diane Malcolm		2254	2	It has been stated that the water could possibly be contaminated for at least the next 500 years. Apparently, SDEIS does not contain any credible information on actual ongoing costs. How can anyone estimate the costs for such a disaster that far to the future? This would mean perpetual clean-up.	NS	X
24677	Unique			FIN	Jim Cashman		1075	1	Thank you for taking on my comments. While I'm in favor of jobs and Northeast Minnesota my heart tells me that we need to make sure that the water in northern Minnesota and in all Minnesota is taken care. From what I have seen, leaching will be an issue for a long, long time. If this mine is approved, please make sure that the company puts significant dollars in a fund for future mitigation. This money needs to be able to cover any future costs associated with closing the mine. This money also needs to be protected from bankruptcy.	NS	X
23917	Form Letter	1	Variant	FIN	Jim Steitz		977	7	When the full scale and scope of liabilities to Minnesota’s precious waters and lands are considered, and the financial cost to mitigate and offset those liabilities are calculated, a comprehensive NorthMet SDEIS will find that the proposed mine is has a grossly negative net worth to Minnesota and to the country. Future generations will care little about how much copper or nickel we have produced for our own material indulgences, or to give ourselves the convenience of disposing of so much of our metals in landfills, but they will look back in scorn at the waste piles and acid-soaked waters we leave them. They will not regard the trade of Minnesota’s forest, wetland, and lake ecosystems for a temporary binge on metals as a fair trade.	NS	X
29844	Unique			FIN	John Lapham		2665	3	The financial assurances mandated by state law haven't been adequately addressed. 200 to 500+ years of active treatment will require hundreds of millions of dollars in financial assurances to ensure that the taxpayers of Minnesota are not stuck with the costs of cleaning up this potential superfund site.	NS	X

709	Form Letter	1	Variant	FIN	John Roth		255	2	Given the current worldwide surplus of the minerals, and the large number of mining projects already in development elsewhere, the price for these minerals will virtually guarantee PolyMet NorthMet's bankruptcy and inability to pay for environmental monitoring and cleanup. While not openly admitted by the mining companies, bankruptcy is a central part of their business model. Most importantly, I consider it to be absolutely immoral to allow any mining action that will require our children and grandchildren, and potentially generations after them, to pay the price for cleanup. We have a moral responsibility to give the next generation a world that is equal to, if not better, than the one we inherited from our parents. If PolyMet NorthMet are allowed, we will be giving our children and grandchildren a polluted and damaged northern Minnesota. That we cannot allow. No amount of money earned by the owners of the mining companies and mine workers can justify that damage or compensate future generations for their loss.	NS	X
963	Form Letter	1	Variant	FIN	John Tonsager		263	2	I have an issue with both the financial and ethical aspects of the PolyMet mine. The holding company providing the monetary backing to PolyMet is problematic at best.	NS	X
963	Form Letter	1	Variant	FIN	John Tonsager		265	4	We are only fooling ourselves to believe the money can be set aside to mitigate any known and unknown hazard for ever into a future we know nothing about.	NS	X
29269	Unique			FIN	John Wild		2476	2	It is not realistic to expect a for profit transnational mining company to care much about Minnesota's environment when their first priority is to make money. Mining companies are notorious for leaving behind big messes for the public to deal with, often for years. Will this company even be around in the future? Will the resources be available to deal with the inevitable disaster to come?	NS	X
30065	Unique			FIN	Jon Schubbe		2778	2	If approved, Polymet should pay for all cleanup costs up front before any profit can be taken. Otehrwise they will just file for bankruptcy and leave taxpayers on the hook.	NS	X
27696	Unique			FIN	Judith Derauf		2094	2	I am bothered by reading the claims that adequate water treatment will be maintained and run off contained. I frankly do not believe it is possible or plausible, and the burden will eventually land on the shoulders of future Minnesota taxpayers.	NS	X
30097	Form Letter	1	Variant	FIN	Karen Graham		2815	6	The conclusions issued by numerous independent scientific agencies find the PolyMet environmental evaluations inadequate and unsubstantiated on many points listed below. These agencies focus on evaluating environmental impact. The safety to our environment and the long term impact is based on project on faulty information. With the caveat of promises to maintain a vital filtration system for 500 years and we'll put money aside.	NS	X
29982	Unique			FIN	Karen Katz		4306	2	The Final EIS does not sufficiently addresses how PolyMet will manage to remain in business for 500+ years to ensure maintenance and containment of the site. And I do not think it is acceptable for them to abandon the site to be maintained by taxpayers.	NS	X
29809	Unique			FIN	Karen Williams		2639	4	Glencore's financial responsibility is unsure, especially for the necessary 500+ years of water treatment that is necessary.	NS	X
29514	Unique			FIN	Kathleen Miller		2542	8	6. Financial assurances for meeting standards: there is no price that will cover the enduring environmental costs of site clean up, watershed water cleanup and the loss of wildlife and habitat. The officers of the shell company and all affiliates need to be held responsible for all costs including potential well water contamination for municipal water supplies such as in Hoyt Lakes.	NS	X
29514	Unique			FIN	Kathleen Miller		2543	9	7. Timing: Minnesota cannot afford the risks of this project. Lessons must be learned from "deals" struck with other multinational- foreign companies. They don't live here - they don't care. They want to grab and run. With commodity prices so long today and for the near future, it would be poor judgment to permit this mine today given the shaky finances of the mining project sponsor.	NS	X
1084	Form Letter	1	Variant	FIN	kelly hemsath		269	1	There will be NO benefit for the State of MN, and it is IMPOSSIBLE for PolyMet to honor any cleanup guarantee into the future....there could be a spill 300 years from now. Just tour ALL the mining failures, they were once state-of-the-art mines too and the same promises were made to their area.	NS	X
1084	Form Letter	1	Variant	FIN	kelly hemsath		271	3	Also, what if PolyMet goes bankrupt? They are off the hook, and who is on the hook?	NS	X
26854	Unique			FIN	Kenneth Swanson		1476	4	these companies are not us companies so clean up is not their concern. They just mine then go bankrupt and leave superfund sites.	NS	X
29193	Unique			FIN	Kevin Heaslip		2440	3	PolyMet wants to strip mine instead of mining underground. PolyMet intends to use a wet tailings basin and not the safer dry stack tailing filtering process. PolyMet claims it will monitor the tailings basin and treat affected water for hundreds of years. While PolyMet says that reverse osmosis will effectively treat tainted water, reverse osmosis has never been attempted on such a huge scale; reverse osmosis may well be too expensive to use. PolyMet has not given financial assurance to cover centuries of tailings basin containment.	S	O
379	Unique			FIN	Kevin Kramer		184	3	How long before Polymet declares bankruptcy and leaves us with the bill to clean up their mess.	NS	X
10709	Form Letter	1	Variant	FIN	Kevin Lee		714	3	The law on EIS's is clear, and this EIS is not in compliance with that law. The law, including guidance from the EPA, clearly requires evaluation of financial assurance in the EIS itself, as the prospect and likelihood of environmental harm is directly related to the amount of, and security of, the proposed financial assurance. As you know, the Polymet FEIS contains no evaluation of financial assurance, which makes a true evaluation of environmental impact next to impossible. This is clearly not the intent of federal and state environmental review laws, which is to provide the public and decisionmakers with the information necessary to assess environmental impact.	S	O
30066	Unique			FIN	Kevin Viken		2790	3	Financial assurances for the plan are far from adequate. Over the millennia that this waste will be sitting there slowly discharging it toxic leachate we will be virtually assured of a flood that will overwhelm all measures covered by the FEIS and to pollute the surrounding area and all downstream bodies of water including lake superior. The financial assurances need to be much greater and more protection from political interests.	NS	X
27721	Unique			FIN	Kris Wegerson		2118	10	The FEIS is inadequate because it didn't include detailed information of financial assurance. Financial assurance is part of the proposed action as is the land exchange, but was omitted from the FEIS.	NS	X
27721	Unique			FIN	Kris Wegerson		2119	11	If the "level of engineering design and planning isn't currently available to calculate detailed financial assurance amounts", then the entire FEIS should be considered inadequate. The entire FEIS is engineering design and planning in support of the NorthMet Project Proposed Action.	NS	X
27121	Unique			FIN	Laverne Wagner		1664	3	What happens with the waste water and cleanup if Polymet go out of business? If the owners are international corporations trying to hold them responsible for cleanup is nearly impossible, especially for 200 years as predicted.	NS	X
27689	Unique			FIN	Lea Foushee	North American Water Office	3203	7	Identifies a Trust Fund (\$350 Million) that is short changed for required length of clean up (indefinitely) and Minnesota taxpayers will be forced to pay any shortfall.	NS	X
23643	Unique			FIN	LeRoger Lind	Save Lake Superior Association	2942	11	In addition, the economics of continued treatment do not describe a sustainable management process. Financial assurance polices do not address this issue on a continuing basis since the piles will be added to on a daily basis, not on a yearly basis.	S	O
23643	Unique			FIN	LeRoger Lind	Save Lake Superior Association	2944	13	Financial assurance requirements appear to be front-loaded to understate the long term requirements for mitigation of sulfates, toxic metals and related pollutants. Permitting water pollution cannot be done on this basis. This would be "trial and error" permitting of an irreversible source of toxins.	S	O
10215	Unique			FIN	Lisa Lenz		676	3	2) How confident are you that Polymet will be around for 500 years to keep cleaning up the impacts of their waste? What will happen if they fail?	S	O
24610	Unique			FIN	Lisa Wrabek		1053	2	If we don't care and still need the jobs, I believe we should tax or force the company to reserve 10% or more of their profits to be saved for filtration systems that will be required in the future.	NS	X
29740	Unique			FIN	Lori Andresen	Save Our Sky Blue Waters et. al.	3884	11	The FEIS accepts an unlimited number of years of water treatment (at least 500 years according to the SDEIS) after closure, even though this goes against state law. The solution presented in the FEIS is to label the needed treatment as "passive", thus evading the intent of the law. However, even passive treatment needs maintenance. Permitting a mining operation that will need perpetual treatment is immoral, as well as contrary to state law.	S	O
29740	Unique			FIN	Lori Andresen	Save Our Sky Blue Waters et. al.	3898	9	No financial assurance is included in the FEIS, for unexpected accidents, or upon closure. Considering that Brazil is suing BHP/Vale for \$5 billion, the lack of financial assurance is a huge taxpayer liability. The FEIS is inadequate in protecting our tax-paying citizens.	NS	X
29980	Unique			FIN	Lori Andresen		4301	4	If the DNR were to follow Minnesota state law — Chapter 6132.3200 Closure and Postclosure Maintenance: "the mining area shall be closed so that it ... is maintenance free" — PolyMet would not be permitted.	S	O
29980	Unique			FIN	Lori Andresen		4303	6	The November 2015 tailings basin disaster at the Samarco iron ore mine in Brazil resulted in the loss of life, homes, and livelihood. The Brazilian government is now suing the two major mining companies for \$5 billion in damages. PolyMet's FEIS does not address financial assurance issues that would apply to unpredictable mine spills or post-closure pollution. Instead, the FEIS is being pushed out before incorporating any analysis from the most recent and costly mine disasters.	NS	X
30072	Unique			FIN	Lori Andresen		4340	6	What kind of financial assurance would PolyMet need to post in order to cover potential tailings basin failure, as well as covering over 500 years (virtually forever) of water treatment? This issue isn't even addressed in PolyMet's FEIS. Instead it will be negotiated between the DNR Division of Lands and Minerals and PolyMet--both with immediate and direct interest in the permitting of PolyMet.	S	O
29370	Unique			FIN	Lori Olinger		2521	6	The FEIS seems overly optimistic on the need and cost for water treatment into the future. It states that water will need to be treated for the foreseeable future but also talks about the possibility of transitioning to non-mechanical water treatment. Either mechanical or non-mechanical would require monitoring, maintenance, and replacement in the future and should include best-case and worst-case projections. The FEIS seems to include what I would call best-case and has little reference to worst-case (when things go wrong) plans other than to say that adjustments would be made. The costs for long-term, 500+ years should not be underestimated. PolyMet should be held responsible for long-term costs and not the State of Minnesota.	NS	X

29370	Unique			FIN	Lori Olinger		2522	7	The FEIS states that PolyMet will be released when permit conditions are met. It also states that PolyMet must treat water for as long as necessary. I am concerned that PolyMet will be released too early. Some problems would be evident at closure but the most significant costly problems could occur well into the future. If permit conditions are evaluated too soon after closure then the significant future problems will not be the responsibility of PolyMet. The biggest environmental threats and costliest to clean-up are likely to occur years from now. PolyMet should have financial consequences for as long as the State of Minnesota which is 500+ years. PolyMet must have as much at stake as the State of MN for very long-term environmental impact or their focus will be to finish mining operations and resolve their responsibility as soon as possible. Minnesota will be left holding the bag.	NS	X
27921	Form Letter	1	Variant	FIN	Louis Mielke		2234	6	PolyMet and Glencore will not pay for what they will have done to the land, and the burden of restoration will be put on the people of MN. Why is okay for the taxpayers of Minnesota agree to pick up after a foreign company's risky venture?	S	O
21726	Unique			FIN	Maki Christopher G.		845	2	So PolyMet puts down some money for clean up. What happens when all that is used up.. No one knows how much money it will take. There are projects all over the country still waiting to be cleaned. Many of them sulfur rock mines.	NS	X
21726	Unique			FIN	Maki Christopher G.		847	4	Who is going to pay that bill? Who is going to pay when the company goes out of business. Mining companies do not last forever; a lesson we have learned here on the Iron Range. It says that bankruptcy does not wipe out this debt; but a judges ruling is only paper. Money doesn't grow on trees and a company that doesn't make money has no investors. They tend to take there money and run. The company dies and the state or should I say the tax payers are left with the mess that must be cleaned up and maintained. This will have to be maintained for generations. So the state is trading 20 years of jobs for a lifetime problems. This will be like thorn in our side. Just like Tar Creek Oklahoma and the Anaconda mine in Montana. I hope I don't have to say in 20 years "I told you so". Thank you for this opportunity.	NS	X
26648	Unique			FIN	Margaret A. Redmond		1394	4	c. What possible assurances could be given regarding 200-500 years of financial support of both the mechanical systems PLUS the labor to operate and monitor it?	S	O
26648	Unique			FIN	Margaret A. Redmond		1395	5	2. What examples exist of corporations that have been operating for 200-500 years? (Again, the issue of "in perpetuity.") Why should we be the ones who "experiment" with this concept? What happens if PolyMet (or its succession of purchasers over 2-5 centuries) fail, go bankrupt, or split off, or find a way to shed the obligation?	NS	X
26648	Unique			FIN	Margaret A. Redmond		1404	14	9. Although this is not within the purview of the EIS, the amount of money needed for escrow to be sure Minnesota taxpayers are not left paying for cleanup (possibly "in perpetuity") has got to be utterly colossal. How do we even calculate it? Would in not have to be in the billions of dollars?	NS	X
29397	Unique			FIN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3779	72	adequate financial assurance must be set aside to maintain and operate perpetual RO treatment at both the mine and plant sites.	S	O
29397	Unique			FIN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3792	86	In order to determine the impacts of a mine, the effectiveness of closure and reclamation after the mine is no longer in use must be assessed.227 But in the FEIS, there is little discussion regarding the type of financial assurance that would be used. The level of detail that is provided in the FEIS regarding the estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project is based upon highly flawed, unscientific analyses of Project impacts. Even though the MNDNR has stated that PolyMet financial assurance will include clean-up costs for contamination resulting from LTVSMC operations,228 the FEIS provides no discussion regarding financial assurance that will be needed for the existing contamination associated with previous mining activities at the site. This is of particular concern because the hardrock mining industry has a pattern of failed operations, which often require significant environmental responses that cannot be financed by industry.229	S	O
29397	Unique			FIN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3793	87	no cost estimates were provided for any of the AMCs, and therefore it seems unlikely that any have been factored into the estimate of financial assurance here, either. The cursory estimate of financial assurance in the FEIS provides little detail about how the dollar amount was derived. Instead, discussions have been postponed for the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy.	S	O
28653	Form Letter	1	Variant	FIN	Margi Preus		2330	2	Who is going to oversee the toxic waste and mess that is made and left behind when the company inevitably dissolves or goes bankrupt or walks away? Who is going to clean up a catastrophe--if there even IS a way to clean it up? Who is going to be tending to the waste for the 500 years that it remains toxic? We have yet to hear answers to these most obvious questions. Until there are answers to these basic questions, there is no good reason to approve this project.	NS	X
1624	Form Letter	1	Variant	FIN	Marilyn Benson		282	1	Why are we being so shortsighted? Jobs are important. BUT once the natural world is polluted, there is no way back. Why do we think a dam will hold? Look at what happened in Brazil this last week? Why do we think a company will continue into infinity to pay for clean-up?	NS	X
2	Unique			FIN	Mark		2	1	The environment will eventually be polluted by the NorthMet Mining Project and Land Exchange Project. The project may meet the State of Minnesota's legal requirements, but these requirements are not sufficient to maintain the integrity of the environment. If the project goes forward the developers, investors and other groups benefiting from the project should back environmental cleanup with the entirety of their corporate and personal assets. Failure to do this should stop the project. If at any time the assets of the company and their personal wealth are not sufficient to complete cleanup and restore the area to it's original condition should place the failing parties in prison for life or until the cleanup is complete. Our environment is not for sale.	NS	X
29737	Unique			FIN	Mark Kaprelian		2599	8	Moreover, while the Co-Lead Agencies claim to have addressed many of the comments concerning PolyMet's financial condition in Section 3.2.2.4 of the FEIS, no substantive discussion of PolyMet's financial condition appears there. Among other things, Section 3.2.2.4 claims to outline the "risk analysis" involved in determining the required financial assurance. Section 3.2.2.4 discusses the costs that would need to be covered by PolyMet and sets forth PolyMet's estimates of amounts needed to cover these costs at various points in time. It does not, however, include any discussion of the financial resources available to PolyMet to cover these costs. There is ample reason to doubt that PolyMet currently has such resources. For example, PolyMet estimates it would need between \$50 and \$90 million to cover the costs of closure at the end of its first year of operation (FEIS at 3-142). PolyMet also estimates that post-closure monitoring and maintenance costs would amount to \$3.5 and \$6 million per year (id.) for an indefinite period that could last for more than 200 years. (FEIS at 5-8). At an interest rate of 3 percent, the value of a perpetual annuity covering the minimum estimate of post-closure monitoring and maintenance costs exceeds \$115 million." But according to its most recent Condensed Interim Consolidated Financial Statements, PolyMet has current assets of only approximately \$9.3 million." The ability of PolyMet to obtain the necessary resources to cover the costs of closure and to provide for annual post-closure monitoring and maintenance, by operations, assets sales, financing or other means, is a significant risk that should be included as part of the risk analysis outlined in the section, particularly in view ofthe "boom and bust" phenomenon described in the FEIS and PolyMet's precarious financial condition. The omission of such a discussion is inconsistent with the requirement that the FEIS encourage "good analysis and clear presentation" of the proposed action and include a "thorough but succinct discussion of potentially significant adverse or beneficial effects generated, be they direct, indirect, or cumulative." This omission must be corrected.	S	O
6124	Form Letter	1	Variant	FIN	Marlise Riffel		448	2	I am also concerned that the citizens of northern Minnesota will be left with the cost of "indefinite" water treatment. Because the models do not allow any predictions about the length of ongoing treatment required, there is no adequate way to require Polymet to contribute sufficient funds to cover what might be required. I found this disclaimer about the models' inability to predict in at least five different places in the FEIS. I object to the project and I request a specific response to my comments.	NS	X
29963	Unique			FIN	Martin Cooney		4222	3	Properly structured, the financial assurance requirement will force PolyMet to pay the full cost of mining in Minnesota. This requirement is by definition onerous to the mining venture. Setting aside millions of dollars requires significant additional investment on the part of PolyMet's parent company. This will depress rates of return, just like any other cost of doing business. To keep faith with Minnesota taxpayers the DNR must resist pressure by PolyMet and mining advocates on the Range and their lobbyists or elected political representatives to compromise on the rigor and objectivity required to protect the environment. If the mining companies cannot make money by bearing all of the costs arising from their mining operation, they should not be mining in Minnesota. Period. Fortunately, the Minnesota legislature can profit from other states' bitter experience with regulating non-ferrous mining activities. In 2008, Minnesota passed a financial assurance law specifically requiring non-ferrous mining companies such as PolyMet to provide a bankruptcy-proof pool of high quality guarantees and/or financial instruments under the control of the commissioner of Minnesota's Department of Natural Resources ("DNR") to ensure that all requirements of non-ferrous mining permits, including the cost of reclaiming the mine and any environmental damage arising from the mining activities are paid for by the mining concern and not the Minnesota taxpayer. Barring a denying PolyMet's application, the next best alternative is to make sure that the financial assurance put up by PolyMet is ironclad and in an amount sufficiently conservative as to deal with any actual or potential environmental damage arising from PolyMet's mining activities.	NS	X
26628	Unique			FIN	Mary Adams		1381	2	It is human nature to think in the moment, jobs, economy, profits, but where is the long-term vision in this proposal? Putting Minnesota's treasure, our water, at risk is shortsighted. Corporations can declare bankruptcy, and citizens left with the responsibility of forest, wetland and restoration of contaminated waters.	NS	X
26285	Form Letter	1	Variant	FIN	Mary Ann Cunningham		1297	1	Although I live in New York State, I have a strong interest in the BWCA Wilderness, the Superior National Forest, and Lake Superior, all of which are national treasures threatened by the PolyMet copper-nickel sulfide ore mining proposal. When the proposed PolyMet mine becomes an abandoned mine and a public liability like the other 500,000 abandoned hard rock mines in the United States, my tax dollars will be used to attempt remediation of environmental disasters associated with acid mine drainage. Much of the damage to waters and forests and biodiversity will be impossible to repair, however, at any cost.	NS	X
26478	Form Letter	1	Variant	FIN	Mary E. Jones		1324	3	When rain falls on open pit sulfide mining ore waste, sulfuric acid mine drainage is produced. Although two waste water treatment plants are planned for the acid mine drainage, these treatment plants must stay operational for at least two hundred years. If not, this acid mine drainage will contaminate drinking water, damage or destroy fish and wildlife habitat in lakes and rivers, and harm human health. Will Polymet be maintaining their treatment plants' operation after they've extracted the copper and nickel over the expected twenty year mine's lifespan? I doubt it very much.	S	O

30030	Unique			FIN	Mary Erickson		2776	1	Many of the graphs have a timeline for long term management as 200 years and it is stated on page 3-72 that water models are “not designed to predict the duration of treatment nor do they capture all the factors that influence the duration of treatment...models cannot be used to predict when treatment would end”. If we do not know when treatment will end how can we determine the Financial Assurance needed to cover the cost of monitoring as well as treatment and unforeseen incidents? Such as possible costs of an environmental disaster such as recently happened at the Gold King Mine in Colorado?	S	O
28495	Unique			FIN	Mary Heise		2307	2	This EIS does not adequately address previous concerns about guaranteed funding in the event of water contamination or failure of mine infrastructure for the entirety of the mining waste generated from mining operations.	NS	X
1831	Form Letter	1	Variant	FIN	Matt Straw		286	1	Where's the protection for taxpayers? Why aren't "we the people" making demands that THEY clean up their mess afterward? Why aren't we demanding AT LEAST a \$10 million deposit, to be returned only when the pollution is gone and cleaned up by THEM, not US, for a change?	NS	X
26997	Unique			FIN	Maureen Johnson		1522	1	The FEIS is still inadequate to properly predict impacts on wetlands, ground water, and surface water. The error here is that the FEIS allows the Proposed Action to be infinite in its ability to treat its effluent and ground water contamination through Adaptive Management which also has infinite capabilities to devise answers and implement them with infinite finances, all for an infinite amount of time! This approach is just as equally impossible to perform infinitely in practicality. Polymet's or its successor's money will not be infinite, and the financial assurance will not be infinite. A few Responses to Comments condition the adaptive mitigation measures used as those that are shown to be "cost-effective", but the FEIS does not use this condition.	S	O
26997	Unique			FIN	Maureen Johnson		1524	3	On top of this, the FEIS does not discuss what might happen if serious mismanagement were to occur in which no one would be able to respond, such as an electrical brown out causing pumps shutdown, or money became unavailable due to a financial depression . Adaptive engineering cannot resolve those in time to prevent surface and ground water pollution exceeding standards for a long time, causing impact on aquatic life and wildlife. These illustrate the importance and relevance of the DNR goal for non-mechanical maintenance of waste containments to meet water quality standards.	S	O
29319	Unique			FIN	Maya Batres	The Nature Conservancy	3663	7	The FEIS fails both of the first two requirements since it has not developed and thoroughly discussed an adequate financial assurance package which is a key to assessing the environmental consequences, and it has not substantively responded to comments establishing the need for financial assurance that will ensure that the public is not burdened with the costs of perpetual operation, maintenance, and monitoring of the project site.	S	O
29319	Unique			FIN	Maya Batres	The Nature Conservancy	3676	18	The FEIS is inadequate because it does not thoroughly develop and examine the size or mechanism for financial assurances and does not substantively respond to comments establishing the need for the inclusion of financial assurance in the FEIS. A. The FEIS fails to provide thorough documentation of the cost estimates underlying the financial assurance and to provide an opportunity for public comment. Serious risks to the environment are associated with the reclamation, closure, and the perpetual operation and maintenance of treatment systems and engineered structures. To minimize the risk that there will be inadequate funds to protect environmental resources in perpetuity, it is critical to develop robust financial assurances and for them to be carefully scrutinized by state and federal agencies and the public. It is well documented that mines frequently fail, go bankrupt and are abandoned. As a result of this financial failure risk, the probability of hazardous substance releases and the severity of the consequences associated with such releases, mines are the highest priority category for development of financial assurances under the Superfund program. 58 The financial risk of mine failure is not merely a documented historical fact but remains an issue today, as underscored by the recent financial reports about Glencore, a major financial backer of Proposed Project. Low copper prices and extremely high debt loads have caused a huge fall in the market value of Glencore's stock and triggered renewed concern about its ability to sustain its financial commitments. As the USEPA has noted with respect to the NEPA reviews of proposed mines, "the amount and viability of financial assurances are critical factors in determining the effectiveness of reclamation and closure activities and, therefore, the significance of environmental impacts. This is particularly important when long-term water management and treatment will be needed." Thus, as with an Ecological Risk Assessment, it is essential that the FEIS thoroughly develop and examine a financial assurance package in order to realistically assess the environmental consequences of the proposed mine during its operation, closure and reclamation, and post-closure periods. In response to the Conservancy's detailed comments on financial assurances, the FEIS simply states that a thorough analysis of financial assurance is not possible due to a lack of detailed engineering plans and that such plans will be provided during the permit to mine process (i.e., after the completion of the EIS process). The response is contradictory: the engineering plans for the Proposed Action are put forth as sufficiently developed for the FEIS to analyze environmental consequences while lacking the detail to allow analysis of the expenses associated with these consequences. At least equally important, the development of this information would be relatively straightforward and not excessively or exorbitantly costly. According to press reports, the applicant is prepared to file its application for the permit to mine, along with its detailed engineering plans, in February or as soon as the state EIS process is complete. Additionally, if the reason for excluding financial assurance were based on the exorbitant cost or lack of information, the FEIS should have claimed the exception from providing such information as provided for under federal law. Therefore, the purported lack of detailed plans at this time is hollow and non-responsive to comments. The FEIS has not developed any additional information, analysis, or justification for the cursory financial assurance estimate prepared by the applicant's consultant in 2013. The general summary of costs, cited in Foth 2013, provides scant information on the amount necessary for protection of the environment and the public. Foth 2013 provides no explanation of how these general costs were derived, no description for the amount of individual cost components, and no discussion about the appropriate size of the contingency for the perpetual operation and maintenance activity of the proposed action.64 Instead, the FEIS indicates that any additional information on financial assurances will be developed during the permit-to-mine process, which is not anticipated until after the conclusion of the FEIS process. When this critical information is developed, the adequacy of the FEIS will have been determined and the public will not have an opportunity to comment on this project's impact on public resources.65 In effect, the FEIS will deny the public a meaningful opportunity to comment on this critical element of the Proposed Project and its impact on the environment, contrary to the principles of NEPA and the Minnesota Environmental Policy Act.66 For these reasons, the EIS document should provide detailed financial assurance information, assess its impacts on environmental resources, and make that information and analysis available for public comment.	S	O
29319	Unique			FIN	Maya Batres	The Nature Conservancy	3682	20	The FEIS fails to provide a mechanism of financial assurance that will remain effective and fully payable in perpetuity. As advocated in previous comments on the SDEIS, 90% or more of the financial assurance should be in the form of a fully-funded trust fund, particularly for long term operation, maintenance and monitoring of the site, including the tailings basin and water treatment systems. The FEIS did not substantively respond to these comments and simply reiterated the types of mechanisms which might be available for projects with shorter operation and maintenance periods. Neither did it identify or justify the specific mechanism to be used here either for short term or long term activities. The FEIS thus failed to adequately respond to the assertion in previous comments that all of the third party mechanisms for financial assurance (e.g., surety bond, letter of credit, insurance, parent guarantee) will not be sufficient to cover long-term operation, maintenance and monitoring in the event of PolyMet's insolvency. As noted in an analysis of financial assurances for mine reclamation and closure, "[w]here closure costs are long term (in many water treatment situations, costs are "in perpetuity"), forms of cash such as trust funds are the only practical way to provide a financial guarantee."70 Most of the non-trust fund/third party mechanisms referenced in the FEIS typically have tailored terms which specify when payment under the mechanism is required, and would be unsuitable as financial assurance for the Proposed Project due to the likelihood of disputes and litigation with the third party over the applicability of these terms. Moreover, many of these mechanisms are written on an annual or short term basis with the possibility of cancellation and the need for renewal. If PolyMet or its successors finds itself under financial pressure it is unlikely that a third party provider would renew the mechanism because of the high likelihood of a substantial loss. Given the FEIS's failure to adopt the fully-funded trust fund as the primary mechanism for financial assurance of long term activities, the FEIS provides inadequate financial assurance for the project, for perpetual maintenance after closure and for the environment in perpetuity. II. Summary of Necessary Action on Financial Assurance. The FEIS should complete this analysis and provide a detailed financial assurance package which includes, at a minimum, the following : 1. The FEIS should provide a thorough documentation of the direct and indirect costs of reclamation and perpetual operation, maintenance, and monitoring. The documentation should identify each individual component of cost; disclose the assumptions and sources utilized in deriving each individual component; and include a contingency amount for unanticipated costs. 2. The FEIS should use an Ecological Risk Assessment as a basis for determining critical elements of financial assurance, for calculating the amounts needed for an adequate contingency, and for determining the appropriate assurance mechanism. 3. The FEIS should provide financial assurances that will remain effective and fully payable in perpetuity, the majority of which should be a fully-funded trust fund. 4. As part of the EIS process, the agencies should solicit and consider public comment on the amount and mechanisms of financial assurance. In conclusion, the FEIS fails to meet the requirements under Minnesota Rules for determining adequacy as well as the requirements of NEPA and in its current form should be determined inadequate.	S	O
29141	Unique			FIN	McCabe Susan		2427	2	The worst part would be taxpayers having to pick up the continued clean up (forever) should the company go bankrupt. Is this worth the risk? For what? A company to make money?	NS	X
27405	Unique			FIN	Melanie Peterson-Nafziger		1716	8	The assurances required by the PolyMet EIS do not protect Minnesota's natural resources and communities from this same permanent degradation, despite a promise from PolyMet to provide funding for clean up.	NS	X
27660	Unique			FIN	Michael Levings		1807	7	Their plan of operation is for 40 years, they admit to an indefinite time of water treatment possibly 500 years can they guarantee this long of a treatment. I think not, as most mining companies in this area change names, ownership, and responsibility as fast and much the same reason they change underwear. Not to mention the Canadian controlled mining company will probably be guided by liberal Trudeau governing body.	NS	X
27671	Unique			FIN	Michael Youngquist		1828	3	Once they are gone, we will be left with a very long-term effort to try to keep land and water safe, and I'm sure the tax payers of Minnesota will end up paying the bill for a very long time.	NS	X
27692	Unique			FIN	Michelle Lackey Olsen		2091	3	Economically, I don't think it is realistic to expect that a company that will operate a mine for 20 years will have the presence or resources to monitor water quality and remediate acid mine drainage for 200 or 500 years. This will eventually become a financial burden for our descendants-not the legacy I want for our future. How could the amount of money needed to protect our waters from this seepage be estimated for this many years? Could you really expect to obtain a bond or some other protection for this far out into the future? I think we have been unpleasantly surprised too many times in the past to believe the Pollyanna version of what will happen after the PolyMet mine closes and the company is potentially closed, sold, or bankrupt.	NS	X
8906	Form Letter	1	Variant	FIN	Mike & Linda Gallagher		619	2	What kind of company would agree to monitor and maintain mine waste "indefinitely"? In other words forever. No company who was honest would agree to that because of the liability involved with the word indefinitely. No lawyer would let their client agree to that. They WILL cut and run, declaring bankruptcy as soon as trouble occurs. And you know problems will occur.	NS	X

N/A	Form Letter Template	4	Non-Variant	FIN	Multiple	Center for Biological Diversity	FL27	5	how PolyMet can provide financial assurance for the hundreds of years of mechanical water treatment that would be required to comply with water quality standards. The FEIS also fails to evaluate pollution risks and impacts using realistic and scientifically supported assumptions concerning how much polluted seepage is likely to be captured and treated both during and after the proposed mining operations	NS	X
27901	Unique			FIN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3330	43	The tribal cooperating agencies have repeatedly requested a clear answer to our question regarding remedial action requirements for the legacy contamination at the portion of the former LTV site that PolyMet has acquired and proposed to use for their processing operations. While the Co-lead agencies stipulate in the FEIS that PolyMet will bear liability through financial assurance, it is troubling to see that apparently, they will not be required to complete remedial activities until closure, many decades from now:	S	O
27901	Unique			FIN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3401	122	But in the FEIS, no detail is provided regarding the estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project, despite clear and consistent recommendations from EPA to do so. Even though the DNR has earlier stated that PolyMet financial assurance will include clean-up costs for contamination resulting from LTV operations, the FEIS provides neither a timeline nor a discussion regarding financial assurance for the existing contamination associated with previous mining activities at the site. This is of particular concern because the hardrock mining industry has a pattern of failed operations, which often require significant environmental responses that cannot be financed by industry.	S	O
27901	Unique			FIN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3403	124	The financial assurance costs for long-term post-closure monitoring and maintenance identified in the FEIS range from \$3.5 to \$6 million, but these appear to be an estimate for monitoring activities only ²²⁶ without any long-term wastewater treatment costs. At another mine site on the same property, the estimate of annual operation and maintenance costs for the same type of wastewater treatment the Project proposes to use (reverse osmosis/nano-filtration) was \$2.6 million. ²²⁷ Perpetual operation and maintenance of mechanical wastewater treatment is an additional cost that must be represented in the estimate of financial assurance. The cursory estimate of financial assurance provides little detail about how the cost estimates were derived. Instead, specific discussions about the scale and appropriate instruments for financial assurance have been postponed until the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the FEIS should have incorporated significant additional study to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates.	S	O
27901	Unique			FIN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3434	152	Third, the FEIS recognizes that Project will require ongoing wastewater treatment not only during the mine’s 20-year operations, but for several hundred years after the mine closes. At the same time, the FEIS concedes that the calculation of the full costs of these measures has not yet been done, and therefore the financial assurances that would be required to ensure the necessary environmental protections are presently unknown. FEIS 3-140. Thus, even if the discussion of the environmental impacts of the mine in the FEIS were correct, the FEIS’s conclusion that the mine will cause no environmental harm is wholly predicted on fully-functioning wastewater treatment facilities for several hundred years. The absence of a calculation of the financial assurances needed to make that a reality deprives the Corps of any basis for determining that the public interests in the environment would be protected if a permit were issued.	S	O
27408	Unique			FIN	Nicholas Eltgroth		1722	2	No matter how much money they put up for insurance to do the clean up, they will not be able to clean up the water tables and rivers and lakes in NE Minn.	NS	X
28097	Unique			FIN	Noreen Tyler	Izaak Walton League Minnesota Division	3449	5	The PolyMet Final EIS should be rejected as incomplete because it fails to detail future risks and costs that are necessary to determine financial assurances to protect our children from paying for the clean up of this proposed mine.	NS	X
29263	Unique			FIN	Pat Hawkinson		2469	5	How can an accurate financial assurance estimate possibly be made for indefinite water treatment? "Adaptive management" I suppose. In other words, "We'll play it by ear".	NS	X
27898	Form Letter	1	Variant	FIN	Patricia Isaacs		2224	4	if there is an environmental disaster, I have serious doubts about PolyMet's ability to pay for mitigation. As a taxpayer I don't want to be stuck with a bill they cannot pay.	NS	X
24516	Unique			FIN	Patrick Kvidera		1044	1	How about having them post a bond to cover the cost of any cleanup of lost material: be it from a train wreck, dike or damn breach, etc. Also covering the lost revenue to all State and private businesses affected by any such lost material.	NS	X
28479	Unique			FIN	Paul Mandell		2270	2	As for any assurance, as stated above, I understand that the question of assurance is not settled in the EIS; but with the mine likely to close after twenty-to-thirty years and the clean-up (water treatment of the tailings) expected to be needed for what is likely to be far longer than the companies behind the proposal, how much will be enough to guarantee that we, the taxpayers don’t end up paying for the mess we allowed them to create. At what point, if the taxpayer bailout may be necessary, do we see a cost benefit analysis that state creation of jobs to match to possible workforce payroll might be cheaper in the long run, and a lot safer for the environment?	S	O
29676	Unique			FIN	Paul Nasvik		2566	4	The risk of this project is so ridiculously high, even if it were a 50 year risk, but for a risk that potentially will last for 500 years, or more, is insane to even think about. Minnesota will be stuck dealing with the largest toxic waste dump in the states history.	NS	X
				FIN	Paula Maccabee	Water Legacy	3174-1	167	X. FINANCIAL ASSURANCE The PolyMet NorthMet FEIS not only fails to specify the level of financial assurance that will be required for the NorthMet sulfide mine project, as previously requested by WaterLegacy. The FEIS fails to provide either the conceptual or factual basis from which an appropriate calculation might be made either by the MDNR for a permit to mine or by the Army Corps for a Section 404 permit. Even to the limited extent that the FEIS addresses financial assurance, it does so poorly, placing much of the risk of externalities on the public rather than on the PolyMet Company, or its parent company and joint venturer - the entities that would profit from the mine. On a conceptual level, the FEIS does not recognize that the only time in the life cycle of a mine when government agencies have any leverage to secure adequate financial assurance is before permits are issued. When a mine is operating, leverage shifts to the mining company, which can threaten closure when asked to pay costs of mitigation or assurance, irrespective of its actual profits. After a mine closes, bankruptcy is likely, particularly when the mine is a limited liability company’s only asset. Unless post-closure contingencies are specifically required to be assured up front, the FEIS’ repeated insistence that PolyMet “would be held accountable for maintenance and monitoring required under the permit and would not be released from financial assurance until all permit conditions have been met,” (e.g. FEIS, 3-5, 3-59, 3-72, 3-127, 3-140) carries no weight. Once an insufficient instrument is exhausted and the mine has closed, taxpayers and the public will be unprotected. The FEIS contains specific statements as well as gaps in analysis that virtually guarantee that financial assurance will be inadequate. 1. The FEIS improperly deferred to the project proponent to set financial assurance. The FEIS implies that PolyMet would play a central role in determining the amount of financial assurance needed. The text states that “PolyMet would ensure that the financial assurance amount is established as a function of (but not limited to) the following three main variables: Extent of surface disturbance and potential releases from waste storage facilities Reclamation and long-term care standards (including mechanical water treatment) and Reasonable assessment of the costs to execute the Contingency Reclamation Plan.” (FEIS, 3- 142).		
				FIN	Paula Maccabee	Water Legacy	3174-2	167	That this unfortunate language relates to PolyMet’s role in setting financial assurance levels, rather than the company’s role in financing the level required in the public interest is supported by the next sentence, “PolyMet has developed preliminary cost estimate ranges that address the above items for hypothetical closure at years 1, 11, and 20.” PolyMet’s estimate, the only one mentioned in the FEIS, is then summarized. PolyMet’s cost estimate for closure is \$50- 90 million in Year 1, \$160-200 million in Year 11, and \$120-170 million in Year 20. (Id.). As discussed below, PolyMet’s estimates minimize legacy costs and wastewater treatment costs, exclude risks of poor quality modeling and “unexpected” outcomes, deny and minimize assurance to compensate for wetlands impacts and provide no resources for corrective actions resulting from either routine or catastrophic failures. 2. The FEIS financial assurance estimate discounted existing legacy pollution costs. The only estimate of financial assurance in the FEIS - PolyMet’s estimate - is inconsistent with PolyMet’s disclosure to shareholders of the liabilities associated with legacy pollution. In PolyMet’s Form 20-F, filed with the U.S. Securities and Exchange Commission (SEC) in April 2015, PolyMet estimated total costs to indemnify Cliffs for reclamation and remediation obligations assumed in PolyMet’s Purchase Agreement as “approximately \$72.6 million in present day costs.” PolyMet summarized the litigation against Cliffs and the 2010 Consent Decree applicable to the acquired property and disclosed for investors, “based on the expected timing of such payments, our cost of capital, and anticipated inflation rates, we made a provision of \$72.3 million in our financial statements at that date.” (PolyMet Form 20-F, filed Apr. 21, 2015, pp. 18-19, Exhibit 23). PolyMet noted in its disclosure to the SEC, “there is substantial uncertainty related to the long-term mitigation plan implementation cost” and that outcomes “that are unfavorable to us could result in material additional liability.” (Id., p. 19). Before a shovel reaches the site, PolyMet has already estimated that \$72.3 million is needed to provide for legacy liabilities. Any financial assurance for the NorthMet mine project must be over and above that amount. Simple arithmetic discloses the discount of legacy pollution costs in the FEIS’ estimate of financial assurance. 3. The FEIS provides no foundation to assure long-term water quality treatment. The FEIS provides no factual foundation from which financial assurance for long-term water quality treatment could be reasonably calculated. The PolyMet NorthMet draft EIS predicted that waste rock stockpile leachate collection would exceed water quality standards for up to 2,000 years. (DEIS, Table 4.1-45, p. 4.1-80, FEIS reference MDNR et al. 2009).

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
				FIN	Paula Maccabee	Water Legacy	3174-3	167	Responding to comments of Tribal Cooperating Agencies suggesting that water treatment would need to be perpetual, the Co-Lead Agencies stated numerous times, “Modeling predicts that treatment activities will be a minimum 200 years at the Mine Site and a minimum of 500 years at the Plant Site. While long-term, these time frames for water treatment are not necessarily perpetual.” (Tribal Comments and Co-Lead Agencies’ Dispositions, Aug. 19, 2013, attached as Exhibit 24). An EIS with similar language would provide a basis to calculate financial assurance for water quality treatment. The FEIS provides no such foundation. It states that PolyMet would include funds in its contingency reclamation estimate and financial assurance package to operate mechanical water treatment “for as long as necessary.” (FEIS, 3-81). Although the FEIS admits that the potential effects of the PolyMet NorthMet project are “based on mechanical treatment that would operate indefinitely” (FEIS, 5-8), the FEIS itemization for the financial assurance package in long-term post closure only provides for testing and implementation of non-mechanical water treatment. (FEIS, 3-81). While admitting that the effectiveness of non-mechanical water treatment has not been demonstrated, in listing the long-term post-closure monitoring and maintenance activities that must be assured, the FEIS does not include any provision for WWTP treatment of polluted tailings seepage. The FEIS only provides for “Developing and implementing non-mechanical water treatment systems.” (FEIS, 3-141). Minnesota has experience with post-closure use of non-mechanical water treatment to treat mine discharge when a taconite mine encountered Duluth Complex rock. It is not positive. At Minnesota’s Dunka Mine, non-mechanical water treatment, implemented when the mine went bankrupt and closed its treatment plant, has resulted in consistent violations of Minnesota numeric as well as narrative water quality standards.44 Replicating this cheap and ineffectual plan for the PolyMet NorthMet mine project would be the opposite of financial assurance. 4. The FEIS improperly excluded contingency mitigation from financial assurance. Presumably in response to concerns about assumptions in PolyMet’s modeling of seepage concentrations, seepage capture, and the absence of northward flow, the FEIS has a long list of contingency mitigation and conceptual mitigation options to address the potential that the project will not operate as “expected” and that polluted seepage would flow north to the Boundary Waters watershed. (FEIS, 5-239 to 5-244). It would be reasonable for regulators to require that PolyMet assume the risks of the errors in its modeling or overreaching in its promises. This could be done by financially assuring contingency mitigation and retaining funds pending verification that the PolyMet NorthMet mine site, tailings and hydrometallurgical residue facilities operate as modeled and claimed.		
27085	Unique			FIN	Paula Maccabee	Water Legacy	3174-4	167	The FEIS improperly excludes contingency mitigation from the financial assurance package until some unspecified future time if “appropriate and approved” by the MDNR and MPCA. (FEIS, 5-239). Given the potential that pollution would be discovered after mine closure due to seepage times and the relationship between northward flow and Northshore Peter Mitchell Pit closure, plus the difficulty in securing remediation in Minnesota from an operating mine, let alone a bankrupt mine, it is highly unlikely that funds for contingency mitigation would be secured at a future time if they were needed. By excluding contingency mitigation from financial assurance rather the providing a basis for quantifying these costs, the FEIS has effectively externalized to the public PolyMet’s risk of modeling and performance failures. 5. The FEIS excluded and undermined assurances for wetlands mitigation. The FEIS provides no basis to financially assure compensation for the indirect effects of the NorthMet project on wetlands. By providing no assessment of reasonably foreseeable impacts from hydrologic changes and pollution (see discussion in Section V, supra), the FEIS precludes assurance that compensation will be available when wetlands near the NorthMet mine or tailings site are indirectly destroyed or impaired. Even for direct wetlands mitigation, while citing laws that require assurance until the success of mitigation is well-established, the FEIS implies support for waiver of financial assurance. (see e.g. FEIS, 3-140, 5-256, 5-367, 5-368, 5-369, 5-370). As explained in the expert opinion of Morgan Robertson attached with these comments, the direct mitigation proposed is already substantially out-of-kind, in addition to other violations of federal rules applicable to wetlands compensation, and would fail to fully compensate for direct destruction of coniferous bog wetlands. (Robertson, 2015, pp. 16-22). Bogs are difficult to replace resources and there is a substantial risk that the “experimental” replacement proposed by PolyMet will fail. (Id., p. 21, citing PolyMet 2014j). The FEIS’ equivocation on requiring assurance to mitigate direct wetlands impacts undermines the potential that effective in-kind replacement would be provided for bog wetlands. 6. The FEIS provides no foundation to assure corrective actions. Although the FEIS states that financial assurance must cover reclamation and postreclamation activities including implementation of “corrective actions that may become necessary to address any permit non-compliance” and remediation of sites where “potential pollutants may have been released” (FEIS, 3-140), the FEIS provides no analysis that would allow calculation of an appropriate level for this assurance. As detailed in previous Sections of these comments, the FEIS provides no probabilistic estimate of pollutant releases resulting from a range of seepage collection performances and assesses no reasonably foreseeable adverse effects of the failure of engineered systems, whether routine or catastrophic. Recent major dam failures have resulted in an average cost of \$543 million per failure. (Bowker and Chambers, TSF Failures, pp. 1-2, Exhibit 19) Even relatively minor spills can result in costly remediation. The FEIS’ failure to consider any risk of pollution not modeled by PolyMet establishes no foundation for assurance of the risk of corrective action. The risk of failures, large or small, could thus be externalized to the public.	S	O
17670	Unique			FIN	Phyllis Kahn	Minnesota House of Representatives	2927	1	The PolyMet NorthMet Final Environmental Impact Statement (FEIS) is inadequate, fails to fully analyze the issue of financial assurance and fails to respond to my comments on the Supplemental Draft Environmental Impact Statement (SDEIS). There are numerous reasons why the FEIS is inadequate. I will focus on one that I feel the most strongly about. The FEIS fails to fully analyze the issue of financial assurance. I understand that the terms and amounts of financial assurance would be evaluated in the Permit to Mine. However, these permits often lack the amount of analysis and information necessary for a project of this scale. This issue deserves a greater analysis than you provide and you must ensure that the public, including those with expertise in finance and those elected by the people of Minnesota have an opportunity to weigh in. This project should not go forward unless a reputable third party insurer can be found to back the issued bonds. Private insurers have expertise in managing risk that Minnesota doesn’t have. Simply put, if a third party private entity won’t take on the financial risk posted by Poly Met, then the state shouldn’t be expected to either.	S	O
27521	Unique			FIN	Randy Holland		1767	3	Furthermore, the legacy of every name involved will be stained if an accident happens and the pollution endowment isn’t enough. Federal funding for private pollution is becoming harder to come by, so Minnesota taxpayers would be stuck with cleanup costs centuries from now. In particular when you comprehend that no nation has existed for five centuries yet, it’s mind-boggling what kind of endowment legal issues must be anticipated as the concept of nation-states and corporations evolves.	NS	X
26137	Unique			FIN	rayoungsmn@aol.com		1271	2	Who is cleaning that up? Our tax dollars and not the original mining company.	NS	X
29019	Unique			FIN	Rev. Elton W. Brown		2387	5	Will PolyMet be willing to set aside enough money to completely pay for the monitoring of containment barriers, the quick repair of leaks caused, say, by some unexpected flood or earthquake of the century, the maintenance (and eventual replacement) of reverse osmosis installations, etc?	S	O
29019	Unique			FIN	Rev. Elton W. Brown		2388	6	Should not the public be told now how this huge sum of money will be paid and held safely in escrow for future maintenance and clean-up? Why is the SDEIS so vague on this critical and thorny issue? Any short-term financial benefits to Minnesotans will be more than negated in the long run if clean-up costs fall yet again on taxpayers.	S	O
29019	Unique			FIN	Rev. Elton W. Brown		2389	7	I also wonder if there is a way to hold the parent corporation legally responsible for future clean-up costs once the PolyMet subsidiary declares bankruptcy or simply dissolves when the North Met project is no longer profitable?	S	O
28922	Unique			FIN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3557	18	This project carries with it financial baggage unlike anything ever proposed by the mining industry in the state. The plan modeled the need to monitor and treat runoff from the mine for 200 years and the tailings basin for 500 years. These time frames are unprecedented. It is unclear to us how the State can insure that its citizens are free of financial liability for such an extended period. After all, our State has only been in existence for 157 years and this cleanup effort could last for three times that long, or longer.	S	O
28922	Unique			FIN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3561	19	A significant deficiency of the PolyMet mine project is the need to provide a very large financial assurance package to protect Minnesota’s taxpayers for such a long period of time. We believe that the State should acquire a cash bond in the neighborhood of \$1B, to monitor and remediate uncovered environmental damages. The State should invest this bond and allow it to grow to provide enough income to cover clean up costs for when the mining company goes out of business or defaults.	S	O
28922	Unique			FIN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3564	20	The State should also ensure that all corporate interests in this project are held equally accountable. Meaning, the use of a “shell corporation” should not be allowed in an effort to protect the parent company and its subsidiaries, partners, and investors. All of these should be held as responsible parties, with their assets used for any remediation, prior to the State using its financial assurance bond.	S	O
28922	Unique			FIN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3565	21	The fact that a financial assurance plan was not included in the FEIS is a glaring deficiency in our view. The public has the right to know what the financial assurance package entails, and the risk involved, before the project is permitted. This needs to be included in the FEIS which is supposed to include economic, as well as social and environmental impacts.	S	O
28922	Unique			FIN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3573	22	Also concerning is the retention of a law firm with strong ties to the mining industry. No matter how well intended, this decision has colored the perspective of the public and has cast doubt on whether the “blind eye of justice” will be served in this case. This lack of independence and transparency raises a question about the resolve of the State to adequately represent the best interest of its citizens and protect the environment.	S	O
24661	Unique			FIN	Richard Morse		1068	1	Page ES-24 of the EIS makes the following statement: "Therefore, the water modeling cannot be used to predict when treatment would end and thus indicates that water treatment systems would be needed at the Mine Site and Plant Site indefinitely." Since it would be IMPOSSIBLE to determine the funds necessary to fund water treatment systems indefinitely, this is the nail in the coffin for this mine.	NS	X
29908	Unique			FIN	Rick Fry		2711	3	500+ years of monitoring. Do you really think that the public won't get stuck with the bill? It will take every penny of the value of the removed minerals plus quite a few more dollars to maintain the system.	NS	X
2260	Unique			FIN	rkhudnut@aol.com		317	3	Furthermore, PolyMet’s parent company, Glencore, is in grave financial condition, selling off assets, eliminating its dividend, closing two African copper mines, laying off large numbers of workers. How could such a company possibly guarantee the funding needed for PolyMet, not only now but for the hundreds of years into the future that PolyMet will be required to continue monitoring and remediating?	NS	X
27114	Unique			FIN	Robert Essian		1659	4	I am terribly concerned with closure costs and that the funds set aside for this would be adequate and segregated.	NS	X

27778	Form Letter	1	Variant	FIN	Robert Graves		2137	6	Worst case scenario evaluations need to be conducted to indicate what actions are required to mitigate potential failures of proposed safeguards. Will the mining company have billions to pay for these worst case mitigations? If the mining company does not have adequate funds, then the public will have the responsibility to pay for billions and possibly tens of billions of dollars to correct for the mistake of going forward with this project.	NS	X
27828	Unique			FIN	Robert Hagen		2172	3	I think the financial assurance provisions are inadequate, and the risks of the mine and its waste underestimate it affects.	NS	X
27690	Unique			FIN	Robert Topliff		2081	5	Can we as a state afford to treat their wastewater Forever?? That would be an enormous cost.	NS	X
28508	Unique			FIN	Robert V. Hovelson		2311	1	have a concern that the State has not required that Ply Met provide to the State third paryt issued Payment and Performance bonds coverin its commitment to protect th environment during the term of the mining operations and the resoration of the environment after mining has ceased, including provisions that would indemnify the State from having to pay for post- mining inspections to assure that the prvision of the EIS in this regard are properly performed.	NS	X
25207	Unique			FIN	Rome Jeffrey D. M.D.		1143	3	Additionally, it is untenable to try to establish a meaningful financial assurance package for risks that occur hundreds of years in the future. Economic cycles, climate changes, and political forces, in addition to inherent volatility in the boom and bust mineral extraction industry, invalidate projections of what it might cost hundreds of years in the future to remediate ecological damage from sulfide ore mining in the in water-rich region of northeastern Minnesota.	NS	X
29246	Unique			FIN	Ron Brodigan		2458	7	A financial review, yet to be done, should be rigorous, done by a qualified, disinterested third party, and should show how the probable owners of the mine, Glencore Xtrada PLC, can be held financially responsible for perpetual pollution damage even though it is owned in a foreign country.	S	O
29746	Unique			FIN	Sandra Wagner		354	5	To not consider financial assurance at this phase makes the process flawed by design. To even suggest it is possible to ascribe a number to perpetual treatment is preposterous.	NS	X
29289	Unique			FIN	Sandy Sterle		2498	4	This proposed mining project does not meet the Minnesota Rules (6132.3200) which states when a proposed mine is closed that it is to be left clean and maintenance free. It cannot be ignored that the proposed mine would create a need of at least 200-500 years to finance testing and maintenance of water quality. This should be highlighted in the FEIS and not glossed over. A significant reason for this rule is to stop a mining company from avoiding their financial responsibility to clean up the site. The ideal way to apply this rule is to not permit seepage of polluted water and the site must be cleaned up during operations, so most of the cost of cleanup is applied as an expense against yearly profits. To require them to store the tailings in dry form is a step in this direction or what about turning the tailings back into stable rock? Just because PolyMet finds this too expensive is not a reason to let them off the hook.	S	O
29289	Unique			FIN	Sandy Sterle		2500	6	The mining industry is notorious for avoiding liability after taking financial gains. Unfortunately, the FEIS does not address financial assurance that would apply to mine spills, or pollution after closure. This is a significant missing piece to protect Minnesota taxpayers.	NS	X
29231	Unique			FIN	Scott William Mills		2448	4	It fails to evaluate the impact to state finances for an acknowledged indefinite future of continued treatment of runoff water.	NS	X
26723	Form Letter	1	Variant	FIN	Scott Wolff		1442	3	If senior executives of PolyMet (wherever they may be) are so sure this can be done without environmental harm, then I request they put up as collateral their personal assets (residences, savings, trust funds etc). They need to demonstrate "skin in the game". The pattern of this sort of thing is many grand promises, then years down the road things go awry, they leave with huge profits, and the local people and taxpayers are left holding the mess and the bill.	NS	X
541	Unique			FIN	Shawn Roed		234	2	PolyMet company never has operated a mine and that the company and state have yet to tell taxpayers how they PolyMet would pay for cleanup needed for at least decades after the mine closes.	NS	X
25308	Unique			FIN	Shelley Robshaw		1150	1	After a though read of the documents provided to the public, I believe that the review of the NorthMet Mining Project and Land Exchange was conducted using mostly data provided by Polymet. PolyMet’s proposed sulfide mine would require 500 years of treating polluted water. Nowhere did I see a plan to even escrow funds to cover treatment of pollution that is likely to occur, if not immediately, at some time in the future. There is absolutely no way the state could get Polymet to guarantee coverage of containment and/or clean-up in the likely event of soil and water contamination. All that a business like Polymet would need to do is declare bankruptcy and the taxpayers would be on the hook. This doesn’t even take into consideration the permanent damage to our precious environmental resources in the Boundary Waters and Lake Superior, plus nearby wetlands, streams and rivers. The unemployment issues of northern Minnesota deserve a better long solution, and one that benefits a local business, not an international one with no ties or concerns for our community. Our State Department of Natural Resources should be advocating to preserve our environment, not pander to the business community’s short term profits.	S	O
28488	Unique			FIN	Shirley Huskins		2285	4	PolyMet admits run-off water pollution could continue for countless (100 –500) years. What financial assurances are in place to counteract the damage done by pollution?	NS	X
14	Unique			FIN	Spencer Shaver		42	6	Each of those mines passed a similar environmental impact statement process, then left unacceptable amounts of pollution to clean up, paid for mostly by taxpayers.	NS	X
7283	Unique			FIN	steve dubiak		534	1	How does polymet intend to pay for the clean up? Where are they going to get the money? Glencore is in major trouble and is not going to keep giving them money. Who is going to finance them? I dont see how this can move forward as I dont think they have the money and they need to prove they have the money.	NS	X
24761	Unique			FIN	Steve Timmer		1099	5	Financial assurances in Minnesota law do not even address themselves to the losses incurred by the public. Only a solvent mine owner, and current, adequate liability insurance will do that. The governor has stated that he will only permit a mine that stands on a solid financial footing, and after a sobering tour of the Gilt Edge mine in South Dakota, Commissioner Landwehr stated that a “bankruptcy proof” plan would be required for PolyMet.	NS	X
				FIN	Steve Timmer		1100-1	6	The permit applicant: PolyMet Mining, Inc. Even when consolidated with its British Columbia parent, PolyMet Mining Corp., PolyMet Mining, Inc., a Minnesota corporation, has very little in liquid assets. It is not now, nor has it ever been, an operating business. The stock of the parent has always been just a stock play, and valuation isn’t based on earnings (there never have been any) or even the liquidation value of the company. Well, a stock play and a vending machine for company executives through stock options. The idea that regulators would consider taking this flyer – because that is what it is – is preposterous. Putting a little money in at eighty-nine cents a share as a gamble on the penny stock market is one thing; gambling the legacy of pristine water in northern Minnesota is quite another. PolyMet officials say on the one hand, Well, we’re good Minnesota folks. We’d look after the environment. But on the other hand, they say, A permit to mine could be assigned; we can assign it to somebody with the wherewithal to operate a mine. In a commercial lending environment, the applicant PolyMet would be laughed out of the room and told, Come back, Junior (mining company), with a real partner. The only reason that PolyMet has even continued to exist for the last several years is because of the periodic allowance it gets from its practical parent, Glencore PLC. Glencore’s fingerprints – footprints, really – are all over the PolyMet balance sheet. PolyMet lives, moves (such as it does), and has its being because of Glencore. PolyMet exists on the continuing edge of bankruptcy. Glencore has a first-lien position in all of the assets of PolyMet. The extensive debt owned by Glencore on PolyMet’s balance sheet means that it would be difficult and expensive to replace Glencore with another investor to assign a mining permit to. Doubly so because Glencore has an off-take agreement with PolyMet for the first several years of production from any opened mine. But the Land and Minerals Division seems to want to pretend that Glencore doesn’t exist. There are a lot of adjectives that could be used to describe this, and none of them are flattering. Simply recognizing that Glencore is a real party in interest, maybe the real party in interest, and requiring it to be on the application and any subsequent permit – and be responsible for the financial and environmental obligations imposed on a permittee would not eliminate the bankruptcy risk that the Commissioner worries about, but it would mitigate it... A. On the issuance of a permit to mine to PolyMet, the current permittees, Cliffs Resources and Minnesota Power, would have their permit to mine closed and be relieved of liability for the currently-leaking tailings dam at the crushing facility.		
				FIN	Steve Timmer		1100-2	6	(The fact that it is and has been leaking into the groundwater for some time is a demonstrated failure of regulators to enforce the regulations they are charged with enforcing.3) PolyMet would pick up that the liability for the tailings dam. The cost to fix the tailings dam is about ten times what PolyMet has in current assets. The day that a permit is issued to PolyMet, it starts in a \$70 million+ hole. A junior banker approving the novation of this liability from two substantial obligors to a lightweight like PolyMet would be cashiered on the spot. B. In a press conference subsequent to the Gilt Edge visit, in response to a question about how to handle the very long liability tails after the mine is closed, Commissioner Landwehr said that PolyMet’s mining permit would be kept open, so that it would continue to be on the hook for its environmental liability. With due respect to the Commissioner, that’s a little like telling a gravely ill person – or one already dead – that he doesn’t have permission to die. A charming sentiment, perhaps, but unenforceable as a practical matter. Loan agreements always prohibit a borrower from becoming insolvent or going bankrupt, too, but it’s useless, of course. C. Insolvency and bankruptcy are no respecters of permits, or Commissioners, for that matter. And it isn’t a solution to say, “We’ll just get sureties.” Sureties become insolvent too. Moreover, surety bonds are not available for a term that is even a fraction of the time horizon for a serious adverse event at the proposed mine or crushing plant, at least now that AIG is no longer around to offer them. The FEIS pays only glancing attention to the issue of financial assurances. A few pages in three thousand. And the language in these pages is full of words like “appropriate” and “propose.” Dancing around the issue, in other words. There is no assurance – there’s that word again – that the public will ever have an opportunity to review and comment on what the DNR concludes is adequate. Or know, without periodic data practices act requests, when the DNR allows PolyMet backsliding, as it obviously has for other mining companies over the years. Quoting from 3.2.2.4.2 of the FEIS: ... It seems that it is expected that PolyMet would “propose” financial instruments that would change over time.

24761	Unique			FIN	Steve Timmer		1100-3	6	All of the above-identified “instruments” (except cash) require somebody to buy them – and continue to buy them on some periodic basis. (I doubt that many of these “instruments” are available for more than a few years, at most, at a time.) D. As soon as PolyMet hit a rough patch at the mine – and you know it would, given the cyclical nature of the commodities markets – it will be back asking to be relieved from financial assurances obligations, or some regulatory requirement. Or the miners will get it. It might be a rough enough patch that PolyMet couldn’t buy or pay for renewed financial assurance “instruments.” This is entirely probable after the mine closes. There will no longer be revenue from mining operations to pay financial assurance renewals The need to pay for water treatment, tailings dam maintenance, and possible dealing with a catastrophic failure of pollution treatment systems will continue for probably at least a couple of centuries. Will PolyMet still be around buying “instruments” in say, year 92 after the mine closes? I think we all know the answer to that. Even PolyMet recognizes the absurdity of the proposition. 3.2.2.1.10 - Reclamation and Long-term Closure Management in the FEIS includes this statement: Water quality modeling performed in support of this FEIS indicates that water treatment systems would be needed indefinitely at the Mine Site and Plant.6 PolyMet hopes to rely on “non-mechanical” treatment systems after only fifty-five years.7 In other words, turn off the pumps and hope for the best. But non-mechanical treatment proved ineffective at the Dunka Pit, and the 2009 PolyMet DEIS was rejected by the EPA for relying on it... The real party in interest, Glencore PLC, must be brought in on the permit to mine and associated applications and named as an obligor on any permits issued. The applicants must put up adequate cash, for financial assurances, and to fix the leaky tailings dam, as a condition of the issuance of a permit to mine. What is adequate must be determined, not by PolyMet and the DNR only, but after hearing and comment by the public. It cannot be assumed that the permittees will be able to buy financial assurance instruments in the future; it is naïve to so assume. If these things are not done, the Commissioner’s words about a “bankruptcy proof plan” for PolyMet will be hollow words, indeed.	S	O
27805	Unique			FIN	Steve Timmer		2144	1	According to the press release, PolyMet has about \$8,000,000 in the bank, and other than the maturity extension from Glencore, I don’t see any new money for PolyMet; it has no practical way to raise any. In a news article by John Myers, PolyMet spokesman Bruce Richardson says the extension shows Glencore’s “continuing support” of the PolyMet project. PolyMet won’t be actually paying interest, though. It will just accrue. Another way of looking at it is to say that Glencore is merely maximizing its first lien secured position in an impending PolyMet bankruptcy with a sixteen percent interest rate – just to fatten up its claim. If it really supported PolyMet, Glencore would cut the interest rate and give its junior partner a break, and loan it some new money, which it obviously has to have to survive. The financial news for PolyMet grows more dismal by the day. There will probably be a cash bar at the Christmas party. This is not a company that the State of Minnesota should trust to the smallest degree with our environmental resources.	NS	X
23004	Form Letter	1	Variant	FIN	Steve Voiles		881	2	Similarly we cannot pretend that the Polymet assurances can be believed. If they had confidence, why would the parent company hide behind the shell corporation of Polymet which is set up to fair by holding no real assests that could be seized in the event of failure. They have, in effect, pre-planned bankruptcy. But they don't hesitate to promise hundreds of years of monitoring the containment. How patently transparently dishonest!	NS	X
23004	Form Letter	1	Variant	FIN	Steve Voiles		888	4	I again asked that they post a billion dollars in escrow to pay employees during any shut-down, and that an third party monitoring system be created with the power to shut down the mine as soon as problems appear and keep it shut until the problems are solved. Only in this way can be be protected from the black-mail tactics that pit jobs against the environment. If they really can "do it right" the escrow will never be used.	NS	X
29325	Unique			FIN	Steven Ring		3689	4	Financial assurances: I realize that financial assurances are not necessarily part of the FEIS, but they actually are directly pertinent to the capability of the proposed mine to meet environmental requirements. If a ridiculously expensive design were proposed to meet water quality standards for a mine, the permitting agencies would realize it and reject the design as impractical. Yet, those agencies seem to be willing to consider a design and plan that is similarly ridiculous. The unknown, but lifetimes long requirement for treatment is fraught with exceptional financial risk. Financial risk leads to environmental risk due to inability to continue treating the water or maintain the facility. Recent history has several examples of mining companies declaring bankruptcy and leaving taxpayer to pick up the costs. What are the chances of this happening in a 500--year treatment project? Please recognize that this plan is unworkable and this FEIS is inadequate and unacceptable.	S	O
28770	Unique			FIN	Susan Beerhalter Soule		2346	4	The powers that be at Polymet themselves say that their mining activities will result in the necessity for on-going water/environmental treatment in perpetuity. Yes, they say that they will set up a mega-fund to cover these costs. But THINGS HAPPEN. Ask the people who trusted their pensions to see them through their retirements! Mismanagement, greed, the unforeseen, then: Gosh, we’re sorry. No money to keep the water clean, the aquifer safe.	NS	X
30585	Form Letter	1	Variant	FIN	Suzanne Damberg		2877	2	Please also consider how challenging it would be to truly put in escrow sufficient funds to cover potential hundreds of years of cleanup	NS	X
29356	Unique			FIN	Tara Widner		3696	2	By PolyMet’s own admission, the water used at its proposed mine will require 500 years of perpetual treatment—leaving a toxic legacy to our children and theirs. To put that treatment time frame into perspective, 500 years ago there were no European settlements in what is now the United States and Canada. The oldest company in North America, the Hudson Bay Company was incorporated in 1670—345 years ago. History shows that there is no amount of corporate stability that can guarantee a 500 year promissory note.	NS	X
29356	Unique			FIN	Tara Widner		3701	7	In a nation where mining companies have used ‘strategic’ bankruptcies to avoid meeting contractual obligations to worker, retirees and creditors alike, PolyMet’s promises to protect Minnesota’s legacy of clean water and land ring hollow.	NS	X
26759	Unique			FIN	Terrance Wilm		1448	2	As the mining industry as proven time and again throughout the U.S.; the choice is always is to destroy watersheds, release any and all toxic substances and then WALK AWAY with a disaster that is impossible to remedy.	NS	X
26759	Unique			FIN	Terrance Wilm		1450	4	It is also imperative that since this project will get crammed down our bodies that PolyMet is forced to set aside the billions of dollars that will be required to attempt to clean this up.	NS	X
26499	Form Letter	1	Variant	FIN	The Rev Donald Rudrud		1340	1	In the last ten years the Rio Tinto Mining Company, the current owner of the mining rights, has been forced to engage in a mulit-year over 100 million dollar clean up of the mines pollution and continued chemical threat to the clean mountain water. Now in 2015 (some 77 years since the first copper extraction) Rio Tinto hopes to compete one of the most expensive environmental protection projects in American history.	NS	X
29478	Unique			FIN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3850	5	WE urge Governor Dayton to recognize that the cumulative, perpetual risk to the environment exceeds any possible financial assurance, and therefore put a stop to any further sulfide mining in Minnesota;	NS	X
29478	Unique			FIN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3860	22	WHEREAS, the financial assurance required from PolyMet for eventual cleanup, reclamation of the mine site, and the treatment of continuously polluted water is, and cannot be, adequate to the task, which is admitted to be a high risk in perpetuity; WHEREAS, PolyMet’s position that they will address the financial assurance question only after the DNR issues its approvals demonstrates a willful disregard of the probably future costs to the public taxpayers;	NS	X
29478	Unique			FIN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3863	17	WHEREAS, the method of Reverse Osmosis is a difficult, short---term, and very expensive process with a high degree of continual maintenance and monitoring, that will be nearly impossible to sustain in perpetuity as would be needed;	NS	X
29478	Unique			FIN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3868	23	WHEREAS, regulators and official Environmental Reviews of sulfide mining operations around the United States have consistently underestimated the true costs of clean---up and reclamation after a mine has been closed; WHEREAS, the PolyMet company has no prior experience at all in operating a mine; WHEREAS, the Swiss parent company that owns PolyMet, Glencore PLC, has a dismal record of environmental disasters, labor violations, and flouting of regulations and requirements of its operations; WHEREAS, the liability for cleanup costs once the mining activity has ended remains only with the junior partner PolyMet, which could easily disappear through bankruptcy as there is no financial assurance directed toward Glencore PLC, which is not mentioned in the FEIS; WHEREAS, while the metals that PolyMet will mine (copper, nickel, colbalt, platinum, and palladium) are essential for modern daily life and found in countless products, global metals mines and markets have already produced an overabundance of these materials; WHEREAS, the commodity prices of the materials to be mined by PolyMet have, like iron ore, fallen to a level that could easily cause the venture to fail, risking both the jobs created by the mining and processing operation, and the ability to pay for cleanup and restoration;	NS	X
22249	Unique			FIN	Tim Schwarz		858	4	I will not foot the bill for our state's inability to protect the water and wildlife that defines our landscape. I refuse to pass down a polluted North Shore to generations of Minnesotans to come.	NS	X
27061	Unique			FIN	Tyler Kaspar	1854 Treaty Authority	3005	32	The FEIS states that financial assurance requirements for the project are not included in the document, but will instead be determined during the permitting phase. We are concerned about this approach given the potential for long-term/perpetual treatment, maintenance, and monitoring that may be needed from the proposed project. The environmental effects, expensive cleanups, and bankruptcies at other precious metal mines raise a significant red flag. This project may stand on its own, but completing financial assurance disclosure during the EIS process will help understand the needs to safeguard the environment and protect the public from significant expenditures.	S	O
29599	Form Letter	1	Variant	FIN	William Fischer		2555	2	The people of Minnesota do not want to pay the environmental cost, or acquiesce to proposals of privatized gain at distributed costs proposed by PolyMet.	NS	X
27563	Unique			FIN	William K.		1772	3	Nor is there any plan for how financing for this indefinite treatment will be provided.	NS	X
29367	Unique			FIN	William K. Dustin		2512	5	The FEIS is also vague about how its various proposals to protect the environment will be enforced. The most stringent of standards are worthless unless backed up by rigorous enforcement. The use of the passive voice in describing enforcement is indicative of this weakness. What this boils down to then is the adequacy of the financial assurance which cannot be determined until an accurate economic analysis is applied to all the items in the FEIS. The estimates that appear in the FEIS are way too low. Cleanup and mitigation costs are likely to approach ten billion, not 500 million. The determination of financial assurance will be an interesting exercise, and it had better be conducted above board, in full public view, with complete transparency. The funds for the financial assurance will also need to be protected from any political interference. We have had too many adverse experiences with financial game playing.	NS	X

28021	Unique			FIN	William Lynch		2247	1	I think no permit should be given unless a upfront bond is given to the state of MN DNR to cover the cost of continuous clean up of ground water for 200 years as expected in the EIS. There is no way the company can be expected to pay for environmental clean up for 200 to 500 years without a pre paid bond. After the 20 year life of the mine they could declare bankruptcy and leave state taxpayers with pollution clean up costs for the next 500 years. If they can't afford a 200 to 500 year up front bond it is not a viable project.	NS	X
26969	Unique			GEN	Eleanor R Wagner		1491	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Even though it would create jobs, the risk to our environment it too great to allow this project to go through.	NS	X
23032	Form Letter	1	Variant	GEN	Aaron Pendl		891	3	Not to mention the collateral damage to the environment, people's health, etc.....	NS	X
23032	Form Letter	1	Variant	GEN	Aaron Pendl		894	6	We saw that mistakes get made even by those who want to protect the environment (Animas River in Colorado).	NS	X
558	Unique			GEN	Abbie Debiak		241	1	Both the proposed mine (open-pit) and the Eagle mine (underground) are located in the Lake Superior watershed. Both mines have sulfide-based ore bodies. The proposed Minnesota mine is approximately 100 times larger than the Eagle mine.	NS	X
558	Unique			GEN	Abbie Debiak		248	11	In all fairness the SWP believes that Eagle mine is a state-of-the-art facility using the best practices available and that Eagle staff are truly committed to environmental protection. Eagle has also provided significant economic support to the region and the state. On the other hand the mine has only been in full operation for just over a year and CEMP is currently tracking several groundwater trends that could indicate future problems. More importantly, the very real potential for long term environmental impacts after mine closure has still not been adequately addressed. Historically, sulfide-based mining operations have left a legacy of pollution.	NS	X
558	Unique			GEN	Abbie Debiak		250	13	For decades Minnesota has been an environmental leader among the Great Lakes states. Long before it was common, Minnesota required intensive environmental education in the classroom.	NS	X
29788	Form Letter	1	Variant	GEN	Abby Tofte		2610	1	I know how important taconite mining and processing is to our community and our state, but this is a different type of mining. A VERY very different type of mining with horrible possible outcomes. We really, really need to take a look at this type of mining and especially the companies coming in to carry out the process. We can not afford to risk polluting the largest fresh water supply in the world. When water scarcity is a real global threat, we must seriously look at this and realize, it's NOT worth the risk. I am pro-taconite mining but VERY much so against sulfide mining in northern Minnesota.	NS	X
27720	Unique			GEN	Adam Heckathorn		2097	1	It is not worth it. no to copper mining.	NS	X
29913	Unique			GEN	Adam K. Wilke		4218	2	I oppose the FEIS as it is currently written.	NS	X
4617	Unique			GEN	Aiya Butler		412	1	I strongly oppose any mining that has the potential to poison our land or water.	NS	X
26780	Unique			GEN	Alaina Pilate		1451	1	We have many concerns regarding the Final Environmental Impact Statement, object to a land exchange of the Superior National Forest as well as any issuing of a federal permit to allow PolyMet to destroy wetlands and also impact water quality. We request a more thorough review of many components within the FEIS and do not see how the statement is adequate under federal and state guidelines.	NS	X
26927	Unique			GEN	Alan Andreae		1480	1	After 10 years of study and review the final EIS has been shown to support that copper nickel mining can be done in a safe and environmentally friendly way. I fully support this project to bring much needed jobs to northern Minnesota. With all of the agencies prior studies and continued monitoring after the mining operations commence I feel the state can permit this project without further delays.	NS	X
26240	Unique			GEN	Aleks Kosowicz		1296	1	I'm writing today because I'm concerned about the impact that PolyMet's proposed sulfide mine would have on Minnesota's water and, thereby, other resources and inhabitants as well. There is no question in my mind that PolyMet would do more harm than good. Pollution from PolyMet threatens our clean water and would pollute it for hundreds of years after the mine has closed. In this age of fresh water shortages, it is unthinkable to me even to consider further jeopardizing the quality of one of the greatest sources of the very thing right in our own backyard. We are so very privileged to have access to such singular natural beauty and abundant resources. Please put Minnesota's water (and, therefore, all life that depends upon it) first when deciding on PolyMet.	NS	X
30120	Form Letter	1	Variant	GEN	Alex Spitzer		2831	1	#StopPolyMet	NS	X
24810	Unique			GEN	Alexa Douglas		1113	1	My Family and I are Asking you to Oppose the PolyMet FEIS plan, the Land Exchange, require an Independent Review for Clean Water Act Permit for the sulfide mine. And, make PolyMet pay for All Toxic Clean Up for the 500 years period. We urge you to protect Minnesota waters and communities by denying all parts of the PolyMet mine proposals in the Boundary Waters Wilderness and surrounding areas. You must deny this Destruction and Toxic Dump in our pristine Federal Park Lands owned and declared for use by the citizens. There is no way this horrendous act could be called "safe". Run Off into Lake Superior will effect Tourism... our Biggest source of Revenue in Cook County.	NS	X
24810	Unique			GEN	Alexa Douglas		1115	3	Almost 98% of the 58,000 public comments were opposed to the mining. Minnesotans do not want this mine.	NS	X
13888	Form Letter	1	Variant	GEN	Alizabeth Moore		790	1	I WILL NOT STAND FOR THIS TO BECOME OUR REALITY!!!! Please take a few minutes to view the video below. I hope that influences your decision. I am certain Minnesotans and everyone 'downstream' from us would oppose making this a reality as well. https://www.facebook.com/permalink.php?story_fbid=10103601325905913&id=10239881	NS	X
19722	Form Letter	1	Variant	GEN	Allegra Dengler		837	1	I spend my summers at "The Lake", my family's lake for generations. When "our" lake becomes polluted and killed by the PolyMet mine, we will lose the value in our year-round cabin and we won't come up any more. We won't spend our money there, because we won't be there. We travel 1400 miles every summer to go to northern Minnesota because it is beautiful and wild and we love it. We can stay closer to home, like NJ, if we want to spend time in an industrial wasteland. MN will lose its tourism industry.	NS	X
26488	Unique			GEN	Allen Andrys		1336	1	I don't agree to opposition to the mining and mineral extraction by principal. However to do so in a way when the technology entails running the risk of causing a disaster we are, frankly, incapable of cleaning up and the reality of putting ourselves in a quagmire of "indefinite treatment and containment", does not make scientific or economic sense! The benefit of a few million dollars being made by large foreign investors and a few hundred jobs being created in the local area in no way outweighs the very definite reality of being stuck with treating the toxic waste for hundreds of years, nor the threat which that waste poses to human and environmental health for as long as it is contained.	NS	X
26488	Unique			GEN	Allen Andrys		1337	2	Recent history gives a lesson to draw upon involving the San Juan River of Colorado. A mining operation of striking similarity, which had long since closed but where toxic waste was being stored indefinitely, was being reviewed by the EPA. Control of the containment facility was compromised. The waste began draining and quickly made its way to the San Juan River, causing hundreds of miles to turn bright opaque-orange. This spill caused the river to become contaminated with dangerous concentrations of metals. The threat this containment facility posed became a very real attack on the local environment and the lives of the people living in that area. The effects have caused devastating harms toward the people of the Southern Ute Reservation and the Navajo Reservation, (thru which over 200 miles of the San Juan flows), the extents of which are yet to be seen. These nation's sovereignty, economic health and well-being of the individuals are dependent and are in every way intertwined with the integrity and health of the San Juan River. Just as our state's integrity is intertwined with the health of the of Indigenous Nations', and just as all of our health is intertwined with the integrity of Minnesota's clean water.	NS	X
26488	Unique			GEN	Allen Andrys		1339	4	Lastly, I say (above) "clean-up" because, simply, no matter how much money is promised to be available should disaster strike, even if those funds are delivered there is no way to reverse the effects entirely. Permanent harm will be done, which will impact generations to come.	NS	X
29	Unique			GEN	Allen Killian-moore		86	1	My name is Allen Killian-Moore, and I am a resident of Duluth, Minnesota. I am writing to voice my comments on the proposed Polymet mine in Minnesota. After plowing through an arduous reading of the NorthMet Mining Project and Land Exchange Final Environmental Impact Statement, and after reviewing a dozen or so articles written about similar projects in other places, including the a burst dam at a British Columbia tailing basin, which gave way and sent 1.3 billion gallons of tainted, sludgy water into local streams and lakes, I must say that I continue to be opposed to the Polymet plan to implement a copper-sulfide mining operation in Minnesota.	NS	X
7012	Unique			GEN	Allen Killian-Moore		528	1	After plowing through an arduous reading of the NorthMet Mining Project and Land Exchange Final Environmental Impact Statement, and after reviewing a dozen or so articles written about similar projects in other places, including the a burst dam at a British Columbia tailing basin, which gave way and sent 1.3 billion gallons of tainted, sludgy water into local streams and lakes, I must say that I continue to be opposed to the Polymet plan to implement a copper-sulfide mining operation in Minnesota.	NS	X
7012	Unique			GEN	Allen Killian-Moore		529	2	Our wildlands are far too precious to take such risks. Our wildlands already provide far too many jobs for those working the the outdoors industry, forest industries, land water management industries, tourist industries, children's and adult camps, farming, etc. I don't think the benefits of jobs potentially provided by the mine outweigh the risks to the jobs and livelihoods that already exist in this region of our state due to potential long-term pollution etc.	NS	X

5744	Form Letter	1	Variant	GEN	alyssa greening		433	1	I completely, with great passion object to Polymet/sulfide mining in Minnesota. With great urgency I plead for you to decline this mining endeavor permanently. It is extremely shortsighted to downplay the value of the pristine habitat and wealth of clean fresh water that our state holds. As our world continues on its consumption trajectory at greater and greater speeds, more and more resources will be tapped, more of the natural world violated by oil spills, chemical leaks, mining runoff, etc etc. When all the clean corners of the planet are polluted, when the west coast hasn't seen rain in 20 years, when we're having a hard time growing enough food to feed our nation, when fresh water from the ground is a rare delicacy, our state could be the crown jewel source of vitality. water brings life. and we have so much of it. nature brings healing to humans, and we have so much raw beautiful powerful nature that can help us - if we let it. The short term financial gain from the sulfide mining is minimal in comparison to the long term financial gain that the state could garner from clean fresh water. water not tainted with sulfide runoff, chemicals, radiation, not recycled gray or purple water ... but clean fresh water from the ground. It will be a novel thing. There are parts of California currently looking at desalinization as their new water source - which is expensive and toxic. I'm telling you. WATER WILL BE GOLD! Do not ruin our greatest resource! The Boundary Waters, Lake Superior ... these are incredibly special places, tourist attractions. Lets keep them that way for generations to come. What if we refocused our attention reacting to now, from getting money out of mining minerals now at the cost of the future... to focusing on how we can be the locus of clean water for the future?	NS	X
56	Unique			GEN	Amber Garlan		137	1	Please do not allow sulfide mining in northern Minnesota to proceed.	NS	X

1588	Form Letter	1	Variant	GEN	Amber Garlan		281	1	Do not allow sulfide mining in Northern Minnesota! When sulfur comes into contact with water or oxygen is becomes sulfuric acid. There is no safe way to do sulfide mining. Five hundred years of pollution must be avoided.	NS	X
4098	Form Letter	1	Variant	GEN	Amber Garlan		398	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. The track record across the United States for sulfide mining is 100 percent failure.	NS	X
10722	Form Letter	1	Variant	GEN	Amber Garlan		663	1	Sulfide mining has a dismal track record of pollution and taxpayer liability.	NS	X
11022	Form Letter	1	Variant	GEN	Amber Garlan		750	2	The mine plan is inadequate and likely to cause long-term pollution. Five hundred years of pollution is not worth any profit made by this mine.	NS	X
23357	Unique			GEN	Ammhsmith@aol.com		935	2	Please Reject the PolyMet mine proposal. The following highlight some of my concerns: The mine would destroy or damage 7,680 acres of prime wetlands at the headwaters of streams leading to Lake Superior. These are irreplaceable. ? It would result in centuries of toxic drainage from more than 500 acres of 20-story waste rock piles and the mine pit. This drainage would require treatment “indefinitely.” That means “forever.” ? Sulfates and mercury released from the mine would increase mercury contamination of fish, already a problem in the area. One in ten infants in NE Minnesota is born w/ excessive mercury levels. ? The financial risk to future generations would be enormous. Who would pay for centuries of active water treatment? What about spills and accidents? Mine sites are the #1 liability of the taxpayer supported Superfund cleanups, with a bill exceeding \$50 billion to date.	NS	X
23357	Unique			GEN	Ammhsmith@aol.com		937	4	ps. The state does not belong to commercial interests. It belongs to the citizens of MN and, actually, the world. We, especially you and Governor Dayton, owe it to the current and future generations to protect to the extent possible.	NS	X
29843	Unique			GEN	Amy Schwarz		2658	1	The Final EIS clearly demonstrates that the land exchange and proposed mine will not meeting state or federal environmental standards.	NS	X
4833	Form Letter	1	Variant	GEN	Andrew Kuncel		417	1	Not worth the risk if harming our water! Polymet will just skip town when then go bad or global copper prices go down. People have worked so hard to protect this area, constantly turning down offers, knowing how important natural land is. Don't be weak and give in.	NS	X
6680	Form Letter	1	Variant	GEN	Andrew McKibben		500	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. I am a NE Minnesota land owner, taxpayer, and year-round resident. I work and live here. These decisions will have a direct impact on my life and livelihood.	NS	X
406	Form Letter	3	Variant	GEN	Andrew Thorsen		196	1	I support the proposal to mine put forth by Polymet. Their plans for environmental protection seem adequate to me. While there is no such thing as a 100% perfect plan or complete safety their plans seem to cover foreseeable situations that might arise.	NS	X
4505	Unique			GEN	Ann Gustafson		407	1	I'm an almost 40 year old, teacher, wife/mother, City Councilor, 4h leader, avid outdoors woman: biking and skiing. I love living in northern Minnesota! I think allowing for the proposed copper-nickel mine would be a big Mistake. Current and future generations already have enough environmental-baggage to clean up. We need to help the local economies come up with sustainable economic development. The amount of jobs that this mine could create does not come close to justifying the associated risks.	NS	X
27041	Form Letter	1	Variant	GEN	Ann Santo		1636	1	PLEASE, PLEASE protect the Boundary Waters Canoe Area, the St Louis County watershed & Lake Superior!!! They are all in danger from the proposed copper- nickel sulfide mining in Northern Minnesota. This type of mining has NEVER been done successfully in the world without MAJOR pollution!! The abundant fresh water in this BEAUTIFUL area of the world is very valuable & needs our protection.	NS	X
22659	Form Letter	9	Variant	GEN	Ann Schley		879	1	The risks to our environment are too great. Northern Minnesota and Lake Superior are precious resources on their own. There is no need to open up the land and expose the area to sulfide mining waste.	NS	X
24678	Unique			GEN	Annie Francoise		1076	1	Please do everything possible to minimize mining and its impact on the environment and population. What is in the ground should stay in the ground. People have to adapt to new less destructing and polluting solutions. Mining only benefit companies who are only interested in immediate monetary rewards to their stockholders and disregard the Greater Good of the earth and our civilization. Thank you for hearing the McCuen family request.	NS	X
16488	Form Letter	7	Variant	GEN	Anthony Driza		810	1	There is but one opportunity to get this right and that requires the rejection of this proposal. Even under the best of circumstances, this would be a blight on the pristine landscape of northern Minnesota. The opportunity for mining disasters to pollute for hundreds of years the waters of Lake Superior and the surrounding Boundary Lakes region abounds. One need look no further than the recent Animas River spill in Colorado from upstream mining...Thank you for your time, and please take my concerns to heart. In no way, shape, or form, are the risks worthy of the money that will benefit only a single entity.	NS	X
27619	Unique			GEN	Antoinette Gilchrist		1785	1	I'm opposed to the NorthMet project.	NS	X
27653	Unique			GEN	Arla Schumack		1793	1	Clean water is more important than mining!	NS	X
25509	Unique			GEN	Arly Piri		1193	1	I am against any more degradation of Minnesota's natural resources. Too much forest land, habitat, and water has already been ruined with mining, farming and ongoing trashing of our land. We share our land with other creatures and birds, not just humans. As with all proposed manufacturing, environmental impacts are never made clear until after the work is in progress or many years later. Let us not repeat the failures of the past to again imperil our land.	NS	X
28533	Unique			GEN	Arno S. Kahn		2317	5	Given the certainty of contamination by sulfide and other mine spoils, it appears to me to be highly unethical to approve this method of mining.	NS	X
3309	Form Letter	1	Variant	GEN	Art Alanen		368	1	Because all northern Minnesota should work for minimum wage while they wait on Twin City tourists.	NS	X
30079	Form Letter	1	Variant	GEN	Ashlee Kveton		2809	7	I say Iron Rangers and Minnesotan's deserve better. We deserve clean water, and we should not give it away for the price of boom and bust economics, that leave our communities destitute and polluted. The lead agencies need to reject this FEIS as inadequate and demand Poly Met give Minnesotans what we deserve. If Poly Met wants the Metals in our ground they need to prove that they can remove it safely and leave Minnesota with a site that does not require treatment 500 or more years into the future. So far Poly Met has failed miserably to earn my trust. I simply do not believe they care one little bit about Minnesota or it's Iron Rangers. They disrespect us if they think they can come here and do any kind of resource extraction that requires indefinite treatment for 100's of years into the future, and pollute the resources we cherish most as Minnesotan's, our lands, our waters, and our outdoor heritage. Our elected officials need to pull their proverbial heads out of their proverbial %\$^&%^&, Yes jobs on the range are needed, but not at this cost. The writing is on the wall, Rebecca Otto, the state auditor, looked at this project entirely from an economic stand point and concluded it was a bad deal for Minnesota. We do not have to say No to all future developments, but we need to examine them thoroughly and objectively. Poly Met as currently drawn up is bound to be an environmental and economic blunder, there is no available evidence, aka other mines of this type to show that it can be done responsibly. It is a no brainer. say no to POLY Met	NS	X
30024	Form Letter		Variant	GEN	Audrey Cullen		2772	1	I OPPOSE THE OPENING UP OF THE LAST GREAT WATERSHED IN THE U.S. TO MINING.	NS	X
30143	Form Letter	1	Variant	GEN	Audrey S Royer		2833	1	Please don't ruin the Boundary Waters. Wilderness can never be recovered.	NS	X
30145	Form Letter	1	Variant	GEN	Barb Senty		2834	1	Please don't allow this - once destroyed its too late!!!	NS	X

26165	Unique			GEN	Barbara E Knoth		1280	1	I think the project should not be allowed to move forward. A project where the valuable material material is only 1% and waste is 99% is ridiculous. The risks to a major watershed is never worth it. The St.Louis river and Lake Superior are amazing places and a major water source. Forestland is meant to be protected not traded, stop this worthless effort now.	NS	X
22	Unique			GEN	Barbara Richards		66	1	This land surrounds the Boundary Waters southern border. It abuts Lake Superior. I could wish that you aren't really thinking this is a good idea. Please listen to those who have a good understanding of watersheds; who realize the issues with surface flows, storage- like the ones that just collapsed creating a huge mud slide destroying lives, livelihoods and communities; and who know the dangers to underground water- aquifers.	NS	X
25736	Form Letter	1	Variant	GEN	Barbara Schlaefer		1216	1	Please don't be short-sighted. Don't let this happen. Don't assume everything will go perfectly. It won't. It's your job to protect our precious waters, natural resources and recreational wilderness.	NS	X
27664	Unique			GEN	Barry Lesar		1818	1	I firmly believe that this project has been shown to be as safe as humans can make it for the environment I also know that as refinements are made to the process and as conditions change, the requirements for Polymet to meet even more stringent environmental controls will be enacted. One need only look at Taconite mining and how it has evolved and improved it's processes to enhance the environment to see that this is a safe and needed endeavor. Please quit dawdling and get the permits to Polymet so they can start mining and processing the minerals we so desperately need to continue in the lifestyle everyone seems to need.	NS	X
27725	Form Letter	1	Variant	GEN	Ben Kreilkamp		2121	1	I oppose the current PolyMet proposal. The FEIS isn't adequate; I object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I oppose any federal permit to destroy wetlands and impair water quality.	NS	X
24656	Unique			GEN	Bertil William Lindquist		1061	1	I just wondering if mining has ever been good for the environment. That is all.	NS	X
30155	Form Letter	1	Variant	GEN	Beth Darey		2835	1	Stop Polymet save lake Superior!	NS	X
24206	Form Letter	1	Variant	GEN	Betty J. Van Wicklen		1010	2	Particularly, in this time of climate changes, we must do all we can to preserve intact wild areas, forests and wetlands. Mitigation of these regulations benefits only PolyMet; certainly not public health, safety or the ecosystems affected! Please deny PolyMet any mitigation if==of any kind in this matter. I think most Americans would agree with me at this time that mineral exploration and mining is, in general, a messy, pollution-ridden activity,and when done on public/national lands especially, it mars and destroys the environment surrounding the mine, and risks too much a chance if forever polluting the wetlands and ground water surrounding it. We've thrown away far too much of what Nature provided us - mostly irreparably. I hope a better alternative can be found, where a mine will not endanger the environment and public health and safety. If not, then the minerals should be left in the ground with all the remaining fossil fuels, until such time as our climate has healed itself. Otherwise,it'ss just not worth the risks involved.	NS	X
2240	Unique			GEN	Bill Doran		267	1	I live on Lake Eshquaguma and SUPPORT the MN final EIS for the Polymet project	NS	X
27697	Form Letter	3	Variant	GEN	Bill Erzar		2096	1	I look at the opportunity to bring the Polymet NorthMet project to our area. I look at the need, the jobs, and benefits it will bring to our communities, the state, and the Nation. I also looked at the challenges that face a project like this in water quality, wetlands, wildlife, etc. I have had the opportunity to tour the site and heard the explanations of tailings basin construction and water control among other concerns.	NS	X
27287	Unique			GEN	birchriverwolf@gmail		1680	1	Based on the information you provided I support your project.	NS	X
346	Unique			GEN	Bjorn Reed		174	1	Please do not mine near the bwca!	NS	X
22358	Unique			GEN	Bob Dolores Delaney		867	1	the U.S. Environmental Protection Agency veto this request and start making an effort to ENFORCE the Clean Water Act. This will save our retirement dreams to live in Ely with clean water and clean air health problems eliminated. It is our belief that based on my own financial review that this will become an above ground mining project in a very short time with damage to our health and well being FOREVER. You can stop this! Please do.	NS	X
9995	Unique			GEN	Bob Hedlund		649	1	This project is so much more controlled than what it was then. Minnesota has had mines for a long time. This is better.	NS	X
30161	Form Letter	1	Variant	GEN	Bob McNattin		2836	1	We must stop this!!	NS	X
24643	Unique			GEN	Bob Walker		1057	1	How can this be a good idea? Seems like it should be against the law to let a private company that will saddle the citizens of Minnesota with ongoing costs to keep the environmental mess in check, if it can be kept in check. I am totally against this. This is too precious an area to be playing around with this kind of possible disaster. It's like mounting a toilet on your well and saying you'll put some filters on it to keep the water clean. Someone will have this as their legacy and be remembered for generations as the people who dropped the ball.	NS	X
3855	Form Letter	1	Variant	GEN	brad carlson		386	1	i do not want the polymet mining to be allowed. there are all sorts of reasons i do not want this type of mining to be allowed in the state of minnesota overall but the thought of it being allowed in the water rich environment of n.e. minnesota is appalling. it is my researched and verified opinion that this type of mining/industry will cause profound irreparable damage to the area. anyone who believes an industry that leaves behind horrendous pollution problems that last for hundreds of years should be allowed to operate has not thought through the issues. I OPPOSE THE POLYMET MINING AND WANT THE PERMIT DENIED.	NS	X
465	Unique			GEN	Brad Hill		216	1	Please deny the Polymet mine the ability to operate in Minnesota. There is too much risk to the public.	NS	X
23966	Form Letter	1	Variant	GEN	Bradford Shinkle		979	1	Please issue an SDEIS that fully accounts for these ecological and financial costs, and find correctly that no mining permits conforming to the public interest can be issued. Thank you for your attention to this issue.	NS	X
25898	Unique			GEN	Brenda Doup		1241	1	There is "no" amount of job creation or money worth jeopardizing human health and our fresh water resources. We know the affects please put a stop to this. As a mother who has watched their child go through chemo treatment for leukemia that is expected to be from a benzine spill. STOP the debate once and for all. Polymet is going to keep throwing money at this until self centered, greedy individuals make it happen.	NS	X
28486	Unique			GEN	Brenda Simonson		2281	2	The extensive environmental review has assured us that mining can be done without environmental damage. It has been a lengthy review process that has proven to be effective. The State of Minnesota, along with the DNR, the US Army Corps of Engineers, and the US Forest Service has agreed that mining will be done safely to ensure no long-term harm to the environment.	NS	X
23984	Unique			GEN	Brent Decook		984	1	I'm Brent from st.charles and I'm very concerned about the proposed mines near the boundary waters area. If there ever is a problem we could destroy the only true wilderness left in Minnesota and lose our voyageur heritage and the all those jobs it produces year after year. please don't gamble with our water and our bwca	NS	X
30098	Form Letter	9	Variant	GEN	Brian Harrington		2817	1	The environmental safety of this mine is based on the assessment by the requesting corporation. Do you advise your family, children or friends to buy based on the used car sellers report? Famous last words, "trust me -- it's safe."	NS	X
30098	Form Letter	9	Variant	GEN	Brian Harrington		2818	2	In return, we are promised: ~20 years of jobs mostly during the construction period ~500+ years of water filtration to prevent the worst of the pollution to enter our waterways. Over 2x longer than the US has been a country. Just think you're basing decisions on maintaining a vital system for twice the span of our nation's existence. I ask you to step back and reconsider your decision making process.	NS	X
30098	Form Letter	9	Variant	GEN	Brian Harrington		2820	4	The conclusions issued by numerous independent scientific agencies find the PolyMet environmental evaluations inadequate and unsubstantiated on many points listed below. These agencies focus on evaluating environmental impact. The safety to our environment and the long term impact is based on project on faulty information. With the caveat of promises to maintain a vital filtration system for 500 years and we'll put money aside.	NS	X
30098	Form Letter	9	Variant	GEN	Brian Harrington		2822	6	This report and it's recommendations continue the deep denial about the critical conditions of our lakes and the responsibility our officials and citizens share in their demise. Out of 30,000 comments, 98% are against the mine.	NS	X
27672	Unique			GEN	Brian Smith		1829	1	I am writing to express my opinion that the mining of precious metals project should not go forward in Northern MN.	NS	X
27418	Unique			GEN	Brian Wesley		1735	3	For 40 years we have enjoyed and treasured using Voyageurs National Park, the Boundary Waters and Minnesota's 67 State Parks. Our state is unique and precious naturewise; please don't allow more mining in such a delicate area.	NS	X
2113	Unique			GEN	Bruce Harten		296	5	The DNR should recognise the inadequacy of the Final EISand serve notice that permitting will not proceed in the future ! Non-ferrous mining is not conducive to maintaining Minnesotas Woods and Wildlife !	NS	X
29910	Unique			GEN	Bruce Harten		2723	1	Dancing around the "Elephant in the room" in this instance is RIDICULOUS !!! I did the electrical work on the Forbes tac plant in 1965 and again in 1978 ! I spend a lot of time flyfishing the St Louis river and all the Nor shore streams....Putting One Sulfide Creating Monster right on top of an abandoned 'Poluter' is "THE DUMBEST DAMN THING MINNESOTANS EVER PUT ON THEIR PLATE"	NS	X
29807	Unique			GEN	Bruce Ludewig		2632	1	I do not believe the proposed plan goes far enough to ensure that the St. Louis River watershed will not be significantly polluted in the future. This enterprise would unearth caustic materials on a large enough scale as to require hundreds of years of monitoring and treatment. The proposal does not provide enough assurance that this monitoring and treatment would actually occur as long as would be necessary, given the unpredictable nature of politics and the economy.	NS	X
27591	Unique			GEN	Bruce Valen		1779	1	Please be advised that as a citizen of Minnesota I am opposed to the above referenced project. The long term environmental effects are so uncertain that I believe that the risks far outweigh any short term benefits. Even if the mine operators pledge a certain sum for future cleanup, there is no assurance that said funds will be adequate.	NS	X
2113	Unique			GEN	Bruce Harten		294	3	After careful review, of the Final EIS I have concluded that these documents are flawed and skewed to enable 300 iffy jobs and give minnesotans 500 plus years of devastation	NS	X
23757	Unique			GEN	Bryan Emmel		967	1	This is an environmental disaster waiting to happen. This company, which is not even a U.S. company, couldn't care less about the well being of the people of the Iron Range. All of this talk about jobs is just pie in the sky. The state should recognize that the mining industries of Northern Minnesota, after being in existence for 130 years, have reached the point of beating a dead horse. If this area can't find other ways to make a living then people need to move elsewhere. Trashing a fragile ecosystem won't help anything.	NS	X

NorthMet FEIS Comment Matrix											
Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
26617	Form Letter	1	Variant	GEN	Bryan Wyberg		1368	3	You are aware of independent studies that differ in conclusion from the industry developed analysis chosen for the FEIS. In light of that knowledge, I believe that a decision to ignore independent analysis and accept the FEIS as it is, biased in favor of the project, is unethical and an abrogation of your legal duties as stewards of these public lands for future generations of Americans. Therefore, I oppose issuing any federal permit allowing PolyMet to destroy wetlands and impair water quality. Period. No permits until they explain how they will provide for water quality control for the next five hundred years.	NS	X
27673	Unique			GEN	C Darwin		1832	1	Because it is impossible to assume long time safety of Lake Superior I urge you to not give PolyMet the right to mine in the arrowhead.	NS	X
24664	Unique			GEN	c freeman		1071	1	My vote is a resounding NO. I understand very well what different types of mining entail. Currently working in the state of Oregon on their proposed mining issue which, by the way has been a resounding NO from Fish and Wildlife (California and Oregon), Forest Service, BLM, as well as several state legislators and citizens. No one wants mining along the Smith, Chetco and other rivers due to severe ecological imacts.	NS	X
21868	Unique			GEN	Caree Gordon		850	1	The aftermath of the Mount Polly Mine tailings pond breakage in B.C. is an example of the worst-case scenario of what could happen with the PolyMet/NorthMet project in the Hoyt Lakes area. The Kawishiwi River & surrounding watershed will be affected by the pollution, even if things go well and there is no disaster. The BWCAW is protected, but not protected from the drainage traveling north and east. The Spruce Rd Twin Metals site is nearly adjacent to the BWCAW, and is less than a mile from Gabro and Bald Eagle Lakes. Thousands of visitors to the Superior National Forest and BWCAW seek solace in the wilderness, as it is one of the last areas in our Nation that is protected from pollution. I want to see ZERO pollution and avoid any possibility of a disaster happening in this area. I have signed numerous petitions to defend our Constitution and the Federal Wilderness Act of 1964. Is it really in Minnesota's best interests to allow a foreign company with no ties, or connections to our pristine wilderness and neighboring communities to jeopardize and possibly destroy what has been protected and maintained for public use? In the future, when PolyMet/NorthMet has completed stripping the area of copper, nickel, and platinum, what will be left with? There will be no second chances after the damage is done. Recently, I was employed as an information assistant for the US Forest Service at the Superior National Forest Headquarters located in Duluth, MN. I issued BWCAW permits and spoke with people from all over the world who were in the process of planning trips to the BWCAW. These people bring commerce to our beautiful State of MN. They spend money throughout the state as they travel north for their vacations. There are many well-established businesses that stand to loose profits if the wilderness is spoiled. PolyMet/NorthMet will create jobs for people in Northern MN, however, the essence of our beautiful wilderness and clean lakes is at stake – the exact reason why so many people choose to vacation and visit Northern MN. I believe the stakes are too high and definitely not worth the risk. Future generations of family members return year after year to experience the unpolluted lakes, forests and solitude that is exclusively offered in the BWCAW and surrounding areas. For long-term commerce, we need to keep MN clean and free of unwanted pollution for the sake of our unique lands, water, animals and forests. The Wilderness Act of 1964 was put in place as federal law to protect the boundaries of the BWCAW. Let us HONOR our land and RESPECT the foresight our leaders had to create these protective boundaries.	NS	X
27184	Unique			GEN	Carl Sack		1670	2	have lots of specific objections to the FEIS, which are bulleted below. I have taken what time I can to read through the proposal myself and generate my own objections based on my education in natural history, environmental science, and GIS, rather than submit a form letter provided by a third party. However, I share many of the objections that are contained in such form letters, even if I omit some of them here because they have been so eloquently stated by others. Above all, my objection to the FEIS is that it does not base its recommendations on the precautionary principle: that of, first do no harm. Here in Wisconsin, we have a forward-thinking metallic mining law known as the "Prove It First" sulfide mining moratorium, which says that a company wishing to mine in a sulfide ore body must back up its safety claims with evidence that sulfide ores have been mined elsewhere in North America without major environmental contamination. To date, this reasonable precautionary standard has not been met.	NS	X
27184	Unique			GEN	Carl Sack		1671	3	Yet, regulators of the Minnesota DNR, U.S. Forest Service, and U.S. Army Corps of Engineers-- yourselves--are willing to throw caution to the winds and take on faith the dubious, untested claims that A) containment and mechanical treatment of all but 10 gallons per minute of the mine's runoff is possible, and that B) such containment and treatment can and will be maintained in perpetuity, for at least the next 200 years at the Mine Site and 500 years at the Plant Site. You know and I know that such assumptions--on which Polymet's entire claim of the environmental safety of the mine are based--are laughably unrealistic. Nothing, I repeat, nothing created in the United States of America has yet lasted 500 years, because the United States of America itself is not yet that old. The FEIS flatly states that a reverse osmosis water treatment plant will continue operating for longer than buildings erected by Spanish conquistadors in the days of Cortés have been standing. Such a prediction is absurd.	NS	X
8550	Unique			GEN	Carlan Lesch		582	1	I am against the North Met Mining Project.	NS	X
25466	Unique			GEN	Carly Hawkinson		1186	1	Due to its negative consequences on both the environment and on the citizens of Minnesota, sulfide mining (PolyMet project) is indubitably unethical and should not be pursued further. Sulfide mining is unethical because it jeopardizes and damages the overall well-being of the greater biotic community. As Aldo Leopold (highly recognized conservationist and author) states, “A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise”. Sulfide mining clearly does not adhere to stability, integrity, or beauty.	NS	X
25466	Unique			GEN	Carly Hawkinson		1188	3	The laundry list of negative factors from sulfide mining is outstanding. Another thing that I’ve noticed listening to both sides of this issue is the wide diversity of people who oppose it. I’m happy to see that it’s not just the typical environmentally-friendly tree-huggers standing up for the health and well-being of the planet and all of us who live upon it. The soil is planted for all of us to eat, the air moves for all of us to breathe, and the water cycles for all of us to drink. So, it’s nice to see that others also “get it”. I noticed farmers, doctors, lawyers, Pollution Control Agency employees, teachers, loggers, recreationists, old people, young people...all oppose sulfide mining and they voiced not just their personal concern but also physical and scientific proof of its disastrous, negative effects. But, regardless of any proof, it just takes common sense to realize what irreparable damages and hazards will occur if it were to be done. Other areas of the country and world have not used common sense, pushed away their cares, and sought after the money. And now, we as a global community are suffering from it. Let’s not follow in those mistaken footsteps.	NS	X
24131	Unique			GEN	Carlyle Conrad		1005	2	Tom and I are very concerned about the total environmental impact of this project. There has never been a sulfide mine that hasn’t left pollution behind. We the people, wildlife, forests and our whole ecosystem will pay the price in years to come. As humans poison ourselves over time there will be devastation. We are wondering why such a valuable resource as our National Park system would contribute to this problem by trading lands to assist these companies that are in it for the short term financial gain, rather than for the good of all people in our country to enjoy the pristine wonders of our Superior National Forest. WHY would we risk our most valuable resource, WATER!!!!????? As a Native American man said at a Duluth meeting, “ Water Is Life!”	NS	X
26016	Form Letter	1	Variant	GEN	Carmen Elisa Bonilla Jones		1257	1	I am writing to urge you to withdraw your proposal to allow PolyMet NorthMet copper-nickel mine. It would result in the industrialization of now-pristine backcountry. It would damage habitat for dozens of wildlife species including moose, lynx, gray owls and goshawks. And it'd destroy the rivers which are the life blood of all wildlife and humans with its pollution.	NS	X
2338	Form Letter	1	Variant	GEN	Carol bechtel		323	2	Mining is an exploitive industry by nature & we need to get beyond it.	NS	X
2338	Form Letter	1	Variant	GEN	Carol bechtel		324	3	Even the Eagle mine in MI that is supposed to be a model is rife with environmental problems & potential problems.	NS	X
2338	Form Letter	1	Variant	GEN	Carol bechtel		325	4	If there is any kind of glitch, it is too late.	NS	X
328	Unique			GEN	Carol Kidder		172	1	I want to express my opinion as very much against the proposed mining in northern Minnesota.	NS	X
25562	Unique			GEN	Cat Thompson		1197	1	Hello. I am writing to express my very deep concern over Minnesota's continued push for mining in the water-rich regions of the state. In case you missed it, Brazil just had an iron ore dam collapse, killing an entire river, displacing thousands of people and devastating a huge region of the country. Their government is now suing the mining companies for \$5B http://www.theguardian.com/world/2015/nov/28/brazil-to-sue-mining-companies-bhp-and-vale-for-5bn-over-dam-disaster We all know that mining companies leave their mess behind and using shady legal tactics, skip town on their clean up responsibilities. Moving ahead with the PolyMet mine will guarantee human life will no longer be able to survive in our state at some point. From the MN Tourism Coalition website, the following numbers should explain why saying NO to dirty mines is a much smarter idea than turning over our pristine wilderness. \$32 million a day?? Mining cannot even come close to that. This mine would, at the most provide between 70-140 new jobs. Tourism can put hundreds of people to work. Investing in Tourism is Smart ? Tourism in the state of Minnesota is an \$11.9 billion industry – generating \$32 million a day. ? Tourism supports almost 240,000 leisure and hospitality jobs providing \$4.1 billion in wages. ? Tourism generates nearly \$769 million in state sales tax revenues, which is 17 percent of Minnesota's sales tax revenues. ? Travel and tourism creates jobs and generates sales in virtually every county of Minnesota ? Travel and tourism has a positive impact, supporting a wide variety of Main Street businesses across the state. Tourism Spending Return on Investment ? Every \$1 invested in state tourism marketing returns an estimated: \$8 in state and local taxes, \$22 in income and \$84 in spending by travelers. ? Explore Minnesota Tourism leverages state funding by generating private sector support through cash and in-kind matching funds. ? There are few ways government generates revenue and jobs – tourism does both. Tourism is Fueled by Promotion ? Minnesota's investment in tourism marketing has fallen to almost 1990 levels. ? Our funding level ranks 30th in the country. ? Minnesota is being outspent in tourism marketing by our competitors. ? Regional competitors like Michigan, Wisconsin, South Dakota, Illinois and Montana outspend us in tourism marketing. I urge you to consider that selling out the land to international corporations will cause the economic collapse of Northern MN. Please say no. Or, if you're insistent that you will sell out the state, then I think demanding a \$5B escrow fund for future spills (which we know there will be) is reasonable.	NS	X
26526	Unique			GEN	Catherine Fontanazza		1346	1	We have experienced many problems with companies coming in mining and abandoning the mines and leaving huge environmental problems behind. It is better for the people, the air, the water and the land if the minerals are left in place and the mining companies spend their profits cleaning up the last place they were mining.	NS	X
2759	Unique			GEN	Catherine Johnson		337	1	I would like to express my strong opposition to the proposed Copper Nickel plan offered by Polymet.	NS	X
24934	Unique			GEN	Catherine Keim		1123	1	Please allow no more mining.	NS	X
53	Unique			GEN	Cathy A. White		127	1	This whole deal needs to be taken OFF the table. After what happened in Canada this should be a no brainer.	NS	X

25756	Unique			GEN	Cathy A. White		1222	1	There is NO WAY you can absolutely guarantee that there would be no environmental impact. There are no protocols in place that could replace any damage done to the environment. . If this wasn't a big money thing for a few you wouldn't even be wanting to do it.	NS	X
8782	Unique			GEN	Cecilia Kurtz		612	1	I recently received info on 4 discs containing information in regards to the PolyMet project. I had already been somewhat informed on this topic and while the info I received in these discs is very detailed and extremely long, I still stand by my first inclination to be opposed to this project.	NS	X
8782	Unique			GEN	Cecilia Kurtz		614	3	I have been a tourist many times to the very areas being described for future mining. These new mines would permanently scar, destroy and basically get rid of what we Minnesotans have now. We already have the big farmers destroying much of MN ag lands with improper tillage methods. Their toxic chemicals contaminate the air we breathe and most of the adjoining waterways. Our birds, bees and butterflies are disappearing thanks to a federal and state government that allow farmers to continue to give a whole new meaning to the words "dumb farmer".	NS	X
8782	Unique			GEN	Cecilia Kurtz		615	4	Do we have to continue to destroy this beautiful state, it's fish and other aquatics, and it's wildlife with mines such as this one being proposed by PolyMet?	NS	X
2449	Unique			GEN	Chad Sahr		327	1	This is simple. They will meet everything they need to and we NEED the jobs. Done deal, move forward!	NS	X
25758	Unique			GEN	Charles Lininger		1224	1	I am deeply troubled that undue financial interests are willing to sacrifice our nearly pristine wilderness for a temporary goal of enriching a few industrialists. I don't have time to research and comment on the details of the application, as a citizen, however, I am familiar with the idea that a certain amount of accidental damage occurs with every big project. The area in which this is proposed will not endure "accidental damage" it will be spoiled forever. Do not allow this folly to continue.	NS	X
29101	Unique			GEN	Charles Zeugner		2420	1	I believe that the EIS is insufficient and inaccurate because it overstates results of modeling without accounting for disputable inputs, overstates the ability of the proposer to remediate without accounting for the economic viability of the proposer, and other issues.	NS	X
27485	Unique			GEN	Chatta Small		1764	1	This project will cause permanent and devastating damage. The answer to this company should be a resounding Absolutely Not. You cannot destroy our habitat, our water. I understand the need for jobs, but this is NOT the way to do it.	NS	X
24590	Unique			GEN	Cheryl Hegman		976	1	I believe copper mining can be done safely in Mn and I trust that the MN agencies responsible for making the rules to keep it safe.	NS	X
14590	Form Letter	1	Variant	GEN	Chip Borkenhagen		795	1	The Polymet mine that is being proposed at the doorway of the BWCA is simply too high of a risk to take for this beautiful state. This is a foreign company that is virtually stealing Minnesota assets to sell to other foreign companies. What is possibly in it for Minnesotans for this kind of risk? There are so many of us that implore you to disallow this rape of our resources for needs that can obviously be met in far less risky arenas. Please reconsider the importance of your decisions, and veto the opportunity that Polymet is trying to literally gouge us with. Our BWCA and surrounding areas are world-class destinations, and our legacy for many future generations that follow us. By saying no to this multinational corporate assault will gain substantial political capital of the ever-growing multitude of people who believe our state's welfare is worth far more than making a quick buck - at the potential expense of harming our assets. Thanks for reconsidering our collective conscience, and just doing the right thing.	NS	X
22055	Form Letter	1	Variant	GEN	Chip Jones		854	1	We need to protect our State's natural resources and NOT allow the destruction of our unique resources for short term financial gain. This land will be around much longer than any type of business and we should not allow this project and others like it that jeopardize the Boundary Waters Wilderness Area. I urge you to reject this project.	NS	X
27414	Unique			GEN	Chris Bangs		1731	1	I ask that you NOT approve this mine to be developed and opened. The risk is far too great for such a special place in Minnesota and the entire continent.	NS	X
25945	Unique			GEN	Chris Bohler		1248	1	As a business owner in Minnesota I have taken time to review the environmental reviews and impact statements for PolyMet mining project. It looks like it will be safe to proceed. I would vote to go ahead with the project.	NS	X
25945	Unique			GEN	Chris Bohler		1250	3	It would also be a fine example of public private partnership to see a sensible use of our State's mineral resources while still protecting our lakes, forestry, and wildlife resources.	NS	X
24662	Unique			GEN	Chris Casper		1069	1	We must think to the future, not the past. No more mining. We must move ahead with sustainable energies, clone or create synthetically things we previously had to mine to get. We have to stop destroying the earth, the very homes of many creatures, the water, the fire, the future for our children. We must think outside the box.	NS	X
22538	Unique			GEN	Chris Heeter		871	2	Even if the environmental impact study were to be strengthened, if more people could agree that it is thorough and complete—which it is not. There remains unavoidable and unpredictable risks that we cannot take. We can't do it. We have to think bigger and broader and more creatively in terms of how we support communities and individuals in need of jobs. Risking the environment isn't the answer. We've done it before with unspeakable consequence. And so it falls to you, Governor Dayton, and leaders of agencies tasked with protecting our environment, to make the hard call. To speak and act from our wiser selves, compassionately resisting the pull of a "quick fix" for our employment needs. And standing for wild places that depend on your voice.	NS	X
13	Unique			GEN	christie white dauphin		34	5	I am 100% against this mining venture, and the land swap.	NS	X
48	Unique			GEN	Christine		38	1	I am opposed to the Polymet mine because water is life.	NS	X
6819	Unique			GEN	Christine DiSimone		511	1	Please deny this project and protect our environment instead!!	NS	X
24348	Unique			GEN	Christine DiSimone		1027	1	Please do not allow any more mining to deface our environment.	NS	X
29120	Form Letter	1	Variant	GEN	Christopher Garza		2425	1	I think that PolyMet's mining plan provides too many risks to the ecosystems and the organisms that are dependent on it. I would be remiss if I did not try to protect it so that others could share some of the same kinds of experiences that I had during my summer in the BWCAW. I would expect that the Forest Service would do what is right for land that they are supposed to manage and protect instead of putting it in danger.	NS	X
29623	Unique			GEN	Christopher Lish		2556	1	As a former resident of northern Minnesota, I strongly oppose the PolyMet NorthMet copper-nickel sulfide mine.	NS	X
8493	Form Letter	3	Variant	GEN	Chuck Lyons		579	1	Copper is a needed mineral, it needs to be mined in an environmental safe manner. That can be done at PolyMet rather than a country that abuses both the environment and the workers.	NS	X
6957	Unique			GEN	Cicpri@aol.com		525	1	I think 10 years of studying the environmental impact of this mining operation is more than enough. Since they have met all the requirements from a monetary, scientific and engineering perspective to adequately protect our environment any further delay would only be punitive. This area is suffering from a slowing of the economy especially in the mining industry. This project would go a long way to relieve the economic pain in the mining industry. Although the tourism industry is part of our economy it is not the main stay of it. And since this project would have no effect on it, it should not be delayed because of an unconfirmed perceived threat to it.	NS	X
23629	Form Letter	1	Variant	GEN	Cindy Josin		883	1	Please stop fucking with the little land in this country that we are trying to preserve!!!!	NS	X
29861	Unique			GEN	Claire Vanderslice		2685	1	PolyMet's sulfide mining proposal is inadequate. One of the target metals (stated or not) in the project are the platinum group (PGM). They require very fine grinding of ore. The sulfides present in the ore are much more quickly mobilized than the finer particles. This makes the acid mine tailings and the acid mine drainage much more potent to dissolve the toxic elements present in the ore like arsenic and lead etc. I understand that PolyMet's proposed mine would be the first of its kind in Minnesota. Its approval risks polluting the headwaters of unique places with toxic metals and acid mine drainage for hundreds of years, contaminating fish, killing wild rice, sickening people and wildlife. The waters of this area must not be sacrificed and wasted for copper and gold and etc. The water is more valuable by far to life as it is known in this area of Minnesota.	NS	X
10364	Unique			GEN	Claudia Egelhoff		683	1	Can Minnesota afford another company moving to the Arrowhead region making promises it won't be able to fulfill? I say no.	NS	X
24826	Unique			GEN	Claudia Gibson		1121	1	Just don't let it go forward. It's a bad deal for the ecology. It's a scourge upon the land. It destroys all that has real value, that which cannot be replaced, for some private interest that will leave you in their waste when they're done. Just because one is able to do something does not mean he ought to do it. There must be a measure of right and wrong. A long view of -if it will help or harm the people you swore to protect and serve! What your legacy is. The big polluter or the realist, protecting his constituents from harm to their water and their waterways	NS	X
25856	Unique			GEN	Colleen Meyer		1239	1	I am the child of a miner from Mid Minnesota. I grew up with a father who had a good job and was able to take care of his family. While I directly benefited from that, I do not believe that jobs at any price are worth the damage to our northern Minnesota landscape and potentially the Boundary Waters area that stand as a beacon of natural wilderness. This area is priceless and just like a one-of-a-kind painting, or a baby, or anything else that is not replaceable, you do not take chances with for short-term gain. Also note that this gain is for a small number of people over a short period of time with the potential damage having no time line but eternity. This is not an acceptable plan. Please stop this nonsense.	NS	X
433	Unique			GEN	Courtney Scott		202	1	Please please please, for the love of Mother Nature. Keep the pristine beauty in the Boundary Waters.	NS	X
535	Unique			GEN	Craig David		230	1	I would like to express my TOTAL OPPOSITION to the proposed PolyMet Mine.	NS	X
535	Unique			GEN	Craig David		232	3	With all prudence, and caution, to protect the state's environment, especially the pristine waters of the northern tier, I beg of you not to make this huge, shortsighted mistake. PLEASE - DO NOT LET THE MINE BE BUILT.	NS	X
6966	Form Letter	1	Variant	GEN	Craig Samson		526	1	After all the years and all the discussions the whole PolyMet project is realistically back right where it started. Their assertion at the beginning was that new technology (which was never fully explained) would allow this form of mining to be done safely. Yet after all this time it has become evident by their own EIS that it not only can not be done safely, but they admit that they will pollute, and remediation will take centuries. They have actually proven all the arguments that had been given to kill this project right from the beginning. I think it is time for all the decision makers to stand up and do the right thing and put an end to this proposed project before an environmental disaster occurs. An environmental disaster that could not be fixed, there would be no second chance or reconsidering. That is a huge responsibility and I for one would not want to be responsible for taking that type of gamble for some short-term jobs, most of which would not even go to the Minnesotan's who are so keen on going forward with this project. Please consider the consequences of this project very carefully.	NS	X

13532	Form Letter	1	Variant	GEN	Crystal Yakacki		778	1	The way the world is going, I just will not vote for candidates who are not on the right side of environmental issues anymore. I'm not the only one and I hope it will become political unfeasible to allow this kind of things to continue anymore. I don't believe that voters up north swayed by THIS issue would be voting for you anyway. Please be on the right side of history, don't let the same old mess take over.	NS	X
13532	Form Letter	1	Variant	GEN	Crystal Yakacki		786	2	Polymet is not trustworthy, the venture is inherently flawed, it has only lead to bad things wherever it has been attempted, and it should not be attempted so close to our precious resources, the Boundary Waters and Lake Superior. These are national treasures - world treasures!	NS	X
2089	Unique			GEN	ctok		291	1	We are not in favor of the Polymet project. We feel that there have been exaggerated and even dishonest claims about the number of jobs which will become available. We are also unhappy about the reputation of the companies behind this endeavor. There definitely could possibly be threat of danger to the environment and the people who sitll hope to live here after Polymet's proposed 20 year lifespan is complete. My grandchildren will be in their 30's and out of work if they hope to work there. Please count our 2 votes against the project.	NS	X
30201	Form Letter	1	Variant	GEN	Cynthia Tande		2842	1	No Mining in BWCA	NS	X
27699	Unique			GEN	Dale Olson		2102	1	Please Gov. don't let Polymet destroy what we are known for. There has not ever been copper mine that hasn't polluted the water. The Land of 10,000 lakes and a five thousand year treatment plant. Sure who will be around in five thousand years	NS	X
2403	Form Letter	3	Variant	GEN	dale Saari		326	1	I never commented. Just hoping it goes through. What more can the range handle.	NS	X
872	Form Letter	1	Variant	GEN	Dan Korpi		259	1	please build mine sready. We need the minerals to build wind mills (bird choppers)	NS	X
2777	Unique			GEN	dancath		342	1	I am opposed to Copper mining in Northern Minnesota. The cost of polluting this valuable natural area is to high to permit a operation like this from happening. By allowing Polymet, you open the door to other operations as well, each with the potential to permanently harm our natural environment. The DNR has the responsibility to protect the natural resources and is not obligated to hold up the economy of the Iron Range. Please do not allow Copper Nickel Mining in this area.	NS	X
24660	Unique			GEN	Daniel Houle		1067	3	SAY NO TO THESE FOREIGNERS WHO WANT TO MINE IN OUR BEAUTIFUL BACK YARD,,BESIDES, THEY ARE ALREADY BANKRUPT.	NS	X
27037	Unique			GEN	Daniel Iverson		1635	1	Copper nickel sulfide mining is bad mojo. You don't need a degree in biology or economics to realize , based on the history of the mining corporations and their key people that Minnesota is being played the fool.And, I am sure that Poly-Met and Twin Metals are growing impatient after sinking millions of dollars into manipulating politicians, scientists,data and public opinion.But, the sad truth is most Minnesotan's are unaware of the dangers of sulfide mining and the very real threat to our treasured sky blue waters, betrayed by doctored up EIS documents, silence, sworn lies and blackmail reminiscent of Watergate.Minnesota shining star of the north, land of 10,000 lakes..please.	NS	X
24676	Unique			GEN	Daniel J. Peters		1074	1	I am writing to voice my opposition to the proposed Polymet copper/nickle mine currently being considered in Northern Minnesota. While there may be some debate about the ability of Polymet to contain the pollution associated with copper/nickle mining, even this data assumes a 'best case scenario', and given that the pollution containment assets would need to be operated for hundreds of years. I also am fearful that eventually, Polymet will become financially insolvent, as has happened in several other mining sites around the world, and the taxpayers of MN will be stuck footing the bill, long after the spoils of mining have been reaped and spent by Polymet and it's parent company. The environmental risks are far too great, and the number of sustainable mining jobs are far too few, for this mine to make sense in MN. If this mine is allowed to proceed and operate, I'm fearful that my children, and future generations of Minnesotans, will never have the opportunity to enjoy the wild beauty that is Northern Minnesota.	NS	X
29801	Unique			GEN	Daniel Pauly		4168	2	The FEIS assessment of Tailings Basin mercury contamination conditions is fraught with systematic data integrity problems that include mathematical errors in key formulas, improper selection of data sets, and suspected sample collection errors. These same errors were present in the SDEIS, but have NOT been remedied in the FEIS.	NS	X
29801	Unique			GEN	Daniel Pauly		4169	3	The errors and omissions in the Tailings Basin dataset have permeated the FEIS (as they had with the SDEIS) and its supporting reports, resulting in incorrect fundamental conclusions as to current and future mercury discharges at the Tailings Basin and Waste Water Treatment Plant. In particular, the Tailings Basin and Waste Water Treatment Plant as proposed are likely to significantly increase total mercury, and especially methylmercury, loading in the Embarrass River watershed.	NS	X
6910	Form Letter	1	Variant	GEN	Danny Terry		520	1	They are going to Bribe the weak people in Office and those people who in Need of a little Money and they are going to put your Friends against each other and Destroy what family[']s are made of on a Large Scale	NS	X
6910	Form Letter	1	Variant	GEN	Danny Terry		524	5	We pay over 78 Billion Dollars PLUS every year in our Tax's that they have stuck us with, now you need to thank about all this before it happens because your Future will be the Same as our Children's if you Don't STOP THEM NOW !	NS	X
18055	Form Letter	1	Variant	GEN	Darlene White		828	1	Mining is boom/bust business. The boom times wreak havoc on the earth, air and water. In the bust time, we place our trust in the companies' promises of full clean up costs but it's really the taxpayers who are on the hook. In boon times workers can make very good wages but it's the investors and CEO that run away with the pot of gold leaving employees having to go on unemployment (taxpayers) with constant threat of benefits being cut off. This is dysfunctional economics. Northern Minnesota would prosper with a diversified economy. This is where our energy, imagination and capital should be going. If Polymet is given permission to assault our land, they will be followed by many more mining companies. When will we learn that destruction and (kind of) clean up is not the way to steward the earth for the sake of following generations.	NS	X
10777	Unique			GEN	Darrell Godbout	Ironworkers Local 512	2918	1	I am writing this in support of the FEIS for the NorthMet Mining Project. The first thing that people need to understand is that this is an existing mine site, active for 44 years, not developable property. We now have the opportunity to bring this site back to life along with the town of Hoyt Lakes, which has been depressed since LTV Steel Mining Company shutting down in 2001. Through extensive research and modern technological advances, this project can be constructed and operated safely and efficiently for both the environment and the economy. The Final Environmental Impact Statement (FEIS) has addressed a magnitude of potential risks, hazards and also solutions for these issues	NS	X
10777	Unique			GEN	Darrell Godbout	Ironworkers Local 512	2921	4	In summary, the FEIS addresses every possible scenario that could cause a potential risk. The combination of research teams has come up with preventative measures and treatment solutions leaving this an environmentally safe project with assurances to keep it that way. I strongly encourage the DNR to conclude the FEIS meets all necessary requirements to allow this vital project to move forward.	NS	X
569	Unique			GEN	Darrell patterson		253	1	I would like to see the DNR approve the final Environmental Impact Statement (EIS) for the PolyMet Mine. After 10 years, millions of dollars, and countless hours of labor, PolyMet has convinced me they will comply with the strict state and federal environmental laws.	NS	X
569	Unique			GEN	Darrell patterson		254	2	If an extensive EIS that satisfactorily meets the state and federal requirements can be overridden by a group of naysayers, then I am concerned we will discourage businesses from investing in our state in the future. Let's approve PolyMet's final EIS so we can show the rest of the country that there is a safe way to mine the precious metals that we all use every day.	NS	X
23406	Unique			GEN	Darwin Dyce		954	4	If you are following world and national news you are aware that the Trans-Pacific Partnership and the influence of the energy industry in climate talks threaten to further undermine pollution regulation in the name of free and unfettered trade. This mine and the very real possibility of other mines, pose great risk to the water so many of us depend on. Denying its operation is one step in the right direction amidst many great challenges that we face. Many others, and I urge you not to approve PolyMet's NorthMet FEIS.	NS	X
29749	Unique			GEN	Dave Chambers	Center for Science in Public Participation	4143	1	Although there have been modifications to the mine proposal from the 2013 SDEIS, there are still a number of issues that have not been adequately addressed. These include: ? The design for the tailings dams still continues the use of outdated and inherently unsafe upstream-type dam construction, even when it is feasible (but more expensive) to employ safer centerline-type dam construction technology; ? The Hydrometallurgical Residue Facility is still being sited on a risky foundation which jeopardizes the long-term integrity of the double-lined containment system; ? The FEIS does not present even a basic analysis of the Financial Assurance required for both mine closure and post-closure water treatment, even though the company is willing to make this information available for public review; ? Even though the rail cars that have been redesigned could still spread as much as 32,000 pounds of ore per year along the railroad corridor, the FEIS considers that there is no potential for impact to either air or water resources; ? The FEIS still makes overly optimistic assumptions about the ability to collect seepage water from the tailings impoundment and Category 1 Waste Rock Storage Area; and, ? The FEIS continues to refuse to consider underground mining as a potential alternative for purely economic reasons, even though it can be demonstrated that underground mining could be economic viable.	S	O

12544	Unique			GEN	Dave H		762	1	I sternly oppose the activation of the Polymet mine for the following reasons. 1. The state of Minnesota already owns the dubious distinction of being the largest changed/modified landscape-geography in the United States. Why? Global demand for food precipitated the massive drainage of prairie/swamp land thru the great red river valley starting from the Canadian border and extending to the Iowa border amounting to approximately to ? of the state’s wild natural acreage. Iron mining in the NE/NC modified another large percentage of the state’s northern geography in order to satisfy the world demand for steel. Urban sprawl for housing the Twin Cities 4M population. 2. No history exists, anywhere in the world, proving that sulfide mining does not negatively impact the environment. In Minnesota this means potential damage to our: o natural wild rice plots o streams,rivers, lakes o forests and vegetation o wild life o fish o current & future drinking water supplies 3. Jobs are important, but 75 local jobs out of 350 Polymet jobs does not justify the unmitigated risk affecting two very large and nearly pristine watersheds in NE Minnesota. 4. Swapping nationally protected BWCA acreage for mining is a most ridiculous idea. 5. Risk of losing tourism revenue in the NE counties. 6. Foreign owned/backed mining companies have NO risk to their own soil & environment. Lastly, awareness of our state’s diminishing water supply should be enough of an impetus for us to strictly protect ALL ground water, from any and ALL type, OR RISK, of pollution. We all should know by now the, inevitable, water shortage in the coming years will dwarf the agitating cost of current gasoline prices. Without fuel we don’t move around, without water we die. Even more serious, are you ready to increase the risk of polluting the states only natural water supply ever granted by creation to us in this state? Should we continue to lead the nation with the most changed landscape by adding more modified natural acreage for a few million dollars of copper/nickel ore that mostly benefits a foreign nation? My parting thought. Man is the only animal on this planet that Pooh’s in his own nest! Let’s stop it now! Natural resources are not renewable!!!	NS	X
28919	Unique			GEN	Dave Wennlund		2379	1	I am AGAINST ALL COPPER-NICKEL MINING IN MINNESOTA!	NS	X
27308	Unique			GEN	David A. Lien	Minnesota Backcountry Hunters & Anglers	3249	8	In addition to copper, nickel and platinum, the rocks dug up at the PolyMet pits also contain mercury and larger amounts of sulfide minerals—a form of sulfur. When sulfides are exposed to water and air, a natural chemical reaction produces harmful sulfuric acid. Sulfides also interact with mercury, already toxic, to turn it into its most toxic form: methylmercury.	NS	X
27645	Unique			GEN	David Bonello		1792	1	After reviewing the information from both sides of this issue, I am convinced the risks outweigh the benefits.	NS	X
27390	Unique			GEN	David Brown		1706	1	ALL mining is bad for the environment and pollutes the water. IF you look at all the other mining areas in the U.S. any type of mining has caused pollution in each area.	NS	X
5495	Form Letter	1	Variant	GEN	David Danz		425	1	I would like to go on record as OPPOSED to the PolyMet cooper-nickel sulfide mine proposal. As a critical decision maker in the final determination of allowing this mine to become operational or not, I ask you also to oppose this mining proposal.	NS	X
5495	Form Letter	1	Variant	GEN	David Danz		429	3	3. The odds of permanently damaging our lands and waters through this copper-nickel mining operation are high. Based upon the history of copper-nickel mining operations world wide, betting on the promises of PolyMet that the mine will not leave poisoned lands and waters in its wake is a mighty poor bet. How can you take this bet on behalf of current and future generations and sleep well at night?	NS	X
5495	Form Letter	1	Variant	GEN	David Danz		431	5	As a resident of NE Minnesota whose home is 40 miles as the crow flies from the proposed mine site, I have a considerable stake in your decision. With this in mind, I respectfully request a response to this letter and my expressed concerns.	NS	X
5546	Form Letter	1	Variant	GEN	David Dresbach		432	1	Don't be on the wrong side of history. Don't be another individual bought so a corporation can destroy an entire ecosystem that is so dear to so many people and the very essence of Minnesota. This CANT BE REVERSED!	NS	X
30212	Form Letter	1	Variant	GEN	David Garren		2843	1	Don't do it. The economics don't balance out be long term risks	NS	X
27625	Unique			GEN	David Genson		1790	1	It has come to my attention there is a pit mine being proposed near Lake Superior spilling into a river that spills into Lake Superior. I am extremely opposed to such a stupid idea. I will call anything stupid that could have a negative impact on the Great Lakes, even the smallest chances of an accident. Find another solution for the sulfide source. Let me say again, do not mess with the Great Lakes, protect them at all costs, their value is limitless.	NS	X
14954	Unique			GEN	David Lauseng		805	1	We fully support PolyMet Mine, we need this up here in the Northland.	NS	X
12306	Form Letter	4	Variant	GEN	David Low		756	1	Please also consider a spiritual angle: it is very likely, I think, that the creator wants us to preserve as much of his original handiwork as possible!	NS	X
2529	Form Letter	3	Variant	GEN	David Marty		329	1	Polymet and the DNR have been excruciatingly meticulous in reviewing the possible environmental impact of a Polymet mining operation. We have met due diligence and it is time to move forward with this project	NS	X
12943	Form Letter	1	Variant	GEN	David McMahill		780	1	But I do know that 20 to 40 years from now if we find ourselves dealing with the tragic consequences of the PolyMet mine, my children and grandchildren will look back and wonder how it was possible that this magical place that they have learned to love has become permanently polluted.	NS	X
25614	Form Letter	1	Variant	GEN	David Potter		1201	1	My wife and I have lived and used National Forest land and especially undeveloped wild and wilderness areas for many decades. We are very much unhappy with the constatnt nibbling away of national forest lands or national forest values for private developments [and despoiling.] And, sadly, all too often it is with the approval of federal agencies charged with protecting and preserving the lands and waters. I suspect the intense lobby and other political pressures brought by big money corporations cause this. Please stand strong against the PolyMet and other mine schemes. Please think of clean forest lands for generations to come. Use your authorities to do the right thing. We 100% oppose the PolyMet NorthMet copper-nickel sulfide mine proposal. This type of mine, like many others, is highly likely - over time - to produce and eventually abandon significant pollution to air and water and aesthetic values. All this damage so a corporation can make short term profits. This is wrong. We read that the PolyMet Final Environmental Impact Statement is poorly done. I therefore support objections and the needs for vast improvements in this document. Here in my home Klamath County, the local federal Congressman is proposing the give away of 200,000 acres of national forest to two counties. The move to give away federal land is happening nearly everywhere. We again strongly oppose any give away or trading off of federal forest land to corporations. Helping them pollute by making land trades is wrong, very wrong! The public's land is not to be traded off! Please pull this whole process back for more review. And, we feel you should not permit this mine as planned at all. Just look at Colorado and so many more sites in our national forests where old mines continue to bleed pollution. We can not afford to clean up after past mine permittees. Please do not allow this one.	NS	X
30215	Form Letter	1	Variant	GEN	David Robert Ott		360	1	Please reject this project. A couple hundred jobs are not a fair trade of for our irreplaceable water and wilderness resources.	NS	X
24679	Unique			GEN	David Romportl		1077	1	Any additional mines in Minnesota, and this project in particular, will have such drastically negative effects on our water quality than even the best possible economic or other positive results of this project would be far outweighed. We do not want future generations to deeply regret what we did for a short-term gain, but which will have lasting negative consequences that will make lives and communities worse for many decades beyond the end of any benefits from this mine. Minnesota water quality is already very bad, and we must take extremely huge measures to fix this. Approving this mine will do the opposite, and make Minnesota water even more contaminated, which will have enormous negative environmental, social and health effects. We simply should not take any actions at all that will make water quality worse. We must draw a line and firmly reject more contamination and pollution of water, and put our efforts and resources towards projects that can make water cleaner and make our environment healthier. The economic opportunities for green industries are limitless, while those for dirty and polluting industries is very limited and is detrimental to future economic growth. We as a state should totally turn our focus to creating a green economy, and this will not only help improve water, air, and soil quality in our state, but will improve public health, and will also create an economic boom and so many well-paying jobs that will improve prosperity for Minnesotans and attract talented, productive people to our state which will make our states economy continue to grow far beyond its current level. Please reject this mine and shift your focus to promoting green industries in our state. Thank you so much, and I look forward to your reply to me.	NS	X
25385	Form Letter	1	Variant	GEN	David Witt		1159	1	I STRONGLY SUPPORT the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
25385	Form Letter	1	Variant	GEN	David Witt		1169	11	I support all federal Clean Water Act permits for PolyMet discharge and wetlands exchange because: - PolyMet discharge of pollutants and utilization of wetlands will not cause impairment or significantly degrade surface and groundwater or violate federal, state and tribal water quality standards.	NS	X
25385	Form Letter	1	Variant	GEN	David Witt		1170	12	PolyMet discharge of pollutants and wetlands utilization would not significantly impair or have adverse impacts on municipal water supplies, aquatic life, wildlife, human health and welfare, environmental justice and special aquatic sites.	NS	X

3914	Unique			GEN	DD W		390	1	I am really surprised that we are having this discussion and wasting our time and resources on entertaining a proposal from people like this and within the Federally Protected area of the Boundary Waters Canoe Area (BWCA), which flows into the "cleanest"/largest body of fresh water in the world. When are we going to learn that raping, pillaging, and plundering the landscape isn't SUSTAINABLE? First we cut down all the trees in that region, then we take away their topsoil and other parts of the healthy ecosystem, then we take as much of the iron ore as we profitably can, and now PolyMet open-pit copper-sulfide mining. Can't you see the outcome for these people continues to get worse with ever stage of raping, pillaging, and plundering their landscape? What is the current health of that area after all the years raping, pillaging, and plundering? PolyMet open-pit copper-sulfide mining would be catastrophic to that part of Minnesota and beyond. Also, pay attention to where the Laurentian Divide is; they have already crossed that line, which should have never happened in the first place. I wish Albert Einstein was here to tell you this, maybe people would get it. He might say, "Insanity is doing the same thing over and over again and expecting different results." Which sub-committee at the Minnesota State Capital is in charge of making decision(s) regarding this matter? Why is it so hard to say, "NO, go away"? Who on this email list supports this mining in the BWCA watershed? Who on this email list opposes this mining in the BWCA watershed? Have you read the link below; I'm sure there is more too, but this really seems like a "no-brainer"? After first search and picking first non-profit, I get this info: http://www.miningtruth.org/sulfide-mining-minnesota/polymet-mine-proposal/#.Vk6aXXarTcs	NS	X
4508	Unique			GEN	Deanna Arce		57	1	I strongly oppose any mining that has the potential to poison our land or water.	NS	X
30071	Unique			GEN	Deborah DeLuca	Duluth Seaway Port Authority	1499	5	We support the proposed NorthMet Mining Project Land Exchange in the Superior National Forest that has been arranged to enable the proposed NotihMet surface mining operation. The land exchange summary information provided by the MDNR indicates a general gain in the federal estate in relation to ecological services and socioeconomic value.	NS	X
30071	Unique			GEN	Deborah DeLuca	Duluth Seaway Port Authority	4331	1	Consistent with Resolution #7 -14, the DSPA is now writing in support of the adequacy of the Final Environmental Impact Statement (FEIS) on PolyMet Mining's proposed NorthMet mine project in northeastern Minnesota. The DSPA also supports the U.S. Forest Service proposal to exchange Superior National Forest lands to support the proposed NorthMet project.	NS	X
30071	Unique			GEN	Deborah DeLuca	Duluth Seaway Port Authority	4332	2	The PolyMet EIS has adequately met federal and state and standards: It evaluates risks to drinking water, fish, and wild rice using realistic assumptions relative to, and responsible analysis of contaminant transport.	NS	X
29164	Unique			GEN	Deborah Huskins		3607	18	I hope that the DNR, USFS, and USACE will give careful consideration to comments of caution and concern. As I said above, the damage cannot be undone, once it occurs. The Northern Minnesota environment that could be impacted is too precious to risk.	NS	X
27675	Unique			GEN	Deborah Mielke		1839	7	Overall, I would have to say that I prefer the "No Action" option, but if more attention were paid to long term accountability and worst case scenarios, that would improve the proposal. Nothing can improve the impact on local native ecology with this proposal.	NS	X
30753	Unique			GEN	Dennis Good		2889	1	Nice touch, releasing the FEIS late on a Friday afternoon to take advantage of what's commonly known as "The Friday Night News Dump" wherein controversial news is released late on a Friday in the hope that it will be downplayed, missed or overtaken by other events. An even nicer touch is releasing it on the Friday before deer season when people will be occupied for the next 2 weeks and 3 weekends. After that is the run-up to Thanksgiving, Black Friday, Cyber Monday etc. etc. An added bonus is that this comment period runs concurrently with the comment period on the 10mg/l sulfate standard, another momentous issue. Coincidence? One would have to be virginally naive to believe that. This was done deliberately to eat up time before the comment period ends, reduce the amount of time a person has available to go through this lengthy document and generally, to attempt to stifle debate. Most people won't get through the Executive Summary anyway (which is basically a written pep rally for the project), but even if you're curious you'll most likely never make it to the Financial Assurance and the Land Exchange sections.	NS	X
30753	Unique			GEN	Dennis Good		2891	3	These are only a few examples of why the preparation of this EIS should have been sent out of state. There is a precedent for this. I was involved in the "MINNTAC Water Diversion Project" DEIS (ca.2006). This project was considered so controversial, certain officials in the MPCA decided to send the DEIS preparation out of state and to hold open and fair public meetings. This helps to minimize bias, preordained outcomes, political meddling and conflicts of interest. The contrasts between that MINNTAC EIS process and this NorthMet EIS process couldn't be more stark. The NorthMet EIS has been prepared by and overseen by two entities that stand to make a lot of money if this project is permitted. This would be Barr Engineering and the MNDNR. The conflicts of interest are obvious. And with the Co-Lead Agencies preparing position papers for Polymet, in essence working for Polymet and abandoning all the due diligence they're required to exercise by law, one can easily see how dirty and corrupt this process has become.	NS	X
23255	Unique			GEN	Dennis Szymialis		923	19	Count Thirteen That the cooperating agencies are arbitrarily and capriciously and without substantial evidence setting a president for mining in Minnesota that will lead to the premature death tens of thousands. That the cooperating agencies have notice of the causation of death by their actions and that all of the principles are now on notice of the premeditated nature of their conspiracy to cause the premature death of tens of thousands in violation of the criminal law and civil rights laws of the victims. That the victimization by fraud of tens of thousands of water consumers in Minnesota and Wisconsin in its scope is a crime against humanity.	NS	X
23255	Unique			GEN	Dennis Szymialis		925	21	That commentator, Dennis Szymialis, requests relief in that no permits be granted for the PolyMet mining project and that the no action alternative be adopted. That commenter, Dennis Szymialis, in addition to the above comments restates and reiterates his comments in the EIS and SDEIS on the basis that responses were lacking by the cooperating agencies including the US Forest Service, Duluth, MN, were vague, or otherwise deficient, and for other relief.	NS	X
27685	Unique			GEN	Dennis Szymialis		1859	14	Count Fourteen When in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor.	NS	X
27685	Unique			GEN	Dennis Szymialis		1862	17	That commenter, Dennis Szymialis, in addition to the above comments restates and reiterates his comments in the EIS and SDEIS on the basis that responses were lacking by the cooperating agencies including the US Forest Service, Duluth, MN, were vague, or otherwise deficient, and for other relief.	NS	X
27685	Unique			GEN	Dennis Szymialis		1868	23	Future monitoring and the filling in of some very substantial gaps of the SDEIS will be left to these lead agencies that have contracted with PolyMet to act on their behalf. These agencies have already in the DE IS written an EIS that was rejected by the EPA. This does not mean that the EPA will continue to save us. It only means that the EPA will be the focus of pressure to capitulate. Because environmental organizations rely on donations they arealso subject to the pressure of being financially influenced. Volunteers cannot be relied on to continue to carry the load. There is little hope without drawing a line in the sand to stop PolyMet. Unlike Bangladesh we have a choice http://www.bmj.com/content/342/bmLd2431 .	NS	X
27685	Unique			GEN	Dennis Szymialis		1874	33	The SDEIS simply shifts, as indicated on 5-211 and 212, toxic materials around or fails to specify actual measures to be taken. The SDEIS should be viewed in the context of the burden set by the EPA-EU-3 rating. The SDEIS is simply a denial and an attempt to evade environmental responsibility. The facts remain that the SDEIS is a recipe for another failure on top of the failures of the permitting of every mining of sulfide bearing rock every occurring in the U.S. This consistency of failure which is so pervasive as to provide public notice meets the standard that beyond a reasonable doubt agency regulation and agency administrators generally are failures and not deserving of any kind of deference. Weak regulation doesn't make metals cheaper and more available it simply shifts the cost and discourages recycling.	NS	X
27685	Unique			GEN	Dennis Szymialis		1951	106	The MinnAmex cite within a few miles of The MorthMet was observed undergoing constant pumping and visitors were nonetheless required to wear hip boots.	NS	X
25900	Unique			GEN	Derek Madsen		1242	1	It's simple to me. This mine has the potential to damage the environment around it. The BWCAW is within that environment. The BWCAW is the most visited wilderness area in our country. Why take the chance? For some temporary jobs in a failing industry that add no diversity to the economy in that region? How would I explain to my 7 year old who has visited the BWCA with me and his grandfather twice that people allowed it to be damaged? There is no answer to any of these questions. This mine going through would be another example of leaders not being willing to make the tough decisions, not willing to choose the higher path. Despicable.	NS	X
6844	Form Letter	1	Variant	GEN	dianne carey		512	1	Protect fresh water - just say no to tar sands - frack oil - sulfuric mining.	NS	X
25681	Unique			GEN	Dietl Paul D HRD		1210	1	I am writing in opposition to the NorthMet Mining Project and Land Exchange proposal. I have been going to the BWCA for the past 36 years and can tell you there is no other place like it on earth. The BWCA is a fragile eco system, one so pristine you can drink the water right out of the lakes. Please reject the mining project and protect this unique wilderness area.	NS	X
1733	Form Letter	1	Variant	GEN	Dirk Hanson		285	1	I'm not against mining; I'm against mining that is economically and environmentally unsound from the start, meaning that the odds of a cleanup in the future are even worse. This is one of the reasons people speak of the "resource curse," one aspect of which is that some people make money--but not the locals, who just get stuck with the Superfund site. For a grand total of 350 jobs, this one is a bad bargain from every angle.	NS	X
332	Unique			GEN	Dnr For		173	1	Let's get the permits going and start constructing this worthy PROJECT!!	NS	X
29969	Unique			GEN	Don Brown		2734	5	5. There is no analysis of the very real possibility of catastrophic analysis.	NS	X
29972	Unique			GEN	Don Brown		2739	5	5. There is no analysis of the very real possibility of catastrophic analysis.	NS	X
12908	Unique			GEN	Don Krebs		779	1	Having spent 40 years in Civil Environmental Engineering Design. I can tell you that no one can predict what might happen when dealing with engineered solutions to complex environmental pollution treatment. Reliable "Treatment forever" or 100 or 500 years is just not feasible. There are too many variables including human, geophysical and technical. If you allow this sulfur ore mining to go forward remember that, its not if a problem occurs, its only a question as to WHEN it occurs. I certainly would not put my name to such a project in such a unique and cherished wilderness area. When I started in the business in 1970 there were clients that we just had to walk away from. They wanted to circumvent the new rules, delay the costs, take short cuts or build facilities that would not be effective. We resigned fees, got fired and sometimes just walked away. I never regretted doing what I thought was right. In your hearts you know that this mining is just not the right thing to do. You'll take the heat but will sleep much more soundly in the future knowing that you protected a great resource for future generations.	NS	X

27707	Unique			GEN	don malley		2108	1	All the time and money spent already is a great waste. I feel it is time to get this operation going to keep people in Northern Minnesota working. Making a living for families is much more important than listening to the stories of people that live hundreds of miles away trying to tell us how to live.	NS	X
28915	Unique			GEN	Donald Schreiner		2374	1	I am writing along with my wife and daughter to oppose the establishment of the PolyMet mine in NE Minnesota and reject the Final EIS. I am a professional Fisheries Biologist that has worked for the MNDNR for 33 years and I have lived and worked in NE Minnesota for the past 26 years. I have worked exclusively in the Lake Superior watershed and know this resource and its attributes well. It is both my professional and personal opinion that the PolyMet mine is not compatible with the future sustainability of water resources and public use of these resources in this area of the state.	NS	X
28543	Unique			GEN	Donna Buckbee		2323	1	We should not allow an activity that will put our water resources at risk. Nor should we allow mining activity that would risk the wild rice pools that our Native American brothers and sisters depend upon.	NS	X
11015	Form Letter	1	Variant	GEN	Donna Cannon		734	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
11015	Form Letter	1	Variant	GEN	Donna Cannon		735	2	It will despoil the land, water, wetlands & render the entire surrounding area uninhabitable.	NS	X
25755	Unique			GEN	Donna Mienk		1221	1	The area is not rich in minerals and it is one of the most pristine areas in the whole state. Reasons stated below why this is such a bad idea. Why would anyone even consider this, is more the question. Greed, yes greed. Do they really want to destroy wild rice beds? Do they want to destroy an area where many people world wide come to canoe and enjoy the beauty of the area? In one bio-chemical process, sulfates become sulfides which attach to wild rice roots, destroying entire wild rice beds in the most polluted areas, or greatly reducing plant yield in other stretches of the St. Louis River. Both fish and wild rice impacts affect the Fond du Lac, Grand Portage, and Bois Forte Bands of the Lake Superior Chippewa nation's treaty rights, as well as affecting fishermen, resort owners, and local residents. As sulfates, mercury and other pollutants work their way downstream, they impact the health and economy of both the Fond du Lac Tribal nation and the citizens of Cloquet, Duluth, MN and Superior WI. Of further concern are the loss of wetlands, destruction of wildlife corridors, and loss of public lands within Superior National Forest to a Canadian mining company whose major underwriter, Glencore, is taking a huge market hit, with shares falling approximately 60 percent over the course of the year. How will a company under financial duress manage to treat water pollution at the proposed plant site for at least the next 500 years, as projected in the Supplemental Draft Environmental Impact Statement? Thank you and I hope someone sees the light before it is too late.	NS	X
24612	Unique			GEN	Dorie Rae Gallagher		1054	1	Subject: Comment on Northmet Mining Project Do not trust the mining company, as it has been proven to have given wrong data. Do not trust the government oversight as it wants to appease. Polymet is an open invitation of a death sentence to our environment in Northern Minnesota. For what ? A smattering of jobs? Who will answer the question WHY to future generations for this continued destruction that is never-ending and yet, not necessary.	NS	X
12961	Unique			GEN	Dorie Reisenweber		782	2	I urge that you do not approve Polymet's NorthMet Final Impact Statement.	NS	X
17819	Unique			GEN	Dorie Reisenweber		813	1	Consideration needs to be given to the cumulative effects of mine seepage into the water, climate change, the combined effect of other even larger mines' operating in northeastern Minnesota and the resulting pollution , plus the likelihood that the fast-tracked TPP would circumvent state and national laws intended to safeguard the environment.	NS	X
17819	Unique			GEN	Dorie Reisenweber		815	3	The NorthMet project is not the only mining project lurking in the woods. If PolyMet's NorthMet project were permitted, it would be only the first of several mines seeking to operate in northeastern Minnesota. It has been pointed out that the NorthMet processing plant would logically make full use of the facilities to process for other companies in the area. Already other larger mining companies are doing exploratory work. Duluth Metals which is now fully owned by Chilean mining giant Antofagasta is in the Duluth Complex. Talon Metals and Kennicott a subsidiary of international Rio Tinto is drilling north of Tamarack some fifty miles west of Duluth. The PolyMet project is small compared to the others. Cumulative effects must project the whole of the environmental impacts of the NorthMet operation as well as those waiting to open up in northeastern Minnesota.	NS	X
17819	Unique			GEN	Dorie Reisenweber		816	4	Remember NO sulfide mine has ever NOT polluted. Look at the recent mining disasters in British Columbia and Chile. This is not what we want in Minnesota or anywhere. Keep the minerals in the ground, until sulfide mining can be done without the pollution risk.	NS	X
17819	Unique			GEN	Dorie Reisenweber		820	7	What is at risk here if an unproven mining company like PolyMet began operating and other giant mines opened? Clean water for sure. Please look at the big picture. Is that the kind of future anyone wants tomorrow's generations to deal with? We may not stop climate change fast enough, but we can say no to sulfide mining. I urge you, do not approve PolyMet's NorthMet FEIS. Finally, include with the above a consideration of the world's current political climate and the rule of law. The mining companies I have mentioned are foreign companies. While that was not in the FEIS, the matter needs to be factored in this evaluation. What power would the state of Minnesota's environmental laws or any other laws and regulations have, if the TPP (Trans-Pacific Partnership) goes into effect? The last I knew, the TPP was on fast track—an up or down vote in Congress. My understanding is that a state's and even a nation's laws could be challenged and taken before three international judges to decide the case. I think the odds would favor the corporations overMinnesota's enforcement of mining laws and regulations. Again, I urge you, do not approve PolyMet's NorthMet FEIS.	NS	X
25016	Unique			GEN	Doris Braley		1126	1	Mining in this area really concerns me. What will happen when the water is contaminated and wild rice will be destroyed. I have kayaked in a few of the lakes up there and feel this will be destroyed. Along with the fish I could see swimming in the clean lakes. I really do not feel there will be many jobs especially with the changes in the cost of gas, going to renewable energy and changes in how copper etc are being used. Also the health of the people living near the area, their water, the air they breathe, and how much will be left in the earth. Will they be able to grow crops, orchards etc. after the mining industry leaves. I have not seen a pretty sight in any of the areas that mining has been done in Minnesota. We have a beautiful state. Sometimes what is in the earth need to stay there. I will be north of Duluth after Christmas. A trip we enjoy so much.	NS	X
25094	Unique			GEN	Douglas Delaney		1130	1	I'm so frustrated over all the meaningless discussion over the Poly met proposal I could scream. Poly met has spent millions and millions of dollars doing studies to endorse their plan, their plan has been approved and has been found reasonable and safe. Meanwhile, the media gives coverage to folks from anywhere that want to shut this plan down faster than a house fire. Senseless. If the criteria is satisfied for safe mining of critical minerals, MAKE it happen. All the mean folks at Poly met want to do is make money, provide valuable jobs in a part of Minnesota that has few jobs that one can raise a family, pay taxes, and be productive. I'd like to think the time has come that our State and Federal Governments stop cow towing to special interest groups that think they can save the world if we all live in tents and tee pee's, all the while using their laptops and cell phones to distribute their message.... the very same devices that rely on mining for their operation. I've lived and paid taxes in this state for most of my 54 years and find it terribly tiring that our politicians pander to special interest groups using fear tactics. Mining has been a way of life here for a long, long time and if a mining company like Poly met can show they can safely mine minerals and elements, LET THEM DO IT!	NS	X
27771	Unique			GEN	Douglas Landsverk		2131	1	I wish to state my opposition the the NorthMet Mining project and land exchange proposal. Northern Minnesota's most precious resources are the unspoiled beauty of it's wild places and the lakes, rivers and wetlands that would be threatened by mining and the waste products produced by this activity. The long-term threat of devastating pollution from toxic waste materials of this proposed mine has not been adequately addressed. Please don't risk the health of this fragile environment over short-term financial gain.	NS	X
28779	Unique			GEN	Dr and Mrs Thomas G. Murn, Jr		2348	1	The land in Minnesota belongs to the people of Minnesota. The Department of Natural Resources is not the "Department of Give our Resources Away" because the mining people need something from us and are being nice to us right now. If you cannot be stewards of one of the most pristine places in the United States get a different job. Work for the mines. If this land belonged to your family would you let the mining company do this? I don't think so. Monitoring for at least 500 years? My goodness is anything worth that? Why not have the DNR work to make tourism so big in the BWCA that everyone would love their jobs and spread joy to others? I am absolutely shocked that the state is not putting a stop to this lunacy. Wild Rice and salmon cannot survive this assault. What will the mining company say when everything is spoiled? Sorry. We don't have to pay for anything. Fool me once, shame on you fool me twice shame on me.	NS	X
28779	Unique			GEN	Dr and Mrs Thomas G. Murn, Jr		2350	2	Sulfide mining has never been done in Minnesota, and is much more dangerous than traditional iron mining. In fact, there is no example of sulfide mining being operated successfully anywhere that did not pollute nearby groundwater, lakes, and streams. And independent studies show pollution of surrounding lakes, rivers, and streams has occurred in one hundred percent of sulfide mines.	NS	X
25239	Unique			GEN	Dr. Jill D. Greer		1145	1	I would like to express my grave concerns over the safety and negative environmental impact of this NorthMet Mining Project. Please consider this message in your weighing of public opinion on the matter. I am not a resident of your state, but the effects of environmental toxins and pollutants do not respect state boundaries, particularly through the riverine and estuary connections across the entire Midwest. Nor do our wildlife confine themselves by our human-created state boundaries. Thus, it is imperative to include the views of all Americans (and Canadians, for that matter) when weighing the consequences of such large destructive undertakings. Thank you for your consideration as you attempt to wisely approach this serious decision. Remember that the proper way to measure effects is to ask what are the harmful effects of NOT allowing the project, and would these effects be more than a simple financial loss to a particular corporation? The continued habitability for the future earth we are leaving to our children's children must be the ultimate yardstick for our decisions today. Too many hasty decisions have already marred that future. Let the tide turn back toward preservation and conservation, for those precious generations to come.	NS	X
27730	Unique			GEN	Dr. Kyle R. Crocker		2125	4	There are many other problems in the EIS and proposal, failures to adequately address risks to the public health, to fully comply with both Federal and State law and scientific standards, to examine alternate planning, to supply any mitigation for the loss of thousands of acres of wetlands or means to protect the threatened wildlife within them, to allow a flimsy land exchange as 'compensation.' And there are still others you well know I could cite.	NS	X
27730	Unique			GEN	Dr. Kyle R. Crocker		2126	5	I respectfully urge that you reject the PolyMet EIS. It is scientifically, legally and ethically compromised. I also oppose granting any Federal permit to allow the operation.	NS	X

3406	Form Letter	1	Variant	GEN	Duluth Coffee Company Eric Faust		376	1	We are a growing group of 56 small businesses, representing a cross-section of industries, including technology, manufacturing, service, entertainment and the trades. We employ nearly 1000 people in the North and we are continuing to succeed and invest, adding jobs and dollars to our economy. Our businesses depend on the health of our watershed. WE ARE PRO RESPONSIBLE MINING AND PRO JOBS We support and benefit from ferrous mining, which has built the economy and culture of the North. We rely on mined products in our businesses. As primarily owner-operators, we are pro worker and pro quality of life, and we have and will continue to rely on union labor as we expand. We are vitally connected to the entire regional economy, and its success is our success. COPPER-NICKEL MINING POSES A SIGNIFICANT NEW THREAT TO OUR WATERSHED But we are also part of a regional ecology, which is why we are concerned about copper-nickel mining. The proposed PolyMet NorthMet copper-nickel mine, and others like it, are vastly different from ferrous mining, and have the potential to spread toxic metals throughout our watershed. In copper-nickel mining, water that passes through the site leaches toxic metals, including mercury, from the metallic sulfide ore. According to the NorthMet Environmental Impact Study (EIS), this pollution will continue for a "minimum of 200 years at the Mine Site and a minimum of 500 years at the Plant Site," requiring treatment "indefinitely". 1,2 Flow path maps in the EIS show that the plume of contamination will reach the Partridge and Embarrass Rivers, which flow to the St. Louis River and ultimately Lake Superior.3 This mine does not just threaten a water source; it threatens one of the world's greatest freshwater resources. Lake Superior contains 10% of the world's freshwater. We trust that PolyMet intends to meet all applicable regulations, but our concerns are based on the track record of similar projects. We welcome them to show us one metallic sulfide mine of this type that has operated for 10 years and been closed for 10 years without exceeding government pollution standards. Indeed, under Wisconsin's 'Prove It First' law, no such example has yet been identified. Like the rest of the resources we rely on, we want mining to continue to become more technologically advanced and more environmentally friendly. But until the technology is proven, we simply don't believe the Land of 10,000 Lakes is the place for a test case. WE'RE STILL CLEANING UP FROM THE UNSUSTAINABLE PRACTICES OF THE PAST The St. Louis River, after decades and more than \$100 million dollars spent on cleanup from the unsustainable practices of the past, is finally becoming a safe place to live, work and play again. Up to an estimated \$240 million will likely be spent over the next 5 years to continue the cleanup and restoration. We owe it to future generations to finish the cleanup, not to put our water at risk again. THE RISK TO OUR REGIONAL ECONOMY OUTWEIGHS THE BENEFIT The value of jobs now is real, in any number. We all rely on mined products. And yes, copper mining has to happen somewhere. However, we believe this type of mine, in one of the world's great freshwater resources, is too great a risk. We know some people will take issue with us getting involved in what is perceived to be a political issue. Indeed, a recent article in the newspaper - without a clear explanation of our position - was enough to cause some of our customers to boycott our products. This is an economic issue resulting from an environmental issue. We believe the risk to the environment poses a long-term threat to the regional economy that far outweighs the shortterm benefits. OUR REQUEST: INVEST THE MONEY THE STATE WOULD SPEND ON POLYMET IN SUSTAINABLE LOCAL BUSINESS DEVELOPMENT INSTEAD	NS	X
24709	Unique			GEN	Dustin Rosemark		1093	1	Please, Please Stop Polymet! We cannot afford to damage the BWCA	NS	X
22356	Unique			GEN	DyAnne Korda		865	1	I have serious qualms about the safety of the PolyMet Mine. Since proponents and opponents have completely different views as to the outcome, I question the actual risk of the mine’s pollution the level. The data within PolyMet's final environmental impact statement is confusing. It needs to be evaluated by an outside, trustworthy source since the DNR and mining industry are closely tied together through shared employees.	NS	X
8768	Unique			GEN	Dyke VanEtten Williams		608	4	The wild areas of the Arrowhead have been and need to continue to be a carefully controlled and protected "classroom" in which young people can and do learn responsibility, constructive risk-taking, leadership, limits and develop character. This generation has few of those traits and reality-based experiences due to their helicopter parents who guaranteed that absolutely nothing would ever happen to their kid - good or bad. These "screenily dependent", virtual reality taught youngsters have nothing to draw on when faced with real crises - global warming, for example. They need to be able to say to development that "This far is too far" - just what we who want to see no mining are saying. Destruction of an irreplaceable resource necessary to quality of life for the sake of profit for a few to make the "stuff" consumed by the many is not right. This far IS too far!	NS	X
4314	Unique			GEN	Ed Casper		143	2	Polymet may actually reduce overall pollution by being the low cost producer and shutting down other foreign mines.	NS	X
4314	Unique			GEN	Ed Casper		144	3	Technology has advanced to allow mining to proceed in a safe environmental way. Let’s get this project approved so others can begin the process and get the "Range" back to work.	NS	X
27406	Unique			GEN	Edward Pendleton		1720	4	Therefore I am opposed to granting any permit.	NS	X
27665	Unique			GEN	Egil & Gudrun Hoivik		1819	1	We are thoroughly convinced that the PolyMet project will cause environmental distruction for centuries to come if it is allowed to happen.	NS	X
5982	Form Letter	1	Variant	GEN	Elaine Thrune		442	1	I strongly and vehemently oppose the proposed PolyMet NorthMet copper-nickel sulfide mine, and all such mines in Minnesota.	NS	X
25350	Form Letter	1	Variant	GEN	Elizabeth Heck		1155	3	3) Potential negative environmental effects to the BWCAW are unacceptable.	NS	X
29803	Form Letter	1	Variant	GEN	Elizabeth K Larsen		2623	1	As a resident of Northeastern Minnesota I care about the welfare of the people who live here and the people downstream from us. As such I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
3919	Unique			GEN	Elizabeth Larsen		391	1	I strongly oppose the entire PolyMet's project, it will cause far more harm than anything good that comes of it. The EIS does not assess the value of the ecological benefits the lands that will be impacted will cost the people and they must be calculated to provide us with a meaningful evaluation of the project	NS	X
27836	Unique			GEN	Ellen Hawkins		2178	1	We believe the PolyMet NorthMet proposal should be rejected. We live in northeast Minnesota and have a number of concerns about how the proposal would hurt this area’s natural resources and economy.	NS	X
27836	Unique			GEN	Ellen Hawkins		2203	27	This proposal would critically harm an important headwaters of the Lake Superior Basin, with direct destruction of 914 acres of wetlands and indirect loss or degradation of an additional 7,694 acres.	NS	X
27836	Unique			GEN	Ellen Hawkins		2205	29	All of this foreshadows a bad outcome should the project be permitted. An invaluable natural reservoir of fresh unpolluted water, wild rice, waterfowl habitat, healthy fish populations, unique wildlife habitat, great places to recreate, and possibly the BWCAW – these are some of the things at risk of being permanently ruined. Because so much is at stake, and there are so many unanswered, poorly addressed or unanswerable questions, NorthMet shouldn’t be allowed to go forward.	NS	X
28378	Unique			GEN	Em Westerlund		2248	1	it is clear that the impacts of copper-nickel mining in this region, and in the manner proposed, would likely cause environmental degradation as well as negative impacts upon human health.	NS	X
11017	Form Letter	1	Variant	GEN	Eric Krenz		743	1	That being said, in its current state I ~strongly oppose~ the current proposal to allow copper nickel mining in this part of the state.	NS	X
11017	Form Letter	1	Variant	GEN	Eric Krenz		744	2	Due to the well documented shady histories of a number of the businessmen pushing for this mine, good reasons exist to question the ethics and honesty of the people and money behind Polymet.	NS	X
26608	Form Letter	1	Variant	GEN	Eric Snyder		1358	1	I am strongly opposed to the proposed PolyMet mine in MN.	NS	X
26608	Form Letter	1	Variant	GEN	Eric Snyder		1361	4	As the public has seen repeatedly, mining companies have repeatedly taken such shortcuts (as above) resulting in environmental disasters.	NS	X
45	Unique			GEN	Erica Johanson		113	1	I disagree with the use of public, taxpayer-paid land (ie, public forests being used for corporate gain, especially as it will ruin the land for our enjoyment.	NS	X
29452	Unique			GEN	Erik Hatlestad	Minnesota Public Interest Research Group	3843	1	Long after the final decision on copper nickel mining in the Arrowhead Region Minnesotans must live with the consequences of our actions. As young people in Minnesota the decision to move ahead with the Polymet project will impact us the longest. Ultimately it will be future generations that will inherit 500 years of clean up, undrinkable water, and polluted communities.	NS	X
10132	Unique			GEN	Ernest Peaslee		653	1	I am writing to state my opposition to granting a mining permit to PolyMet for its proposed copper nickel mine in the Hoyt Lakes area of northern Minnesota.	NS	X
27015	Form Letter	1	Variant	GEN	Eugene Ollila		1626	1	However, I cannot see ruining the future to be in ALL of our best interests, wherever we live. I do not believe Polymet can contain the toxic substances as they so blithely feel they can.	NS	X
30263	Form Letter	1	Variant	GEN	Evans L Edwards		2744	1	How can j???? Not do Independent assessments rather than j??? Polly Matt ?? ?????!	NS	X
12727	Unique			GEN	F Jeff Verito		770	6	Your own document species the risks from mercury, a list of other metals, sulfate and the potential impact to lynx, wolf and bats. You know the risks and you know the way government operates, yet you proceed with the proposal anyway.	NS	X
12727	Unique			GEN	F Jeff Verito		772	8	Lastly, what’s to say PolyMet will still be in business over the decades that are required to remediate the exploited land, or whether a corporate sale will negate PolyMet from liability, as we’ve seen in Upper Michigan. At best, such projects pose eyesores, reducing the value of our priceless, already compromised, public spaces. I’m dead set against this proposal. My fear is the impetus has gotten too far before projects reach this stage. NorthMet is asked to conduct their deleterious projects on another planet.	NS	X
27678	Unique			GEN	Faye Topliff		1842	5	Just because PolyMet is financially back supported by endless money does not give them the right to bully our environment. We must preserve these priceless gems of clean air and waters for all people, and all generations to come.	NS	X

30076	Unique			GEN	Faye Topliff		4347	1	We have a 40 acre parcel in the area of Polymets proposed EXTRACTION PIT. We also live downstream in Duluth and this project could mess up the whole area. My kids, relatives, others love the BWCA. So we follow with great interest any proposed swap. With everything I have been able to find out, it seems as though the Polymet project is a poorly thought out project. To deposit toxic waste in a pit that already leaks is a bad idea to start with and then looking at the published maps it would seem as though Polymet is not disclosing their exact Dump site. Why would anyone want to swap land for a project that has engineers that designed a pit in British Columbia that failed terribly. There is NO room for error on this extraction project. Polymet will have many toxic chemicals in their waste. My family was here for the big Reserve Mining screw up in Lake Superior. Remember Asbestos! It cost us private citizens much time and money to get the dumping out of the lake. The lake still suffers. Also what Polymet wants to do is not iron ore mining or taconite. It is extraction with too much waste to handle. Why would we think that we would have the right to contaminate Minnesota far into the future? Would tourists come by the planeload to canoe, swim and recreate in our fouled waters? Our necessities for life are clean air and clean water. There are already places that do not have either of these. They are priceless.	NS	X
14058	Form Letter	1	Variant	GEN	Finn Soderstrom		791	1	I am 12 years old, and live in Orono, MN. I play hockey with your nephew, Joe Dayton. I have a cabin in northern MN, about 15 minutes from Ely. I really hope Polly Met cannot ruin the BWCA and watershed area around it. It says it can contain it, but it can't. I know you've heard that a million times, but I'm saying it again. I have met you before, and I was very small. I don't remember too much. I think you are a great governor, and I hope I can keep that opinion of you. I hope you get this email, because me and many other people care very much about this beautiful area. I have experienced it first hand, in a camp called Widjiwagan, and just on family camping trips. We will find out results soon, and I hope you will continue to support us.	NS	X
23524	Form Letter	1	Variant	GEN	Flint Krupinski		960	3	i have worked as a mechanic on mining operations where you can literally light the water on fire. if that isn't enough to sway you as to why this is a terrible destructive mistake, may god help us all. we've already done enough harm to our ecosystems, the Mississippi river is the biggest examples of how we destroyed and polluted our beautiful and well preserved wetlands, water ways and lakes. DO NOT LET MINNESOTA FALL INTO HABITAT DESTRUCTION!	NS	X
5303	Unique			GEN	flynn karen		422	1	I am opposed to the Polymet mine proposal. Even with the best of intentions, I don't believe that the safety of our water supply can be protected. Time passes, leadership changes, promises can be broken, and polluted water is forever. I foresee a disaster for our future.	NS	X
22744	Form Letter	9	Variant	GEN	Fran Field		884	1	Lake Superior and its surrounding lands and waterways are like no place else in our country. With its million acres of wild lands, 1000 pristine lakes and streams, and 1500 miles of canoe routes of the Boundary Waters Wilderness, people are drawn to this area for its incredible beauty and unlimited opportunities to enjoy the outdoors. Unfortunately, these pristine lands and waters are threatened by something that would forever destroy this area -- a proposed open-pit sulfide mine on the headwaters of Lake Superior near the Boundary Waters Canoe Area Wilderness. I am asking the U.S. Forest Service, Army Corps of Engineers, and Minnesota's Department of Natural Resources to stand up to PolyMet Corporation and reject this dangerous and destructive mine. This mine is not in the public interest! Instead, please choose to do the right thing, the moral and ethical thing! Protect Lake Superior and the Boundary Waters Canoe Area Wilderness! The risk is simply too much -- polluting Lake Superior, threatening our clean water and wild lands, and endangering public health for generations to come. If PolyMet starts mining, the floodgates for more sulfide mining near Lake Superior and surrounding the Boundary Waters Wilderness would open. The dangers of sulfide mining are so extreme that Wisconsin has banned this type of mining until it can be proven safe. Last year, the Mount Polley sulfide mine in British Columbia dumped billions of gallons of toxic water and heavy metal sludge into the surrounding forests, rivers, and lakes -- which has been called the worst mining disaster in Canadian history. And PolyMet has even admitted that their proposed sulfide mine threatens to pollute waterways and groundwater with toxic heavy metals for hundreds of years. Don't allow PolyMet to profit at the expense of our health and wild places. The U.S. Forest Service, Army Corps of Engineers, and Minnesota's Department of Natural Resources have a moral obligation to reject this dangerous mine.	NS	X
24631	Unique			GEN	Francoise La Monica		1055	1	I am opposed to this project as it has obvious negative environmental implications. Extractive industries are not well monitored and regulated. Let us not forget that water is our most precious resource.	NS	X
17916	Form Letter	1	Variant	GEN	Frank Verderame		822	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. I could have just clicked and sent the form letter, but I'll tell you straight out that I did not read the FEIS. I did however, read most of the draft EIS. I am not an engineer, but have a degree in Environmental Science, so I can understand most but not all of the information. However, that's not why I'm writing you. I oppose the project based on the fact that a foreign company wants to come in to one of the finest parts of my state and sully it for short-term gain. The track record of these mines is abysmal, there are NO guarantees against disaster (despite what the engineers say) and only a few temporary jobs will be created. Meanwhile, the risks of impact to the recreation industry, the residents of the area, and the taxpayers footing the clean-up bill are too great. We love the clean lakes and streams of Minnesota too much to let a foreign company with no track record attempt an operation with a poor track record for their monetary gain and a supply of metals for China's benefit. TURN THIS PROPOSAL DOWN!	NS	X
29229	Unique			GEN	Gail C. Roberts		3627	17	The FEIS is not adequate for the following reasons: • The scattered parcels of land being proposed as a land exchange are not an adequate replacement for the high-quality wetlands and habitat that would be lost. • The impact of the proposed PolyMet project on fish and wildlife populations is considerable and provisions for protection of this valuable natural resource are not adequate. • The ability of the Department of Natural Resources to ensure environmental integrity for significant parts of northeast Minnesota and to see that the area is returned to its natural state after mining would be seriously compromised if this project goes forward. • A foreign corporation should not be allowed to extract Minnesota's natural resources on public lands for private profit and then leave Minnesota taxpayers with the pollution, waste, and long-term expense of reclamation and cleanup. • Minnesota's existing financial assurance statutes are not sufficient to protect taxpayers and citizens of the state from this type of mining. • A Health Impact Assessment (HIA) should have been conducted on a project of this magnitude with such serious long-term health effects. • It is morally and ethically irresponsible for state agencies charged with protecting Minnesota's natural resources to allow a project with such potentially deleterious effects on future generations to be permitted. The Minnesota Department of Natural Resources is charged with the protection of the state's resources for all the inhabitants of the state. The Federal Agencies involved have responsibilities for managing our national forests, wetlands, and water resources. The short-term financial gain of a mining company and foreign corporation should not trump the long-term stake that all of us have in protecting our natural resources for future generations.	NS	X
4765	Form Letter	3	Variant	GEN	Gail Matthews		415	1	I am opposed to the poly met project. These are not long-term sustainable jobs. When has a mining company ever kept its promises. Never. Taxpayers of Minnesota will be left to pay for cleanup after Poly-NET either goes bankrupt or pulls out. 1000 jobs lasting 20 years is not a good trade-off for 500 years of monitoring. Does anyone really believe poly Matt will be around that long to clean up it's mass. It's preposterous. This is a bad deal for Minnesota	NS	X
26561	Form Letter	1	Variant	GEN	Gary Fifield		1356	1	I oppose the PolyMet mine.	NS	X
55	Unique			GEN	Gary Geisler		133	1	Global warming is going to get much worse before it gets better, even if all emissions were to magically stop tomorrow. The total collapse of civilization by the end of the century is a real possibility. If you think I'm exaggerating the seriousness of the situation, consider this. It was calculated several years ago that 80% of the known fossil fuels reserves presently on the books must remain in the ground to avoid a global catastrophe that will reek havoc for many thousands of years. It's virtually guaranteed that large energy corporations will use their tremendous wealth and political power to avoid taking a huge loss no matter what the consequences. Highly populated areas of our country may become inhabitable due to, among other things, severe droughts. Minnesota may be one of the few places left on Earth that humans can eek out a meager living.	NS	X
29965	Unique			GEN	Gary Glass		4244	9	Comment #1: Gaps in completeness and coverage are identified throughout the various eight chapters and executive summary of the SD EIS. Data and informational gaps must be corrected using accepted scientific procedures, data collection and analyses techniques. Errors of omission, flaws in data and procedures used in leaching tests, and suggested alternate approaches are identified below. The chapters and executive summary must be rewritten to fill the gaps in coverage and reflect the content in the comments on omissions, errors, flaws and suggested improvements provided as 20 new specific comments on the SD EIS document. In addition, the original 20 comments on the DEIS previously submitted Feb. 3, 2010, are included at the end of this memo since they identify additional continuing deficiencies.	NS	X
29965	Unique			GEN	Gary Glass		4248	13	The first chapter sets out eleven major "constituents of interest" (pages 1-19- 20) for the proposed project. Many more constituents are needed to properly deal with the actual and potential impacts from 355 million tons of mined rock to the environment including humans. Critically important characteristics and essential components of the proposed project are omitted and missing from this chapter, and the eight chapters that follow. Major, essential components of the proposed project are NOT included or evaluated in this SD EIS or in the DEIS, and must be added and completely evaluated.	NS	X
25620	Unique			GEN	Gary Johnson		1205	1	I believe the justification for accepting unknown environmental problems and after effects, in order to offer employment to 300 possible employees is not acceptable. It would be far cheaper to find or create other employment or pay other social costs to support these families through some other programs than to saddle future Minnesotans with high risk environmental problems.	NS	X
25853	Unique			GEN	Gary Kluender		1238	1	While most engineers,lawyers, politicians are used to the jargon used in an EIS most of us public people aren't. Why not simply say if it is good or bad for the Enviroment? From what I Have read about the results of this type of mining ,while it reaps fair results, it also RUINS the surrounding environment for decades. Therefore, I cannot accept the idea to let any type of mining like this to go foreward. I'm a hunter and the area they proposed to use will no longer be good for any type of outdoor recreation or anything else, if this mining procedure goes thru as proposed.	NS	X
29836	Unique			GEN	Gary Swanson		2650	1	I have huge concerns about the accuracy of the PolyMet FEIS data that they are trying to basically ram down the state of Minnesota's throat.	NS	X
29805	Unique			GEN	Gedicks Al		2628	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine because PolyMet's Final EIS provides no scientific evidence that metallic sulfide mining can be done in the water rich environment of Northern Minnesota without polluting our waterways for centuries to come.	NS	X
24985	Unique			GEN	Gene Cooper		1124	1	I am totally against this project. It will pollute the water for years to come, and destroy the environment. It will destroy some pristine forests, all for a few jobs. It will take hundreds of years to repair the damage this project would do!	NS	X

449	Unique			GEN	Gene Dale Kalligher		215	1	If we are going to risk ruining the BWCA and sinking tourism around Ely, why are we offering this to the least experienced, smallest company of its kind instead of the most experienced corporation with a track record of success in this type of mining? Polymet itself has no track record for this type of operation. The company has no earnings and is what's called a shell corporation. Its stock (PLM) trades for 95 cents per share and is priced not on current operations but on possible future projections, the most risky type. Companies like this go out of business every day which is why the stock is priced so low. Everyone including the Governor and Mr. Landwehr state there is some risk to this effort. So I'll ask again why are we placing this risk in the hands of a company that is inexperienced with no track record to demonstrate their ability to manage the risk we are placing in their hands?	NS	X
46	Unique			GEN	Gene R Cooper		114	1	I am totally against this project.	NS	X
46	Unique			GEN	Gene R Cooper		116	3	It would take hundred of years to correct this pollution. In the meantime the land and water with the citizens of Minnesota would suffer. This project should not be allowed to proceed.	NS	X
5811	Unique			GEN	Gene R Cooper		436	1	I am totally against the NorthMet Mining Project and Land Exchange, This is a total waste of natural resources. If this project is allowed to proceed, it will reek havoc on the Boundary Waters Canoe area and will eventually pollute surrounding waters, the water supply and the natural beauty of the wilderness. I would hope that the people in charge of approving this project will reconsider and vote not to let this project move forward. This project is not worth all the damage that it will do the environment, and the few temporary jobs this will create. The people of Minnesota deserve better from our leaders.	NS	X
4469	Form Letter	1	Variant	GEN	Geoffrey Johnson		406	1	I completly agree with openeing the new mines in MN. Bringing in jobs and stability to a dying region in our great north. This response was sent VIA the mining truth website. as a Northern MN native I request a specific response to my comments and hope you get to open the mine.	NS	X
27824	Unique			GEN	George Kluempke		2169	1	I have taken the time to review the Executive Summary and some of the related documents included FEIS document as prepared by MDNR; USACE and the US Forest Service. I believe that the studies conducted as part of this comprehensive Final EIS document clearly supports approving and going forward with the PolyMet project.	NS	X
27842	Form Letter	1	Variant	GEN	George Wollenburg		2206	1	I don't see this in any way worth the risk to any state's environment let alone our boundary waters. None of the parties to this decision will be around for much of the time that this pollution will endure. The known risk and the damage that we know will occur to land and water during the normal process is without any known or affordable cleanup remedy. With clean water supplies diminishing on this planet, why on earth would we put any of our known sources of fresh water at such risk. Decision makers must think long term. PolyMet is not owed anything from the people of Minnesota. What they want is to make a business from extracting our resources for huge profits for themselves and jobs that will mostly disappear once the plant is operational. If the end goal is for the benefit of jobs for the people of Minnesota, we need to go back and think this through. It just is not worth it!	NS	X
28	Unique			GEN	Gerald Brown		85	1	I am a lifelong resident of northeastern Minnesota, a frequent visitor to the BWWCA, child of resorters on Seagull Lake, and a true lover of our wilderness. But I fully support the NorthMet project. The balance of environmental protection and economic necessity weigh in favor of this project. The objective experts have studied it to death and concluded mining activity can safely co-exist with a healthy environment. Now it is time for final approval of this project and the benefits it offers for all Minnesotans.	NS	X
25463	Unique			GEN	Gerald Fisher		1184	1	I want to Push for the Passing of legislation and get this project underway!!!!!!!!!!!!!!!!!!!!!!	NS	X
30274	Form Letter	1	Variant	GEN	Gerri Wilhams		2844	1	Sulfide mining has a 100% record of polluting. Polymet's "predictions" that they could contain tailings that pollute water is unproven by any current science in a water-rich environment such as Northern MN. This proposed mine should not be approved.	NS	X
30276	Form Letter	1	Variant	GEN	Gina Alberti Chase		2845	1	Keep these mines, out of MN!	NS	X
24372	Form Letter	1	Variant	GEN	gloriana casey		1034	5	One thing America has that other nations do not-----this nation has not been bombed to smithereens, as many other places in the world have been. So, maybe people are stupid about the effects of chemicals -----it's kind of like reading Kurt Vonnegbut's story, ICE NINE---read that, it's not very long and then I think that the argument for making Nature and the environment the most necesssry part of a culture would be made very clear. PLEASE, really read this as it's kind of a shorthand message of keeping the Earth pristine. Nature will adapt, she always does, but homo sapiens aren't always so sapient! : (NS	X
21	Unique			GEN	GMS Industrial		65	1	Just the description and scope of this proposal is too far fetched to receive approval. Please tally me as against this proposal.	NS	X
2146	Unique			GEN	grant mcdougall		309	1	I feel that this project has been studied to a point that it will be safe. Enough with all the red tape lets get people working and get this mining project started.	NS	X
26224	Unique			GEN	Greg		1283	1	30,000 comments on the adequacy of the EIS. Of the 30,000 respondents, how many are qualified to determine if the EIS is adequate? DNR, you do your job to ensure that the project meets regulations. If it meets regulations then proceed. If not, respond with what changes need to be made so it does. If there is no possible way that it can meet regulations, than that's that and be done with it. My layman's opinion is that this has taken way to long. Do not turn this into a political popularity contest; which, it seems, you and the governor have done. It has come to a contest of who can get the most people to cut and paste arguments, for or against, into an e-mail.	NS	X
6563	Unique			GEN	Greg and Julie Carlson		499	1	We believe that Polymet will be responsible in the activities that they are proposing. This whole process has taken over 10 years of research and planning for responsible open pit mining. Even though my family does not live on the iron range, it is our belief it will help our economy in Duluth and surrounding areas with spin off jobs and stable employment for many unemployed people from our area. Yes, we have concerns about our water, fish and animals in our area, but with the extensive planning, we feel that this operation has done their due diligence in understanding the environmental impact the operation may have.	NS	X
2598	Unique			GEN	Greg Holcomb		335	1	It is my opinion the groups that lined up against Polymet, from the very beginning, would be against any mining, even if they had total control over the operation. It is the same world view that is destroying good paying jobs in my industry. For the "environmentalist" the only solution is NO.	NS	X
27834	Unique			GEN	Greg Keilback		2177	1	I understand the flood of emails and template comments that are being received. I will keep my words short: Please for the long term health of both the human and ecological environment do not allow this mining project to occur.	NS	X
16226	Form Letter	7	Variant	GEN	Greg Swanson		794	1	I can't believe that the people and departments that we count on to protect our forests and water would even consider any such proposal. I am strongly against this and ask you to deny and reject this proposal or any similar proposals in the future.	NS	X
24785	Form Letter	1	Variant	GEN	Gregory Beckstrom		1110	1	I support the PolyMet project. It's good for Minnesota, it will be managed responsibly and I know that we can mine better here than anywhere else in the world. On a more holistic level, people who opposed this mine fail to realize how important copper is to a civilized society. Anyone who opposes this project should stop using their cell phones, computers, electricity and all other modern conveniences that we rely on.	NS	X
24151	Unique			GEN	Gregory Smegal		1008	1	NO!! NO!! NO!! DO NOT ALLOW THIS TO HAPPEN!!!	NS	X
27668	Unique			GEN	Gretchen Pederson		1823	1	We are writing to ask that you do everything you can to stop sulfide mining in northern Minnesota. The short term benefit of job creation is far outweighed by the negative risks to the environment.	NS	X
26050	Unique			GEN	Hannah Anderson		1265	3	According to the projects own disclosure. They are going solve problems of "permanent damage." I could go on, but you need to read the disclosures carefully and thoroughly. It is your job to protect the land for Minnesotans. You need to do everything in your power to do so.	NS	X
6433	Unique			GEN	Hans Olsen		485	1	Neighbors: As a son and grandson of iron miners and a supporter of proposed copper / nickel mining in the Duluth Complex, I am disappointed in the Final Environmental Impact Statement (FEIS) released this week on the DNR website.	NS	X
6433	Unique			GEN	Hans Olsen		487	3	The old news is that PolyMet is refusing to accommodate and deal with certain important issues that have been raised in the public comment process. Their response can be neatly summarized in one word: no. This is to be expected, I guess, in an age when corporations have only one ethical imperative, shareholder value. It is still depressing to witness first hand. I was hoping for something more, particularly because so much good work has already gone into this. I know the PolyMet executives working here locally want to do this right, Minnesota right.	NS	X
29738	Unique			GEN	Harold Edwards		2600	1	I am a geologist licensed by the State of Minnesota, and I object to the NorthMet Mining and Land Exchange project.	NS	X
29909	Unique			GEN	Harold Nordin		2712	1	Despite almost ten years of debate, discussion and delays, together with the tens of thousands of comments received in opposition to this project, the latest PolyMet NorthMet sulfide mining proposal has changed very little and remains incomplete and inadequate. When one considers the pollution caused by virtually all similar projects of this type (around the world) one can only assume this will be no different. The potential for pollution of ground and surface water cannot be underestimated or disregarded, and any project that has the potential to compromise that quality should be held to a higher standard of operation and accountability.	NS	X
29909	Unique			GEN	Harold Nordin		2714	3	It relies too heavily on the premise that unforeseen or unexpected issues can be adequately addressed in a timely manner by PolyMet employing locally available resources in close proximity to the mining site;	NS	X
29909	Unique			GEN	Harold Nordin		2716	5	It fails to accurately predict (and independently confirm) the flow rate and dispersion area for pollutants from the project site;	NS	X
26207	Unique			GEN	Harvey Thompson		1282	1	I'm guessing it would be nearly impossible to make a comment that has not already been made. No one in their right mind would want to pollute our natural resources. One could also argue that no one in their right mind would want to see private business have to go through over ten years and millions of dollars to get a project off the ground. This exhaustive process is just plain UNBELIEVABLE. I would like to see Polymet get started already. I don't understand how our judiciary can allow law suit after lawsuit. I think we need to examine the judicial guidelines, if there are any.	NS	X
24683	Unique			GEN	healing line		1079	1	DO NOT allow sulfide mining in our pristine Boundary Waters! No amount of human car can render it safe. No industrial promise can justify the scar upon the wellspring of our Boundary Waters.	NS	X
15	Unique			GEN	Heidi Aubrey		47	4	I am against it. It is irresponsible and smacks of greed, corruption, and personal profiteering from PUBLICLY HELD land.	NS	X
12609	Form Letter	1	Variant	GEN	Henry Hark		764	2	Openpit mines are not ever good for the environment. That is a fact.	NS	X

29240	Unique			GEN	Henry V. Mott		3628	1	While I understand the desire to provide needed metals obtained through this project for use by our society and the desire to provide jobs for individuals in Minnesota’s Iron Range, I find that the measures planned to protect the sensitive environment within which the mine site is situated will fall short. I strongly caution that if this project is allowed to go forth as planned, Minnesota will join the ranks of the many states in the Western Intermountain and Appalachian regions of the U.S. that currently must deal with one or more acid rock drainage superfund sites.	NS	X
29240	Unique			GEN	Henry V. Mott		3643	16	I have reviewed the numerous technically based comments brought forth by cooperating agencies. Many of these mention the very points I’ve made above. By and large, PolyMet’s responses provide lip service, refer to “industry standards” or claim conformance with existing Minnesota regulations. Given that Minnesota has not yet experienced the pain associated with sulfide mining, few regulations have been developed directly pertaining to such operations. If this mining proposal is allowed to go forward with the fully inadequate provisions for post-closure environmental protection, certainly Minnesota will have opportunity to observe firsthand the adverse effects of sulfide mining upon sensitive watersheds – because an important Minnesota watershed, in the absence of significant input of Minnesota’s financial resources, will become severely adversely impacted. Would it not be prudent to learn from the experiences of others? These tough questions posed by cooperating agencies are based on the experience of others. PolyMet needs to address these questions with technical responses backed up by some prudent alterations in its post-mining closure plan.	NS	X
29240	Unique			GEN	Henry V. Mott		3650	17	Let’s consider the policy for use of Minnesota’s Boundary Waters wilderness area. The theory behind sustained use of this wonderful resource is that of “leave no trace.” If you bring it in – carry it out. If we examine the negative effects of sulfide mining in other states and in other countries, what we find is that if sulfide minerals are left by mining operations in a condition where contact with the environment is allowed, big-time problems occur. Invariably it is we the people who then must deal with the ramifications of these problems. In order to render the mining industry to be environmentally sustainable, we the people, through those we entrust with the general welfare, must hold the mining industry to a “leave no trace” standard. I call on Governor Dayton and his upper management team to be stewards of our environment not for the short-term monetary profits of a few but for the benefit of Minnesota’s posterity now and for many future generations. Let me describe one specific example of how not to proceed. The Brohm mine at the now established Gilt Edge superfund site was approved in 1987 by the SD board of Minerals and Environment as supported by the SD Department of Environment and Natural Resources on Governor George Mickelson’s watch, in the face of solid scientific evidence that mining sulfide ore using Brohm’s plan would lead to a huge environmental problem. Ten or so years into the mining operation, the environmental problems had materialized and in the face of the financial consequences, Brohm Mining, Inc. (the company incorporated to protect the parent company and investors from financial risks) declared bankruptcy. South Dakota could not afford to treat the contaminated water from the mine site let alone do the cleanup, so Bill Janklow (to the applause of those who’d profited from the mining operation) passed the problem to the EPA. The problem is now the Gilt Edge superfund site and the costs to “we the people” of the remediation of the problem will likely exceed the value of the gold recovered by the entire mining operation. Let’s not have a Berkely Pit or a Gilt Edge site in Minnesota. I have no arguments whatsoever with the environmental provision proposed during the active mining period. I believe that with significant oversight from the Minnesota Pollution Control Agency as supported by the Minnesota Department of Natural Resources, environmental measures put in place during active mining will adequately protect the sensitive watershed within which the PolyMet site is situated. Conversely, I know that if allowed to proceed based on the currently-proposed closure/reclamation plan the PolyMet mine will be a legacy problem. I call on Governor Dayton and Minnesota’s environmental stewards to hold PolyMet to a closure/reclamation plan that leaves no sulfide bearing rock, tailings or hydrometallurgical wastes on the Earth’s surface for ultimate eventual contact with atmospheric oxygen and ultimate distribution of produced toxics to Minnesota’s waters by natural hydrologic processes. Governor Dayton and his team of high-level managers within the DNR and MPCA should individually and collectively look out for Minnesota’s resources as they would look out for their own children, perhaps holding Minnesota’s environment as closely to their hearts as they might hold an only child. We have but one environment and no risk should be considered reasonable for that environment that would not be deemed appropriate for a child. The following quote exemplifies the to-date dealings of states and the fed with mining companies: “Insanity: doing the same thing over and over again and expecting different results.” Albert Einstein. How would allowing the spoiling of another of the Earth’s sensitive ecosystems in the name of corporate profits not be “insane”?	NS	X
30	Unique			GEN	Heyward Nash		91	1	DON'T ALLOW THIS MINING PROJECT TO HAPPEN. IT'LL POLLUTE LARGE SWATHS OF NORTHEASTERN MINNESOTA, INCLUDING PRISTINE WATERS THAT FLOW INTO THE BWCA AND LAKE SUPERIOR. STOP IT NOW.	NS	X
31	Unique			GEN	Heyward Nash		92	1	THIS PROJECT SHOULD BE DROPPED IMMEDIATELY AND NOT CARRIED OUT ANY FURTHER. YOU'RE PLAYING RUSSIAN ROULETTE WITH THE HEALTH, SAFETY AND BEAUTY OF NORTHEASTERN MINNESOTA AND LARGE PORTIONS OF LAKE SUPERIOR. YOU'LL NEVER BE ABLE TO CLEAN UP THE TOXIC MESS THIS PROJECT WILL CREATE--NO MATTER HOW MANY YEARS AND LARGE SUMS OF MONEY YOU POUR INTO THE CLEANUP. YOU'D BE MAKING A TERRIBLE MISTAKE TO CONTINUE WITH THIS DISASTROUS ENTERPRISE. END IT NOW!!	NS	X
7451	Unique			GEN	HJKKJS@aol.com		546	1	The five changes to the final EIS cannot ensure anything! PolyMet has spent 10 years and \$28 million trying to make us believe that they are going to create lasting employment on the range (how many jobs?) and that they will make every attempt to protect the environment. We just have to trust them. Anyone who believes that PolyMet really cares about anything except profit has their head stuck in an open pit mine. I am adamantly opposed to this adventure.	NS	X
29094	Unique			GEN	Holly Buchanan		2416	1	I share the informed opinion of thousands of others vehemently opposed to this project that its impacts will cause serious and lasting environmental damage for very negligible benefit to the people of Minnesota.	NS	X
14667	Form Letter	7	Variant	GEN	Howard Gantz		797	1	Everyone, the decision to reject PolyMet's request should be one the easiest you'll ever need to make. Their proposal is not in the interest of our country and its people. My guess is that they've submitted a mountain of paper (studies, legal arguments, promises, etc) in an effort to try to turn an obvious decision to reject, into a "debate". It's basically a "con". They are trying to put the burden on you to rebutt what's in their pile of paper. PolyMet's requests are against our interests on it's face (and probably that of Canada).	NS	X
4672	Form Letter	1	Variant	GEN	In Closing		413	1	In closing I would just like to say that I can't believe we are even considering allowing this kind of mining in a wetlands, by an international company none the less. Yes mining produces jobs, but it also leaves impoverished towns once the mining operations are done. My question to you is has PolyMet ever had an operation that did not result in a spill or accident? Once the mining jobs move out, which they always do, can PolyMet guarantee that the wilderness will be left uncontaminated so that the only sustainable industry (recreation/tourism) can continue to thrive? What happens if there is a spill? Can PolyMet afford long term cleanup? You know as well as I do that companies such as this simply file bankruptcy and go on their merry way when things go wrong, leaving the tax payers to clean up their mess...if the mess can even be cleaned up effectively. Please, please, don't let the greed of a few ruin a rare gem like the BWCA for a little nickel and copper. There are plenty of places in the U.S. where these minerals can be mined safely without threat to one of the earth's most valuable resources...clean water!	NS	X
10841	Unique			GEN	Ingrid Timboe		729	1	My family has owned a home and land along Lake Superior in Lutsen, MN since the 1970s and I grew up spending summers in the BWCAW with my father and siblings, autumns hiking in the Sawtooths, and winters cross-country skiing in the Superior National Forest. This is precious land to my family, to our North Shore communities, to the thousands of people who paddle and fish the rivers and lakes of the North Shore each year, and most importantly, to the native Ojibwa peoples who have called this land home for thousands of years. Expanding mining operations along the Partridge River is unacceptable. Several rivers in the region are already listed as impaired under the Clean Water Act and must be managed under costly TMDL regulations. Adding additional, risky mining operations is likely to exacerbate the environmental problems already faced by regional rivers, as well as by the Great Lake herself. This area is an international treasure and opening more of its forests and wetlands to sulfide mining would be a travesty.	NS	X
28494	Unique			GEN	Ivan Weber		2293	1	We respectfully urge denial of the application on a number of bases, particularly the biogeochemical fate of contaminants inevitably produced, consequent water quality effects, and impacts of the proposed land exchange.	NS	X
26658	Form Letter	1	Variant	GEN	J.M. Alexander		1407	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine because it doesn't appear that there are ANY copper-nickel sulfide mines anywhere that have successfully operated for at least 10 years without causing significant environmental damage.	NS	X
19	Unique			GEN	Jack Parker		58	1	I've been here before, about ten years ago, when confidence man Cherry teamed up with Foth's Donohue and the "mining man" in Michigan's DEQ to present Kennecott's Eagle Mine as a sure thing, with absolute confidence, ignoring both the facts and the laws of the land. And it worked. It really was a done deal. The "mining man" at DEQ wielded the rubber stamp, lying as necessary, unchallenged. The evidence is available and Kennecott does not bother to respond.	NS	X
19	Unique			GEN	Jack Parker		59	2	And that "done deal" approach meant that the protesters were few and faint-hearted - whereas they should have sent those ringleaders to jail, where they belong. Today your defender of the land has made it quite clear where he stands, and it's not on conservation.	NS	X
19	Unique			GEN	Jack Parker		60	3	Let's start at the beginning: show us the orebody. Show us the dd holes and the thickness and grade. If you cannot do that Tom you might as well be peddling another Penokee Pit. And don't forget the power plant, you're going to need it.	NS	X
34	Unique			GEN	Jack Parker		99	1	Lori Andresen has suggested that my letters would "carry more weight" if I included my credentials. I respect her opinion so instead of referring you to my online resume I will attach it.	NS	X

43	Unique			GEN	Jack Parker		111	1	My most significant objection to the project is that you are dealing - perhaps unwittingly - perhaps not - with unconvicted felons who practised very similar deceptions, with prearranged collusion from the courts, to obtain illegal permits to mine at the Kennecott Eagle property in Upper Michigan. The two principals involved in the fraud, as at PolyMet, were Mr Cherry, then Project Manager, and Mr Donahue of Foth Engineering who, to quote him, "Knows how to get permits". We still have the evidence. It is significant that Kennecott never denied wrongdoing. In court they would stroke their mustaches thoughtfully and change the subject. We allowed them to do that. Everything was under control. A "Done Deal". The EPA had earlier delegated power to MDEQ to handle all mining regulation in Michigan, without having mining expertise, but they ignored real expert advice and handed out the permits. One item stands out very clearly: Our experts easily recognized lack of expertise and manipulation of data fed into mine design, which led to mine design with safety factors lower than one, indicating that the structure, as planned, is likely to collapse. They simply denied it, without evidence. The judge took a nap. That matter is now in the hands of MSHA (responsible for underground mine safety and health) but they too appear to have been enlisted and compromised, despite Director Joe Main's vow to eliminate all "Sudden and Unexpected Mine Collapses". I remind them every month or two but they have implemented Joe Main's vow by "Talking to Lundin, the current owner/operator, who says that there is no problem." As did the fox in the henhouse. According to Michigan Mining Law, Part 632, pp 14-16 they - and all persons having knowledge of the deceptions - are felons and are subject to stiff penalties - more so now that lives are knowingly endangered. Please acknowledge receipt of this letter, which will go public, then arrange a little chat with the two principals, and go public.with your findings. It would seem to make sense to do that at an early stage in the permitting proceedings.	NS	X
6182	Unique			GEN	Jack Parker		457	1	Emboldened by successes at the Eagle and at Flambeau (where they still proclaim no pollution, without shame, as the manganese leaks out) and now in the early stages at PolyMet - we can expect more of same and must be prepared to repel it.	NS	X
24349	Unique			GEN	Jack Parker		1028	1	On Thu, Dec 10, 2015 at 5:55 PM, MN Department of Natural Resources <dnr.updates@updates.mndnr.gov> wrote that the deadline for comments would be extended. Thankyou, it could extend the hearings yet closer to perpetuity. But it may bring this, my fourth submission, closer to the top of the heap.... This, unlike the majority of the opinions I hear, is to suggest that you thank everybody for their interest but to be of good cheer, as befits the season, because most of the discussions and arguments are not necessary. They are pointless. Go home. This is a part of the typical ploy to divide and conquer. Go on your way, rejoicing! The point which they all overlook or fail to comprehend is that the principals behind the Polymet proposal are the same as those who guided the permitting processes for the Kennecott Eagle project, the Kennecott Flambeau project - and now the Polymet project, and, in doing so, committed serious crimes against the law of the land and the people too. They lied and cheated in the proceedings, thus becoming eligible to spend the rest of their days in prison as felons, in Grand Frauds worth billions of dollars - and endangering property and lives too - for profit. So far they get away with it, and the absence of good mining people allows that to happen. The evidence is absolutely clear, already prepared and presented but ignored by the criminals and their accomplices in court, up to and including Attorneys General. I guess that the preparations began some thirty years ago in Michigan. Dow Chemical and Granholm, now retired but a member of the Board. For example - for reasons unexplained but now obvious - the Federal EPA delegated to Michigan DEQ (with zero mining expertise) all authority over mining in Michigan. The AG's lean on that to bemoan the fact that they do not have the necessary jurisdiction. Read Schuette's inaugural pledge - "to root out and prosecute corruption at all levels of his government." He could start far above the roots. Ask him about that. Help him by asking where he was employed before Kennecott moved in ... The technical evidence is even clearer than the politics. The application appears to have been written by schoolboys under pressure. Four mining experts, including the one selected by MDEQ, consider that the technical data were tampered with, then misused to produce a mine plan which was, and still is, likely to bring on a sudden and unexpected mine collapse. Even MSHA (Mine Safety and Health) is now implicated. They, like the other agencies, were forewarned, as you are being forewarned, and they "investigated" by asking the operator about the charge - and were told that there is no problem. Industry and administrators are on good terms, but rock structures and inherent stresses suggest to the experts that the collapse will indeed be sudden and unexpected. I will leave you with that thought - that you might question Polly people in depth - to get at the truth. I doubt that you have the resources to even ask the right questions. For example: Can you guarantee that no major catastrophes or damages will ever be attributable to the mining as planned? If not - the hearings are closed. You need a better plan. Now you have something pertinent to talk about. Are we again dealing with crooks?	NS	X
29863	Unique			GEN	Jack Ray		2686	1	no to Polymet	NS	X
387	Unique			GEN	Jacob Davis		189	1	I am writing you to express my disgust and disbelief that the state of Minnesota is willing to threaten the environment, thousands of tourism jobs, and its own collective dignity to pander to foreign mining interests who will extract wealth from our state as they extract minerals from the land they destroy.	NS	X
30293	Form Letter	1	Variant	GEN	Jacqueline Moen		2848	1	Once this natural resources is ruined it is gone forever-there's lots of way to make jobs that are not destructive	NS	X
26824	Form Letter	3	Variant	GEN	James and Marianne Potratz		1470	1	We certainly support the approval of Polymet's ability to mine without environmental damage. They have met all the requirements of the DNR, US Army Corps of Engineers, and US Forest Service.	NS	X
27001	Unique			GEN	James Burpee		1585	1	I think this is a very bad idea.	NS	X
24235	Form Letter	1	Variant	GEN	James Cunningham		1015	1	I must reiterate; who is being bribed to allow such malfeasance?	NS	X
24235	Form Letter	1	Variant	GEN	James Cunningham		1016	2	How much have the bribes totaled so far that have permitted this gross injustice to even be considered?	NS	X
24235	Form Letter	1	Variant	GEN	James Cunningham		1017	3	I would recommend an immediate investigation into Ms. Halter's possible acceptance of bribes from PolyMet. No sane individual would ever agree to consider such a horrific loss of state resources in exchange for some greedy mining corporation to destroy said state resources for private profit while ignoring completely the very real potential for widespread human health problems. Someone, or many "someones" are on the take here.	NS	X
5861	Form Letter	1	Variant	GEN	James Ferstle		439	1	The problem with inflicting environmental damage is once it's done you can't repair it. We argue about climate change, but do very little to address the problem. Jobs trump resource destruction when all at issue is training oneself to do a job, not demand that the job must conform to your "skills." America was not built on people demanding work, it was by Americans working to make the country strong, not rolling over to a corporation that wants to minimize their costs and drive up their profits. If it was cheap to mine copper or other "precious metals" under the Washington Monument, the White House, etc. in Washington, DC, would we plow under those structures to create jobs to mine there? No, you manage your resources, not go wherever it is easiest or cheapest to get resources that are not vital to anything but a company's bottom line. Mining copper-nickel sulfide at a place, such as the proposed site in Northern Minnesota, is not worth the damage it will do to the area. Create something good for the country instead of stripping the land at a higher cost than any minerals you take out of it. Take a trip around the area and look at what mining has left behind. Pits and waste. Yes, it built great schools, such as Hibbing HS in the era when companies were more responsible and the profits trickled down to education and community, not merely for the carpet bagging practices of today where companies don't care about the community. They promise things that they have no intent on keeping. Use out of work mine workers as a bargaining chip. Spend money bussing them into public meetings, rather than putting money into retraining them so they can have the skills to do something aside from mining for the times when the environment does not need their mining skills. They'll also ship in workers from outside the area, rather than maximize the economic impact on the skilled workers who already reside on the iron range. In short they take out minerals, money, opportunity from the area and leave behind their waste.	NS	X
742	Form Letter	1	Variant	GEN	James Mayerle		256	1	This is the same old story of mining companies claiming to be able to now safely mine the sulfide ores that have led to so many ecological disasters in the past. And it's the same old story of politicians backing any project that produces new jobs, no matter what the ultimate cost. I am a native of the Iron Range and am sympathetic to the difficulty of creating jobs in the region. However, in this case, the risk is just too great.	NS	X
24687	Unique			GEN	jamie ness		1083	1	I would like to submit the following as a comment to the DNR about Sulfide Mining in Minnesota: Minnesota should not allow Glencore Glencore Documentary (DOKU HD) 2013 (Panorama S60 E15) Glencore Documentary (DOKU HD) 2013 (Panorama S6... View on www.youtube.com Preview by Yahoo to profit from polluting our water. These clean waters are an enormous wealth that we have to pass on to our kids and grandkids, and we should resist anyone who wants to profit from polluting it. Minnesotans don't like conflict, we don't like saying "no", but when it comes to the wealth and the well being of future generations we need to fight for what's best for us, and not just give in to self-interested business people, unions, and politicians.	NS	X
23992	Unique			GEN	Jan		996	1	There are too many variables and inconclusive research to say conclusively that the Boundary Waters and the St. Louis River would not be affected by this copper/sulfide mine. Pollutants could very easily leach into the groundwater. 500 years is a long time to keep toxic substances from spreading into our Minnesota waters. I am against this mine.	NS	X
672	Form Letter	1	Variant	GEN	Jan Kilian		206	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
6294	Form Letter	1	Variant	GEN	Jane Koschak		462	1	The PolyMet NorthMet Final Environmental Impact Statement (FEIS) proposed on 6,700 acres of public land in the Superior National Forest, is a bad plan for Minnesotans and should be rejected with all permits denied.	NS	X
6294	Form Letter	1	Variant	GEN	Jane Koschak		466	5	PolyMet mine is the tip of the iceberg for sulfide-ore copper mining companies wishing to stake their claim in northeastern Minnesota. There will be a half dozen or more mines with miles of open pits, wasterock piles, intrusive roads and corridors, concentrator plants, railroad lines, heavy truck traffic...all dissecting the heart of the Superior National Forest.	NS	X
6294	Form Letter	1	Variant	GEN	Jane Koschak		467	6	Despite years of citizens raising concerns about the impact PolyMet would have on Minnesota's clean water legacy, and despite some 50,000+ comments against PolyMet's Supplemental Draft Environmental Impact Statement (SDEIS) in 2014, PolyMet's plan has not changed much at all. Considering that our clean water is at stake, PolyMet is not worth the risk.	NS	X

9309	Form Letter	4	Variant	GEN	Jane Nicholson		623	1	The recently released Final Environmental Impact Statement (FEIS) is inadequate, and the proposed open-pit mine would result in unacceptable, irreversible environmental harms.	NS	X
9309	Form Letter	4	Variant	GEN	Jane Nicholson		624	2	It is essential that we guard against any pollution whatsoever.	NS	X
9309	Form Letter	4	Variant	GEN	Jane Nicholson		629	7	[The proposed land exchange would] harm endangered species, impair downstream tribal resources and conflict with laws and policies to protect wetlands and other resources.	NS	X
9309	Form Letter	4	Variant	GEN	Jane Nicholson		630	8	In sum, the FEIS is inadequate and fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts.	NS	X
25565	Unique			GEN	Janell Oelrich-Schreiber		1200	1	Having grown up in Hoyt Lakes and its surrounding forests, I have deep concerns about the long-reaching, and long-lasting effects of Polymet's proposed operations in regards to wildlife populations (particularly lynx, gray wolf, moose, and others), and am also concerned about air and water quality. I am aware too, of the lack of employment and growth on the Iron range, and do have grave concerns about this- however, in my view, without the healthy land and ecosystems seen in the area, all else becomes a moot point. I am not convinced that a large mining operation, nor its investors, have the best interests of the land and its inhabitants as a top priority. Money becomes the bottom line- but the life of and on the land itself is not something that can be readily renewed or brought back once damage is done. Put simply, I am not convinced Polymet is to be trusted, and I am also unconvinced that their operations will never cause lasting, unmitigated harm.	NS	X
29810	Form Letter	1	Variant	GEN	Janelle Carlson		2645	1	Copper mining poses a possible threat. What an understatement. Kind of makes it sound like if it goes bad five surrounding homes would be negatively impacted. The reality is if it goes bad, and I would bet it's a matter of when not if, it would be an irreversible disaster; not just for northeastern MN but for the whole state. Opponents call it sulfide mining because to mine for copper you unearth sulfide.	NS	X
24594	Unique			GEN	Janna Neperud		1047	1	Do NOT want anywhere in Mn. much less near the precious Boundary Waters!! This could become such a tragic enviromental disaster, I shudder to think of the potential damage that would be done.	NS	X
10673	Unique			GEN	Jared Martin		711	1	I cannot believe we're once again considering giving in to another corporation that wants to get even wealthier at the cost of the environment and our health. From what I've read sulfide mining is dangerous and incredibly dirty... and accident just waiting to happen. Meanwhile the boundary Waters and it's surrounding areas is an amazing place that we should respect and cherish. How many jobs will this actually create??? Not enough to risk everything! These shouldn't be the kinds of jobs we're looking for anymore it's almost 2016 for crying out loud! Do NOT go through with this proposal. PLEASE. Minnesota should be showing the rest of the country how to take care of it's wilderness. DO NOT. APPROVE. THE PROPOSAL.	NS	X
27411	Unique			GEN	Jared Yount		1726	1	I am staunchly against this project.	NS	X
27411	Unique			GEN	Jared Yount		1730	5	They do not have our states best interests at heart. Stop them before they do irreversible damage...	NS	X
29282	Unique			GEN	Jason H. Kuehn		2489	2	Strictly from a scientific and economic standpoint, the Northmet operation as proposed by PolyMet and Glencore is not to be of any significant benefit for the populations of Northern Minnesota and may indeed prove to be quite adverse to those living downstream of the mine site.	NS	X
76	Unique			GEN	Jason Kuehn		146	1	As a resident of Duluth and Ely, I would like to express my strong opposition to the Polymet sulfide mine operation and land exchange.	NS	X
76	Unique			GEN	Jason Kuehn		148	3	What benefit we do fetch from this project would be instantly and forever overshadowed by any incident involving leakage of mine waste.	NS	X
76	Unique			GEN	Jason Kuehn		149	4	Something that is guaranteed to happen to some extent over the next several generations. Science and history have shown that this project is not in the best interest of residents in Northern Minnesota and I plead with the appropriate agencies to reject this mine proposal.	NS	X
27686	Unique			GEN	Jason McCall		2069	1	You seem to think everyone in N.E. MN. Is for copper nickel mining. I assure you, you couldn't be more wrong. I've made my living directly from the mining industry as have my family for 120 years. I am strongly against it.	NS	X
15066	Form Letter	1	Variant	GEN	Jason Ziehm		806	1	All evidence suggest that there is a great likelihood of this mine being disastrous. The "pros" to this proposal are few, and the "cons" dramatically outweigh all benefits. There simply are no do-overs, and I feel that approval of this mine would be a mistake, and looked upon with great remorse and sorrowful regret. The damage could NEVER be undone. EVER.	NS	X
7017	Unique			GEN	Je Blomquist		532	1	No to PolyMet. The few years of jobs is not worth the decades of pollution and clean up. We all know the taxpayers get stuck with paying for hazardous clean up after these companies suck their profits out of the business, then move on after a few years. The degradation and destroyed habitat is not what Minnesota is about anymore. We must preserve what wilderness/habitats we have left.	NS	X
51	Unique			GEN	Jean Public		122	1	i do not support this project. this comment is for the public record. please receipt	NS	X
24704	Unique			GEN	Jean Public		1090	1	i am noit in favor of this land exchange. i am not in favor of this mine., this comment is for th epublic rtecord. pleasde receipt.	NS	X
29870	Unique			GEN	Jeanette and Jack Curphy		2676	1	We are very much against the Polymet Project, for the following reasons: The Partridge River is very close to the Polymet Project. That river runs into the St. Louis River. The St Louis River flows into Lake Superior. There us also the Mississippi watershed to consider. Cleanup of any sulphide getting into the water is near impossible. Has the investors in Polymet put sufficient funds to mitigate, should any pollution problems occur? In one of last weeks Duluth News Tribune, there was an article about a copper mine closing in either Arizona or Colorado because the price of copper was down. So why are we risking our environment when there are so many unknowns?	NS	X
27421	Unique			GEN	Jeff Bryan		1739	4	The impact to the water quality and surrounding wilderness areas will be great!	NS	X
27970	Form Letter	1	Variant	GEN	Jeff Conrod		2236	1	I'm sure you have received the below form-letter hundreds of times. I'm leaving it because it lists some great reasons for opposing the proposal and I agree with them.	NS	X
27631	Unique			GEN	Jeff Feldmeier		1791	1	no mines	NS	X
24646	Unique			GEN	Jeff Kitterman		1059	1	I do have a fundamental ethical question at the center of the controversy..... How can our MNDNR (regardless of the affiliation with the USACE/USFS) be expected to serve as the stewards of the land while simultaneously promoting commercial growth abusing natural resources? To my untrained eye this holds itself out as a clear conflict of ethical interests.	NS	X
26870	Unique			GEN	Jeffery D.		1479	1	I would like to extend my support for the Polymet Project and feel that a very in depth study has been completed to allow the construction of Polymet.	NS	X
25687	Unique			GEN	Jeffrey Ballou		1214	1	Please reject sulfide mining as it has not been shown to be safe and previous mining operations prove this.	NS	X
10793	Unique			GEN	Jeffrey L. Wiles		725	1	I conclude that PolyMet's proposed sulfide mine in northern Minnesota poses unacceptable risks to Minnesota's clean water legacy. And that PolyMet's mine plan would put Minnesota's wetlands, health, and taxpayers in dire jeopardy. Bottom Line: That PolyMet would do substantially more harm than good. And this is not what I want for the State of Minnesota in the future!	NS	X
27060	Form Letter	1	Variant	GEN	Jennifer Church		1639	1	The PolyMet NorthMet proposal is deeply flawed -- especially in its failure to ensure that the resulting pollution is adequately limited.	NS	X
27060	Form Letter	1	Variant	GEN	Jennifer Church		1641	3	We have all witnessed the disasters resulting from breaches in the containment structures at nuclear power plants -- despite continuing assurances that the probability of such breaches is infinitesimal. We must not be complacent in this case.	NS	X
27067	Unique			GEN	Jennifer Church		1647	1	The PolyMet NorthMet proposal is deeply flawed — especially in its failure to ensure that the resulting pollution is adequately limited.	NS	X
3514	Form Letter	1	Variant	GEN	jennifer schad		382	1	Hello, I object to PolyMet's mine plan in Northern Minnesota.	NS	X
748	Form Letter	1	Variant	GEN	Jenny Dahl		257	1	Please reject mining proposals in northeastern Minnesota.	NS	X
24482	Unique			GEN	Jeny Ungers		1039	1	This is a terrible idea. I don't trust this company to have minnesota's best interest at heart.	NS	X
25943	Unique			GEN	Jerry Pederson		1244	1	I support the approval of the PolyMet project.	NS	X
27691	Unique			GEN	Jessica Diamond		2084	1	I am writing to urge the MDNR to deny and terminate the pending application for an open pit copper, nickel and platinum element mine with temporary proposed by PolyMet.	NS	X
24684	Unique			GEN	Jessie Kruchowski		1080	1	Get Polymet open already!!	NS	X

23552	Unique			GEN	Jill Rassmussen		961	1	I am sending this email to plead with you not to allow the PolyMet mine to continue with the current EIS. As a proud Northern Minnesotan I would like to shout, now is not the time for a copper-nickel mine! A mine that will cause pollution that will devastate our lakes, rivers, and wetlands for the profit of one Canadian Corporation. Now is the time MN needs to demonstrate it's leadership in environmental protection! Now is the time to step forward as the rest of our Country and World are attempting to do. I grew up in a thriving MN tourist town that is still thriving today. The main draw, clean lakes. My husband grew up in a neighboring mining town. I also taught school in this town. Unlike my little tourist town, it's community was left with drug problems and streets lined with thrift shops and bars. Until resently the struggling town was left with only memories of a booming mining town. The salvation of this town, a state recreation area. The difference is Polymet's EIS states it will need a MINIMUM of 200 years of water treatment while only running for twenty years. This leaves no opportunity for a bounce back. Our state has not allowed this type of mine thus far for a reason. Now the question is which leaders are working for a sustainable economy, and which leaders want to open a giant wound in our most precious resouce with the vow to put a quick bandaaid on it? Yes, mining supports a small number of us, but a copper-nickel mine is not worth the painful payoff. What will we say when our grandchildren ask us what actions we took to leave them a better world?	NS	X
24592	Form Letter		Variant	GEN	Jill Wiebe		1046	1	I love our northwoods, and I challenge our lawmakers and policymakers to be stewards of the earth for generations to come, forsaking easy profit in the short term. The Boundary Waters Canoe Area Wilderness, in particular, is a gem worth preserving at almost any cost. Though	NS	X
261	Unique			GEN	Jim and Diane Malcolm		155	1	I am writing today to voice my concerns about the proposed Polymet Copper Mine in Minnesota. I fear there is a great danger of severe and widespread environmental damage as result of this mine.	NS	X
261	Unique			GEN	Jim and Diane Malcolm		156	2	Mines nearly the same as this proposed one have caused much damage in other parts of the world.	NS	X
28475	Unique			GEN	Jim and Diane Malcolm		2253	1	I fear there is a great danger of severe and widespread environmental damage as result of this mine. Mines nearly the same as this proposed one have caused much damage in other parts of the world.	NS	X
24632	Unique			GEN	Jim bambenek		1056	1	If you don't know history it will repeat itself. Just check in to mining history and see if you think this mine will be any different ? The fact that waste water will have to be processed forever is enough to stop this mine.	NS	X
3073	Form Letter	1	Variant	GEN	Jim Bendtsen		357	1	I fully support the current PolyMet NorthMet copper-nickel sulfide mine proposal. The PolyMet Final Environmental Impact Statement (FEIS) is fully adequate under both federal and state standards; I support the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal.	NS	X
2603	Unique			GEN	Jim Companion		336	1	I believe they can comply safely with the clean water, If they circle the holding pond with. Sheet piling within. the berm surrounding the holding ponds.	NS	X
25972	Unique			GEN	Jim Pounds		1253	1	The Poly Met mine is bad for MN on so many levels.	NS	X
29957	Unique			GEN	Jim Pounds		2727	1	There is no rationale basis for allowing this mine to exist. Period.	NS	X
23917	Form Letter	1	Variant	GEN	Jim Steitz		969	1	I express my strongest opposition to the proposed copper-nickel sulfide mine that the Polymet company wishes to dig in the wetlands that provide some of the headwaters of streams flowing into Lake Superior. Far more is at stake in this EPA permit decision that is noted in the SDEIS, as this will set a precedent for an unknown number of companies that wish to extract hardrock minerals from the far north-central United States that sustain some of our finest remaining hardwoods, boreal forest, wetlands, and lake ecosystems. As a former resident of Minnesota and sometime visitor to the Boundary Waters wilderness, I personally attest to both the exquisite biological value and biochemical vulnerability of this landscape. Some of these speculated future mines may even occur within the watershed of the Boundary Waters Canoe Area Wilderness itself.	NS	X
24224	Unique			GEN	Jim Tuomala		1013	1	After 10 years of rigorous and diligent study and a cost of over \$100 million incurred by this venture, I certainly agree it is time to put the wheels truly in motion and provide the permitting for Polymet. I live right down the road from this site in Babbitt and I as well as everybody I talk to have absolutely no fears of risk to the local ground water and environment. We have mined this area for well over 100 years and it is still the most pollutant free area of the state. As we all already know, those of us who have lived here our lives and perhaps worked in mining, local mines already meet very stringent emissions standards. Those of us who know the truth realize, Polymet will also need to meet these standards along their way while providing much needed economic resources to working families in our area. 10 years is enough already, please see this project through.	NS	X
28981	Form Letter	1	Variant	GEN	Jim Wagner		2380	1	I am writing to tell you that you should not support the PolyMet mine development. I go the Boundary Waters and Ely area every year or so. It is a wonderful area full of unmatched beauty. This area and the resulting tourism should be preserved at all cost. I worry about the long-term effects of mining on the area's watershed for many years to come. Please say no to this development. Keep mining ouf of this area in Minnesota.	NS	X
24333	Unique			GEN	Joanna Schor		1020	1	I am writing to oppose PolyMet's proposed NorthMet sulfide copper mine on the Superior National Forest; the proposed open-pit mine would result in horrific and irreversible environmental damage. The proposed land exchange with PolyMet is not in the public interest, and would violate the forest plan for the Superior National Forest, harm endangered species, impair downstream tribal resources and conflict with laws and policies to protect wetlands and other resources.	NS	X
29445	Unique			GEN	Jodi L. Perkio		3842	1	I know jobs are needed in our state, but not at any cost. There has never been a sulfide mine able to contain the toxic waste they produce. The companys I'm sure try to do all they can to assure that these toxins are not released into environment, but accidents happen. Why take a chance where something like this could happen on such a prestine area of our state. Even some of our present mines tailings basins are leaking. Once these toxins are released into the environment they are there forever. We see what has happened in other accidents It never totally gets cleaned up, They get into the water table, food chain causing birth defects, cancers and a host of other other health issues. We already have enough of these toxins in our environment. The company said it will maintain the site for 500 years after the mine closes. It will cost more to maintain it than the wages paid for 20 years of production. This type of rock is safe as long as long as it is uderground. Its like a siberian tiger in a cage at the zoo, but if it gets out and it has happened, it will kill you and others until it can be contained again. I personally don't think it is worth the risk. I had to move when I couldn't find work near where I live. I came back when more jobs came to the area.	NS	X
3533	Form Letter	1	Variant	GEN	Joe Krall		371	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Even if the mine operates for 30 years and creates 2000 jobs for Minnesotans (which is debatable), a disaster would wipe out 10s of thousands of jobs in the tourism industry. A disaster would also destroy a beautiful wildlife habitat. So once again, it all boils down to money. Let Minnesota set an example for the rest of the country by declaring our clean air, water and land is more precious than a few tons of copper.	NS	X
27904	Form Letter	1	Variant	GEN	Joe Moriarity		2226	1	It's with the utmost gravity that I am writing regarding the plans for the PolyMet NorthMet copper-nickle sulfide mine proposal. I've read all the claims of the companies. . . and yes, they all look good. But. . . it's all well and good on paper, but you need to take off your blinders because NONE of these type of mines as escaped the years without some kind accident, usually catastrophically polluting the environment for decades if not longer. This is a disaster waiting to happen. . . but a preventable one.	NS	X
6183	Unique			GEN	Joe Musich		452	1	The tipping point ... for encroachment on the Minnesota wilderness will be a decision to allow Polymet to proceed. The next reaches into the forests and lakes will be even more easily justified with a Pollyanna view of the present danger to health of the people the animals and the forests and waters. Science is science and facts are facts. The deep struggle of the human has always been overreach as exemplified by hubris. A decision to allow Polymet to mine will be exactly this. We are not bigger and more powerful then we are even if we would like to think so. There are many examples of the miscalculation of the "margin for error." Do the right think. Say No !	NS	X
30334	Form Letter	1	Variant	GEN	Joe Sturm		2852	1	Please stop PolyMet!	NS	X
10208	Unique			GEN	Joel Zimmerman		673	1	No way, no how, no polymet!!!! KEEP MINNESOTA AND LAKE SUPERIOR BEAUTIFUL!! Save the wetlands, prestine Minnesota forests, moose, waterfowl and any other animals this threatens !!! A waste pond for 500+ years? ARE YOU KIDDING!? They are owned by ANOTHER COUNTRY!! Glencore owns 60%, the owner is in court in spain for lying and corruption. THINK OF YOUR CHILDREN AND SAY NO!!!!!!	NS	X
27670	Unique			GEN	John Burchfiel		1825	1	Please say no to copper-nickel mining here in Northern Minnesota. We already have to many toxic waste site in this great state. We are responsible to future generations to protect two jewles in Minnesota, Lake Superior and the BWCA.	NS	X
3798	Form Letter	1	Variant	GEN	John Deitering		383	1	The polymet is an INSANE idea...to risk our environment for hundreds of year for a few hundred jobs for 20 years. Here is a better idea: hire the same number of people and have them retrofit every public building north of Minneapolis . You will not only save the environment, but you will get your money back over time in energy savings.	NS	X
3939	Unique			GEN	John Eggert		392	1	I want to express my opposition to the Northmet project. It is not safe for our environment and the company does not have a good record.	NS	X
6762	Unique			GEN	John Eloranta		506	1	As a lifelong Ranger, a University of Minnesota graduate with a degree in Environmental Science, and someone who lives and works at a family business 15 miles from the proposed mine site, I wholeheartedly support this project. This is what our communities need. Let the people who live here decide what to do with our area, not the weekend warriors who visit our beautiful region a few days out of the year. This project is long overdue and will greatly benefit the Iron Range.	NS	X
24686	Unique			GEN	JOHN ESCHEN		1082	1	Let me see, if I got you right on this, you want to destroy for profit? Our country, does not need more mines. Every time I turn around, I am hearing about another accident, another toxic sludge tank, leaks into another fresh water source, for hundreds of millions of people. The company declares protection, and walks. So who wins, it not the people, they are left holding the bag and the cost of any clean up. The people, must live with the damage caused. How about for once, you, don't just let the companies get their way. How about holding the dirty corporations accountable? Humans, have put an environmental imprint on this planet. And the planet is doing everything to re-balance itself. This planet, is a living, breathing, thing. A delicate balance has been altered by our growth and consumption. We humans, our own worse enemies. We keep destroying the environment, thinking that we will survive, its only by GOD'S blessings, have we survived this long. What ever happens between now, and CHRIST coming. What happens, will be the result, of human choice. Our choices, either good, or evil, will reflect on where we go not just as a nation, but as a world as a whole. What will you choose?	NS	X
27693	Unique			GEN	John G. Raines	North Central States Regional Council of Carpenters	3277	1	On behalf of the 10,500 Minnesota residents who belong to our Carpenters union, I write to commend the Minnesota Department of Natural Resources, the U.S . Army Corps of Engineers, and the U.S. Forest Service for conducting a thorough and independent review of PolyMet's proposed NorthMet mine. The Final Environmental Impact Statement finds that the proposed mine can comply with strict state and federal environmental standards. The EIS takes a careful and comprehensive look at the project, and it should be deemed "adequate".	NS	X

24130	Unique			GEN	John Gaffney		1003	1	This project is too risky for Minnesota or any place in the country. It is a real threat to pollute already precious and depleting supplies of clean fresh water. Please keep this operation out of Minnesota and protect our environment.	NS	X
24802	Unique			GEN	John Goetz		1111	1	I urge you to reject the Polymet mine. My reasons are three. 1. Water is Minnesota's most precious resource, and mines are always dangerous to water. No matter how safe they are designed or supposed to be, they present a risk of disaster. 2. This mine would be a blight on the landscape, another precious Minnesota resource, especially in the northern part of our state. 3. The number of jobs that might be created does not justify the above drawbacks.	NS	X
709	Form Letter	1	Variant	GEN	John Roth		208	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal for legal, economic and moral grounds.	NS	X
29585	Form Letter		Variant	GEN	John Strand		2553	1	I want to believe that all of this is not just a formality, and that a decision on this disastrous project (that is bad enough in and of itself, but is also a Trojan Horse that will bring with it a whole army of Greeks that will pillage and rape Minnesota beyond all recognition for years to come). It is in that spirit, a spirit of belief in the process that I write. I believe the FEIS has been rushed and is inadequate in almost all respects.	NS	X
963	Form Letter	1	Variant	GEN	John Tonsager		262	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
4259	Unique			GEN	John Trullinger		400	1	I'm writing in support of the Polymet project. While I am not intricately familiar with all aspects of the EIS, I believe there is a plan in place that is compliant with the laws of the land. If any project comes up with a plan that can meet the law, I am a firm believer that project should be allowed to happen. I trust the government, and I trust that the USACE, the USFS, and the MNDNR have thoroughly reviewed and vetted the plan to the point where they are comfortable with the mine plan. There were tens of thousands of public comments regarding the plan during the draft phases, and the EIS owners were able to address all of these comments. The fact that Polymet, the USACE, USFS, and MNDNR were able to justify and slightly tweak the FEIS following all of these comments, and still want to proceed with the project, leads me to believe they have a viable plan in place. The mine will provide many benefits for the region. It will provide much needed high paying jobs and allow for the iron range to start diversifying the types of minerals it is mining. This will also buy the communities of the iron range additional time to transition into other types of manufacturing to keep these communities viable beyond when the minerals run out. Polymet will provide new taxes and school funds for the state and nation. Proponents argue that copper prices are currently low, and there isn't much of a demand for it, however, in copper's case this seems to be more of a short term anomaly rather than a lengthy trend. I've read studies where the world's demand for copper will outlast its' current mineable reserves in a frighteningly short time period. I am not a fan of the nebulousness of the water treatment period that the EIS proposes at plant closure; however I realize that there will be many unknowns by then including sulfate laws making it difficult to plan for, so I am willing to overlook it and still provide my support for the project. My biggest concern with this project is outside the realm of Environmental impacts. This is a very polarizing proposed project, and short of some unforeseen politics, I believe this project will be permitted. There are good caring people on both sides of the argument. My biggest concern is that the people who are against this project do not trust their government, and do not trust the process, and because of this, they have been forced to resort to "dirty tricks" and "dirty politics" to try and do anything they can to try and stop the project. After the dust clears, I'd like to see the respective government agencies to do what they can to try and rebuild trust in their government by all. This process has worked, and it has made the project environmentally viable. It has turned a draft EIS that the EPA gave a very poor rating to into a viable final EIS that will safeguard the people of the region while aiding the region's economy.	NS	X
10456	Unique	1		GEN	John Walsh		687	1	I think this decision should be put up for a public vote for all Minnesota residents. Let us decide. Like everything else, once it is up and running if they pollute MN waters? We wont shut them down because of the jobs involved we will just fine them for not meeting water Quality standards and the state/residents will have to pay to clean up the mess.	NS	X
29269	Unique			GEN	John Wild		2475	1	To knowingly put hazardous waste that will last for decades and longer in an environmentally sensitive area is foolhardy.	NS	X
398	Unique			GEN	Johnnie Forrest		194	1	The final draft Environmental Impact Statement addressed the environmental and safety concerns necessary to safely treat the water and utilize the LTV mine site.	NS	X
26510	Unique			GEN	Jon Marcaccini		1342	1	It is clear that polymet can be a safe and productive project for northern Minnesota	NS	X
24663	Unique			GEN	Jon Moss		1070	1	I want to voice my strong opposition to any sulfide mining near the Boundary Waters and Voyageurs National Park. The potential for massive environmental disasters is almost certain being that it has never been successfully done and the efforts of monitoring and cleaning up from any disaster would be for over a hundred years for a very short mine-life span. Why would it make any sense to risk one of Minnesota's (and the world's) great environmental sanctuaries for such a small gain. While I'm not a Minnesota resident I do own property on the border waters of Minnesota & Canada and I'm very concerned about the ramifications of any copper sulfide mining.	NS	X
28739	Form Letter	1	Variant	GEN	Jon Ridge		2336	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Please do not allow mining to take place in the Superior National Forest so close to the water resources of the Boundary Waters and St Louis Watersheds. The risks are far too great and the FEIS does not prove that the water will be protected from future contamination. This violates both state and federal water quality standards.	NS	X
28739	Form Letter	1	Variant	GEN	Jon Ridge		2337	2	The Prospecting Draft EIS fails to provide site-specific analysis of drilling impacts. This is a basic requirement for environmental review.	NS	X
28739	Form Letter	1	Variant	GEN	Jon Ridge		2341	6	The Prospecting Drat EIS provides inadequate monitoring and unenforceable conditions. In addition, we wonder why multinational corporations from other countries are allowed to take the valuable resources out of our state and leave the mess for us to clean up. If we are to mine in MN, let the revenue remain here!	NS	X
28739	Form Letter	1	Variant	GEN	Jon Ridge		2342	7	Please do not allow PolyMet to receive a permit for mining in the Superior National Forest.	NS	X
9011	Unique			GEN	Jonah Shaw		620	1	As the DNR completes the Environmental Impact Statement for the Polymet mine and looks towards a future EIS on a proposed mine by Twin Metals, I urge you to do what you can to stop these projects. Risks to both the incredible natural environment of the North Shore and the Boundary Waters far outweigh the potential benefits of these mines. The failure of all prior containment systems for open-pit sulfide mining sets a clear precedent that the toxic byproducts of these mines cannot be safely contained. In addition to threatening the environment, these mines pose threats to the tourism industry that employs 18,000 people and is dependent on the Boundary Waters. Polymet would only employ around 400 people for 20 years. These mines are not the right decision for northern Minnesota.	NS	X
24702	Unique			GEN	Jose de Arteaga		1088	1	Please do not permit mining to destroy the environment of Minnesota. Including Lake Superior, northern lakes and rivers and the Boundary Waters. Tourism is a much greener and more sustainable than mining. There are species on the endangered species list that will be further threatened like wolves and moose.	NS	X
27807	Unique			GEN	Joseph Butler		2147	2	Environmental Impact. As an engineer who has worked on the mines and worked on pre planning for this project, I have seen the effort and care of planning that has gone into this project. I have also reviewed the FEIS and it is my opinion that the project owner and design team has a plan in place that will properly protect our environment. Risks have been properly identified and mitigated. Environmental safegaurds are planned and are more than adequate.	NS	X
27807	Unique			GEN	Joseph Butler		2148	3	Future of N. Minnesota Mining. The project and new mine will diversify the mining industry, leading to a more stable economic environment in Minnesota. The global economy causes steel prices to be boom or bust, thus the economy in northern MN tends to be cyclical. Diversifying mining in Minnesota will help create stability, which will create confidence for other industries to grow in the area, growing and stabilizing the economy even further.	NS	X
7482	Unique			GEN	Joseph Heegaard		547	1	After reviewing the EIS for the proposed Polymet mine, I believe it is inadequate and that the project should be refused.	NS	X
7482	Unique			GEN	Joseph Heegaard		550	4	The bottom line is that we have devastated our environment enough. As we begin to feel the effects of climate change and see the implications of land exploitation, we must put a stop to reckless profit seeking projects and start building our economy sustainably. Let's leave a little piece of the natural world for our children, and cherish it while we have it. We cannot survive without clean water, and this project threatens that at a time when water scarcity has never been more prevalent. Please, make the responsible decision and refuse this mining project.	NS	X
29083	Unique			GEN	Josh Gregorich		2413	1	I am pleading with you for the sake of our children's, children's children and Minnesota to stop Polymet!	NS	X
29984	Unique			GEN	Josh Gregorich		2755	1	I am writing this letter to you today, to request you to oppose and stop the Polymet/Northmet project proposed on the Iron Range of NE Minnesota.	NS	X
29984	Unique			GEN	Josh Gregorich		2756	2	I am pleading with you for the sake of our children's, children's children and Minnesota to stop Polymet!	NS	X
29984	Unique			GEN	Josh Gregorich		2757	3	I've spent a significant amount of time reviewing the SDEIS, FEIS for the Polymet/Northmet project, along with existing or previous open pit copper/sulfide mining operations throughout the Western and Southwestern United States. For a prime example of the downfalls associated with open pit copper mining in the United States, please lookup Berkeley Pit in Butte, Montana. Nearly every open pit copper/sulfide mining project has had some breach or acid mine drainage during or post mining activities.	NS	X
29984	Unique			GEN	Josh Gregorich		2759	5	My background is Mechanical Engineering and too often the financial gain for a few, outweighs the greater good for many. Engineers have said that Polymet can handle this project with minimal risk because many engineering controls will be put in place (i.e. geomembrane, water treatment, etc....) to protect the ecosystem. Engineering controls fail throughout our world continuously.	NS	X
516	Unique			GEN	Joshua Bernstein		223	1	I am writing to express deep opposition to the proposed PolyMet mine.	NS	X
516	Unique			GEN	Joshua Bernstein		228	5	The Environmental Impact Statement, which ostensibly addresses these concerns, reflects unsubstantiated claims and dubious science at best. At worst, it represents the corruption of science and environmental review by overzealous investors.	NS	X

4549	Unique			GEN	Judith Chervený		399	1	I want to register my objection to permitting copper-nickel mining in northern Minnesota. I have followed the progress of this matter for many months, and I cannot imagine for one minute that anyone would do anything that would in any way would harm the water quality in northern Minnesota. All it takes is a quick read of the newspaper or an hour of television news to be made aware of the value of clean water on our planet. We have an abundance of it where we live, and I think we take it for granted at times.	NS	X
27696	Unique			GEN	Judith Derauf		2093	1	I am writing to comment on the EIS submitted by Polymet for the sulfide ore mining project they are proposing to locate adjacent to the Superior National Forest and near the Boundary Waters Canoe Area Wilderness in northern Minnesota. To think that Polymet or any other corporation can or will stand by their claim to contain the potential water pollution from this kind of mining operation for centuries into the future is ludicrous. Open pit sulfide ore mining does not belong in an environmentally sensitive, water rich area such as the Superior National Forest and Lake Superior Basin.	NS	X
15220	Form Letter	1	Variant	GEN	Judith Isaacson		808	1	There is no human action without an unforeseen disaster lurking.... Protect our environment, we do not need these mines.	NS	X
5976	Form Letter	1	Variant	GEN	Judy Kelloway		441	1	I was raised in Northern MN and now live in Minneapolis. However, I have a summer home in Northern MN, which is very close to PolyMet. From my opinion the amount of jobs/money that come in for this mine will be equal to the loss of tourism and money that people like me that like to support the area with tourism and buying and buidling summer homes if the area. If this goes through, I will move to Wisconsin that has STRICTER regulations on perserving the wilderness.	NS	X
26188	Unique			GEN	Judy Schiller		1281	1	My husband, my relatives, my neighbors, and myself are all against the Poly Met mine operation . While we understand the need for jobs in the Range area, we who live in Northern MN have had the same struggles, but still have found work so we can remain in the Minnesota's most beautiful region.	NS	X
24472	Form Letter	1	Variant	GEN	Julie Backer		1038	1	This is crazy. To heap inside our beautiful state and our natural resources for a few hundred jobs. No way!!!!!!	NS	X
30354	Form Letter	1	Variant	GEN	Julie Pavelich		2855	1	I also live in Ely and do not want this!!	NS	X
26809	Unique			GEN	Julie Young-Garayt		1469	1	I am very opposed to this mining proposition. Over and over we hear about the failed promises and environmental degradation from the mining industries. Can't we learn from the oil spills, the derailed trains, the blonde mountain tops, the nuclear waste problem that these promises often go awry. The boundary waters region is such a beautiful and sensitive area that we should be extra cautious here.	NS	X
467	Unique			GEN	K Tharaldson		222	2	I am not in support or agreement of this environmental impact study. You did not look deeply enough or have the unbiased review you claim to have had. Please reconsider before seeming to approve something that will pollute into perpetuity and harm the environment that you are charged with protecting.	NS	X
26225	Unique			GEN	Kaitlin Seiberlich		1284	1	I do not support the decision to allow PolyMet to construct a copper-nickel sulfide mine in Northern Minnesota for several reasons. However, those reasons are not the reason I am writing. Instead, I have been asked to address the problems in the Final Environmental Impact Statement (hereafter referred to as the FEIS) in relation to the prior draft.	NS	X
27736	Form Letter	1	Variant	GEN	Karen Eckman		2127	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
30097	Form Letter	1	Variant	GEN	Karen Graham		2813	4	I oppose the PolyMet NorthMet copper-nickel sulfide mine. The environmental safety of this mine is based on the assessment by the requesting corporation. Do you advise your family, children or friends to buy based on the used car sellers report? Famous last words, "trust me -- it's safe."	NS	X
30097	Form Letter	1	Variant	GEN	Karen Graham		2814	5	In return, we are promised: - 20 years of jobs mostly during the construction period - 500+ years of water filtration to prevent the worst of the pollution to enter our waterways. Over 2x longer than the US has been a country. Just think you're basing decisions on maintaining a vital system for twice the span of our nation's existence. I ask you to step back and reconsider your decision making process. Glencore Corporation formed in 2013 through a merger with Xstrata founded in 1926 in Switzerland. As of Oct 2015, the CEO Ivan Glasenberg is trying to calm investors from fleeing due to the company's high debt load. Such confidence building for this venture. Their primary interest commodity trading, secondarily mining.	NS	X
30097	Form Letter	1	Variant	GEN	Karen Graham		2816	7	We are exchanging our health, our safety, our precious water, our forests and marshes for 20 years of mining operation. This report and it's recommendations continue the deep denial about the critical conditions of our lakes and the responsibility our officials and citizens share in their demise. Out of 30,000 comments, 98% are against the mine.	NS	X
30109	Form Letter	9	Variant	GEN	Karen Graham		2824	1	The environmental safety of this mine is based on the assessment by the requesting corporation. Do you advise your family, children or friends to buy based on the used car sellers report? Famous last words, "trust me -- it's safe."	NS	X
30109	Form Letter	9	Variant	GEN	Karen Graham		2825	2	In return, we are promised: - 20 years of jobs mostly during the construction period - 500+ years of water filtration to prevent the worst of the pollution to enter our waterways. Over 2x longer than the US has been a country. Just think you're basing decisions on maintaining a vital system for twice the span of our nation's existence. I ask you to step back and reconsider your decision making process.	NS	X
30109	Form Letter	9	Variant	GEN	Karen Graham		2827	4	The conclusions issued by numerous independent scientific agencies find the PolyMet environmental evaluations inadequate and unsubstantiated on many points listed below. These agencies focus on evaluating environmental impact. The safety to our environment and the long term impact is based on project on faulty information. With the caveat of promises to maintain a vital filtration system for 500 years and we'll put money aside.	NS	X
30109	Form Letter	9	Variant	GEN	Karen Graham		2829	6	This report and it's recommendations continue the deep denial about the critical conditions of our lakes and the responsibility our officials and citizens share in their demise. Out of 30,000 comments, 98% are against the mine.	NS	X
25971	Unique			GEN	Karen Holden		1252	1	We must protect our environment, including our large fresh water reserves, from pollution from any kind of mining in the future. It's bad enough that the Iron Range is pock-marked with huge holes left from taconite and iron ore processing; we don't need to compound the problem further. Please do NOT allow any other kind of mining within the boundaries of this states.	NS	X
29982	Unique			GEN	Karen Katz		4305	1	Choosing whether or not to permit this mine is the pivotal decision of the environment in northern Minnesota. If it is allowed to go through, I fear that it will be the opening of floodgates for more mining companies to step in and set up shop, ravaging the forests and lakes more and more. Usually, I take great pride in the decisions my state makes surrounding natural resources. I am especially reminded of how our state voters voted for the Legacy Amendment in 2008, when voters willingly allocated a tax increase to support environmental and cultural resources. The PolyMet mine does not reflect the values of Minnesotans and a decision in favor of the mine would jeopardize those values and the natural resources we have worked so hard to preserve. The BWCAW and the Superior National Forest are invaluable resources to people locally, statewide, nationwide, and even worldwide. The BWCAW receives more than 250,000 visitors annually, generating income and offering opportunity for thousands of people to experience the wilderness. This recreation opportunity is critical to children growing up in a world far different than the world that PolyMet owners and current DNR, Forest Service, Army Corps of Engineers, the EPA, and Minnesota State Government lead decision-makers grew up in. Access to nature is becoming harder to find and children are growing more and more disconnected from the earth. Recreation in the Boundary Waters, the forests of Northern Minnesota and on Lake Superior, is an essential opportunity to preserve for future generations, and I think the PolyMet mine puts this resource in jeopardy. I am skeptical that the opening of the mine will create sustainable jobs. Mines are boom and bust operations – once the minerals are out of the ground, the operation is over, and only those lucky folks in superior positions get to keep on. I expect the un- or under- employed people looking for work on the Iron Range will be without a job in twenty years. Twenty years isn't even long enough to see a child through college, let alone be stable employment for future generations. So how can this mine be smart development for our economy? I think we would be better off initiating clean energy industries in the same location and training these individuals to learn those skills, instead of training them to learn the new skills needed to work on a sulfide mine. I do not think the Final EIS sufficiently addresses the security and sustainability of PolyMet jobs for Minnesota.	NS	X
26679	Form Letter	1	Variant	GEN	Karen Kormann		1436	1	In addition to the objections made by many individuals and organizations on the obvious flaws in the EIS, I am greatly disappointed that state officials have allowed a mining nightmare bedazzle the public for this long.	NS	X
26679	Form Letter	1	Variant	GEN	Karen Kormann		1437	2	It's been made clear, most recently by the Paris talks, that mining of any kind is a thing of the past. In particular, the mine proposed by Polymet, and supported by a very few interesed parties is not invested in the future health of people or the area.	NS	X
25682	Unique			GEN	Kari Miller		1211	1	I'm concerned about the impact that PolyMet's proposed sulfide mine would have on Minnesota's water. I think PolyMet would do more harm than good. Pollution from PolyMet threatens our clean water legacy and would pollute water for hundreds of years after the mine has closed. I do not support this mine.	NS	X
6321	Unique			GEN	karlene plante Jim Etzel		477	1	It doesn't matter who looks at this project or what is said to try and persuade the public that this is a good idea,IT IS NOT!! Humans do not learn from their mistakes. This will cause major damage to the region. We set aside the Boundary Waters Canoe area to preserve nature and allow people to enjoy a specific experience. Iron ore mining is bad enough. Allowing sulfide mines in the region will be the biggest mistake made by Minnesotans. Please turn this project down and have them mine these products from the dumps that we have created throughout this country. We throw so much useable material away in the name of money. Do something right for once. Deny this project.	NS	X
10237	Unique			GEN	Kate Dougherty		677	1	I was stunned with the lack of honesty, and objectivity exhibited from the MN DNR regarding the PolyMet FEIS. I would expect this from the southern states and many states in the west, but from my DNR who has the responsibility of protecting MN residents and their property, quality of life along with our wildlife, it was an appalling rejection of everything northern Minnesotans hold dear, our clean water and our lifestyle along the shores of these waters and wetlands.	NS	X
10237	Unique			GEN	Kate Dougherty		678	2	These mines would be located in my backyard and drain into my drinking water. The Polymet-FEIS is not acceptable.	NS	X

24675	Unique			GEN	Kate Savage		1073	1	Say no to PolyMet	NS	X
30367	Form Letter	1	Variant	GEN	Kathleen A Brandt		2857	1	Preserve the Boundary Waters! Say no to mining!!	NS	X
1701	Form Letter	1	Variant	GEN	kathleen kelnberger		283	1	With water being the resource touted as more powerful and pervasive to life on earth than oil, I am amazed that it is given so little regard in this proposal. THERE HAS NEVER BEEN A CLEAN COPPER SULFIDE MINE. Why is our DNR, the state government, and our elected officials in a state of denial especially in THIS STATE, which prides our clean and plentiful lakes.	NS	X
29514	Unique			GEN	Kathleen Miller		2536	1	The proposed mining project has numerous flaws. 1. Location: this project is proposed in NE Minnesota where, up until now, we have the best water quality in the state. The water quality in this region needs to be preserved as a safeguard for a better future for its residents.	NS	X
1	Unique			GEN	Kathleen Whitson		1	1	PLEASE do NOT approve the mining. It will profit the owners who do not even live here but can do much damage to our waters and land and air. We are the state noted for our lakes, why would anyone take any chances of harming it. Wisconsin was smart enough to vote NO, why would MN. even consider this. IT IS NOT WORTH IT TO OUR MINNESOTA OR OUR FAMILIES. GOD BLESS YOU AND OUR PEOPLE.	NS	X
24483	Unique			GEN	Kathy Alvig		1040	1	I was born and raised in Duluth/Carlton county. I know quite well how connected to the land the rural area people are. After watching their struggles with making a living there all my life, I keep thinking of the large ulcer like looking iron ore mines up there, and, I think of all the arsenic accidents and poisons that have leaked out of mines over the years. I don't care what the company promises, they want copper, gold, platinum or whatever they find to make their profit. And after they are done, they take off, and leave unemployed people who then have to figure out how to make a living anyway. I say no to Polymet and yes to Minnesota s beauty. We do not leave our beautiful state to our children, we borrow it from our children.	NS	X
29865	Unique			GEN	Kathy Glover		2675	1	There are so few places left that don't have the mark of human greediness and shortsightedness. Please, please stop the Polymet plan. Take a stand to protect the priceless resources in the North country. You know, and I know, mistakes will happen. Accidents will happen. And the fallout will be devastating. Let us do the right thing... leave the the land be. Humans are so shortsighted. Stop this plan now!!	NS	X
18	Unique			GEN	Kathy Kietz		54	1	I am writing to state my opposition to this mining project as it presents too much danger to the sustainability of our environment.	NS	X
10919	Unique			GEN	kathyck@centurytel.net		733	1	The Final EIS for PolyMet's proposed mine concludes a review of the project's potential environmental effects. After 10 years of study, I DO NOT believe that the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and correctly found that the NorthMet Mine can comply with strict state and federal environmental standards. It is a shame that the supporters of the project are more concerned with their jobs than what this project would potentially do to the environment for generations. There is no proof that pollution can be avoided from this project. Other similar projects have created environmental disasters that can not be corrected. No amount of financial gain is worth this risk, which is only a short term gain for the region in the jobs it would create. We need to address the environmental issues with this project to the point that it is guaranteed by the company, that NO POLLUTION will occur. It is not possible for this company to do at this point. They assure us that polluting the environment "probably" won't occur, and, if it does, they'll just clean it up. I don't believe this is a good plan going forward, since clean-up at other sites can't be accomplished, and polluted areas will remain, affecting generations to come. SAY NO TO POLYMET!	NS	X
25274	Unique			GEN	Katie Jensen, Svetta, Mollie and Erik Palmer		1149	1	Hello, I personally oppose the mining operations. A few hundred jobs aren't enough to risk some of the only natural places we still have left.	NS	X
32	Unique			GEN	KatieWilli@aol.com		93	1	I am opposed to the PolyMet Mine proposal.	NS	X
26531	Unique			GEN	Kelley Haldeman		1347	1	My heart deflates when I think of the ugly responsibility and burden we bestow on future Minnesotans if we approve this mine.	NS	X
26572	Unique			GEN	Kelley Haldeman		1357	1	PLEASE DO NOT permit PolyMet to build its copper-nickel mine in the Superior National Forest.	NS	X
1084	Form Letter	1	Variant	GEN	kelly hemsath		272	4	The environmental study is also laughable, using phrases like "not likely" to cause the destruction of the area, and "probably" safe.	NS	X
1084	Form Letter	1	Variant	GEN	kelly hemsath		273	5	The RISKS FAR OUTWEIGH any gain the state of MN would benefit from, and what are the details of the 10 billion they say will be the benefit to MN? Their lack of details alone is an embarrassment that the DNR is even considering this	NS	X
1218	Form Letter	1	Variant	GEN	Kelly Munson		278	1	Wilderness is something that is under assault every day. Because we can't commoditize it, it shrinks in value in people's minds. Minerals are very important to human development but Wilderness is more important. Mining is temporary, nature is forever.	NS	X
24847	Unique			GEN	Ken Evenstad		1122	1	I THINK THE ENVIRONMENTAL IMPACT STATEMENT –IS ADEQUATE	NS	X
27142	Unique			GEN	Ken Gilbertson		1666	1	I'm writing to present my opposition to the NorthMet mining project. Although the EIS/DNR Commissioner says it is a "reasonably" safe project, this is an inadequate assumption/decision based on the severe consequences should any aspect of this mine fail (especially within a "500 year time span").	NS	X
29193	Unique			GEN	Kevin Heaslip		2438	1	This paper is an attempt to comment on the proposed copper-nickel strip mine and accompanying land exchange in Northern Minnesota. The task of reading 3500 pages and then annotating this tome may result in an incomplete analysis. I need additional time to study the FEIS. Such an important issue cannot be rushed; if public comment is truly desired, then more time is necessary.	NS	X
19715	Form Letter	1	Variant	GEN	Kevin Klucas		836	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. But go ahead and support it because, after all: - there is probably no risk to the BWCA, - there is probably no risk to any of the surrounding watersheds, - there is probably no chance that any mining related noise will disrupt the treasured silence of the North, - and there is probably no chance that any private parties or corporation will gain substantial profit at the expense of local, national, and international citizens. These things are PROBABLY ALL TRUE, just as: - it is probably true that there is no global warming, - and it is probably true that man never landed on the moon. Just to be clear, I say again, I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. Last summer took my wife, 3 daughters, 2 grandkids, and my son-in-law (from Uganda) to the BWCA. It was their first visit to this gem of Minnesota. All of them were totally surprised at the unique experience. And this is after family camping trips to Utah, North Carolina, and Alaska. The son-in-law, after spending 3 hours sitting alone on a rock, said that the solitude was the best experience ever. He complained only about someone's constant attempt to start an engine thus disturbing the total silence. It wasn't an engine. It was a grouse! This January I turn 65. I am appalled at what we have done to our planet in those 65 years and few seem to care and most choose to ignore it. We in Minnesota now have chance to pay attention and care. Construction of this mining project cannot be reversed and any damage cannot be repaired. Don't let this project go forward.	NS	X
379	Unique			GEN	Kevin Kramer		186	5	They said that drilling in the Gulf of Mexico was safe. They said all of the environmental protections were in place in the Gulf of Mexico. We all know how that turned out. For the good of all, I beg you to stop this Polymet mining project before it is too late!	NS	X
30066	Unique			GEN	Kevin Viken		2788	1	I am writing because I have concerns regarding the FEIS for the Polymet hard rock mine (copper-nickel). It is clear to me the FEIS does not address all of my concerns with this project.	NS	X
6806	Form Letter	3	Variant	GEN	kim Saari		508	1	And for the record, I have been blocked from posting on Mining Truth and cannot comment any longer.	NS	X
6807	Form Letter	3	Variant	GEN	kim Saari		509	1	I support Polymet and added a bit to the beginning of the comment line stating my opinion and support for Polymet as well.	NS	X
3675	Form Letter	1	Variant	GEN	Kim Young		373	1	I object to PolyMet for all the reasons above, and I live in northern Minnesota. We already have problems from mining here in the north. Mesothelioma is a huge problem from mining, although everyone thinks of taconite mining as safe. Spills are basically a given although know one really wants to believe it will happen. How can we play with the most precious resource we have-water??? For a few hundred jobs for a number of finite years? People of the north deserve jobs that will last. I believe that this FEIS has been tainted by biased people, people that want to give people jobs for the wrong reasons. Science should be taken into more consideration than politics. Science is what matters and is reliable. Water models should be done by an independent company to check Barr Engineerings results. Please be considerate of science, not just what people want to happen.	NS	X
27616	Unique			GEN	Kobilka Bradley		1783	1	They are concerned about the longterm cost of clean up after Polymet leaves, the species that live in and around the BWCA including the fish and wild rice, potential for pollution.	NS	X
22946	Form Letter	1	Variant	GEN	Krehl Stringer		886	1	Minnesota Environmental Partnership's assessment that this proposal fails to evaluate pollution risks adequately, fails to analyze health risks to local communities, and offers no viable alternatives for safeguarding the environment.	NS	X
425	Unique			GEN	Krishna Woerheide		198	1	Sulfide mining has never, in the history of mining, been done safely.	NS	X
425	Unique			GEN	Krishna Woerheide		201	4	There are a number of water quality professionals, chemists, hydrologists and ecologists outside of the mining industry whose advice and expertise should be sought.	NS	X
29794	Unique			GEN	Kristine Vesley		2616	1	Along with so many others, I have studied the issues and now whole-heartedly oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. In fact, it sickens me that the project has come as far as it has, because the momentum generated and the money invested always seems to favor "moving forward." But please, Governor Dayton and other decision makers within the Department of Natural Resources and other governmental agencies, do not just go with the flow on this. Instead, consider the much more precious flow of our northern Minnesota waters. There are times and places where "risk analysis" is not enough, because our relatively pristine environment is not worth ANY risk for these products at this point in time. I feel that the assumptions in the proposal are inadequate and frankly, wishful thinking. Let's get real about the potential for horrible consequences of this mine. I beg you: Please do not sell out our state's environment and future generations for a few jobs. Be leaders. Be examples for other states.	NS	X
29279	Unique			GEN	Kristofer D. Whelan		2487	1	Our shortsightedness and greed will be our undoing. That which lies above ground is far more valuable to our state than that which lies underneath.	NS	X

NorthMet FEIS Comment Matrix											
Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
2141	Unique			GEN	Kristopher Olson		308	1	Please, please, please, Do not let the true birthright of ALL Minnesotans be literally poisoned and polluted by the lure of money, the amount of which that in the future will be likened to "beads & trinkets" compared to what will have been lost. The number of jobs gained is only politically significant and while the welfare of individuals is certainly affected, there is a greater good that needs to be obeyed. Small towns that exist only because of the business of extracting resources from the earth, have no real or legitimate expectation of that work in perpetuity. These unfortunate peoples lives are being used by the corporate interests that are driving the quite literal desire to rape our land.	NS	X
22434	Unique			GEN	Kwilas Tony	Minnesota Chamber of Commerce	2928	1	The Minnesota Chamber of Commerce wants to thank you for allowing us to comment on the adequacy of Final Environmental Impact Statement (FEIS) of PolyMet's proposed NorthMet mine. The Minnesota Chamber of Commerce is the state's largest business advocacy organization representing 2,300 companies of all sizes and types across Minnesota and a half million employees. The Department of Natural Resources (DNR), the U.S. Army Corps of Engineers and the U. S. Forest Service put forth an exceptional amount of dedication and due diligence in reviewing and analyzing the FEIS. The review and analysis was accomplished in a thoughtful, deliberate and thorough process involving many stakeholders, including members of the public, the business community and state, local and federal governmental units. The FEIS analyzed the required topics identified in the original scoping documents, as well as other topics that were identified in both the public comment period and environmental review process. Water quality, water quantity and potential human health effects of the proposed project were all identified and analyzed in the FEIS. Particular attention was paid to the human health impacts of the project. The addition of the new section that concisely analyzed the human health impacts and addressed concerns raised by the Department of Health and others during the public comment period are a positive contribution to the report. Water quality modeling and monitoring information at the mine and plant sites that also included mitigation and analysis of the potential for northward flow of groundwater are also supplements to the FEIS that addressed many concerns in the comment process. The final analysis shows that all of the concerns regarding these topics and others were more than adequately addressed in modeling and analytical discussions.	NS	X
22434	Unique			GEN	Kwilas Tony	Minnesota Chamber of Commerce	2931	4	Thank you for allowing the Minnesota Chamber of Commerce to comment on the FEIS of this vital economic development project for Minnesota. We are encouraged by the thorough and deliberate process used by the co-lead agencies.	NS	X
29850	Form Letter	1	Variant	GEN	Kyle Lind		2668	1	Poly Met North Met as currently Drafted is Bad for Minnesota, bad for Iron Rangers, and should not be allowed to proceed as currently proposed.	NS	X
29850	Form Letter	1	Variant	GEN	Kyle Lind		2669	2	We moved here to be surrounded by clean water full of fish. We moved here for the abundant wild rice beds, for the unique wild life that is absent from most of the continental United States , and for the clean air. We are proud to call North East Minnesota home. It is one of the most unique and economically valuable ecological regions in the entire United States of America. The Boundary Waters Canoe Area Wilderness (BWCAW) is the most visited Wilderness (by tens of thousands) anywhere in the entire Nation. The St Louis River is the largest tributary to our Nations greatest Lake, Lake Superior. As Minnesotans, we are so privileged to have these amazing jewels right out our back door! With great privilege comes great responsibility. As Minnesotan's we hold all the power to protect these invaluable resources upon which all Americans depend.	NS	X
29850	Form Letter	1	Variant	GEN	Kyle Lind		2674	7	It is clear to me as a clear headed Minnesotan that the Poly Met North Met mine as currently drafted is a raw deal for Minnesotan's and the US at large, for all the reasons, and more, stated above by me, and below by Mining Truth Officials. It is our duty as citizens of this great Nation and the State of Minnesota to do everything in our power to get this mine right or to not do it at all. Poly Met chose from the very beginning to not make this an environmentally responsible project by proposing an open pit mine rather than an underground mine.	NS	X
29850	Form Letter	1	Variant	GEN	Kyle Lind		2678	9	IF IRON RANGE WORKERS AND THEIR OFFICIALS, DNR COMMISSIONERS, AND NATIONAL FOREST REPRESENTATIVES WANT TO SEE A VIBRANT COPPER NICKEL MINING FUTURE IN MINNESOTA THEY MUST NOT ALLOW THIS FEIS TO PASS AS ADEQUATE. If the Poly Met North Met project proceeds as currently drafted it will be an environmental and economic disaster that will forever tarnish the copper nickel industries name and the people who supported it. Minnesotan's despite their overwhelming support for a clean environment, and many fears over this new kind of mining on the range, seem very hesitant to oppose this mine, because they understand how badly the range needs jobs, good paying jobs, and they want to trust the people appointed to protect our health, economy, and environment. However, I assure you that if this mining project is allowed to take place as it is currently drafted it will soon become clear to all Minnesotan's that Poly Met's promises to protect the environment, public health, and boost our economy are lies, and that the predictions of the lead agencies FEIS are completely and utterly wrong.	NS	X
25310	Unique			GEN	Kyle Nelson		1151	1	It's a crying shame this project has been held back this long from special interests and now prolonging it further once again is pathetic. Yes the Dnr has followed all the rules along with the state and all other entities tied to this project. The EIS has been followed and them some. No better place for it to happen and follow the rules. Bottom line.... Get this thing passed so the company does not have to pay any more than it already has. Kyle Nelson..... A born and raised Northerner whose family established Lutsen Resort in 1885. Pass this project Please!!!	NS	X
3415	Form Letter	1	Variant	GEN	Lake Superior Art Glass		378	1	We are a growing group of 56 small businesses, representing a cross-section of industries, including technology, manufacturing, service, entertainment and the trades. We employ nearly 1000 people in the North and we are continuing to succeed and invest, adding jobs and dollars to our economy. Our businesses depend on the health of our watershed. WE ARE PRO RESPONSIBLE MINING AND PRO JOBS We support and benefit from ferrous mining, which has built the economy and culture of the North. We rely on mined products in our businesses. As primarily owner-operators, we are pro worker and pro quality of life, and we have and will continue to rely on union labor as we expand. We are vitally connected to the entire regional economy, and its success is our success. COPPER-NICKEL MINING POSES A SIGNIFICANT NEW THREAT TO OUR WATERSHED But we are also part of a regional ecology, which is why we are concerned about copper-nickel mining. The proposed PolyMet NorthMet copper-nickel mine, and others like it, are vastly different from ferrous mining, and have the potential to spread toxic metals throughout our watershed. In copper-nickel mining, water that passes through the site leaches toxic metals, including mercury, from the metallic sulfide ore. According to the NorthMet Environmental Impact Study (EIS), this pollution will continue for a "minimum of 200 years at the Mine Site and a minimum of 500 years at the Plant Site," requiring treatment "indefinitely". 1.2 Flow path maps in the EIS show that the plume of contamination will reach the Partridge and Embarrass Rivers, which flow to the St. Louis River and ultimately Lake Superior.3 This mine does not just threaten a water source; it threatens one of the world's greatest freshwater resources. Lake Superior contains 10% of the world's freshwater. We trust that PolyMet intends to meet all applicable regulations, but our concerns are based on the track record of similar projects. We welcome them to show us one metallic sulfide mine of this type that has operated for 10 years and been closed for 10 years without exceeding government pollution standards. Indeed, under Wisconsin's 'Prove It First' law, no such example has yet been identified. Like the rest of the resources we rely on, we want mining to continue to become more technologically advanced and more environmentally friendly. But until the technology is proven, we simply don't believe the Land of 10,000 Lakes is the place for a test case. WE'RE STILL CLEANING UP FROM THE UNSUSTAINABLE PRACTICES OF THE PAST The St. Louis River, after decades and more than \$100 million dollars spent on cleanup from the unsustainable practices of the past, is finally becoming a safe place to live, work and play again. Up to an estimated \$240 million will likely be spent over the next 5 years to continue the cleanup and restoration. We owe it to future generations to finish the cleanup, not to put our water at risk again. THE RISK TO OUR REGIONAL ECONOMY OUTWEIGHS THE BENEFIT The value of jobs now is real, in any number. We all rely on mined products. And yes, copper mining has to happen somewhere. However, we believe this type of mine, in one of the world's great freshwater resources, is too great a risk. We know some people will take issue with us getting involved in what is perceived to be a political issue. Indeed, a recent article in the newspaper - without a clear explanation of our position - was enough to cause some of our customers to boycott our products. This is an economic issue resulting from an environmental issue. We believe the risk to the environment poses a long-term threat to the regional economy that far outweighs the shortterm benefits. OUR REQUEST: INVEST THE MONEY THE STATE WOULD SPEND ON POLYMET IN SUSTAINABLE LOCAL BUSINESS DEVELOPMENT INSTEAD There is an alternative to the boom and bust extraction economy that benefits foreign corporations and leaves local communities worse off in the end. Our locally owned small businesses are proof positive that a more sustainable model is possible. We, and other locally owned businesses, will continue to reinvest the wealth we create into new jobs over the next 20 years. And there's another important resource on the table the money the state will spend on environmental review, permitting and regulation of Polymet. We call on Governor Dayton to reject the Polymet proposal, and instead invest that state money in sustainable local small business development on the Range. This investment has the potential to make a larger and longer-term impact than the proposed copper-nickel mining project. WE WILL CONTRIBUTE TO JOB GROWTH AND LESSEN OUR DEMAND FOR MINERALS We will do our part to contribute to job growth in the North, and we will reach out to existing Range businesses to partner with them wherever possible. We will also continue our efforts to lessen our demand for minerals by using resources more efficiently. WE WELCOME CONTINUED CONVERSATION We know our voice is only one of many, but we feel it is necessary to say that this is more complicated than jobs vs. the environment. Both are important, and they are linked, and we hope to engage in an amicable debate about responsible mining and building a more sustainable economy in the North for generations to come. We invite other businesses across the region to reach out to us and become part of the Coalition. Sign up at DownstreamBusinessCoalition@gmail.com. And we thank the customers & suppliers that stick by us.	NS	X
12374	Unique			GEN	Langton Todd		757	1	While I understand the need for jobs in Northern Minnesota I do not believe this is the correct course to take to provide employment. First this mine only creates 200 jobs for 20 years. If the waste “pond” fails, as it did in Canada, 100 square miles around this mine will be a wasteland. How many people who rely on tourism will no longer have a viable income when this wastewater destroys the area. Polymet assured Canadian officials that the dam that failed would last 500 years also. You and I both know this is impossible. A pit with a poly liner is not going to last 500 years. Second, several mines in Northern Minnesota have recently closed. Metals including iron, copper, nickel, zinc, gold, silver, etc. are all at historic lows. I recently read a op-ed piece in the Star Tribune that concluded that this mine is not financially feasible. This study was well done and was completed by several financial analyst with very reputable reputations. I believe that Polymet will lose money from the onset and when this happens they will belly up to the taxpayer trough and Minnesota taxpayers will be bailing them out. We just got taken for \$66 million by another Northern Minnesota mine (I realize that was a taconite mine but ALL metals are at historic lows) and do we really want to bail out another one? Polymet has an abysmal record of leaving open pit mining areas environmental disasters after they leave. I also believe that Polymet's only goal with this mine is to set a precedent so that they can take whatever they want in the future. I also believe it is immoral the way they have contributed money to the political campaigns of our elected officials to sway their vote to push this permit through. When you approve this please keep in mind that when this waste pond fails and destroys thousands of acres of pristine forest you are ultimately to blame. If you have any conscience at all this will haunt you for the rest of your life (maybe longer ?). We taxpayers will definitely remember who destroyed our beloved forest.	NS	X
25818	Unique			GEN	Lanny Olson		1228	1	Minneapolis I am totally opposed to the mine because of its threat to the environment in northern Minnesota	NS	X

6184	Unique			GEN	Larry D. Popovich		453	1	I would like to comment on the Polymet FEIS and state that I am fully in favor of the project and think that the FEIS is more than adequate to allow the project to be permitted and go into production. The agencies are to be commended for all of the hard work and studies that have gone into this. Please accept my thanks for all of the effort and let's get this much needed project going on the Eastern Iron Range, so it can benefit the state and the nation. I live in the area and my place of work is next to the plant site. We have worked with Polymet and are eager to get going.	NS	X
16	Unique			GEN	Larry Ekegren		48	1	What in the world are you doing wasting our tax dollars, mailing out sets of 4 CDs to some one who has no decision-making power and little interest in the environmental review process. I will return them to you to use again or recycle. Please remove me from your Mailing list, which I have no idea how I got on in the first place.	NS	X
16	Unique			GEN	Larry Ekegren		49	2	Incidentally, I am quite opposed to the proposed PolyMet mine.	NS	X
11044	Form Letter	1	Variant	GEN	Larry Ronning		751	1	This mining project is positioned at the headwaters of the greatest human resource in our entire solar system, the fresh water of the great lakes. The world must have a say in any decision to taint it!	NS	X
11044	Form Letter	1	Variant	GEN	Larry Ronning		752	2	Isn't it ironic that the steel industry is tanking and asking for handouts from the government, this mine proposal will be the first to close when price is at a low point. The cycle continues,so, why not put the couple hundred million dollars Mn will spend cleaning up the waste into a diverse economy first.	NS	X
19631	Form Letter	9	Variant	GEN	Laura Beitzel		835	1	The BWCA is a very important wilderness area that provides habitat for many animals as well as a spectacular place to get away to. I remember trips to the BWCA as a kid and how important the experience of being outside in the wilderness was to me. There is no reason to jeopardize the beauty and health of such an important piece of land by allowing polymer to mine, we KNOW this will cause damage to a pristine wilderness area. How many places to we have to destroy before we learn from our mistakes. Let's keep the BWCA beautiful for ourselves, the wildlife, and our children.	NS	X
28983	Form Letter	1	Variant	GEN	Laura Morton		2381	1	We need to move beyond destructive industries that treat the earth's resources as commodities to be exploited and that leave poison, illness and devastation in their wake.	NS	X
93	Form Letter	1	Variant	GEN	Lawrence Clemens		150	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. Environmentally precarious - economically very tenuous What's to like?	NS	X
20405	Unique			GEN	Lawrence Suchy		840	1	The history of sulfide mining, and pollution that remains after the mine shuts down has been dismal. This report does nothing to reduce my fears. Count me as one who does not want to see this type of mining in northeastern Minnesota. Not for myself, but for future generations. Living north of Ely half of every year we can see how divisive this issue is.	NS	X
29518	Unique			GEN	Lawrence Suchy.		2546	1	Please do not let this project go forward. The long term risks, verses the short term gains are too great.	NS	X
27689	Unique			GEN	Lea Foushee	North American Water Office	3204	8	Poisons more than 21,000 acres, which is not in the best interests of the State of Minnesota, the Minnesota people, all future generation.	NS	X
2539	Form Letter	1	Variant	GEN	Leah Nelson		334	5	I believe that allowing this project to happen would be a mistake.	NS	X
20725	Form Letter	1	Variant	GEN	Lee Witte		842	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. In addition to the legalities listed below, I oppose the mine proposal because the risks to the peoples of Minnesota's quality of life. Water is our most valuable asset. A failure of the holding pond could pollute the drinking water thousands rely on, it would negatively impact, other industries that provide sustainable jobs for thousands, jobs in tourism, fishing and hunting, outdoor sports, outfitters, bait shops, hunting gear retailers. The mine is a short sighted venture that would benefit a few at the expense of the many.	NS	X
29983	Unique			GEN	Lego Lord		2754	1	How can Minnesota's elected officials and publicly funded agencies, including the MPCA and DNR, even consider allowing foreign corporate interests to pocket the profits derived from extracting Minnesota's natural resources, laughingly heading to their banks while leaving us, and 20-some future generations of Minnesotans, a 500 year (at best) legacy of toxic pollution?? How can anyone, especially any Minnesotan, including our Governor and Senators, even consider allowing any sulfide mining near the BWCA? Can the relatively short-term profits be a fraction of the value of the clean water, air, and land in and near Minnesota's precious Superior National Forest.	NS	X
27235	Form Letter		Variant	GEN	Leif Larsen		1679	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. I feel that the mine creates undue environmental risk in an especially sensitive and valuable area. I also question it's necessity given the current global commodity glut. Are we selling our future for another mine that will whipsaw employees and sit unused?	NS	X
4958	Form Letter	1	Variant	GEN	Lilla Gidlow		421	1	I strongly and pleadingly object to PolyMet building a mine in Northern Minnesota... It is too close to the Boundary Waters Canoe Area Wilderness with a significant risk to polluting the lakes and rivers there. The company can say anything it wants to promise this and that, but those are just empty words. Perhaps they wish their protections and safety will be true, but time tells that it will not be so, and the resulting pollution and damage is proven to happen and be true.	NS	X
40	Unique			GEN	linda kennedy		106	1	I am personally against the irreversible blight on this precious landscape that will be created if this project goes forward. Everyone should be against it.	NS	X
3306	Form Letter	1	Variant	GEN	Linda Rolf		364	1	We don't owe 300 people a job or Polymet a mine. There has never been a safe copper-nickel mine--ever--so why would you trust Polymet, who has never operated this kind of mine, to be the first? Even if there were no Mt. Poly-like natural disaster, the toxic waste water from this mine would still need to be treated for 200 to 500 years. How could you even calculate the cost of the treatment, let a full scale disaster? I wonder what the reviewers of Mt. Poly, Ladysmith and all the other copper-nickel disasters recommended? Can't MN learn from all the other existing copper-nickel disasters?	NS	X
3306	Form Letter	1	Variant	GEN	Linda Rolf		365	2	Freshwater and a clean environment are a million times more valuable to the people of this state than this dirty mine. I don't care how many years you spent studying this mine, anyone with a shred of common sense should know better than to gamble with our pristine wilderness areas and freshwater. I have to ask what the MN DNR and the other government agencies are getting out of this doomed venture? Do the math: 300 jobs for 20 years vs. 500 or more years of toxic cleanup paid for by the MN taxpayers or whatever entity rules this region in the year 2565.By that time, the state of MN may no longer exist and Polymet most likely will cease to exist after they have finished extracting our natural resources and polluting the Boundary Waters, Lake Superior and all the related waterways because that is the modis operendi of mining companies.	NS	X
3306	Form Letter	1	Variant	GEN	Linda Rolf		366	3	The fact that you did not have a single objection to Polymet's plan is a huge red flag. Hopefully, you will actually listen to the opinions of native Minnesotans this time instead of just going through the motions kike you have done in several recent public comment periods. You have the responsibility to do what is right for the state and people of MN--not yourselves, Polymet or the 300 Iron Rangers who are demanding jobs at any cost. 300 jobs is a pathetic reason to risk MN crown jewels. Reject the Polymet Mine in the name of reason, dollars and common sense, and the pristine legacy we owe to future Minnesotans who deserve to inherit a state that is at least as good as the one we inherited. Just Say NO to Polymet!	NS	X
28556	Unique			GEN	Lindsay Sovil		2326	1	It is clear that this project will cause irreparable harm to Minnesota's waters from sulfide poisoning for hundreds of years, mainly to profit a foreign mining company. Can a price even be put on the clean water that we so take for granted in northern Minnesota?	NS	X
25817	Unique			GEN	Lisa Mccolman		1227	1	I feel that the potential environmental risks associated with NorthMet far outweigh the potential economic benefits. This project should NOT be allowed to move forward.	NS	X
438	Form Letter	1	Variant	GEN	Liz Bercaw		203	1	Clearly the mass of mining accidents caused by attempts to mine highly disseminated low grade metals out of sulfide ores without degrading and polluting our environment for the next 500 years, has not been effective. Nor do we have the technology or the political will to clean up the pollution that is already here.	NS	X
438	Form Letter	1	Variant	GEN	Liz Bercaw		209	4	If the Lands and Minerals Division of the Minnesota DNR is responsible for permitting our mines, and the agency stopped promoting mining that is inadequate to protect MN waters, the agency division would basically put itself out of business. But surely such educated people can find themselves employed within the economic system. Understandably the DNR feels obligated to hear out such suggestions as Polymet's. It is clear however that Polymet is only hoping for variances and permission to solve the pollution problem later, as has been granted previously, causing the mining pollution we already have.	NS	X
29080	Form Letter	9	Variant	GEN	Liz Dahl		2408	1	I oppose the PolyMet NorthMet copper-nickel sulfide mine. As a retired physician, farmer, land owner and tax payer I am appalled that our leaders are even considering a project that would inevitably destroy our natural resources including the BWCA, poison our drinking water, lower property values, damage our economy by eliminating tourism all for a few short term jobs in the "boom and then bust" mining industry. What kind of a legacy will the DNR, Army Corps of Engineers and US Forest leave for us? The answer is a super fund clean up site.	NS	X
7689	Unique			GEN	LK Woodruff		561	1	I STRONGLY oppose PolyMet's proposed NorthMet sulfide copper mine on the Superior National Forest. That anyone would seriously consider this as a rational option is mind-blowing.	NS	X
7689	Unique			GEN	LK Woodruff		566	6	The FEIS also fails to evaluate pollution risks and impacts using realistic and ~scientifically supported~ assumptions concerning how much polluted seepage is likely to be captured and treated both during and after the proposed mining operations.	NS	X
7689	Unique			GEN	LK Woodruff		570	9	the FEIS is poorly done and fails to demonstrate that the proposed PolyMet mine would comply with all environmental laws and that it will not result in unacceptable environmental impacts. The agencies should reject PolyMet's proposal, and keep the proposed mine site under the current ownership and protections provided by the Weeks Act, Endangered Species Act, the Superior National Forest Plan and other laws. This is really a no brainer, folks.	NS	X
30402	Form Letter	1	Variant	GEN	Logan Spader		2859	1	There are very few places on Earth that humans haven't destroyed due to greed. Please leave the remaining ones alone.	NS	X
27682	Unique			GEN	Lois & Everett Jenkins		1844	1	With the mighty pen in hand I write with a feeling of grave urgency to express our non-support of the copper-nickel proposed project – the injustice to we the people who assess the long term disaster awaiting the citizens of beautiful MN, all of MN citizens. The injustice to our fragile planet, to the young people, and future generations.	NS	X

26935	Form Letter	1	Variant	GEN	Lois Dalsin		1482	1	What happens to the wild rice, and the water, the air, and the land is crucial to the well-being of all of us who dwell in Minnesota and in the watersheds contiguous-to, and connected-with, these sites being considered for sulfide mining.	NS	X
26935	Form Letter	1	Variant	GEN	Lois Dalsin		1485	4	Five hundred years of cleanup and remediation is quite unthinkable. And un-doable. We have better uses for the energies of our peoples than that of tending a failed project. I wholeheartedly oppose this proposed PolyMet NorthMet copper-nickel sulfide mine	NS	X
29978	Unique			GEN	London Bresette		4293	5	However, what seems to be evident is a prevailing disposition from the Co-lead Agencies towards permitting the Poly Met Mine; despite the undeniable fact that evidence shows this mine will indeed cause Unreasonable Consequences and Adverse Effects. This is unconscionable on every level and is contrary to every environmental goal the EPA has for the Great Lakes Region as well as every environmental goal the State of Minnesota portends is their desire in cleaning the St. Louis River.	NS	X
29978	Unique			GEN	London Bresette		4297	9	Due to these most pressing concerns, from our vantage point we stand in solidarity with the Fond du Lac Band of Lake Superior Chippewa, Grand Portage, as well as all the tribes that GLIFWC is authorized to represent within their mission in tribal assistance. Unfortunately with the Red Cliff Band's awareness of these matters also includes fears that; with the current status of affairs concerning this, it is likely that adverse effects will harm Red Cliff directly.	NS	X
33	Unique			GEN	Lonna Richmond		98	1	I am against any new open pit mining operations.	NS	X
11902	Unique			GEN	Lori Andresen		753	1	PolyMet and the Rest of the Copper/Nickel Mining Industry are Lying to Us About the Safety of its Proposed Operations in NE Minnesota	NS	X
29740	Unique			GEN	Lori Andresen	Save Our Sky Blue Waters et. al.	3904	19	The FEIS is inadequate in considering impacts to wildlife, fish, and wild rice. The FEIS is inadequate in considering past treaty rights and the health and livelihood of future generations.	NS	X
29740	Unique			GEN	Lori Andresen	Save Our Sky Blue Waters et. al.	3914	29	The FEIS fails to evaluate pollution risks from Acid Mine Drainage, heavy metals, arsenic, manganese, mercury, sulfates, etc. to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure.	NS	X
29740	Unique			GEN	Lori Andresen	Save Our Sky Blue Waters et. al.	3936	51	We respectfully submit these comments, reiterating our position that sulfide mining cannot be done in water rich northeast Minnesota without severely damaging and polluting our environment into perpetuity. No amount of data manipulation on paper will change that outcome in the environment. At this time, the technology is not available to mine the highly disseminated, low-grade ores of the Duluth Complex without causing severe and significant environmental impacts for this generation, and for those to follow. The PolyMet FEIS is inadequate and should be rejected.	NS	X
9792	Unique			GEN	Lori Rumpf		632	1	I am writing to oppose PolyMet's proposed NorthMet sulfide copper mine in Superior National Forest. The proposed open-pit mine would result in unacceptable, irreversible environmental destruction.	NS	X
9792	Unique			GEN	Lori Rumpf		638	7	All agencies should reject PolyMet's proposal and keep the proposed mine site under the current ownership and protections provided by the Weeks Act, Endangered Species Act, the Superior National Forest Plan, and other laws.	NS	X
10472	Form Letter	1	Variant	GEN	Lorilee Gesch		704	1	In closing I would just like to say that I can't believe we are even considering allowing this kind of mining in a wetlands, by an international company none the less. Yes mining produces jobs, but it also leaves impoverished towns once the mining operations are done. My question to you is has PolyMet ever had an operation that did not result in a spill or accident? Once the mining jobs move out, which they always do, can PolyMet guarantee that the wilderness will be left uncontaminated so that the only sustainable industry (recreation/tourism) can continue to thrive? What happens if there is a spill? Can PolyMet afford long term cleanup? You know as well as I do that companies such as this simply file bankruptcy and go on their merry way when things go wrong, leaving the tax payers to clean up their mess...if the mess can even be cleaned up effectively. Please, please, don't let the greed of a few ruin a rare gem like the BWCA for a little nickel and copper. There are plenty of places in the U.S. where these minerals can be mined safely without threat to one of the earth's most valuable resources...clean water!	NS	X
23991	Unique			GEN	Lorrie Ogren MA. LPC, LPCC		993	6	Also consider the loss of wetlands, destruction of wildlife corridors, and loss of public lands within Superior National Forest to a Canadian mining company whose major underwriter, Glencore, is taking a huge market hit, with shares falling approximately 60 percent over the course of the year. How will a company under financial duress manage to treat water pollution at the proposed plant site for at least the next 500 years, as projected in the Supplemental Draft Environmental Impact Statement?	NS	X
23991	Unique			GEN	Lorrie Ogren MA. LPC, LPCC		995	8	Solutions to current mining pollution continue to evade our regulatory agencies. If the highly disseminated sulfide mineralization of northeast Minnesota can ever be mined "safely," it will have to wait; a synopsis of the North Star mining committee's position is that we do not have the technology or the regulatory will in place to do so now. Nor have we, as a nation, incorporated the amount of recycling that would negate the need for the extreme mining and extraction of the highly disseminated low grade sulfide ores of Minnesota's Arrowhead Region. The iconic beauty and quality of the St. Louis River watershed is at risk for us and for future generations. Our agencies and leaders are ignoring clean water as a valuable natural resource. We have lost respect for the quality and character of Lake Superior itself and forsaken those who will follow. (Information Source for all the above: Sierra Club) PolyMet is not compatible with the clean water values of Minnesota and must be stopped. Thank you for choosing the long term health of our precious Boundary Waters and MN's Watersheds over short term profits of companies that don't care about our fragile resources, our pristine wilderness, our children and grand children and great grandchildren and all that come after them. This mining company only cares about obscene amounts of profit/money at all of our expense.	NS	X
27921	Form Letter	1	Variant	GEN	Louis Mielke		2229	1	Hello, although I admire the dedication of Kathleen Atkinson, Tamara Cameron, Susan Hedman, and Tom Landwehr and many others to make this proposal work, I do not think that the PolyMet NorthMet copper-nickel sulfide mine proposal should be passed.	NS	X
380	Unique			GEN	Louise James		187	1	I am strongly opposed to any mining development by PolyMet.	NS	X
380	Unique			GEN	Louise James		188	2	Having lived in Colorado for 30 years, I experienced the rape and pillage of mining companies on the land. All they care about is the dollar.	NS	X
29558	Unique			GEN	Lucinda Lenertz		2552	1	nickel mine Please register my position as against the sulfide mine proposed for northern Minnesota. This company has no intention of creating jobs in the short term and they just want the permit for future mining...maybe decades in the future.	NS	X
26738	Unique			GEN	Lyle and Rita Powers		1444	1	Please do not allow any kind of mining in the northern part of our beautiful state of Minnesota!	NS	X
2829	Unique			GEN	Lyle Salmi		352	1	The risks of such a project far outweigh the short term economic gains. Stop this project from moving forward. Our natural resources are too valuable to allow the potential for pollution from this type of mining.	NS	X
1421	Form Letter	1	Variant	GEN	Lynda Pauling		280	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
29451	Unique			GEN	Lynden Gerdes		2533	1	I believe that if an adequate and unbiased FEIS Review was undertaken for the NorthMet copper-nickel sulfide mine proposal there would be no way that the USFS could allow for the destruction of these high quality National Forest lands. I also believe that that if an adequate and unbiased FEIS Review was undertaken for NorthMet copper-nickel sulfide mine proposal there would be without question absolute proof that this proposal should not proceed. I believe the process is legally flawed, primarily because agencies, particularly the DNR, are clearly politically and corporately pressured to make this mine proposal and copper nickel mining in general happen in northern Minnesota. The DNR is financially driven and have internal interest (e.g. Lands and Minerals) that have taken precedence over environmental concerns and long term risks to the environment and citizens. This has influenced the quality of the data incorporated and analyzed in the review process...and ultimately the forthcoming Decision.	NS	X
27021	Unique			GEN	Lyndon Nurm		1628	1	We also do not want our beautiful area ruined forever. That being said, we also want the jobs so our young people can stay up here, find jobs in 'GOD's Country'. Our voices should be heard as going with the outcome of the research already done for many years. I (we) would say the project should be a 'go' if that is what the technology shows can be done safely.	NS	X
26978	Unique			GEN	Lyndon Nurmi		1504	1	I sent my comment via e-mail a couple of hours ago and got a response stating the comments ended in March or whatever. Is this a joke?	NS	X
28476	Unique			GEN	Lyndon Nurmi		2259	1	We also do not want our beautiful area ruined forever.	NS	X
28476	Unique			GEN	Lyndon Nurmi		2261	3	Our voices should be heard as going with the outcome of the research already done for many years. I (we) would say the project should be a 'go' if that is what the technology shows can be done safely.	NS	X
24811	Unique			GEN	Lynn Bottge		1119	1	No to the proposed PolyMet Mining Inc. project.	NS	X
27185	Unique			GEN	Lynn Bottge		1688	1	No to the proposed PolyMet Mining Inc. project.	NS	X
27186	Unique			GEN	Lynn Bottge		1689	1	For the third time we have reviewed the results of the Polymet EIS statements. The FEIS fails to address adequately our objections to this project.	NS	X
27186	Unique			GEN	Lynn Bottge		1693	5	This project is not right for the geology and the water rich environment of Northeastern Minnesota. It needs to be stopped. Your agency must stop Polymet from mining in Minnesota.	NS	X
27032	Form Letter	1	Variant	GEN	Lynn Grano		1631	1	In addition to the specific criticisms below, and despite numerous objections raised in response to the preliminary EIS, this more "final" result is a joke because if fails in any manner to seriously address the complete inability of any possible financial instrument(s) to adequately cover the never-ending (well, at least in excess of a 500 year period) liability raised by the sulfate tailings / tainted ground water / etc. generated by this project. Here's yet another example of privatizing the gain (whatever profit PolyMet takes from its 20 year run projected operation of this mine) followed by socializing the cost (leaving Minnesotans to be on the hook forever thereafter for any damage). It's now quite clear from the DNR's complete failure to address this issue in any manner that the citizenry could consider that said agency is either incompetent or corrupt when it comes to preparing an unbiased assessment of the risks raised by this project. It now seems beyond dispute that the DNR's charge to promote mining has rendered the agency unfit and unable by such an inherent conflict of interest to prepare the unbiased and comprehensive EIS that is required by both State and Federal law.	NS	X

6784	Unique			GEN	Lynn Taliaferro		507	1	Please consider one important question when considering mining in MN. What should be valued most: A healthy environment and healthy people or money from digging resources out of the ground even though it will pollute our water sources and poison our environment and thus our people. I've lived in Minnesota for over 40 years and always valued its resources, clean air and clean streets. I ask you to think twice about the right direction for all Minnesotans. May the Lord, Jesus Christ lead you in your decision.	NS	X
23885	Form Letter	1	Variant	GEN	Malgorzata Schmidt		946	2	This area as well as all environment is the PROPERTY OF FUTURE GENERATIONS	NS	X
8552	Unique			GEN	Mandy Lilla		583	1	I support PolyMet's North Met Mine. I believe Copper can be mined in a environmentally friendly way. An EIS is a very thorough review process of a project and would have identified and evaluated the impacts due to mining. The opening of a new mine on the Iron Range will positively benefit the area and people by providing additional jobs which are needed.	NS	X
26648	Unique			GEN	Margaret A. Redmond		1391	1	There are very strong hazards to land and health which appear to have been ignored, or glossed over, or been relegated to a hazy "we'll figure that out once we've given the go-ahead" status in the FEIS.	NS	X
26648	Unique			GEN	Margaret A. Redmond		1405	15	Given the weakening of legislation and of real input opportunities, and given the FEIS's missing or cavalier treatment of many issues of concern raised by citizens and scientists, I think that granting a permit to mine in such a fragile, interconnected system of waters would be a great wrong. And would do great harm.	NS	X
29397	Unique			GEN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3716	1	Because the Project is the first non-ferrous mine proposed in Minnesota, the Project and the issues regarding its environment impacts are precedent-setting. 20 years of mining is proposed, after which closure and post-closure maintenance would need to continue for more than 200 years because the waste rock will be acid generating. Therefore, Project impacts would be experienced during operations and for generations to come. Yet despite this, the FEIS has many of the same problems of the DEIS and the SDEIS, despite extensive comments and analysis by the Band and many other commenters. The FEIS does not adequately assess impacts, nor does it require appropriate mitigation, and it does not meet the requirements of federal law.	NS	X
29397	Unique			GEN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3717	2	In spite of numerous teleconferences, meetings, and comments in writing at every occasion provided by the Co-leads, the Band must reissue many of the same comments on the FEIS that it has issued on the SDEIS and the DEIS calling for basic evaluation of Project impacts and application of well established Council on Environmental Quality ("CEQ") standards for EIS preparation.	NS	X
28653	Form Letter	1	Variant	GEN	Margi Preus		2329	1	I previously signed my name to the form letter, but I would like to write my own objection. It is unconscionable to think that we are ready to risk our most valuable resource by allowing sulfide mining in a major watershed of some of the cleanest, most pristine water on the planet. To risk our water for a few short term jobs is the height of short-sightedness. To think of the number of potential jobs LOST in the event of water contamination, not to mention loss of fish, waterfowl and wildlife, is to make the project appear to the be the worst idea ever conceived.	NS	X
28653	Form Letter	1	Variant	GEN	Margi Preus		2331	3	And a final question: why are we on the brink of allowing a copper mine to open when" dozens of copper mines globally are cutting or curtailing production." (Duluth News Tribune, "Arizona Copper Mine Closes," Sat. Dec. 19, 2015. I request a specific response to my comments.	NS	X
14803	Unique			GEN	Margot Galt		800	1	I completely support your opposition to the PolyMet mine. Please see my blog on the topic, at margotlog.blogspot. It's the most recent blog "Empty Water" Here's to success in defeating the mine.	NS	X
4357	Unique			GEN	Marilyn Magnuson		56	1	Please take these comments as a great concern for the health of our state and nation. We must look at this situation in the long term.	NS	X
14944	Form Letter	1	Variant	GEN	Marit Anders		802	1	I am a student at UMD in Duluth with a biology major and a passion for our outdoor wilderness. I recently gave a presentation on the sulfide mining project, and since then have had multiple peers signing opposing petitions against the sulfide mine. Sure, we understand this is needed for the economy and that mining workers are in need of jobs, but please, think about our future first. We will be the generation dealing with the consequences of opening a sulfide mine in our land of 10,000 lakes. Do you realize how incredibly horrible acid mine drainage is, especially in the presence of water?? 1/10 children born in the Lake Superior region are already born with mercury poisoning. Please, please, don't allow an increase of this, for my future children. The students of UMD are BEGGING YOU, PLEASE think of our future. Think of the long term effects that we will have to face, not you. We don't have much of a voice, but I am speaking for most. Listen to us, for we are your future. We will be here after there is no mine, and we will have to be the ones to clean it up, if we have to. Think of us when you make your decision.	NS	X
30417	Form Letter	1	Variant	GEN	Mark Arneson		2861	1	Water treatment for centuries should be a non-starter! Mining is not a strategic sustainable job creator.	NS	X
25563	Unique			GEN	Mark C Brandenburg		1198	1	Please do what you can to stop the Polymet mine from proceeding. This kind of risk to a treasure like the Boundary Waters is not worth undertaking, and the history of this kind of mining is not pretty. There are other areas to mine that aren't near a place like the Boundary Waters, please do what you can to stop this, thank you!!	NS	X
4414	Unique			GEN	Mark C Wihriala		394	1	I still don't believe that polymet has our best interest at heart. They state right in the eis that they still will poison our water! We will still have to deal with that for at least 500 years....How can you even come up with a dollar amount for risking our childrens water supply , not to mention the the damage to our wetlands. I just really think we can find better ways for Minnesota to employ its people in a more environmentally safe way. I totally oppose this mining effort.	NS	X
27806	Unique			GEN	Mark Jenkins		2145	1	I wish to express my support for this project. I believe the economic future of Northern Minnesota requires diversification away from iron ore mining. The NorthMet project provides a long-term viable industry that will create many jobs; both directly at the mine and indirectly to many local businesses. The project has been studied for over 10 years and the Environmental Impact Statement has addressed all of the issues required by Federal and State regulations. I believe it is time to accept the adequacy of the report and move forward with the approval and permitting process.	NS	X
29737	Unique			GEN	Mark Kaprelian		2583	1	Commenters, including me, called attention to several factors that create extraordinary risks to the environmental, economic, employment and sociological impacts discussed in the SDEIS. These factors were not addressed in the SDEISand remain unaddressed in the FEIS.	NS	X
14157	Form Letter	1	Variant	GEN	Mark Krenelka		792	1	I am a former member of the U.S. Army Corps of Engineers. I find the comments by some officials regarding the proposed PolyMet mine and how Minnesota agencies will ensure "vigorous " enforcement of environmental standards to be wishful thinking. I also believe that the local tourism economy will be negatively impacted, land values will decrease and many current cabin owners will leave.	NS	X
8525	Unique			GEN	Mark McClellan		581	1	I would like to voice my support for the Polymet mining project. After 10 years of objective study and review led by the Minnesota DNR with involvement of the MPCA, Army Corp of Engineers, U.S. Forest Service and Federal EPA this project has probably received more and closer scrutiny than any other mining project in the world, which is as it should be. We all understand we must protect our resources, but do so as we responsibly make use of them. There is no where in the world today where mining is done more responsibly than Northeastern Minnesota and this project will keep that high standard, probably setting new standards for operating with very low environmental impact. I'm also confident that the 20 plus permits that are required from the DNR, County and other state agencies will identify and further address these concerns to the benefit of the people of Minnesota. We need to mine these resources somewhere in the world and this is where a copper nickle mine will be held to the highest environmental standards in the world. All for mining what we consume responsibly.	NS	X
265	Unique			GEN	Mark Roalson		165	3	3. The failed Mt. Polley Mlne in B.C. has only been fined money in its violation of environmental laws. However, its owners and operators are guilty of criminal acts of negligence and threats to public health. as well as outright pollution. No one has gone to jail or been charged with any crime. Just as in Wall Street's "mortgage securities" & Realty Brokers/ Insurance industry malfeasance of the housing scandal of 2008, no one went to jail, even though outright fraud was committed. What assurance is there in the NorthMet FEIS that this will not be repeated? Mining has a long history of screwing up, polluting, and then declaring bankruptcy. What financial vehicle of corporate surety is going to be the bulwark against long-term or sudden pollution events? As a member of the public, I am NOT ASSURED by the FEIS to prevent this.	NS	X
5793	Form Letter	1	Variant	GEN	Mark Trainor		435	1	I am strongly opposed to any copper mining in the fragile Northeast MN. Yet, I realize all my objections and strong scientific support against doesn't mean anything as there is ONE TRILLION dollars of metal underground. This is all for show because the money always wins. Right?	NS	X
26457	Form Letter	1	Variant	GEN	Martha Roberts		1315	1	I am writing you today in strong opposition to the PolyMet NorthMet copper-nickel sulfide mine proposal. Allowing this sort of mining to occur in Minnesota will set our state down the path towards final destruction of what remains of our fragile, unique, natural resources in northern Minnesota.	NS	X
26457	Form Letter	1	Variant	GEN	Martha Roberts		1316	2	I am actually shocked that the state, and the leadership of administrative agencies (who are tasked with protecting Minnesota's natural resources and human health) are (shamefully) considering this kind of mining. I am outraged that the Commissioners of the PCA and the DNR and the U.S. Forest Service and the Army Corp of Engineers, are currently marching lock step with international corporate mining interests whose ONLY interest is to extract minerals, make a lot of money and leave. These "employers" will depart from our great state (I give them 10-20 years max) and leave us with a cesspool of toxic, poisonous chemicals that will permanently pollute our drinking and natural water supplies, and destroy crucial habitat for many important animals and plant species for 100s if not 1000s of years. This form of "economic development" will eliminate our way of life and decimate a vital resource that will soon be worth far more than minerals--I am talking about WATER--on a planet escalating into climate change.	NS	X
26457	Form Letter	1	Variant	GEN	Martha Roberts		1321	7	I strongly and unequivocally oppose the PolyMet NorthMet copper-nickel sulfide mine proposal. I challenge you to be smart, be visionary, be compassionate, and most importantly, be BRAVE. Do the right thing for the future people, animals, plants, water and land of Minnesota. Do it for planet earth. Do it for humanity. Please REJECT the PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X

29963	Unique			GEN	Martin Cooney		4232	10	As stated at the outset, I am utterly opposed to the PolyMet application, and all pending sulfide mining applications, on the grounds that the ephemeral benefits of these projects to all the residents of Minnesota, including those of the Iron Range and all other citizens of the United States as a whole, do not begin to outweigh the potential cost of an environmental debacle of tragic proportions. Such a tragedy could easily pollute our drinking water, lakes, rivers, streams, and aquifers for generations to come. At a time when drinking water is being poisoned by fracking and phosphate runoff from industrial agriculture, forests in western states are burning up square miles at a time and cities on the Pacific Coast are rationing water consumption, we are seriously considering risking polluting our principal natural resource in perpetuity. And all for a limited economic benefit that will come calling again in twenty years to further erode our precious water. There can be no justification for this intentional despoilment. We have a one hundred and thirty year history of relatively successful iron ore mining in Minnesota. In over a century, we have learned, by and large, how to regulate this mining process. Sulfide mining is a completely different proposition. Can we believe that we can regulate these mining companies effectively, when we do not have the institutional memory or resources in our regulatory bodies to stay ahead of the mining companies' natural propensity to embrace expediency? There is no contest. If the provisions for financial assurance fail to impose the full cost of the externalities of the PolyMet mining venture on the prime beneficiary of this project, PolyMet's shareholders, this Permit to Mine should never be issued. We will never have more negotiating power over PolyMet, and by implication, all other sulfide mining ventures waiting in the wings, to protect the environment and ensure that sulfide mining is conducted responsibly than we do at this very moment. If this project must move ahead, the DNR must make up for its lack of experience in sulfide mining by hiring the best independent advisors available and structure a model financial assurance design, implementation and management process. In addition, financial assurance must become an integral part of the EIS process. Specific to PolyMet, the public must be made aware of the details of the determination of the financial assurance amount and how its integrity will be maintained over the life of the project, after the spotlight has moved on. The public must also be allowed to comment on the detail prior to the issuance of the permit. I particularly urge you to avoid all appearance of back-room dealing by fully disclosing for public comment prior to permitting, the financial assurance details.	NS	X
25751	Unique			GEN	Martin Dietl		1217	1	I am writing in opposition to the Polymet mining proposal in Northern Minnesota! No gems are worth putting this unique habitat at risk! 500 years of cleanup is unacceptable! Let it be!	NS	X
7399	Unique			GEN	MARTY LAAKSO		545	1	MINING IS THE LIFELINE TO THE ECONOMY OF THE RANGE. SURVIVAL OF ALL RANGERS DEPENDS UPON THE CONTINUED DEVELOPMENT OF ADVANCED PROCESSES FOR IRON ORE AND THE DEVELOPMENT OF THE RESOURCES THIS AREA WAS CREATED WITH. I AM IN SUPPORT OF THE POLYMENT PROJECT BECAUSE IRON ALONE CANNOT KEEP THIS AREA THRIVING. THE EXTENDED PROCESS THAT POLYMET HAS HAD TO ENDURE, ITS WILLINGNESS TO MEET ALL REQUIREMENTS FROM SO MANY DIFFERENT AGENCIES, AND ITS UNEQUIVICAL SURPPORT FROM THE PEOPLE LIVING IN THE AREA SHOULD BE ENOUGH TO APPROVE THE EIS AND LET POLYMET INVEST IN THE SURVIVAL OF THE IRON RANGE. PLEASE DON'T LET THOSE WHO LIVE IN DISTANT PLACES OR WHOSE LIVES DO NOT DEPEND ON THIS ENVIRONMENT SOUND PROJECT AFFECT YOUR DECISION TO DO THE RIGHT THING FOR THE THOUSANDS OF FAMILIES WHO ARE COUNTING ON THIS PROJECT AND THE OPPORTUNITIES IT WILL BRING TO ASSURE SOME STABILITY TO THEIR LIVES.	NS	X
30631	Unique			GEN	Mary & Michael Barrett		2888	1	We prefer pure water rather than copper ?????	NS	X
26628	Unique			GEN	Mary Adams		1389	10	The section ES-12 through ES-24 made this project look like a done-deal. The construction, operations, processing, closure and post-closure maintenance looked quite slick within this document. What could possibly go wrong? Is their technology so great that they assume no environmental damage will occur? That is deeply troubling.	NS	X
26628	Unique			GEN	Mary Adams		1390	11	I understand numerous permits requiring financial assurance for premature mine closing land reclamation and risks to the environment are to be negotiated. One hundred to five hundred year sounds like we are placing northern Minnesota, and our children's children in jeopardy.	NS	X
26285	Form Letter	1	Variant	GEN	Mary Ann Cunningham		1300	4	I urge you to reject the PolyMet proposal and all future proposals to develop sulfide ore mines in northern Minnesota.	NS	X
30423	Form Letter	1	Variant	GEN	Mary Boranian		2862	1	BWCA is unique in the world!	NS	X
26478	Form Letter	1	Variant	GEN	Mary E. Jones		1322	1	As a lifelong citizen of Minnesota, I strongly oppose the Polymet Northmet copper-nickel sulfide mining proposal.	NS	X
26478	Form Letter	1	Variant	GEN	Mary E. Jones		1326	5	Sulfide ore mining has not taken place in Minnesota before and the sulfide mining industry has a track record of environmental and financial irresponsibility elsewhere. We must not allow the Polymet mine proposal to succeed and set a risky precedent for more sulfide mining operations in our state.	NS	X
26928	Unique			GEN	Mary Handt		1481	1	Thank you for the opportunity to give my opinion to the proposed mine in Northern Minnesota. I'm 100% in favor provided that we get a guarantee that our water, air, natural resources, and rivers have a 100% guarantee nothing will pollute them EVER!	NS	X
323	Form Letter	1	Variant	GEN	Mary Jo Reiter		171	1	You are welcome.	NS	X
25189	Unique			GEN	Mary Jo Wiatrak Uhlenkott		1139	1	Please protect the earth from extraction harm.	NS	X
47	Unique			GEN	Mary Ofjord		25	1	I oppose PolyMet mining. Yes, it would help an economically depressed area, but it is only a temporary solution and not for long-term gain.	NS	X
47	Unique			GEN	Mary Ofjord		26	2	Once it's gone, it's gone. We only have a certain amount of resources on the planet, and I am concerned about the environmental chaos that might be left behind.	NS	X
439	Unique			GEN	Mary Pavia		210	1	I love the BWCAW, and it would be morally impermissible if it were harmed by toxic sulfide mining corporations. I implore you to block proposals from mining companies in the lands adjacent to the Boundary Waters. If action is set forth, then the benefits will be incredible.	NS	X
439	Unique			GEN	Mary Pavia		212	3	There is a need for radical change as the dangers threatening ecological systems are the result of production and consumption, and we must encourage legislators to understand this need by urging them to co-sponsor and support the National Park and Wilderness Water Protection Act. If we do not, the social and environmental cost would be catastrophic, and only act as a catalyst for greater and greater ecological destruction.	NS	X
23996	Unique			GEN	Mary Richards		998	1	I have an advanced degree in environmental sciences and am very concerned about the impact the PolyMet would have on the environmental integrity of northern Minnesota and beyond. For the sake of all Minnesotans and those who treasure the north woods, for the continued health of the recreational economy and for the simple fact that what we do to the earth we will do to ourselves, do not even consider approving the PolyMet mine.	NS	X
10633	Form Letter	1	Variant	GEN	Mary T'kach		706	1	The pollution from this type of mining will very possibly destroy the future of this area and there is no proof that it won't.	NS	X
10633	Form Letter	1	Variant	GEN	Mary T'kach		709	4	Please do not allow copper-nickel mining in Minnesota.	NS	X
5304	Unique			GEN	Matt Kokotovich		423	1	I do not support the proposed Polymet mine. I believe it will not do that much for the area, economically, and it will ultimately pollute our water. Please do not allow it to move forward.	NS	X
1831	Form Letter	1	Variant	GEN	Matt Straw		288	3	No way will a PolyMet mine help this state. In the long run, it can only impoverish the people and cause health and environmental problems that could last centuries. Only sociopaths could possibly consider accepting the PolyMet plan.	NS	X
27066	Unique			GEN	Matthew Miltich		1642	1	The NorthMet Mining Project is poised to do unprecedented environmental damage to northern Minnesota and three watersheds originating in our region.	NS	X
27066	Unique			GEN	Matthew Miltich		1646	5	We are given soft assurance by those who propose this project that it will provide jobs, and will be safe. A history of sulfide mining belies these assurances. Who profits? Those who live far away from the project. Will such a project be safe? Consider this question: When do accidents happen? Answer: All the time.	NS	X
29992	Form Letter	1	Variant	GEN	Matthew Norton		2764	1	I have a personal connection to and interest in the purity of water in the BWCAW. I have hunted and taken deer in the BWCAW, and consumed venison from those BWCAW bucks, and I have concrete plans to do so in the future. I have on many occasions gone fishing in the Boundary Waters Canoe Area Wilderness, and caught and consumed fish there on many occasions. I have consumed BWCAW lake water on thousands of occasions. Likewise, I have gone fishing in Lake Superior and the tributaries of Lake Superior on many occasions. My enjoyment of these activities would be greatly diminished as a result of the Northmet Polymet project being approved, because of the knowledge of the project's production of acid mine drainage (AMD), and the knowledge that that drainage would leach into and migrate with bedrock groundwater through fissures over time into either or both the BWCAW or/and the St. Louis River and its tributaries, and from there to Lake Superior; and the knowledge that that AMD leachate would continue to leach into the water for more than - possibly many hundreds of years more than - 500 years. No Minnesota mine should be permitted if it would require ongoing, i.e., perpetual or indefinite, treatment after the cessation of mining. May your heads never again rest easy on your pillow if you approve, or participate in the approval, of such a mine.	NS	X
30436	Form Letter	1	Variant	GEN	Maureen Skelley		375	1	Protect our waters!!	NS	X
29319	Unique			GEN	Maya Batres	The Nature Conservancy	3664	8	This project, if permitted, will impact Minnesota's environment for centuries in ways that are not fully described in the FEIS. Without additional analysis and a full opportunity for public comment, the FEIS should be determined inadequate under state and federal law.	NS	X
2161	Unique			GEN	mbk004@frontiernet.net		311	1	Polymet, if allowed to run its course, is going to ruin what's left of this state's watersheds in too many ways to list. We've destroyed countless wetlands and watersheds with our arrogant, ignorant, meddling human ways as it is without even counting mining.	NS	X

2161	Unique			GEN	mbk004@frontiernet.net		313	3	If you depend on water, or know someone who does...please take a stand against open pit mines or any mines in or near a watershed in Minnesota. Mining can't be done clean. Period.	NS	X
58	Unique			GEN	McKenna Eckerline		140	1	I am disappointed in the Minnesota DNR for going through with this new mining plan and continuing to invest its assets into the unsustainable, destructive and unjust fossil fuel energy that contributes to environmental decimation, natural disasters and health risks such as infertility, birth defects and cancer	NS	X
58	Unique			GEN	McKenna Eckerline		141	2	With renewable energy sources at their lowest prices ever, now is the time for Minnesota to halt new developments for this outdated industry and instead put department's resources towards sustainable energy resources.	NS	X
27405	Unique			GEN	Melanie Peterson-Nafziger		1709	1	I write to beg you to not allow the PolyMet project to move forward and to urge you that the procedures laid out in the Final EIS will not protect Minnesota's natural resources from permanent degradation and people and other creatures from permanent pollution and devastation.	NS	X
3860	Form Letter	1	Variant	GEN	Melissa Roach		387	1	I oppose issuing any federal permit allowing PolyMet discharge of pollutants that will destroy wetlands, municipal water supplies, aquatic life, wildlife, human health and welfare, environmental justice and special aquatic sites.	NS	X
27076	Unique			GEN	Meredith Hanson		1650	1	I do not support the NorthMet Mining Project. The harm to the air, water, land, animals, and human health is too great. Please do not allow NorthMet to open this mine in our State.	NS	X
25753	Unique			GEN	Michael		1219	1	I strongly feel that this project would do more harm to the environment that would not be repairable. It is not worth the economic benefit	NS	X
22409	Unique			GEN	Michael Forsman		868	1	I believe all due diligence has taken place in regard to Polymet permitting. Polymet should be given the green light to begin mining.	NS	X
14740	Form Letter	7	Variant	GEN	Michael Guest		799	1	This isn't right and a big mistake. Over the years, the environments, such as wetlands, lakes, and boundaries, have been affected not just by pollution, but other threats. This proposal is unnecessary and could put water, health, communities, citizens at huge risk. We don't want any mining. Allowing that is wrong and unacceptable. The future of our environments depend on us. Conservation and preservation are very important. This is not about about politics. Please listen to the public and reject this mining plan before it happens.	NS	X
26683	Unique			GEN	Michael Hagge		1439	1	I do not believe the short term benefits (jobs) outweigh the potential negative environmental impact. I am against approval of the PolyMet mining operation.	NS	X
26651	Form Letter	1	Variant	GEN	Michael Koch-Weser		1406	1	While sometimes it needs to be done, mining is an incredibly damaging activity. Recently, surges in acid mine drainage discharges from abandoned mines in Colorado have been in the news. Most of this AMD is "forever" in terms of human existence. All we can do is "manage it;" it can't be stopped and threatens water quality, fish, and wildlife in perpetuity. Mining is far more suitable in arid and semi-arid areas where runoff is less of a problem. Northern Minnesota is hardly a semi-arid area. It hosts some of the most pristine fresh water ecosystems left in the United States and those ecosystems should not be threatened under any circumstances. We don't have many left.	NS	X
29546	Form Letter	1	Variant	GEN	Michael Lein		2551	3	The PolyMet Final Environmental Impact Statement (FEIS) has many other flaws - the longer they are examined the more are brought to light - issues with groundwater flow monitoring, issues with wetland replacement, ongoing concerns about long term financing.	NS	X
27660	Unique			GEN	Michael Levings		1801	1	On reading some of the information concerning PolyMet Mining's E.I.S. it is my unshakeable conclusion that to proceed with this method of mining northeast of Biwabik MN. at the headwaters of Lake Superior would be to defraud your citizens to be "IE our children" of their natural and God given rights to clean water.	NS	X
24121	Form Letter	1	Variant	GEN	Michael Miller		1002	1	It's not worth the chance that this thing can be managed so I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
8753	Unique			GEN	Michael N Felix		603	1	I'm for it.. I'm an envionmentalist... from grand rapids mn. There are too many reasons so I'll stick with that.	NS	X
23141	Form Letter	1	Variant	GEN	Michael Swift		900	1	As an aquatic ecologist, I am appalled that the State of Minnesota would even consider permitting this ecologically disastrous project.	NS	X
6412	Unique			GEN	Michael W. Garbisch		484	1	My response to the adequacy of the mining FEIS is that it cannot really peer adequately into the future, by looking at current and historic information. In every realm of science and technology, improvements are being developed with breathtaking speed. Mining is not at the forefront of this parade of newly developing knowledge, but even the mining industry will eventually discover ever-safer ways to develop natural resources. Why should we jump the gun, in the face of almost universal problems worldwide with hard-rock mining? We should wait until we are able to look at numerous examples of clean, safe mining technology in the then-current time. Maybe this is 25 years away, but the resource won't be going anywhere in the interim. When mining is proven to be safe and clean rather than speculative, based on established examples, then we can open new mines in northern Minnesota.	NS	X
27692	Unique			GEN	Michelle Lackey Olsen		2089	1	I don't believe the FEIS adequately addresses my concerns, particularly relating to the economic, health and environmental effects of the acid mine seepage or drainage and intensive water treatment that will be required.	NS	X
27692	Unique			GEN	Michelle Lackey Olsen		2092	4	Given the location of the proposed mine, there are pollution risks to water in both the Lake Superior watershed and the BWCA. This is not acceptable. We don't have a complete evaluation of how these contaminated waters will affect fish, other aquatic life, waterfowl, wild rice, drinking water, and the people that rely on all of these for their subsistence or tourism. Please don't let us be the guinea pigs for PolyMet.	NS	X
29174	Form Letter	9	Variant	GEN	Michelle Lechner-riehle		2434	1	Mines in Colorado and other states where mining was common are still toxic. Recently toxic waste was released into a stream in Colorado, sending a green stew with heavy metals into water used by many communities downstream. I hope we will learn from past mistakes rather than repeating them endlessly until our planet is no longer habitable.	NS	X
27428	Unique			GEN	mike hughes		1740	1	after reviewing the material, i can't help but wonder what would have happened in northeastern minnesota if this review was required 125 years ago when iron mining began. it appears that the impact of mining non-ferrous materials now won't be any different than it was then and things are just fine now. therefore, i fully support the mining of non-ferrous materials slated for n.e. minnesota.	NS	X
25003	Unique			GEN	Mike Malling		1125	1	I oppose the mining project at North met. There's no guarantee that it will not harm the environment and that the public will be responsible for future cleanup costs if there is harm. The impact to wetlands alone is reason enough to oppose this project. Minnesota should be proud of his wetlands water quality lakes and rivers. Recent news Of impaired waters especially in southern Minnesota troubles me. Approving this project would contradict the governors buffer program and lead to continued concern by citizens who care about clean water, The environment, and health.	NS	X
26447	Unique			GEN	Mike Tonne		1312	1	The information released on the water impact speaks for itself. Not only will the water be protected but may actually be cleaner. The scientific advances of water recovery are overshadowed by past mine experiences.	NS	X
26447	Unique			GEN	Mike Tonne		1313	2	There are measures in place that will protect the people, the environment and the local economy. They have taken scenarios from leading agencies that are reviewing this project and proven that this mine will be safe not just now but for future generations.	NS	X
26447	Unique			GEN	Mike Tonne		1314	3	Do not base mining practices decades ago to current projects that have actively implemented systems that improve safety and performance. The Polymet project will have little impact on the environment beyond the production site. In addition, this has the potential to develop new standards for future mines. The science of mining has looked at the past, it took areas that could be improved and did just that. Today, technology has spread into all industries and has created a new world, mining is no exception. In conclusion, the Environmental Impact Study submitted is not only evidence that the Polymet project is able to perform in a responsible and caring manner to the environment and all its inhabitants; it has the potential to set a precedent for future mines and how they interact with the environment. This is something all Minnesota residents will be proud of, especially those that are initially against it.	NS	X
49	Unique			GEN	Mimi McMillen		118	1	As a native Minnesotan, I most strongly feel there should be NO mining nor land exchange where proposed.	NS	X
49	Unique			GEN	Mimi McMillen		119	2	I have canoed the Boundary Waters as have millions of others and want nothing to disturb this magnificent area. Once disturbed, it will never be the same. We have destroyed millions of acres in America for energy purposes. We must cease doing so or our lives on Earth will come to an end long before it should! PLEASE say NO to this ill-advised proposal despite all the environmental assessments which can be configured to prove whatever one wants.	NS	X
23647	Unique			GEN	Mitchell Dane Cervenka		964	1	The mine being proposed in Northern Minnesota is difficult to comment on due to the economic benefits it will provide the state, but I nevertheless express my gravest concern for the methodological approach taken to this issue. This mine seems like a band-aid solution for 30 years of an added economic "push" , and the 300+ year clean-up certainly diminishes the return on investment. The boundary waters and Northern MN is one of the most beautiful places on earth, and I hope everyone involved in this decision personally visits the area before coming to a conclusion. The land swap is great in theory, but national park land is designated as such for a reason, and it should continue to remain untouched by industrialization. Stop the mining.	NS	X
418	Form Letter	1	Variant	GEN	Monica Petrov		197	1	Please do NOT jeopardize all Minnesotans' long term health and environment for the short term sake of high corporate profits and jobs for only a few.	NS	X
272	Form Letter	1	Variant	GEN	mtjohansen@earthlink.net		166	1	I apologize for this automatic reply to your email. N/A	Form Letter Template	1	Non-Variant	GEN	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL1	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine.	NS	X
N/A	Form Letter Template	1	Non-Variant	GEN	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL10	10	I oppose any federal Clean Water Act permit for PolyMet discharge and wetlands destruction because: - PolyMet discharge of pollutants and wetlands destruction and impairment would degrade surface and groundwater and violate federal, state and tribal water quality standards.	NS	X
N/A	Form Letter Template	1	Non-Variant	GEN	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL11	11	PolyMet discharge of pollutants and wetlands destruction and impairment would have adverse impacts on municipal water supplies, aquatic life, wildlife, human health and welfare, environmental justice and special aquatic sites.	NS	X
N/A	Form Letter Template	5	Non-Variant	GEN	Multiple	YMCA Camp Menogyn	FL33	3	I'm writing not only as a concerned citizen, but as a member of a thriving, sustainable, tourism-based, North Shore economy made up of over 18,000 workers that generates over \$800 million dollars of revenue for the state annually, and that depend on the Boundary Waters and Lake Superior remaining the way they are today. I work for YMCA Camp Menogyn, a camp on the Gunflint Trail that takes kids on canoeing, backpacking, rock climbing, and dog sledding trips around the very landscape that these mines threaten to harm irreparably. Our country made a promise to me, the kids I take on my trips, and all future generations when we signed the Wilderness Act of 1964 and the BWCA Wilderness Act of 1978. We declared that this place would remain untrammelled by industry forever. I urge you not to go back on that promise, no matter the political pressures. If not for my sake, don't allow this to mine to be built for the sake of anybody who has never heard a loon call as the sun sets over a pristine Boundary Waters lake, anybody who's never swatted mosquitoes through a muddy, wet, 250 rod portage, or anybody who hasn't yet received what this amazing, uniquely Minnesotan slice of wilderness-perfection has to offer. Thank you for ensuring that children will be able to explore and adventure here forever,	NS	X
N/A	Form Letter Template	8	Non-Variant	GEN	Multiple	League of Women Voters MN	FL40	1	The Final Environmental Impact Statement on PolyMet's copper/nickel sulfide mine proposal is inadequate; it will not protect the lakes, rivers and streams in the Lake Superior watershed and it threatens the BWCA. Please Reject the PolyMet mine proposal. The following highlight some of my concerns: 1. The mine would destroy or damage 7,680 acres of prime wetlands at the headwaters of streams leading to Lake Superior. These are irreplaceable. 2. It would result in centuries of toxic drainage from more than 500 acres of 20-story waste rock piles and the mine pit. This drainage would require treatment "indefinitely." That means "forever." 3. Sulfates and mercury released from the mine would increase mercury contamination of fish, already a problem in the area. One in ten infants in NE Minnesota is born w/ excessive mercury levels. 4. The financial risk to future generations would be enormous. Who would pay for centuries of active water treatment? What about spills and accidents? Mine sites are the #1 liability of the taxpayer supported Superfund cleanups, with a bill exceeding \$50 billion to date.	NS	X
N/A	Form Letter Template	9	Non-Variant	GEN	Multiple	Sierra Club	FL42	1	I oppose the PolyMet NorthMet copper-nickel sulfide mine. The Final Environmental Impact Statement (FEIS) is inadequate under federal and state standards. I object to the U.S. Forest Service (USFS) proposal to exchange Superior National Forest (SNF) land for the proposal, and oppose issuing any federal permit allowing PolyMet to destroy wetlands and impair waters.	NS	X
N/A	Form Letter Template	9	Non-Variant	GEN	Multiple	Sierra Club	FL45	4	I oppose any federal Clean Water Act permit for discharge and wetlands destruction / impairment because it would degrade surface and groundwater, impact water quality standards, and adversely impact municipal water supplies, aquatic life, wildlife, human health and welfare, environmental justice and special aquatic sites. T	NS	X
4712	Form Letter	1	Variant	GEN	Nancy Conger		414	1	Just because it's proposed doesn't mean we have to accommodate it. There is no way that the plans in place are guaranteed to work -- as you well know, no sulfide mine has yet been successful in preserving the environment. This is a BAD DEAL for Minnesota!	NS	X
25564	Unique			GEN	nancy conger		1199	1	Please do not approve a sulfide mine. As you know, EVERY example of these mines has leaked and poisoned its surroundings. As you also know, companies that promise "forever" tending of the toxic waste can go out of business or declare bankruptcy and leave Minnesota with a problem forever, at our expense. There is no way this is good for Minnesota --oh yeah, a handful of jobs, for a handful of years. In exchange for forever-corruption of our age-old and irreplaceable natural resources. Just because something is proposed doesn't mean we are obligated to say yes. This is a very bad deal.	NS	X
12638	Unique			GEN	Nancy Gibson		758	3	I know the laws favor mineral extraction in this State. but this plan is only a piece of paper coming from a company that has no mining experience and questionable finances. Their partner Glencore won the “Pig of the Year” award at last year’s prestigious Davos Financial Conference. Glencore was cited for their horrific environmental and labor practices. Does Minnesota want that risk?	NS	X
27901	Unique			GEN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3280	1	The proposed mine would be the first-of-its kind in Minnesota. It would affect land, water and air over a broad geographical scope – extending to both the St. Louis River/Lake Superior watershed during the mine’s operations, and into the Rainy River Basin and the Boundary Waters Canoe Area Wilderness postclosure. Its impacts would be felt not only during its operations but generations to come – more than 200 years.	NS	X
27901	Unique			GEN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3426	144	There is no question that the Project here will result in the permanent loss of 913.8 acres of wetlands that have high quality and functional values. And as discussed in section 1.J, nearly 2,000 acres of coniferous bog wetlands will be directly impacted by mine pit(s) and stockpiles, or indirectly impacted due to drawdown and/or pollution. The no-action alternative and denial of the 404 permit are the only means offered in the FEIS to avoid the loss of these irreplaceable resources.	NS	X
23515	Form Letter	1	Variant	GEN	Nancy Songer		956	1	The track record of these mines is 100% failure. Why are we looking any further????	NS	X
27408	Unique			GEN	Nicholas Eltgroth		1721	1	I am completely opposed to the sulfide mining that NorthMet is applying for in NE Minnesota. There is no way they have, or will use the technology to do sulfide mining without polluting the soil and land around the mine.	NS	X
1213	Form Letter	1	Variant	GEN	Nicholas Huelster		276	1	I am a Minnesotan and a frequent visitor of the Boundary Waters Canoe Area Wilderness. I believe that Minnesota must protect its natural heritage,	NS	X
1213	Form Letter	1	Variant	GEN	Nicholas Huelster		277	2	Although there are sound rational and scientific arguments why the mine project would do more harm than good, I am also of the belief that we must on principle be even more automatically protective of our wilderness areas, and this mining project is but one large example of a business-minded decision making process that immorally obstructs what should be a universal Minnesotan principle of environmental conservation of our natural heritage.	NS	X
28097	Unique			GEN	Noreen Tyler	Izaak Walton League Minnesota Division	3454	1	There seems to be a stubborn unwillingness to consider practical mining practices that would reduce the damage to public resources from the absolutely unacceptable levels proposed in this mine plan. Cost alone should not rule out these practices! We say, leave acres of wetland destruction and drainage; active water treatment required in perpetuity to control toxic seepage; and a refusal to consider underground mining, or dry storage of tailings, which would reduce these damages to the public resources. This is a shameful proposal, which passes these resource damages on to future generations, and is not worthy of serious consideration by the state of Minnesota.	NS	X
26	Unique			GEN	Norman Lee		78	1	Any risk to the natural resources of northern Minnesota is unacceptable.	NS	X
26	Unique			GEN	Norman Lee		79	2	The true value of the natural resources of northern Minnesota can best be appraised by the people who have grown up in the area. Those who have grown up in northern Minnesota, gone hunting and fishing in undeveloped areas of the north woods, experienced the changing seasons of the north woods, and seen the variety of animals and plant life understand the true value.	NS	X
26	Unique			GEN	Norman Lee		80	3	At what level of development do we tell the mining companies that enough is enough. Especially when there is a risk to the entire eco system. Minnesota has made it's sacrifice to the nation during World War II by allowing the destruction of many acres for iron ore mining and the greed has not subsided since that time with the mining of taconite. When is enough enough?	NS	X
26	Unique			GEN	Norman Lee		81	4	Please reject additional mining in northern Minnesota on the basis that any risk to the natural resources of our north land treasure is unacceptable.	NS	X
30479	Form Letter	1	Variant	GEN	Paige Tighe		2798	1	Please stop Polymet from starting this project.	NS	X
29829	Form Letter	1	Variant	GEN	Pamela Walhovd		2648	1	WE AND YOU ARE THE STEWARDS OF THE LAND WE ALL MUST STAND UP AND PROTECT THE LAND, WATER AND OUR NATURAL RESOURCES. YOU CAN NOT FIX NATURAL RESOURCES AFTER DAMAGE THAT IS WHY THEY ARE CALLED NATURAL. PLEASE DO NOT ALLOW POLYMET OPERATE ANYTHING IN OUR STATE...YOU CAN NOT FIX DAMAGES IN THE FUTURE FROM A COMPANY THAT MAY NOT EVEN BE IN BUSINESS IN THE FUTURE AND WHY WOULD THE PEOPLE OF MINNESOTA WANT TO FOOT THE BILL FOR DAMAGES BY A COMPANY THAT PROFITED OFF OF THE DAMAGE TO OUR LAND AND WATER. PLEASE STOP POLYMET. DON'T ALLOW IT. STOP BEFORE IT IS LOST AND DESTROYED OUR LAND CAN NOT BE REPLACED. DO THE RESPONSIBLE THING AND PROTECT OUR STATE.	NS	X
30481	Form Letter	1	Variant	GEN	Pat Collins		2799	1	Please stop Polymet	NS	X

¹ Issue - the table for reference is on the tab "Codes, Terms and Definitions"
² Response ID - the table for reference is on the tab "Codes, Terms and Definitions"

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
30482	Form Letter	1	Variant	GEN	Pat Tammen		2865	1	Leave the ore in the ground-for less than 1% copper, 99% waste-digging up the earth for this + less than 350 jobs-the mine is not worth it ruiing our water, wetlands, fish and all living things that need clean water. Thanks for reading this!	NS	X
27898	Form Letter	1	Variant	GEN	Patricia Isaacs		2221	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
27898	Form Letter	1	Variant	GEN	Patricia Isaacs		2222	2	I personally have three major objections to the mine.	NS	X
24685	Unique			GEN	Patricia Richard Amato		1081	1	We only have one EARTH. Why not protect it?	NS	X
25754	Unique			GEN	Paul Garding		1220	1	This mine has got to be the most insane proposal I have heard of in a long time. There is no way to do this safely especially in such a pristine area. This is nothing but a big con job where most of the money will eventually end up out of state if not out of the country. They cannot possibly put up enough money for keeping this safe for the next few hundred years. The gain to the local economy will be a net lost once the loss of tourism is factored in. Please use my tax dollars wisely for the benefit of all Minnesotans and fight this. We are not that desperate for these minerals that we need to put this area at risk	NS	X
30490	Form Letter	1	Variant	GEN	Paul Mandell		2866	1	FEIS supposedly used reverse osmosis to test but I'm told they don't even use sulfide in the test but taconite. They can't even use the proper technology.	NS	X
6129	Form Letter	1	Variant	GEN	Paul Musegades		450	2	Next, think of the superfund pollution areas around Minnesota that have been left behind by companies that had good intentions, but poor follow through. 20 years of jobs and 200 years of cleanup just sounds terrible to me. Would you ask the People of Minnesota to remodel the state capital if the the projection was that the building would last only 20 years? Think of the future of Minnesota and invest in businesses that will last a lifetime.	NS	X
3347	Form Letter	1	Variant	GEN	Paul Sears		370	1	That water treatment would be needed for hundreds of years is unacceptable. Consider that it has not been determined for HOW MANY hundred years that water treatment will be required. 400? 900? 14,900? How can this proposed mine be justified to uncountable future generations? What will they think of us, if we allow this mine to happen?	NS	X
28879	Unique			GEN	Paul W Swannstrom		2367	1	What disturbs me most about polymet mines plans is that there is no end to The destruction it does with their entire operation. They can not return the land to the condition it was in before they started operations. What ever happened to the doctrine of Do No Harm?	NS	X
8152	Unique			GEN	Paul White		571	1	I consider myself an environmentalist yet I fully support this project and think that not only will it benefit MN and the local communities with desperately needed jobs, but it can be an example of how to do mining the right way! It is certainly better to do it with care than to have mines that are subject to almost no oversight in foreign countries. It makes no sense to pollute the planet in China or Chile to gather raw materials and then ship them to the USA. In my opinion, the Final EIS for PolyMet's NorthMet Mine is beyond adequate.	NS	X
27085	Unique			GEN	Paula Maccabee	Water Legacy	3007	1	WaterLegacy is a non-profit organization formed to protect Minnesota's water resources and the communities that rely on them. We have approximately 10,000 members and supporters across the state of Minnesota who may be affected by the adverse impacts of the proposed PolyMet NorthMet sulfide mine due to their exposure to pollutants in air, drinking water, or food, their use of affected resources for fishing, gathering wild rice, hunting or recreation, and due to potential impacts on their patients and communities of sulfide mining health impacts, financial and socioeconomic liabilities and loss of ecological services.	NS	X
27085	Unique			GEN	Paula Maccabee	Water Legacy	3143	132	These comments, WaterLegacy's comments on the SDEIS, and the expert opinions and references they cite, demonstrate that the FEIS is inadequate to support the determinations the U.S. Forest Service is required to make. The FEIS has based its conclusions regarding water quality on unsubstantiated assumptions regarding the collection of polluted seepage and leakage, failure to investigate geochemistry, inappropriate selection of compliance points, failure to analyze relevant pollutants, and improper comparisons of pollution with "evaluation criteria" instead of water quality standards and conditions that don't accurately reflect a no action scenario. The FEIS has used scientifically indefensible methods to minimize mercury impacts and avoid analysis of methylmercury impacts and has, thus, failed entirely to assess a highly significant risk to aquatic life, human health, tribal resources and impacts to Indian trust lands. The FEIS has provided no evaluation of the risks of northward flow of pollutants through the 100 Mile Swamp and to the Rainy River watershed and no evaluation of the indirect impacts of mine site and tailings site dewatering and pollution on wetlands, thousands of acres of which are in the 100 Mile Swamp and the Upper Partridge River, federal lands of high biological diversity. The FEIS has failed to analyze impacts of dam failure or failure of seepage collection and has used unsupported assumptions to avoid consideration of the transport of sulfate, mercury and methylmercury downstream to the St. Louis River and to reservation waters.	NS	X
27090	Form Letter	9	Variant	GEN	Pertti Laine		1653	1	I find it difficult to believe that in this day and age, with all of the scientific facts regarding the degradation of our environment, that there would even be ANY conversation which would put at jeopardy any more of the environment and the people of this planet to more toxins. Especially so some corporation can turn a profit at the expense of our needs to live in a toxic free environment to just survive. ANYONE even considering this should be ashamed of their self centered, greedy, soulless existence. I doubt anyone of them would be anywhere near this mine and expose themselves. I hope someone with the authority to stop this wakes up and sees how appalling the concept is, never mind the reality of the damage it will inevitably cause to everyone and everything in its path.	NS	X
24225	Unique			GEN	Pete Gemuenden		1014	1	When do words spoken ever have meaning any longer with our government? Credibility is best understood by action and making your yes's yes and your no's no! Please no more nonsense....APPROVE the POLMET PROJECT as credibility and momentum are essential and I'm on your side for awhile!	NS	X
23990	Unique			GEN	Peter Karhatsu		987	1	Greetings, I wanted to share my opposition to the Polymet Mine. As a Minnesotan and an avid outdoorsman, I believe that the risks far outweighs the monetary gains. The long term Reverse Osmosis plan is proof positive that the designers know the system will produce waste for a very long time, but RO is low capacity, prone to fail and requires manual, regular maintenance. We're talking about decades, if not centuries of waste "management". It seems the general way of dealing with the tailings is to store it, wait for a breach, and pay the fine. The pristine nature of the adjoining watershed should not even allow for this project to ever have taken root, let alone get this far along in the process. Please show the people of Minnesota and the greedy, foreign-owned corporations that we will not bow to the almighty dollar and sellout our single most important resource, clean water. The world market doesn't need the metal, we don't need the temporary jobs and the pollution will happen, as it has happened in every single Sulfide mine so far. If you haven't yet seen the most recent mine disaster, the Samarco mine in Brazil, or not long before before that in Colorado, or most relevant, the Mount Polley Mine disaster, which is most like the Polymet, here you go: https://www.youtube.com/watch?v=T9_0DWpUcOE https://www.youtube.com/watch?v=TtZmpPVFiHk https://www.youtube.com/watch?v=VYYwzAvQIF8 Also famous was the Marcopper Mining Disaster - 1996	NS	X
9846	Unique			GEN	Peter Krause		648	3	if it is true, as it seems to this observer, that you are basing these deliberations primarily on data provided by the mining company then you are basically letting the fox design the hen house.	NS	X
27598	Unique			GEN	pipekeepers		1781	1	why do we need more mines tearing up our world? where is the leftovers going to go? into our rivers and swamps. Why do we want to give away (trade) more of our awesome woodlands so they can make more money. people come to N MN from all over the world to see our beautiful woods will the come to see a big hole?	NS	X
30503	Form Letter	1	Variant	GEN	Quentin Ikuta		2868	1	Stop	NS	X
14656	Form Letter	1	Variant	GEN	Quincy Osborn		796	1	Water is the greatest natural resource in the world, not only is this mine project irresponsible to the future, it is economically a bad decision. Mines come and go, our lakes and trees need to be protected as part of our way of life in Northern MN. Please use your best judgement and don't fall into the trap of thinking only of the initial impact this project would have on the economy. Even in a best case scenario this project will have a negative impact on one of the greatest resources in the world and the economy that relies on it. I request a specific response to my comments.	NS	X
25757	Unique			GEN	r k		1223	1	This is not common sense. The EIS must prove without a doubt that the operation will be safe and leave no hazardous waste. That doesn't appear possible with current methods. It could endanger pristine water sheds that are connected with streams and rivers of northern Minnesota, affecting human water supplies as well as the health of hundreds or thousands of acres of the environment. These ventures always become depleted, leaving devastation.	NS	X
351	Unique			GEN	rachel susan		175	1	I am writing to voice my opposition to the proposed sulfide mine in the Babbitt/Hoyt Lakes area, and my objection to the implication that the project	NS	X
351	Unique			GEN	rachel susan		179	5	I object to the advancement of this project based upon the shallow nature of the EIS. I also object to the EIS under the concept of the Precautionary Principle, which it appears is being ignored.	NS	X
8237	Form Letter	1	Variant	GEN	Ralph Butkowski		572	1	This plan goes against the clean water and clean environment ideals that Minnesotan's stand for, and it is difficult for me to accept the idea that we stand for these principals in name only.	NS	X
8237	Form Letter	1	Variant	GEN	Ralph Butkowski		573	2	We must not forget the work of those who fought polluters in the same region of the state, and we must diligently guard against a repeat of these difficult times.	NS	X
8237	Form Letter	1	Variant	GEN	Ralph Butkowski		575	4	I regard the mining project as having high potential of water, land and air contamination with risks to our health and environment that could not be readily reversed. Once approved and put in place, it would be extremely difficult to undo any damage as we should remember from the past.	NS	X
30507	Form Letter	1	Variant	GEN	Ralph Karsten		2870	1	the fact that the rules were changed by the state smacks of corruptions--money passing from Polymet to the officials in the state.	NS	X
26941	Unique			GEN	Randy		1486	1	Let this project go forward the jobs and economy needs this they proved that it can be done safe and will be good Stuarts to the environment	NS	X

26010	Unique			GEN	Ray Desrocher		1256	1	I believe Polymert should be given the go ahead already.	NS	X
27231	Unique			GEN	RB Hughes		1695	1	Mining-No! Ecotourism-Yes!	NS	X
6855	Form Letter	1	Variant	GEN	Rebecca Dudley		427	4	Please choose our state over big mining adventures.	NS	X
6263	Form Letter	1	Variant	GEN	Rebecca Dudley		461	3	Mining equals pollution.	NS	X
6855	Form Letter	1	Variant	GEN	Rebecca Dudley		517	3	Mining equals pollution.	NS	X
25263	Form Letter	1	Variant	GEN	Rebecca Vincent		1146	1	I urge you to reject Polymet's proposed mine for Northern Minnesota. Polluting and destroying Minnesota's natural treasures is not the way for a sustainable future for the region.	NS	X
25263	Form Letter	1	Variant	GEN	Rebecca Vincent		1147	2	Minnesota's natural and wild areas are treasures that need to be protected and preserved for the present and future. To pollute and destroy these lands and waters for the short term gain of a mining company is unconscionable.	NS	X
25263	Form Letter	1	Variant	GEN	Rebecca Vincent		1148	3	Please do what is morally right and protect the land you are commissioned to protect by rejecting PolyMet's proposed sulfide mine.	NS	X
25692	Form Letter	1	Variant	GEN	Rebecca Wiinanen		1215	1	Concern for jobs in the area of the proposed mines is real as it is in many places, but the drastic devastation of the ecosystem cannot be justified for a few temporary jobs. I am saddened that we Minnesotans have thus far buckled to the unrealistic promises of unethical conglomerates. I write this letter because I optimistically believe Minnesotans are capable of learning from the mining messes around the world and I give my support to my US and MN government to reject this mine. Please do not allow Polymer and others to mess up our waters then run. Please use our tax dollars to enable sustainable jobs and a diversified economy. Support small business lenders, the installation of broadband, and transition away from boom-bust industries such as hard-rock mining.	NS	X
29019	Unique			GEN	Rev. Elton W. Brown		2383	1	Thanks for extending the Comment Period. However, the massive amount of technical material in the PolyMet mining proposal remains more than my brain and time can handle. I attach below my original comments, because as far as I can see, this third version of the EIS still does not adequately address my concerns. The truly difficult issues, it seems to me, are being ignored, glossed over, or postponed. My fear is that, once the mining permits are issued, it will be too late to press the corporation on matters such as adequate Financial Assurance or production taxes; by then they will use the promise of imminent jobs as leverage to get their way. All this is crucial, because -- as we have been told by mine officials and politicians -- PolyMet is the "snowplow" paving the way for the eventual approval of Twin Metals and other mine projects. Rep. Rick Nolan hopes to expedite PolyMet's permitting by assuring us with this promise: "Make no mistake - the monitoring and enforcement process will be vigorous" -- and yet I see no serious effort to increase the funding for regulatory agencies nor any assurance that the Clean Water Act will be enforced with mine shutdowns and meaningful financial penalties rather than by tolerating violations and issuing variances. In addition, there is a very important new matter that is not considered in this FEIS, namely, the recent international climate change agreement. The carbon footprint of copper/nickel mining, including its sources of energy, will be enormous, flying in the face of our nation's commitment to reduce greenhouse gasses. The sulfide-mine industry in NE MN should at the very least be put on hold until these critical issues can be resolved and until the mining technology has improved to minimize the very real risks of environmental degradation.	NS	X
29273	Form Letter	1	Variant	GEN	Rhoda Liebo		2483	4	And all the locals that support the notion of a safe mine would definitely miss the fish and game that would be killed by these mines.	NS	X
29513	Form Letter	1	Variant	GEN	Richard Fuller		2535	1	The environmental risks of the proposed PolyMet NorthMet mine are too great to allow the proposal to become real.	NS	X
15893	Form Letter	7	Variant	GEN	Richard Hunt		793	1	We are losing valuable natural resources and while corporations are profiting, we are left with pollution and a permanent loss of something we were entrusted to hand down to our children. Once the Great lakes are polluted, we are affecting not only Minnesota, but many districts in the surrounding area and Canada that depend on the pristine waters of the Great lakes for drinking and the tourism that brings in most of the livelihood for many that live in the areas. That is too much to lose for the profits of a handful of FOREIGN investors. Don't let money cloud your judgement, Say NO!	NS	X
160	Form Letter	1	Variant	GEN	Richard Mammel		151	1	PolyMet has been a terrible dream that became an awful nightmare. Relieve us of the apprehension that their destruction will vanish to never happen.	NS	X
17918	Unique			GEN	Richard Mitchell		823	1	Please do not allow polymet to mine copper. It will ruin our waters. Would this be a wise move when clean waters are a diminishing resource on the planet? I think not.	NS	X
30074	Unique			GEN	Rick Billmeier		2801	1	I am writing to let you know that I am strongly against allowing any copper nickel mining in or near BWCA or the Superior National Forest. I have researched sulfide mining trying to understand how anyone that cares about the future of Minnesota can seriously consider allowing such a risky proposal. I do not think the FEIS can claim that it has done an "intensive, scientific examination of environmental, social and economic aspects of the proposed project," by using, or relying in any way, on the self-interested "water model" or any other claims made by PolyMet or its consultants. I believe Minnesota should require a higher standard and demand actual proof BEFORE issuing any mining permits!	NS	X
10464	Form Letter	1	Variant	GEN	River Point Resort Outfitting Co.		688	1	As a citizen of Minnesota and a resident and business owner in Ely who lives on Birch Lake and the South Kawishiwi River in the Superior National Forest please accept these comments. The PolyMet NorthMet Final Environmental Impact Statement (FEIS) proposed on 6,700 acres of public land in the Superior National Forest, is a bad plan for Minnesotans and should be rejected with all permits denied.	NS	X
10464	Form Letter	1	Variant	GEN	River Point Resort Outfitting Co.		689	2	This flawed sulfide-ore copper mine plan, to be located between the Boundary Waters and the Lake Superior watersheds, the first of its kind in Minnesota, risks polluting the headwaters of both iconic places with toxic metals and acid mine drainage for hundreds of years. We all know, that if permitted, this type of mining activity will not stop, because based on the geology, mining of the Duluth Complex could extend eventually all the way to the Gunflint Trail. I do not endorse exchanging our public federal land for a mine site so that our present lakes district can be turned into a giant mining district. Our region would never recover from this, and when the minerals are removed, we will have a devastated landscape, polluted water, and air and the present sustainable economy of the Superior could never be rebuilt. Instead, we would get hundreds of years of pollution.	NS	X
10464	Form Letter	1	Variant	GEN	River Point Resort Outfitting Co.		692	5	PolyMet mine is the tip of the iceberg for sulfide-ore copper mining companies wishing to stake their claim in northeastern Minnesota. There will be a half dozen or more mines with miles of open pits, wasterock piles, intrusive roads and corridors, concentrator plants, railroad lines, heavy truck traffic...all dissecting the heart of the Superior National Forest. Despite years of citizens raising concerns about the impact PolyMet would have on Minnesota's clean water legacy, and despite some 50,000+ comments against PolyMet's Supplemental Draft Environmental Impact Statement (SDEIS) in 2014, PolyMet's plan has not changed much at all. Considering that our clean water is at stake, PolyMet is not worth the risk.	NS	X
10464	Form Letter	1	Variant	GEN	River Point Resort Outfitting Co.		695	8	This is a bad plan for Minnesota and one that I adamantly oppose. It is up to you, the decision makers, to safeguard human and environmental health.	NS	X
2260	Unique			GEN	rkhudnut@aol.com		316	2	It is inconceivable that Minnesota would even consider granting a permit to PolyMet, which states that "We have not developed or operated any mines, and we have no operating history upon which an evaluation of our future success or failure can be made."	NS	X
2260	Unique			GEN	rkhudnut@aol.com		318	4	For these reasons alone, no permit to PolyMet should be issued.	NS	X
9824	Unique			GEN	Robert & Anne Haas		639	1	Please, protect the Superior National Forest from this project, which isn't allowed, but will be manipulated using a land swap. Do not rubber stamp it. It is not in the public interest, which goes against your stated mission.	NS	X
9824	Unique			GEN	Robert & Anne Haas		642	4	Please reject PolyMet's proposal, and keep the proposed mine site under the current ownership and protections provided by the Weeks Act, Endangered Species Act, the Superior National Forest Plan and other laws.	NS	X
27863	Form Letter	1	Variant	GEN	Robert Eliason		2210	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal.	NS	X
27114	Unique			GEN	Robert Essian		1656	1	I do not believe the FEIS is an acceptable document	NS	X
27114	Unique			GEN	Robert Essian		1661	6	I just think Polymet and all co agencies have NOT done enough to satisfy my concerns and if they haven't then would potentially ruin well sites, water systems and food sources. We cannot risk this. Besides, we have so many of these type mines sitting idle all over the word since the implosion of China as marginal buyer of the metals we have buried still, that we surely have the time to study this project for much longer.	NS	X
3451	Form Letter	1	Variant	GEN	Robert Gore		379	1	Why would we take any action that has the possibility of destroying what we live most about Minnesota? It's crazy. There is risk. It IS a possibility. That means it can happen. Your names would be associated with this destruction. Earthen dams can break. 1,000 year flood events occur. We are setting a poisonous trap that will survive 100ss of years. It is not worth it. I worked in economic development for a year up on the Iron Range, and I can tell you nothing will change until the Iron Range is able to move away from mining. Approving the mine is foolish. 300 jobs is a pittance for what we are risking.	NS	X
27828	Unique			GEN	Robert Hagen		238	1	I am writing to express my opposition to the proposed PolyMet mine.	NS	X

3558	Form Letter	1	Variant	GEN	Robert Oliva		372	1	I feel that mining is shortsighted and betting the farm on a few years if mining over a lifetime of pristine beauty is ridiculous.. The Ely area economy is doing fine and it's tourist based economy will only grow as the population grows. How many true wilderness areas are left in this country. Not many, How many places on the planet are left with clean water? Water that you can drink directly from the lakes without any ill effects. Not many. I know a few people dream about the hey day of the sixty coming back. What killed a lot of small towns wasn'tt a lack of jobs it was progress. Mega malls, big box stores and the internet. I can get things cheaper at Amazon.com. Delivery right to the house the next day. A mine might make a few people prosperous but not necessarily the community as a whole. We do have mines in northern Minnesota and many of these communities don't seem very prosperous. Not as prosperous as mining proponents would lead you to believe. I'm willing to bet Ely's future on a pristine area of Resorts and wilderness over growth and mining. Let's look out 50 or even 100 years like our leaders of the past were willing to do. As the population of the planet grows there will be fewer and fewer areas like the arrowhead region left. The kind of Mining proposed for the Ely area has a lousy track record. Let the big mining companies prove their new mining practices some place else. The head of the Kawishiwi river, which leads directly into the heart of the BWCAW is not the best place to try this out. The minerals will still be there after these new mining practices are proven. Once an area is polluted it is almost impossible to bring.it back. Holing ponds don't always hold and water treatment aren't always effective.	NS	X
23642	Unique			GEN	Robert Saxton		963	1	he copper-nickle sulfide mine has strong potential to harm our food and our water for generations. That is enough to keep it out of our state. When California and the West dry up from climate change, where will there be clean water? Here. Unless we pollute it. No mines near our water resources. Never.	NS	X
26792	Unique			GEN	Robert Taylor		1466	1	This would be a total disaster to have something like this happen up here in the Northland.	NS	X
27690	Unique			GEN	Robert Topliff		2077	1	IN MY ESTIMATION POLYMET HAS NOT MET THE STANDARD FOR PROCEEDING ON THEIR EXTRACTION PROJECT.	NS	X
21425	Form Letter	7	Variant	GEN	Robert Woolfolk		843	1	National forests are for the American public, not for private companies. The resource extraction industry, including mining companies, has proven time and time again that their only concerns are taking as much of a natural resource from an area for as little expensive as possible, selling the extracted resource for as much as possible, and then moving out of an area once it is completely stripped of resources while abrogating any and all responsibility for cleaning up and restoring the environment post-extraction.	NS	X
23631	Form Letter	1	Variant	GEN	Roderick Owre		217	1	How smart is it to pollute the environment we depend on to continue living? Have you all lost touch with spirituality in nature?	NS	X
23631	Form Letter	1	Variant	GEN	Roderick Owre		962	2	If the government permits sulfide mining to persist, knowing it leads to severe degradation, they are complicit in greed and negligence, both sins. Don't let these cunts poison our church.	NS	X
27031	Unique			GEN	Rodney Booth		1630	1	I am writing as a private individual to express my support for the final NorthMet Mining EIS. The document is very thorough in detailing how the State of Minnesota will control and limit the environmental impact of this project. I believe that it is time for the permits to be issued and this project to begin.	NS	X
24352	Unique			GEN	Roger Klisch		1029	1	I have been a Minnesota resident all my life and what I really appreciate are the lakes, woods, and natural areas of our state. I visit BWCA annually. While I do recognize that industry provides jobs, the natural treasure we have here is more important to keep untouched. Human civilization has come a long way with technology and yes, with the help of fossil fuels and mining of minerals. But we have also come far enough to see the consequences of overuse of our environment, consumption and waste, and the unsustainable pace of it. Science tells us we cannot keep living in the same way because this planet will suffer severe consequences. We have one home, and humans have now come to a tipping point where we have to now decide to care for what remains and find a way to live sustainably. This project is not only a threat to the BWCA, the northern forests, and watersheds, but continues the devastation of our planet that we can no longer afford. I am also a practical person. I am an electrical engineer and work with machinery and see the uses and benefits of technology. I recognize we do need a certain amount of resources. I use resources just as everyone else does. I do my best to minimize my impact on the planet and I'm working to be a sustainably neutral citizen. If this project could be carbon neutral, not harm our state, and all that is mined from it to be used for renewable or green technologies, then I could consider this. For instance, if all the copper that was mined was mandated to be used for wind turbines and electric cars, then it would be easier for me to support. But generally these projects are all about money and profit, so it forces the cheapest way to extract, process, dump, and sell to the highest bidder. Even with regulations, companies find short cuts just as we saw with the BP Deepwater Horizon project that permanently damaged the gulf coast. When money is the motive then you have negative consequences. If the project is about service to the Earth and to humanity, and it can be done in a sensitive, sustainable, and non-impactful way it could gain my support. I highly doubt there is any consensus on my idea, nor any way to mandate it. But I wanted to voice this as the only way I would ever agree with this project. Since it is unlikely mining could be done in this conscious and sustainable way, then I am in opposition to it. We best recycle to metals we currently have on our planet and find alternative ways to create sustainable living.	NS	X
14945	Form Letter	1	Variant	GEN	Roland Wells		803	1	I appreciate the need for jobs on the Range, but to risk the future of the BWCAW for a generation or two of profits is horribly shortsighted. Please don't make the possible destruction of the BWCAW your legacy.	NS	X
14945	Form Letter	1	Variant	GEN	Roland Wells		804	2	Right now, with copper prices high and unemployment high up there, it's an opportune time for Cu-Ni mining to make its big push, no matter what the cost to future generations. They've been waiting a long time. Please stand firm for our grandchildren's sake.	NS	X
8759	Unique			GEN	Ron Bergh		604	1	Hoping the polymet mine will open soon.	NS	X
30526	Form Letter	1	Variant	GEN	Ron Brand		2873	1	Require independent health risk assessment. Increase tailing seepage protection. High risk for watershed damage/wetlands harm. Environmental impact is perpetual; corporate responsibility is limited and therefore needs to be carefully regulated in the public interest.	NS	X
29246	Unique			GEN	Ron Brodigan		2456	5	Scientific modeling in the FEIS is seriously deficient.	NS	X
20494	Form Letter	1	Variant	GEN	Ron Regal		841	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. The risk of long term harm outweigh the potential benefits of shorter term gains. Other ways can and should be found to address job opportunities throughout the state that maintain a state where people want to live and visit . This has worked in the past. Http://www.mn2020.org/issues-that-matter/fiscal-policy/a-look-back-at-a-state-that-worked A Look Back at a State That Worked "What made Minnesota work? The Time article identified several factors ...made possible a variety of public investments that served Minnesota well over the generations." "Not least among these investments was public education—both K-12 and higher. " "By most reckoning, the reforms that Anderson pushed during his tenure were a success. Regarding the state’s investment in education, State Economist Tom Stinson observed that “Minnesota’s economic record over the last half-century is one most states envy. The reason that occurred was because far-sighted public and private sector leaders figured out they were going to invest in the education of the baby boom generation. " Jobs in the future will be more and more dependent on good educations and economies will be fueled by inventiveness. Http://www.technologyreview.com/sites/default/files/images/jobs.5x650.jpg We need to invest in education, not risky shorter term gains. The promises that for sulfide mining "We will get it right this time" are largely unsubstantiated. Other approaches need to be the forefront of Minnesota's march into the future.	NS	X
2206	Form Letter	3	Variant	GEN	Ron shoden		314	1	The DNR, U.S. Army Corps of Engineers and the U.S. forest service have determined after 10 long, grinding years of study that the North Met Mine project has proven they can and intend to comply with the extremely strict state and federal environmental standards. Obviously, the Polymet opponents do not trust these agencies, which is totally ridiculous. We thank these agencies for their hard work in drawing this process to a very expected positive result. Congrats and "LET'S GET THIS PROJECT STARTED"!!!!	NS	X
23979	Unique			GEN	Ronm430@aol.com		982	1	Please don't negatively affect the environment.	NS	X
2125	Form Letter	1	Variant	GEN	Rowan Glaser		298	1	Is this the legacy that the Dayton name wants to be tied to? http://news.yahoo.com/brazil-mining-flood-could-devastate-environment-years-142842186--finance.html RIO DOCE, Brazil (Reuters) - The collapse of two dams at a Brazilian mine has cut off drinking water for quarter of a million people and saturated waterways downstream with dense orange sediment that could wreck the ecosystem for years to come. Or perhaps one of these? http://www.msha.gov/MSHAINFO/FactSheets/MSHAFACT8.HTM When will we accept alternatives that do not harm the earth or its people? How about now!	NS	X
42	Unique			GEN	rozronrockandroll@mchsi.com		109	1	Anyone who believes this will not lead to a environmental nightmare has their head in the sand or worse! Show me one copper/nickel mine that has not severely damaged the surrounding environment and that report would be false! May the Good Lord have mercy on your soul and all the people who will be subject to it.	NS	X
42	Unique			GEN	rozronrockandroll@mchsi.com		110	2	We are fooling ourselves to believe big money, the people who control it, and legislature's that support it and the things they go after is necessary for our very existence. FOOLISH!	NS	X

27033	Form Letter	1	Variant	GEN	Ruth E. Ulvog		1632	1	I find it completely and totally unconscionable, personally offensive, incomprehensible, and utterly embarrassing that the three government entities/Agencies whose mandates are to safeguard the Natural Resources which belong to the citizens of Minnesota and to the citizens of the United States, to allow themselves, individually and severally, to be blindsided and broadsided by either allowing only information from studies from PolyMet Mining, institutions such as Cornell University, whose researchers were, have been, and are on PolyMet's payroll, as well as their business partners and business interests who are undoubtedly colluding with government agencies and entities so they can make more money at the expense of the health of the citizens of Minnesota and the United States. Not only is there collusion in this area, there is obviously collusion on the part of all these entities that negates any concern for the Federal mandate to safeguard, care for, and keep in Sacred Trust PUBLIC LANDS that include unrenewable resources: including recreation, clean, unpolluted air; clean, unpolluted water, clean, unpolluted lakes; healthy fish and wildlife, and the health of all who utilize an area that is a highly regarded and worldrenown part of Minnesota that is owned by the citizens of the United States. These multinational business industries have an abysmal environmental record and are being led by business people who worship the "Almighty Dollar" and care absolutely NOTHING about the environment or the health of anyone or anything--except lining their already very deep pockets. I have read the final reports, and believe them to be completely biased in favor of the industry. Any reports from other sources--whether they be so-called independent sources or biased in favor of environmental groups, have either been blatantly ignored at worst; and demeaned and negated, at best. Follow the numerous sources from the reporting of Minnesota Public Radio, as they delved into this issue. You will find that ALL BUT ONE of the PolyMet Mining sites in the world; in North and South America in particular, have been nothing short of a complete and utterly embarrassing debacle when it comes to environmental compliance.	NS	X
29758	Form Letter	1	Variant	GEN	Ruth Starks		2609	1	I greatly oppose the PolyMet mine because of the health risks for the citizens in the area, and the long range, costly effects on the environment (which will eventually be left to the taxpayers). We need to preserve Minnesota's clean water legacy and all the great benefits that go with it.	NS	X
9158	Unique			GEN	Ruthanne Fenske		621	1	I SUPPORT the proposed PolyMet NorthMet copper-nickel sulfide mine. The PolyMet Final Environmental Impact Statement (FEIS) is ADEQUATE under both federal and state standards; I SUPPORT the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I SUPPORT issuing any federal permits. The PolyMet FEIS is ADEQUATE under federal and state laws.	NS	X
17889	Form Letter	1	Variant	GEN	Ryan Thompson		821	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. Any risk of damaging our wilderness areas in Minnesota is unacceptable.	NS	X
13597	Form Letter	1	Variant	GEN	Sally Fresquez		789	2	We are stewards of this earth and fortunate to have the rich beauty of Northern Minnesota and the Boundary Waters.	NS	X
4916	Form Letter	1	Variant	GEN	Sally Ruvelson		418	1	The long-term risk of catastrophe far, far outweighs the short-term economic gain. I strongly oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. It really is that simple.	NS	X
4270	Unique			GEN	Sandra and William Lavin		401	1	We are against Polymet .	NS	X
25752	Unique			GEN	Sandra Fox		1218	1	A very bad idea..I hope the State can find a way to stop this crazy project. The jobs argument is based on projections and we all know most of the tasks will eventually be done by robots or by software. How many real actual jobs do they guarantee for 20 years? I know the people in the area want jobs but this project is a false hope for the future. Sometimes people just have to move on when their jobs move elsewhere or cease to exist. This is life..we've all been there. Ask the exfarmers. I especially have no faith that the boundary waters won't be polluted or affected by this project. Where will this company be in 50 years when the leakage begins? Where were will you and I be when our kids remember what we did for some jobs for a few. This is a crazy project..unnecessary...we're better than this in MN.	NS	X
10653	Unique			GEN	Sandy Bergeron		710	1	We have seen time again the aftermath of these mining projects. Companies promise safety and vigilance in overseeing environmental concerns. History has shown that the promises don't hold true. The environmental issues for the water and land in the surrounding areas outweigh the short term jobs they are promising. 100's of years of compromised water and possible, almost inevitable, contamination cannot be the price Minnesota pays for jobs that are not guaranteed, long term and threaten wildlife and humans alike. Please look at the long term for the state, people, flora and fauna and deny this to move forward.	NS	X
27454	Unique			GEN	Sandy Kershaw		1745	1	We vote against Polymet's big dig.	NS	X
29985	Form Letter	1	Variant	GEN	Sarah Elizabeth		4309	1	As an environmental scientist (specializing in soil science, wetland ecology, and spatial analysis), I find the FEIS inadequate under both federal and state standards. There are many weaknesses in the scientific and economic analyses for the Northmet proposal and EIS, including: inadequate statistical and spatial analyses, and, related, insufficient geologic and groundwater sampling complete failure to properly implement the MODFLOW model and address its limitations failure to address well-established shortcomings in acid generation tests and models insufficient analysis of potential impact of freeze-thaw conditions on the hydraulic conductivity of barriers, barrier caps, and natural sediments insufficient analysis of the potential impacts of climate change on water flow and acid generation models vague economic projections	NS	X
29985	Form Letter	1	Variant	GEN	Sarah Elizabeth		4310	2	I grew up on the Iron Range, about 30 miles away from the proposed Northmet site. Taconite mining is a core part of my identity. My father and grandfather both spent decades of their lives working for Minntac and Reserve Mining Co., respectively. I completely support safe and manageable modes of mining. Taconite mining put food on the table every day of my childhood and a summer job at Minntac helped me pay for college. I'm very grateful for the opportunities that mining made possible for me, and I want similar opportunities to be available to my niece and nephew and future generations. But sulfide mining, in my estimation, is drastically different from and much more dangerous than taconite mining. I think a 2008 US Fish and Wildlife-commissioned study of mining operations with acid-forming minerals best sums up why moving forward with the Northmet project would be a foolish and short-sighted decision. http://www.pebblescience.org/pdfs/Final_Lit_Review_AMD.pdf They studied the environmental impact statements and outcomes of hundreds of sulfide mining operations and found the following: "Based on review of the acid mine drainage literature it is clear that severe world-wide ecological consequences, especially for aquatic resources, have resulted from mining ore deposits with acid-forming minerals. Multiple complex geochemical, biological and hydrologic factors create a daunting task for mining engineers to profitably recover mineral resources while preventing discharges of metals and acidity to surface and ground water." I know there are many economic challenges in northern Minnesota and I don't have the perfect answer but I think there are other options that can bring numerous, skilled jobs to the Range for the long term and won't threaten to turn the state's freshwater ecosystems into Superfund sites. Instead of mining, one possibility is mineral reuse and recycling. The current percentage of copper supplied by recycled materials is approximately 30%. That percentage is expected to double in the next several decades. In other words, most of the world's copper supply will soon be derived from copper recycling. Why not be forward-thinking and build copper (and other precious metal) recycling facilities in northern Minnesota? These could supply quality jobs for an indefinite amount of time with a drastically reduced level of environmental risk. The Northmet EIS fails to address alternatives to the Northmet project for improving the economy of Minnesota's Iron Range.	NS	X
24	Unique			GEN	Schmidt Michael		72	1	I am against the nickel sulfide mining project in any form whatsoever. It has not been proven to any degree that this typing of mining is long-term safe to the watershed and environment of MN or anywhere in the world.	NS	X
22343	Unique			GEN	Scott DyAnne		864	4	Individual people representing the co-lead agencies will determine the adequacy of PolyMet's FEIS. People, not agencies, are in a position to prevent such a legal loophole from being egregiously misused. They need to scrutinize PolyMet's FEIS further to the most minute detail. Otherwise, those individuals will go to their graves knowing they could have made responsible decisions, but chose to ignore them.	NS	X
5972	Form Letter	1	Variant	GEN	Scott Cram		440	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. The final environmental impact statement is seriously lacking in detail and DOES NOT meet both federal and state standards. The proposed mine will be prohibitively expensive to reclaim so the likely result is the company declaring bankruptcy and then nothing gets cleaned up. Please do not approve this mining operation. A specific response to my comments would be appreciated.	NS	X
54	Unique			GEN	Scott Einbinder		131	1	Copper/nickel mining in or near an environmentally sensitive area or any area prized and used for recreation is just a bad idea.	NS	X
24689	Unique			GEN	Scott Frank		1084	1	I strongly disagree with any form of copper/nickel mining in the state of Minnesota, especially in such a fragile ecosytem as northeast Minnesota. Unfortunately from what I've seen, it looks like this form of mining will become reality in Minnesota; and for what? To employ a few hundred people for the next 10 years until the copper/nickel commodities market drops, and then those miners will become unemployed like the steel workers are. It seems ridiculous. I have been in counties in Colorado were the water table in the entire county was undrinkable because of copper mining. Please, please, please reconsider your acceptance to these mining plans!!	NS	X
26830	Unique			GEN	Scott Meyer		1472	1	My concern is the impact Polymet will have on the lives of the people and animals living here. I believe Polymet is a hazard to every living thing here. I know most of the people here are just looking at the jobs and how much money they would make and not looking at the environmental impact their mining would have and the hazards it would bring. This is just my opinion but Polymet is a hazard to the communities up here on the range.	NS	X
29231	Unique			GEN	Scott William Mills		2449	5	5) Given items 1,2 and 3, the loss of ecological resources was not adequately assessed.	NS	X
26723	Form Letter	1	Variant	GEN	Scott Wolff		1440	1	I am opposed to the development of copper and nickel sulfide mines proposed for NE Minnesota.	NS	X
541	Unique			GEN	Shawn Roed		233	1	Vote NO!	NS	X

541	Unique			GEN	Shawn Roed		240	3	Even With Modern Technology, Disasters Happen ? A landslide occurred at the huge Bingham Canyon open-pit copper mine in April 2013. Reuters News Service reported: “A landslide at Rio Tinto’s Bingham Canyon mine in Utah extended farther into the pit than predicted, and there was greater damage to equipment than previously estimated, Rio’s Kennecott unit said on Friday. Kennecott Utah Copper, which operates the mine . . . said it had not yet determined the impact of the slide . . . or a time frame for resuming mining operations.” More than two hundred people lost their jobs—more than half of them permanently. At Summitville Mine in Colorado pollution spilled from a containment pond and impacted all aquatic life for 18 miles in the Alamosa River. At Mike Horse Mine in Montana 1 million cubic yards of metals-contaminated mine waste is piled behind an eroding tailings dam at the headwaters of the Blackfoot River, an important trout river; a failure of a prior dam poisoned the river for years, causing fish kills and environmental damage for miles downstream. A leak in a Charleston, West Virginia storage tank that held a chemical used in the coal mining industry polluted the water supply of three hundred thousand people for several weeks in early 2014; economic harm has reached \$61 million and continues to increase. ? The Montcalm Mine, Ontario closed abruptly after structural changes and unforeseen ground movements threatened the underground mine. Tailings dams for mining waste storage fail; on average one major tailings dam failure occurs each year. Industry’s track record is full of examples of unintended consequences: A vast landslide (about one square mile) caused by heavy rains on a slope that had been clear-cut by loggers where geologists had warned logging should not occur destroyed much of the community of Oso, Washington in March 2014. Fukushima Nuclear Power Plant in Japan melted down and released radioactive materials following an earthquake and tsunami in March 2011; officials incorrectly assumed the plant was safe because no previous tsunami had ever been high enough to reach the plant site. BP (British Petroleum) oil spill in the Gulf of Mexico in 2010 caused by the explosion and sinking of the Deepwater Horizon oil rig was the largest accidental marine oil spill in history. Exxon Valdez oil spill occurred in Prince William Sound, Alaska in 1989 when an oil tanker struck a reef and spilled crude oil; it is considered to be one of the most devastating humancaused environmental disasters. Oil is still present on the beaches, and the herring population, which is vitally important commercially and ecologically, has collapsed.	NS	X
28488	Unique			GEN	Shirley Huskins		2282	1	Nature/Creation is not meant to be harmed or destroyed in any way that it would be subject to an environmental impact statement.	NS	X
3831	Form Letter	1	Variant	GEN	Shylan Rose		384	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Based on U.S. and Minnesota history of mining pollution and other serious environmental damage from industrial pursuits, I have no reason to believe that this mining would be conducted in a way that would not damage the environment--and the humans that treasure and depend on it for our lives and livelihoods. The few jobs that would be provided by a copper-nickel mine could destroy just as many jobs by damaging an environment that must remain pristine in order to support a vibrant tourism industry, and in order to provide clean drinking water, edible fish, safe swimming, and non-toxic soil to support food plants and natural ecosystems. I have no trust in either regulators or PolyMet to conduct copper-nickel mining AND safeguard the environment. As a former canoe guide in the Boundary Waters and Quetico; as someone already concerned about toxins in Minnesota fish that I would like to eat; as someone acutely aware of how much I depend on a clean, healthy environment for my well-being, and as a daily user of copper and nickel in the infrastructure of my life: I object to this mine. We can recycle copper and nickel that have already been mined. We can also find and create alternatives to the ways we use these metals. We can not find an alternative to a clean environment; we cannot continue to poison our life-support system. It has been reported that this mine may create "some pollution" that may take 100 years or more to clean up. That is absolutely unacceptable. The few people who would profit from this mine would be stealing everything--potable water, nontoxic soil, a healthy healing vibrant ecosystem to live in--from generations of people over an unknown geographic area, leaving them with unsaleable land, undrinkable and unswimmable water, destruction of their tourism industry, and destruction of their health. That is absolutely unacceptable. We can do better and we must. I oppose the PolyMet copper nickel mine as it is currently proposed.	NS	X
26803	Unique			GEN	Solfrid Ladstein		1467	1	the proposed mining project poses incalculable risks to the pristine environment of northern Minnesota.	NS	X
14	Unique			GEN	Spencer Shaver		36	2	I still feel the risks posed by the proposed mine are too great to the state of Minnesota, and know that this type of mining cannot be done safely.	NS	X
25663	Form Letter	1	Variant	GEN	Stacey Schaefer		1208	1	I cannot wait to go to the Boundary Waters with my family. Its natural wildness is a treasure we must preserve. Therefore, I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Too many accidents have happened for us to ignore the impact on the wetlands and water quality of this mine. Please do not let it happen. We must preserve our land, our water, our air and value them more than the short term benefit of the output from a destructive mine.	NS	X
19253	Form Letter	1	Variant	GEN	Stan Jacobson		832	1	I'm writing today to express my opposition to the proposed PolyMet NorthMet copper-nickel sulfide mine.	NS	X
19253	Form Letter	1	Variant	GEN	Stan Jacobson		833	2	As you know, there has never been truly safe, pollution-free mining of the type under consideration. You may have read or heard about the analysis from several business people who concluded that the investment is a "bad deal" from an investor's standpoint. That is relevant because the whole proposal is a based on the assumption that the mining will produce not only jobs, but profits sufficient to protect the MN environment for decades, even hundreds of years to come. Please think about this using the "seven generations benefits" approach	NS	X
28522	Form Letter	1	Variant	GEN	Stephanie Weller-hanson		2312	1	After citing all of the above information, I am truly appalled that our state's Department of Natural Resources would even consider damaging those same precious natural resources, despite the strenuous objections of so many of Minnesota's citizens. I know that the economic realities on the Iron Range are difficult, and, yes, there is the benefit of several hundred jobs in the region for 50 years or so. But when weighed against the cost of vital environments being polluted and requiring cleanup FOR THE NEXT 500 YEARS, there can be no answer to this issue except to soundly refuse PolyMet's proposal. The children and grandchildren of those same miners will thank you and the rest of Minnesota will, too. Please, please don't give in the big mining interests. Stop this mine right now.	NS	X
28878	Unique			GEN	Stephen and Barbara Adams		2366	1	Much as we would like to see increased employment opportunities for residents of northern Minnesota, we feel very strongly that the environmental threats posed by PolyMet’s proposed sulfide mine far outweigh any benefits it might bring. The mine would create polluted water that would need to be captured and treated for 500 years or more. That polluted water could harm both the Boundary Waters and the St. Louis River watershed. We are concerned for the health of those drinking water from the affected areas – especially children – and for the future of wild rice harvesting and the livelihoods of people who depend on tourism and other non-mining industries. We are disturbed by the narrow scope of the Final Environmental Impact Statement, which fails to take into account the full impacts of opening a sulfide-mining district in the heart of Superior National Forest, and in the headwaters of both the Lake Superior and Rainy River watersheds. Also, there are not adequate plans for securing a damage deposit sufficient to protect taxpayers from being stuck with a massive cleanup bill. PolyMet’s sulfide mine proposal simply is not worth the risk to Minnesota’s clean water.	NS	X
24517	Unique			GEN	Stephen Anderson		975	1	I am opposed to allowing copper, nickel, cobalt, etc. mining in MN.	NS	X
28834	Unique			GEN	Steve Blexrud		239	1	After reviewing the available information, I strongly oppose the development of the Polymet mining operation in northeast Minnesota.	NS	X
26659	Unique			GEN	Steve Jay		1432	24	This FEIS does not address numerous substantive questions of critical importance to providing the public with a clear understanding of the purpose, nature, scope, and environmental and public health impacts of the project. I recommend that MN DNR reject the NorthMet FEIS. Second, the USFS should not accept the proposed land exchange and the US EPA and US Army Corps of Engineers should deny any Section 404 permits that would allow NorthMet to pollute wetlands.	NS	X
24708	Unique			GEN	Steve Johnson		1092	1	officer. Not only our family, but our entire state depends on the health of the land and water in our entire state. We have tough winters and getting people to visit let alone relocate to Minnesota is sometimes tough and we have to understand what our strengths as a state are. To me these strengths are the beautiful and healthy natural resources and the well educated people here. Adding the Polymet mine would be shortsighted and would not be a good return on investment as the long term damage inflicted would negatively affect an area that is still pretty well intact. Please keep it that way.	NS	X
2788	Unique			GEN	steve merling		343	1	I am all for this project to go forward!	NS	X
29442	Unique			GEN	Steven gammon		2532	1	I do not agree that the NorthMet Mining Project should be aloud to be mined in the Northeastern Minnesota area because of the threat of possible long lasting pollution to the water, wildlife, land, air, and any other part of the environment and to the present and future generations of the human race	NS	X
29958	Unique			GEN	Steven Gammon		2729	1	I do not agree that the NorthMet Mining Project should be aloud to be mined in the Northeastern Minnesota area because of the threat of possible long lasting pollution to the water, wildlife, land, air, and any other part of the environment and to the present and future generations of the human race !!	NS	X

29325	Unique			GEN	Steven Ring		3694	6	Conclusion: There are many innovative approaches in the proposed design for the NorthMet project. Clearly, they have attempted to come up with a plan to mine sulfide minerals in a water---rich region of the earth that would extract the minerals and preserve the environment. However, it has become clear that they have not succeeded. The ore is so lean that massive amounts must be mined exposing large pits and lots of rock with sulfide metal exposures. The need to treat water for centuries is a significant design failure; it is likely to be impossible. The complexities of the flow of water off the site must be addressed. It is another design failure. Protecting the environment while sulfide mining in an area with large amounts of water is known to be extremely difficult – maybe, it has never been done. Several studies of how well mining operation met their water quality prediction have been completed. The results are daunting. Here is a comment on that from the Minesite Drainage Assessment Group (MDAG). (They are also quoted on a different topic in section 5.2.2 of the SDEIS): “Maest et al. (2006a and 2006b) and Kuipers et al. (2006) compiled comparisons of (a) predicted drainage chemistries before mining to (b) measured drainage chemistries after mining started. They found: --- Three---quarters (75%) of mining case studies with close proximities to waters underestimated (underpredicted) drainage chemistry and thus the downstream environmental effects. This was often due to overestimation of the effectiveness of mitigation measures. “ This is a company that has never run a mine, and thus there is no history with which to judge its capabilities. The agencies are exhibiting extreme credulity to expect that the plan for this project will meet its goals and protect Minnesota’s environment. No design or plan for something this complex is perfect, but the idea that we can “adapt” or “improvise” when some very predictable problems occur that were not considered in the FEIS is unacceptable. These situations are likely to compromise water quality or other resources. Please consider that the design of this project is flawed. We are not producing widgets in a manufacturing plant. This mine will operate in the natural environment with water, sun, snow, ice and storms. It is incredibly risky to accept this EIS as being adequate to actually protect those resources. As it stands, the FEIS leaves far too many unanswered questions, and evaluates far too few “what if” scenarios that have a probability of arising. Those minerals should be left in the ground until a company with a proven track record and a proven design and plan can extract them safely.	NS	X
6149	Form Letter	1	Variant	GEN	Steven Schild		451	1	I oppose the PolyMet mine proposal because the risks to the environment and health are just too great. On numerous projects in the past, numerous companies have made numerous promises about how they'd safeguard against environmental problemsr. And on numerous occasions, those promises have been broken. We as a society simply must stop using wishful thinking as a guide to public policy, as there is no way to undo environmental damage once it occurs. That's especially the case with a mining process such as that would be used in this instance, which is inherently, inescapably risky. Please look to the long-term future rather than to short-term gain in this case. Please don't allow PolyMet to go ahead with this project.	NS	X
26434	Unique			GEN	Steven T. Csargo		1311	1	The Polymet proposed project, by everything that I've read & researched, would be a disastrous project for Minnesota. Our precious Water Resources are at stake. I believe that this project would be a detriment to Minnesota in the long run. Please Reject this mining operation for The Good of Minnesota. Instead, invest our energy & resources in Renewable Energy in creating jobs in Northern Minnesota. Following Denmark's commitment & progress is a great model.	NS	X
29328	Unique			GEN	Susan Lynn		2506	1	I writing to call attention to your primary responsibility as elected leaders that you hold in trust the common property shared by the people of Minnesota. It is your duty to use scientific information to disallow pollution, resource destruction, chemical introduction and other harm to our resources. You cannot allow risk to be taken unless and until conclusive proof exists that such practices will not pose harm. Sulfide mining carries tremendous risk to the water and to the people of our state and the continent. The risk is well documented. Those who are in control of the corporations you are speaking with today are such people as Tony Hayward upon who’s watch the gulf was harmed profoundly by Deep Water Horizon. You are allowing corporations like Antofogasta and Glencore with histories of grave pollution and abuse, of workers, to set up camp in Minnesota to the detriment of the people. While this will put money in the pockets of lawyers and a small host of other people, the people this will take money from will have scant share in the profits and would not want it at the real cost it comes at. We citizens quite literally allow you to take food from people’s mouths by permitting mining companies to leak, ooze, pour or gush sulfide and other chemicals into the water. Sulfide interacts with mercury to produce methylmercury, the kind that lingers in the body, literally indefinitely, and harms babies in their mother’s womb. Mercury is a byproduct of mining. Mercury harms neurological development. Presently 1 in 10 babies born on the North Shore of Lake Superior have abnormally high levels of mercury in their bodies at birth. The St Louis River has such high levels of mercury at present that no plan can be formulated to remove it, and make the fish safe to eat. The levels of mercury in the fish are such that those in our state who seek to sustain their lives eating the fish cannot do so. Half a billion dollars have been spent of the people’s tax money to clean the waste that mining has heftily contributed to in the St Louis River, and still it remains polluted beyond health. It is further endangered now by plans for sulfide mining in the Duluth Complex which stretches from north of Ely to south of Aitkin. We have treaties with tribes that we must honor, that grant them the right to hunt and to fish. If we render the fish inedible we dishonor and eviscerate that treaty. We would like to protect fishing, wild rice harvesting and farming for all citizens of Minnesota and surrounding areas of the Midwest. I ask you to honor the responsibility you have to the people now and in the future. We are being put at risk by decisions to allow risk to our water from Sulfide Mining in the Northeast of Minnesota. Lake Superior holds 1/10th of the nation’s fresh surface water and every person on the continent has a right to that water. It is not something the people can allow you, as the trustees of our lands and water and air, to permit it to be destroyed. We ask that until such time as there is a means to extract the disseminated body of minerals without risk to the water; that you not allow it. Please, uphold your duty to the people to hold their lands in safe trust, with the gravity due, to that duty.	NS	X
29900	Unique			GEN	Susan Lynn		2705	7	We would like to protect fishing, wild rice harvesting and farming for all citizens of Minnesota and surrounding areas of the Midwest. I ask you to honor the responsibility you have to the people now and in the future.	NS	X
25625	Unique			GEN	Suzanne and John Davies		1207	1	Writing to oppose the construction of Polymet in our Northern Minnesota area. There is no sulfide mining of this magnitude that has a track record that Minnesota would want to emulate. Our northern wilderness, Lake Superior Basin deserves better than allowing this foreign owned company to possibly pollute irreversibly for 320 jobs. Mr Cherry's assurances are hopeful scenarios and wishful thinking of sulfide mining history. It is toxic mining and in no way resembles our taconite industry. We have lived in the northland for 45 years and we can do better.	NS	X
30586	Form Letter	1	Variant	GEN	Suzanne L Stennes-Rogues		2878	1	No mining in the BWCAW!	NS	X
17564	Unique			GEN	Suzanne Long		812	1	The threat to the area and the water supply in northern Minnesota is too great. Jobs for the people of the area must be found some other way. The mining companies have no credibility regarding the process nor their promises to clean up or restore their mistakes. Their mistakes cannot be restored. The profit motive by definition and practice prohibits the people (humans) in the companies from best practices that affect the land and water that human beings depend on.	NS	X
25	Unique			GEN	T.C. Smith		74	1	I am deeply concerned about this project; 1- potential negative environmental impacts	NS	X
19021	Form Letter	9	Variant	GEN	Taina Amayi		831	1	Crimes against Nature are causing more problems than admitted by the perpetrators, and their accomplices. Along with the Oak Flats land theft proposed by Senators John McCain, and Jeff Flake (AZ), this is just one more act of war against all living beings upon the Earth. These must not just be limited; they must be stopped.	NS	X
25621	Unique			GEN	Tara McNaughton		1206	1	Please don’t approve any sulfide mines in Minnesota. I’ve reviewed the proposal for containment, I don’t think it is sufficient. The future health of our state, people, wildlife and environment in general is at stake. Why risk all this for a small, short term economic boost. Don’t approve any mine which has even the remotest possibility of poisoning our lakes, rivers or ground water. Fresh water is such a rare resource, don’t mess with it! Thank you for not sacrificing the future good of our state for a short term gain for a few.	NS	X
29356	Unique			GEN	Tara Widner		3699	5	On Balance, the entire PolyMet proposal with its seductive promises of short-term economic gain and its token regard for probable long-term cost, seems like a work of fiction. The proposal minimizes current and future public health risks to the people who live and work in Northeastern Minnesota, skates over the scope of the long-term environmental damage that the mine is likely to cause, ignores the treaty rights of native people, and makes 500 year promises that it is unlikely to be able to keep.	NS	X
24682	Unique			GEN	TC Cowboy		1078	1	The crown jewel of Minnesota is the Boundary Waters area. Allowing this mine is a huge mistake and we will pay for it long after the Polymet and the rest have left the scene!	NS	X
44	Unique			GEN	Tegwin		112	1	Please do not mine, just too crappy on all levels. No Mine!!	NS	X
26759	Unique			GEN	Terrance Wilm		1447	1	It is inconceivable to anyone in 2015 that what has been proposed by PolyMet that irreparable damages will not happen as a result of mining that will only benefit PolyMet.	NS	X
27459	Unique			GEN	Terrie Christian		1747	1	You have an important decision to make about the Polymet mine. I urge you to say no.	NS	X
27459	Unique			GEN	Terrie Christian		1750	4	A few hundred jobs for 20 or so years does not warrant the risk to our Again, I urge you to say no!	NS	X
25162	Form Letter	1	Variant	GEN	Terry Auger		1135	1	As a visitor of many years to the boundary waters, I have grave concerns about any mine in this area. Extractive industries have a doubtful record of meeting their proposed environmental commitments. Please reconsider the wisdom of this mine. We need to recognize as a society that some minerals, due to their location, should remain in the ground.	NS	X
27	Unique			GEN	Terry D Welander		83	1	1. With 1600 volcanoes, 12 tectonic plates covering earth with over 50,000 miles of natural emissions plus volcanic emissions, account for well over 99% of all emissions on Earth, toxic emissions particularly. 2. At much less than 1% of the total emissions on Earth, humanities contribution to pollution is less than minuscule; much less than 1% of Earth’s total toxic emissions. 3. The Polymet project and all human resource projects, being much less than 1% of the 1%; is not and has never been, and will never be a pollution source compared to nature. These above 3 facts have been ignored for at least 10 years, more likely longer, and have allowed NE MN to be turned into an abhorrent Appalachia; lacking investment in highly valuable resources. There is no nickel mine in North America currently.	NS	X
27	Unique			GEN	Terry D Welander		84	2	Meaning any conflict could leave North American civilization in dire straits without a supply of Nickel; threatening civilization; an unacceptable situation. The Polymet mine and other new mines in NE MN will remedy this potentially dire situation; and are very late for not having placed the above 3 facts front and center in getting these investments in humanity moving forward. NASA has pictures of the Sun's solar wind connecting to Earth's magnetic field; transmitting this solar energy to the core of Earth. Meaning, Earth's core can only get hotter; eventually melting Earth's crust; destroying nearly all if not all Earth life. Making nearly all human resource projects an absolute necessity for gaining the resources for humanity to leave Earth; to survive. We all hope these intolerable delays have not cost humanity its existence on other worlds.	NS	X

25617	Unique			GEN	Theresa Hentges		1203	1	I am writing to day to oppose any mining. It has been proven over and over that mining has serious enviromental results. We have way too many lakes and rivers to try to protect from run off from the mines let alone the chemicals seeping into our water aquafillers. We need to be worried about causing shifts in our earth's cores digging mines and causing man made earth quakes. Who will pay for all damages caused by contamination of our water supply etc? What will happen to our wildlife that live in that area? We need to protect our enviroment with forests, wildlife, water, and open fields to keep our eco system in balance not take more away. Northern MN is beautiful with lots of wilderness, forests, and lakes please fight to protect them and not destroy them for mining. We need to be more about protecting what is left as this has a affect on climate changes and everything else. Please no mining.	NS	X
59	Unique			GEN	Theresa Rooney		142	1	I am 100% against the polymet mine Please do not allow this mine here in Minnesota	NS	X
2123	Unique			GEN	Thomas Borbiconi		297	1	I am not in favor of this mining.. these company do not care about the environment only profits I worked in the mining industry and I have seen first hand how irresponsible they can be and they pollute everyday and when they get caught all they do is pay the fine and do nothing more	NS	X
26748	Unique			GEN	Thomas H. Hayden		1446	1	Not not allow any kind of mining in the Superior National Forest. The Boundary Waters Canoe Area Wilderness is inside its borders and would be negatively effected. If cell towers are tall enough to see are not allowed in the portal zone from the BWCAW, how does it follow that the noise, water pollution, dispoiling the land of mining is permitted?	NS	X
29478	Unique			GEN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3846	1	This Public Comment is submitted in the form of a Resolution by the Minnesota Coalition of Lake Associations Board of Directors as both a Determination of Inadequacy on the Full Environmental Impact Statement provided by the Minnesota Department of Natural Resources, and a Comment of General Opposition on the PolyMet/ NorthMet mining proposal. Further Rationale and Findings supporting this Public Comment are attached as a separate document.	NS	X
29478	Unique			GEN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3847	2	WHEREAS, a close examination of the Full Environmental Impact Statement submitted by the DNR does not adequately address a wide variety of potentially harmful environmental impacts (see supplement), nor has a sufficient bonding escrow been established for mitigation and restoration, nor has the MDNR been able to adequately regulate mining of all kinds in the state, WE oppose the current PolyMet NorthMet copper---nickel sulfide mine proposal on the basis of what has been learned and proposed in the Final Environmental Impact Statement (see supplemental Findings and Rationale); WE urge the DNR to expand the time period and scop for public comments regarding such a large and important environmental study, and to provide the missing reference materials, provide a single address for all comments, and allow the Governor to appoint an Administrative Law Judge to supervise the process; WE urge the US Environmental Protection Agency to again rate the PolyMet FEIS as "EU---3," Environmentally Unsatisfactory--Inadequate;	NS	X
29478	Unique			GEN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3854	9	WHEREAS, clean water is essential to all life on earth; WHEREAS, there has never been a sulfide mining operation that has been successfully and safely closed down without significant environmental degradation; WHEREAS, the PolyMet NorthMet mining project is located in the vicinity of the headwaters of three major continental watersheds, including the federal BWCA, which puts at risk far too much of the nation's clean water;	NS	X
29478	Unique			GEN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3876	29	WHEREAS, the inadequacy of the PolyMet FEIS, together with the land exchange proposal will serve as a dangerous precedent for future mining operations in north---east Minnesota, creating a cascade of pollution and environmental degradation that serves only private interests and not the public good;	NS	X
23980	Unique			GEN	thuerasmussen		983	1	I am definitely opposed to the approval of the polymet mine project, for a variety of reasons well detailed by representatives of several reputable organizations with environmental, health, safety, and other important concerns.	NS	X
443	Unique			GEN	thun440@netscape.net		213	1	I live in northeast Mn. and I am completely opposed to to the Polymet project!!	NS	X
30599	Form Letter	1	Variant	GEN	Tiamat Gustafson		2879	1	Sulide mining for never	NS	X
26554	Form Letter	1	Variant	GEN	Tim Callister		1348	1	I object mostly on the grounds of; irreparable environment damage, future financial hardship to the state of Minnesota due to degraded recreational opportunities and the harm that will have on the tourism industry in the state, and good business in general.	NS	X
26554	Form Letter	1	Variant	GEN	Tim Callister		1351	4	It's time for Minnesota to listen to it's citizens who voted for and still champion the clean water goals of the Legacy Amendment.	NS	X
29046	Unique			GEN	Tim Gihring		302	1	The FEIS analyzing the potential impact of an open-pit sulfide mine in the Superior National Forest has resulted in a document that is thick but not exhaustive.	NS	X
24706	Unique			GEN	Tim Harrison		1091	1	Please, no further delays. GET IT DONE!	NS	X
22249	Unique			GEN	Tim Schwarz		855	1	After reading the changes to the most recent Environmental Impact Statement concerning Polymet's proposed copper-nickel mine in and around the Superior National Forest, I'd like to express my complete opposition to the mine. I still feel the risks posed by the proposed mine are too great to the state of Minnesota, and know that this type of mining cannot be done safely	NS	X
6758	Form Letter	3	Variant	GEN	Tim Shoup		505	1	Having followed Polymet for over 10 years, and thus the sequence of compliance steps Polymet has undergone, the millions spent, and noting their continual quest not merely to mine, but to do so in a manner respectful of this earth, and noting most importantly the final EIS providing an independent review of potential environmental effects, which meets all the state and federal environmental requirements, I gladly and strongly encourage the DNR to affirm the Final EIS thus providing opportunity for this project's permitting.	NS	X
2220	Form Letter	3	Variant	GEN	todd danielson		266	1	Can I do this everyday? I certainly will if it helps over power those environmentalist IDIOTS!	NS	X
23	Unique			GEN	Todd Gremmels		70	1	How much pollution remains from mining companies owned by Global Tech after every single open pit mine has its minerals extracted? Is there any mine in existence that Global Tech has been a part of that has been cleaned up and not left a lasting impact on the ground water and creatures of the ecosystem of the area surrounding the open pit mines?	NS	X
2078	Unique			GEN	Tom Mattson		290	1	I support the polymet proposal as it now stands. That said this whole process along with yet another public comment period has been a disgrace to the human race.	NS	X
25824	Unique			GEN	Tom Steigauf		1232	1	I strongly oppose the PolyMet mine project. This is not easy for me to say because metals are my life. However it is the right position to take. We have a cabin in Ely and see no upside to this deal. The land exchange is a horrible deal for the State. The mine plans to use old dam technology to contain waste water and slurry. There have been three large scale mining dam failures in the world within the last 18 months. The potential for pollution far exceeds the small, short-term economic gain the area might enjoy; especially given the record low prices of precious metals at this time. Please see the attached Heraeus precious metal price update. Mining companies have not been a friend to the State of Minnesota with Essar Steel being the most recent example. A small group of investors will make money if PolyMet opens and a small group of residents will be employed for perhaps 5 to 8 years. That will be the extent of the mine's economic impact. Then the investors and mining company will leave and we will have to deal with the consequences of the pollution. What will the people employed by the mine do then? The State may employ them to help clean up the pollution. Minnesota is on the map because of our natural resources. They are the most important thing we have. Our lakes and woods bring people to Minnesota from all over the world. Why would we jeopardize these resources for a possible, small, short-term gain? I realize many people in the Iron Range area support the mine. We see their signs on the way to the cabin but you have to consider the long-term, big picture. A polluted BWCA is worth nothing. No one is going to visit Minnesota to see what was once was a natural wonder. Please consider the future generations. We don't own the natural resources; we lease them from our children and grandchildren. Creating the State and National Parks weren't popular decisions at the time they were made. Today, the people responsible for their creation are revered for their forward thinking. It is time for Minnesota to say enough is enough with mining. Thank you for your time and consideration.	NS	X
24770	Unique			GEN	Tom Thompson		1103	2	Furthermore, I oppose any issuance of 404 permits allowing polluted discharge from Polymet or destruction of any existing wetlands.	NS	X
24770	Unique			GEN	Tom Thompson		1104	3	The mining industry has never mined copper/nickel without polluting water in the area concerned. Polymet has never mined. This combination is an unacceptable combination to be unleashed on North East Minnesota.	NS	X
1170	Form Letter	1	Variant	GEN	tony vavricka		274	1	I oppose sulfide mining in Northern Minnesota.	NS	X
15140	Form Letter	1	Variant	GEN	Tristan Mccormick		807	1	This is a no-brainer. And I don't say not having done my due diligence. I was a natural resource economics major and have studied the issue of sustainable multi-agent landuse policy. This is not such an issue. This would be a phenomenally polluting mine in one of the most economically (and ecologically, socially, etc but we can leave that aside for now) valuable natural landscapes in the country. A northern Minnesota wilderness that produces billions of dollars in tourism and other economic flows cannot coexist with this mine. It's a clear choice. Allowing this mine to move forward would jeopardize billions of dollars of long-term, equitable future revenue for debatably net positive short-term revenue. I grew up going to the BWCA and, 25 years old now, I dream of bringing my kids and grandkids there. Don't rob me of that.	NS	X
29394	Form Letter	1	Variant	GEN	Tristan Mccormick		2528	1	Seriously! This is insane! Setting aside the philosophical/ethical obligation we have to this wilderness and future generations' access to it, the economic downside is enormous! Far more than the mine would ever make up for. Seriously. Please. From a 25 year old guy who dreams of bring his kids to this space (and fueling the economy with my gear rental, guide service, restaurant visits, etc), please do not let PolyMet go forward. Please.	NS	X
29911	Unique			GEN	Vicki Andrews		2724	1	I am writing to express my strong concern about the proposed PolyMet open pit mine to be built in northern Minnesota, on Superior National Forest lands at the headwaters of Lake Superior. The potential of disaster to our beautiful lakes, rivers, and woodlands is too great to be ignored. I live in Grand Rapids and have camped in the Boundary Waters a number of times. I love northern Minnesota and I want it to be protected from environmental disaster for people living now and all future generations. Economic gain is important to our area but not at the expense of our beautiful land and waters.	NS	X
30628	Unique			GEN	Vincent Graziano		2885	1	Please, it's just too risky to put a sulfide mine next to the BWCA	NS	X
30629	Unique			GEN	Vincent Graziano		2886	1	Please, We have a canoe wonderland in northern Minnesota. We don't want to risk a mining catastrophe right now when the State economy is very strong.	NS	X

30630	Unique			GEN	Vincent Graziano		2887	1	Please don't let mining spills spoil our beautiful canoeing wonder land.	NS	X
28815	Unique			GEN	Virginia Martin		2357	1	I completely oppose mining in the north country. I have been in the area many times and made many trips into the Boundary Waters and nothing I have seen convinces me such mining won't be devastating to this beautiful, pristine wilderness.	NS	X
29270	Unique			GEN	W. Charles Huskins		3651	1	Nonetheless, based on careful review, I have concluded the assessment of the environment impacts of the project as they relate to human health is inadequate for the following reasons.	NS	X
28822	Form Letter	1	Variant	GEN	Walt and Marcie Moe		2361	4	I don't think any more precious metal mines should be allowed to start mining until we see what the first one (if allowed) produces in the way of contamination.	NS	X
24598	Unique			GEN	waterfrontseller		1048	1	Time to approve this one!	NS	X
25561	Unique			GEN	Wayne Madson		1196	1	While the proposed mining by PolyMet in the Great North Woods of Minnesota will hopefully not affect me in my lifetime, I am amazed that we as responsible adults are not thinking about our children, grandchildren and great grandchildren. I am a small voice, but the person that owns this voice has experienced Northern Minnesota with summer vacations, fishing trips, seminars and our yearly trip into the Boundary Waters Canoe Area (BWCA). When my son turned 13 we invented the “Guy’s Trip”; 10-days into the BWCA. The last week of May each year we went on our adventure with a backpack and canoe. We did this until he graduated from college. During these trips I watched him mature into the man he is today, gaining confidence, self-reliance and a understanding of what we have that is unique to MN. He now looks forward to the day he can bring his son on the annual BWCA “Guys Trip”. I am amazed the very people we put into office would jeopardize this great resource. The proposed Sulfide Mining will benefit PolyMet and its investors, it will provide metals that can be used for production of products and give a temporary influx of employment. It will also give MN a 500-year commitment for containment and clean-up of their mining. It will affect the groundwater, it will affect the lakes, it will affect the rivers and lastly it will affect the Father or Mother that is looking to bring their Son or Daughter on a “Guy’s Trip” that will not only create fond memories, but will develop self-confidence, self-reliance and the very attributes we as Minnesotans are known for throughout the USA. MN is a great State for a reason, while we are heavily taxed, we shoulder this responsibility with a sense of pride knowing our dollars are going to the betterment of our citizens. It is a shame we would jeopardize the efficient use of our resources for a few. Tourism in Northern Minnesota could, perhaps will be changed forever. Ask Canada if we could recover from an “accident” involving the storage of the waste product, will out water stay the same crystal clear, will we not damage out Great North Woods beyond repair. Do not allow PolyMet to shift the burden of responsibility for the environmental impact to the citizens of MN. Strip our resources and leave. Please read the below clipping facts and keep them in mind when you are in the decision making process.	NS	X
22465	Unique			GEN	Wendy Lane		869	1	I am writing to request a copy of the 60 page executive summary of the FEIS for the PolyMet Mining Inc. Project.	NS	X
28477	Unique			GEN	Wendy Robertson		2266	5	Therefore, I am against the MNDNR giving the NorthMet Mining Project and Land Exchange project a green light. I’m asking them to state, “No Alternative Action”, in their decision on the FEIS.	NS	X
28477	Unique			GEN	Wendy Robertson		2268	7	Leave our future generations and the deserving non-defendable wildlife of the St Louis River watershed with the highest value of natural capital intact and do not support this project.	NS	X
29611	Unique			GEN	Wendy Robertson		3882	1	Even if fully implemented and if all outcomes are as prescribed within the EIS, the impact may be legally acceptable and meet all the prevailing regulations, but such impacts will still remain unacceptable. Technology can cleverly change the form of such impacts but it cannot reduce their total as given by thermodynamic laws: all material transactions with the environment constitute impact and even if the site is restored there will necessarily remain an impact legacy; the extraction and concentration of copper/nickel and dissolved pollutants requires a compensating disordered waste stream, so that the chosen stream is that which is unregulated—namely CO2. Technology can never avoid a waste stream but it can only make it legal under our regulatory scheme. And the accumulation of such legal, incremental impacts over time will prove disastrous. And as this EIS sets a precedent for the opening of a host of such projects, there is effectively no limit to total impact, especially atmospheric carbon. Without a regulatory cap on such wastes, this plan merely sanctions future calamity. More generally, this plan is misleading in that the public erroneously believes that it is a map for impact-less mining, for “getting it right.” The reality is that all such economic growth inevitably and incrementally adds to the planet’s impact load, the total of which is increasingly imposing costs on the public. Since environmental costs accelerate as a function of aggregate impact, and since the EIS evaluates costs as a function of impact in isolation, it concludes that the cost/benefit ratio is favorable, where in reality it is not. Therefore the underlying problem with the EIS is its failure to recognize our collective predicament: we have exceeded carrying capacity and further economic growth results in negative returns wherein costs exceed benefits, which make us worse off rather than better off, make us poorer rather than richer. Secondly this document fails to detail an enforcement plan, without which it is useless. This is especially problematic if the land trade is enacted, as the property will be immediately fenced, gated, and guarded. Ownership confers power and a split estate is the best guarantor of the public’s interest, ensuring enforcement of both process and outcome, as prescribed by the EIS. By forfeiting ownership the public will effectively also forfeit control over both.	NS	X
30621	Form Letter	1	Variant	GEN	William Chase		2883	1	It is not strictly a jobs proposal. Jobs will be lost when the polution sets in. It is also a health and beauty and respcet for the land counter propsoal.	NS	X
26485	Unique			GEN	William Haapala		218	3	It appears that the environmental impacts could be mitigated or prevented using current and some possibly leading edge and yet to be proven methods.	NS	X
26485	Unique			GEN	William Haapala		1260	1	Based on my observations of this project I believe that other than the loss of natural land surface and ecological communities in the directly destroyed areas, it it technically feasible to mine and produce economically valuable metals from this deposit.	NS	X
29373	Unique			GEN	William Lane		2525	1	The proposed Polymet mine is the proverbial square peg in the round hole that is northern Minnesota. It doesn’t fit. It never will. The EIS has largely been created by the mining industry, the state of Minnesota has retained mining industry legal representation, and all this is being propagated to revive an industry notorious for turning pristine areas into blighted landscapes. Apparently, the art of industrial grifting is alive and well in Minnesota.	NS	X
29973	Unique			GEN	William Robbins		2740	1	Polymet’s final EIS is full of general information, but very short on details, especially details relating to control of water pollution and airborne dust pollution and hydrogen sulfide pollution in air. I suggest that the lack of details would not allow a decision maker to know and understand enough to make an informed decision on this project.	NS	X
30625	Form Letter	1	Variant	GEN	Zoe Thouin-Rochester		2884	1	Habitat matters! It needs to be protected.	NS	X
29021	Form Letter	1	Variant	GEN	Zoua Her		2401	1	Thank you Gov. Mark Dayton and Decision Makers for reading and considering my comments in opposition to the PolyMet Sulfide Mine. I have spent several hours learning about the issues, pros and cons around the PolyMet Sulfide Mine proposal and how metal mining companies have had a devastating legacy in how they have left other states like New Mexico, Arizona, Montana, South Dakota and Colorado. None of these states have been left cleaner, better or more prosperous because of metal mining passing and permitted in their states. With the same kind of tactics coming into our state, I fear for our people, the futures of our waters, wildlife and ecosystem which we love, depend on and are well known for. I care about the nature and beauty of what we have here. I am an Environmental Educator, and on behalf of all my students who love animals, nature and the wild outdoors and who are still discovering their own love for Nature, let me stand on their behalf too in this letter as the only one who is old enough to more fully understand the issues and make a public comment. I know that in 20 years when they are older, they will thank me and you for standing against the PolyMet Sulfide mine.	NS	X
27822	Unique			GT	Anita Tillemans		2160	6	This FEIS does not address known fractures, fault lines within the project site, and those along the Range. What of the Waasa and Camp Rivera Faults? What of the Vermilion Fault? The effects of faults and fractures have been downplayed in models, which were made to inform the FEIS. The connectivity of bedrock with surficial aquifers assumed to be low, and the upper surface of fractured metamorphic bedrock assumed to be fractured more heavily at the top than down under. This conclusion seems convenient and arbitrary, since these structures cannot be truly known, sight unseen. Is there some reason that Polymet did not use the available information on inferred faults for more in depth field study on these particular areas? The devil is always in the details. Though details can be used to obfuscate and avoid larger issues, these particular details are major omissions in a study that assumes to represent a truthful picture of the potential risks involved to groundwater from seepages and discharge through cracks, joints, fractures, faults, bore holes, from waste rock, slurry and tailings basins in the Laurentian Uplands. Inferences are made all the time in science, through reason and implication, through the use of data and study. All knowledge is brought about in this way. To discount information on inferred faults is careless. The FEIS makes its own inferences. It infers that bedrock has low conductivity around the site and plant. It infers that the pollution would not travel far from the sites. It infers that all systems will operate sufficiently as expected over the lifetime of the mine and into perpetuity. It infers that, if a fault is found, it will be dealt with successfully. It infers much in supporting a copper mining scenario. Details and independent, in depth fieldwork is still needed concerning bedrock aquifers, faults and fractures in the area because of their potential for being conduits of pollution into ground water reserves, sight unseen. Polymet admits seepage will occur, but it continues to minimize the risks through assumptions concerning the conductivity of fractured metamorphic bedrock and sand and gravel aquifers throughout the area. Water will most assuredly traverse aquifers and find the path of least resistance. The FEIS minimizes and leaves these pathways open to conjecture with promises that all will be handled, in time.	S	O
28533	Unique			GT	Arno S. Kahn		2316	4	Construction projects also don?t tend to do well over that cycle of time. The proposed ponds are unlined and rely on dams that can easily fail. As our climate continues to change, we will see more heavy rains that can easily deliver 12? or more of precipitation in a day, and the likelihood of contaminated water being released in large quantities seems to be a certainty. Unlike petroleum, there doesn?t appear to be any way to remove the sulfide from the watershed after it is released.	NS	X
30073	Unique			GT	Brad Sagen		4254	6	The FEIS fails to acknowledge the potential for a catastrophic tailings dam failure, even after the spectacular failure of the Mt. Polley Tailings Dam in BC about a year ago. The current tailings dam proposal would build on top of an existing tailings waste facility with attendant instability from the waste and seepage. Best management practices that would have created a new tailings waste facility were ignored. This must be considered in a ‘revised’ or supplementary FEIS.	NS	X

29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4146	4	Tailings Basin Reclamation The plan for closure of the Tailings Basin include: The pond would remain in the reclaimed Tailings Basin with a wetland around its perimeter. In general, the pond’s maximum lateral extent would be maintained to be no closer than 625 ft from the interior edge of the Cell 1E/2E dams. ... The pond and wetland would continue to lose water via seepage, but at a reduced rate compared to operations, as a result of the bentonite amendment of the tailings surface. (FEIS, p. 3-133) While the design of the bentonite cap will assist in limiting oxidation of the tailings, it violates one of the critical recommendations of the Mt Polley Expert Panel (2015) – that there be no wet closures” for tailings ponds. The Panel said: For new tailings facilities. BAT (Best Available Technology) should be actively encouraged for new tailings facilities at existing and proposed mines. Safety attributes should be evaluated separately from economic considerations, and cost should not be the determining factor. and; The goal of BAT for tailings management is to assure physical stability of the tailings deposit. This is achieved by preventing release of impoundment contents, independent of the integrity of any containment structures. In accomplishing this objective, BAT has three components that derive from first principles of soil mechanics: 1. Eliminate surface water from the impoundment. 2. Promote unsaturated conditions in the tailings with drainage provisions. 3. Achieve dilatant conditions throughout the tailings deposit by compaction. and; Where applicable, alternatives to water covers should be aggressively pursued. The design for the Tailings Basin at NorthMet meets none of these criteria. Cells 1E & 2E contain a relatively small amount of tailings. It would be feasible to design a new tailings dam, using the Category I waste rock as construction material, based on centerline design that could do away with the dangerous upstream construction method. The Tailings Basin already incorporates a cutoff wall so no additional seepage collection would need to be planned. A centerline dam design could also incorporate enhanced tailings drainage, which would promote the unsaturated conditions recommended by the Mt Polley Expert Panel. While this design might increase the amount of seepage to be treated, the Panel also noted: The Panel recognizes that creating dry tailings may increase the amount of water requiring treatment or storage. In the Panels opinion, the additional water treatment is more than compensated by the long-term stability achieved by maintaining the tailings in an unsaturated state. Upstream Dam Engineering As mentioned above, upstream-type dam construction is the most problematic type of tailings dam construction, and is associated with a majority of tailings dam accidents. Upstream dam construction has been banned as a dam construction practice in Chile as the result of the large number of seismic and other dam failures associated with this type of structure. Three noted experts on tailings dams published “The 10 Rules” for upstream tailings dams in 2002 (Martin et al 2002). They note that: It is also important to note that these rules are not options and are not interchangeable with alternative concepts of soil mechanics. These rules exist based upon the fundamentals of soil behavior, the experience of numerous tailings dam failures and the experience of well-managed facilities that perform as intended. Of the 10 rules, a “score” of 9/10 will not necessarily have a better outcome than 2/10, as any omission creates immediate candidacy for an upstream tailings dam to join the list of facilities that have failed due to ignoring some or all of the rules. Rule number 2 is: 2. A sufficiently wide beach-above-water (BAW), relative to the ultimate height of the dam, must be maintained at all times, to achieve segregation of the coarser tailings sizes and to form a relatively strong, wide, drained (unsaturated), and/or dilatant (non-contractant during shear) outer shell. The dam slope must not be underlain by tailings slimes (beach-below water - BBW), unless the designer has satisfied Rule 4 below. (emphasis added) The shell must be of sufficient width to retain the “bursting pressures” (Casagrande and MacIvor, 1970) of the upstream contractant beach sands or slimes if they liquefy. They further emphasize: The rules for the design of an upstream constructed tailings dam are not optional guidelines for individual designers to randomly select components they can “fit” into their conception of a safe facility. (emphasis added) Even for the proposed upstream-type construction, the proposed dam is violating one of the 10 Rules for upstream dam construction.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4148	6	Theme ALT 10 Rejected Alternative: Paste Tailings Placed on a Lined and Covered Facility It is noted in the FEIS: Industry standard for dry stacking includes the use of a basin liner. Construction of a basin liner on the existing LTVSMC tailings basin has been evaluated and determined not to be feasible.” (FEIS, p. A-315) A liner could be added on top of the existing tailings, and the existing tailings dams (~75 feet high now) would need to be reinforced with a buttress. The reason that it is “not feasible” to put a liner on top of the existing tailings is that the tailings are not stable enough to allow it - which says something about the stability of the proposed impoundment. Cells 1E and 2E have enough capacity to hold the dry tailings, but it is likely that the existing tailings, which are approximately 60 feet thick, could not be compacted enough to provide the necessary stability upon which to build a dry stack. Interesting enough, the Hydrometallurgical Residue Facility is proposed to be built on approximately the same thickness of existing tailings.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4152	10	It was noted earlier in the FEIS that: The inclusion of relatively large zones of finer-grained tailings within this outer shell reduces the drainage ability of the shell, increasing the phreatic surface, and reduces the localized shear strength due to the generally weaker behavior of the finer-grained tailings. There were instances during the operation of the LTVSMC Tailings Basin where significant amounts of fine tailings and slimes settled near the perimeter dams. (4.2.14.2.2 Development of the Existing LTVSMC Tailings Basin, p. 4-427) It is proposed to use Cement Deep Soil Mix (CDSM), and other measures like drains, to stabilize the tailings in order to allow upstream dam construction to continue. Also noted in the FEIS is that the geometry and physical changes to the embankments (such as CDSM) were incorporated into the design so that all computed slope stability Factors of Safety met or exceeded the Factors of Safety required by the NorthMet Geotechnical Modeling Work Plan (PolyMet 2015), Attachment A). It is also noted in the Geotechnical Data Package for the Tailing Basin (PolyMet 2015I) that: The appropriate approach hinges on the extent, composition and continuity of stringers within the deposit as subsequently described. Several types of evidence support the conclusion that heterogeneity within the deposits is localized, so widespread and continuous stringers of the weakest material (slimes) are unlikely and isotropic parameters are appropriate. (PolyMet 2015I, p. 63, emphasis added) This is a necessary assumption for time-efficient modeling. It is also a critical assumption in terms of keeping the costs of the modeling task in a reasonable range. However, if this assumption is wrong, even in relatively local regions of the dams, then the modeling is wrong. To illustrate the complexity of the tailings near and under the dam structures, Figure 5.2.14-6 for cross section F of the tailings basin, the most critical cross section in terms of potential instability. Cross Section F, which intersects the northern dam of Cell 2E, as shown in Figure 5.2.14-4, was selected to represent the critical cross section for stability analysis purposes as it is the maximum section based on height as measured from the downstream toe to the proposed final crest, some layers of the weaker fine tailings and slimes extend close to the dam, and the original starter dam is underlain by peat. (FEIS, p. 5-657) The dam in the area of Cross Section F (see Figure 5.2.14.6 on the following page) will also require underdrains in order to provide long-term stability (PolyMet 2015I, p. 73). This building complexity only raises the chances for misinterpretation and oversimplification in the modeling. Simpler models are better. The Cement Deep Soil Mix columns are designed to provide more weight bearing capacity in the tailings to attempt to justify further upstream-type dam construction. This is illustrated in (PolyMet 2015I) Figure 5-2. Note also the complexity of the geology illustrated in this figure. Of note is that all of the cross section views of the CDSM the top of the CDSM Zone terminates before the top of the LTVSMC tailings, and bottoms in glacial till, not bedrock. Since this is done consistently we must assume it is intentional, yet there is no explanation in the FEIS or PolyMet 2015I as to why these columns are not extended to the top of the LTVSMC tailings.	S	N
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4153	11	One of the critical design parameters for the Hydrometallurgical Residue Facility is maintaining the integrity of the liner system. PolyMet plans on building the Hydrometallurgical Residue Facility on top of multiple layers of tailings and peat (see Figure 5.2.14-9). In order to stabilize the underlying material PolyMet is proposing to: • Install wick drains (if required); and • Place, monitor, and remove a preload fill in the existing LTVSMC Emergency Basin to preconsolidate existing material, thereby reducing future anticipated settlements to mitigate the potential future strains. (FEIS, p. 5-662) A preload would be placed on the existing LTVSMC Emergency Basin to consolidate the foundation materials before construction of the Hydrometallurgical Residue Facility. Wick drains may be used to help accelerate the consolidation time by increasing the effective hydraulic conductivity of the tailings due to decrease in flowpath length. Some portion of this load would be removed before construction, and the remaining material would be graded to provide sufficient drainage slope and provide a suitable foundation material for the facility. The material would rebound a small amount after the preload is removed. The aggregate settlement at a representative location within the Emergency Basin, considering the maximum anticipated tailings thickness in the foundation, is computed to be 3.9 ft. The material at this location is modeled to consolidate an additional 1.4 ft by the end of operations of the Hydrometallurgical Residue Facility. (emphasis added) ... Strain in the Hydrometallurgical Residue Facility liner system would result from differential settlement in the facility foundation between points along the liner. (FEIS, p. 5-667) Adequate factors of safety should be guaranteed by installing engineered facilities verified by quality control, when possible – not by modeling. A less technologically demanding, and safer, method of insuring the stability of the foundation of the Hydrometallurgical Residue Facility is to remove the problematic material down to bedrock. The material removed could be placed in the tailings basin, and not only would the subgrade be stable, but more room for hydrometallurgical residue would be gained. In the case of the Hydrometallurgical Residue Facility placing the liner on the granite bedrock is possible. Problems with the bottom liners likely could not be fixed without removing all of the waste. Safety, not cost, should drive liner foundation design considerations. The short-term attempt to save money by attempting to consolidate the tailings and peat underlying the proposed Hydrometallurgical Residue Facility might backfire in the long run.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4154	12	Both the Hydrometallurgical Residue Facility (PolyMet 2014c, p. 11) and the Tailings Basin (PolyMet 2015I, p. 66) use a design earthquake event with a peak ground acceleration of 0.024g (2,475 year return period). The choice of a 2,475-year return design earthquake is not adequate for a structure that must hold in perpetuity. The Maximum Credible Earthquake, not the 2,475-year return event – which is significantly less than an Maximum Credible Earthquake – should be used for the design event for all permanent structures, both dams and waste rock. The Maximum Credible Earthquake is recommended to be a 10,000-year return period earthquake (ICOLD 2001). That using the 2,475-year return significantly underestimates the effect of an earthquake on a tailings dam or water rock pile. This can be seen by looking at the horizontal accelerations (g) in Table 6-2 Summary of Probabilistic Seismic Hazard Analysis Results (PolyMet 2015I). The 975-year return period earthquake has a maximum acceleration of 0.025g. The 2,475-year return period earthquake has a maximum acceleration of 0.055g, over twice that of the 975-year event. The maximum horizontal acceleration from a 10,000-year event would be significantly larger than that for a 2,475-year event. Even if the legal requirement is only for a 2,475-year return design earthquake, from an engineering and safety standpoint PolyMet and its consultants should not accept the minimum required. They should do what safety and conservative management requires.	S	N

29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4158	4	Tailings Basin Reclamation The plan for closure of the Tailings Basin include: The pond would remain in the reclaimed Tailings Basin with a wetland around its perimeter. In general, the pond’s maximum lateral extent would be maintained to be no closer than 625 ft from the interior edge of the Cell 1E/2E dams. ... The pond and wetland would continue to lose water via seepage, but at a reduced rate compared to operations, as a result of the bentonite amendment of the tailings surface. (FEIS, p. 3-133) While the design of the bentonite cap will assist in limiting oxidation of the tailings, it violates one of the critical recommendations of the Mt Polley Expert Panel (2015) – that there be no wet closures” for tailings ponds. The Panel said: For new tailings facilities. BAT (Best Available Technology) should be actively encouraged for new tailings facilities at existing and proposed mines. Safety attributes should be evaluated separately from economic considerations, and cost should not be the determining factor. and; The goal of BAT for tailings management is to assure physical stability of the tailings deposit. This is achieved by preventing release of impoundment contents, independent of the integrity of any containment structures. In accomplishing this objective, BAT has three components that derive from first principles of soil mechanics: 1. Eliminate surface water from the impoundment. 2. Promote unsaturated conditions in the tailings with drainage provisions. 3. Achieve dilatant conditions throughout the tailings deposit by compaction. and; Where applicable, alternatives to water covers should be aggressively pursued. The design for the Tailings Basin at NorthMet meets none of these criteria. Cells 1E & 2E contain a relatively small amount of tailings. It would be feasible to design a new tailings dam, using the Category I waste rock as construction material, based on centerline design that could do away with the dangerous upstream construction method. The Tailings Basin already incorporates a cutoff wall so no additional seepage collection would need to be planned. A centerline dam design could also incorporate enhanced tailings drainage, which would promote the unsaturated conditions recommended by the Mt Polley Expert Panel. While this design might increase the amount of seepage to be treated, the Panel also noted: The Panel recognizes that creating dry tailings may increase the amount of water requiring treatment or storage. In the Panels opinion, the additional water treatment is more than compensated by the long-term stability achieved by maintaining the tailings in an unsaturated state. Upstream Dam Engineering As mentioned above, upstream-type dam construction is the most problematic type of tailings dam construction, and is associated with a majority of tailings dam accidents. Upstream dam construction has been banned as a dam construction practice in Chile as the result of the large number of seismic and other dam failures associated with this type of structure. Three noted experts on tailings dams published “The 10 Rules” for upstream tailings dams in 2002 (Martin et al 2002). They note that: It is also important to note that these rules are not options and are not interchangeable with alternative concepts of soil mechanics. These rules exist based upon the fundamentals of soil behavior, the experience of numerous tailings dam failures and the experience of well-managed facilities that perform as intended. Of the 10 rules, a “score” of 9/10 will not necessarily have a better outcome than 2/10, as any omission creates immediate candidacy for an upstream tailings dam to join the list of facilities that have failed due to ignoring some or all of the rules. Rule number 2 is: 2. A sufficiently wide beach-above-water (BAW), relative to the ultimate height of the dam, must be maintained at all times, to achieve segregation of the coarser tailings sizes and to form a relatively strong, wide, drained (unsaturated), and/or dilatant (non-contractant during shear) outer shell. The dam slope must not be underlain by tailings slimes (beach-below water - BBW), unless the designer has satisfied Rule 4 below. (emphasis added) The shell must be of sufficient width to retain the “bursting pressures” (Casagrande and MacIvor, 1970) of the upstream contractant beach sands or slimes if they liquefy. They further emphasize: The rules for the design of an upstream constructed tailings dam are not optional guidelines for individual designers to randomly select components they can “fit” into their conception of a safe facility. (emphasis added) Even for the proposed upstream-type construction, the proposed dam is violating one of the 10 Rules for upstream dam construction.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4160	6	Theme ALT 10 Rejected Alternative: Paste Tailings Placed on a Lined and Covered Facility It is noted in the FEIS: Industry standard for dry stacking includes the use of a basin liner. Construction of a basin liner on the existing LTVSMC tailings basin has been evaluated and determined not to be feasible.” (FEIS, p. A-315) A liner could be added on top of the existing tailings, and the existing tailings dams (~75 feet high now) would need to be reinforced with a buttress. The reason that it is “not feasible” to put a liner on top of the existing tailings is that the tailings are not stable enough to allow it - which says something about the stability of the proposed impoundment. Cells 1E and 2E have enough capacity to hold the dry tailings, but it is likely that the existing tailings, which are approximately 60 feet thick, could not be compacted enough to provide the necessary stability upon which to build a dry stack. Interesting enough, the Hydrometallurgical Residue Facility is proposed to be built on approximately the same thickness of existing tailings.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4164	10	It was noted earlier in the FEIS that: The inclusion of relatively large zones of finer-grained tailings within this outer shell reduces the drainage ability of the shell, increasing the phreatic surface, and reduces the localized shear strength due to the generally weaker behavior of the finer-grained tailings. There were instances during the operation of the LTVSMC Tailings Basin where significant amounts of fine tailings and slimes settled near the perimeter dams. (4.2.14.2.2 Development of the Existing LTVSMC Tailings Basin, p. 4-427) It is proposed to use Cement Deep Soil Mix (CDSM), and other measures like drains, to stabilize the tailings in order to allow upstream dam construction to continue. Also noted in the FEIS is that the geometry and physical changes to the embankments (such as CDSM) were incorporated into the design so that all computed slope stability Factors of Safety met or exceeded the Factors of Safety required by the NorthMet Geotechnical Modeling Work Plan (PolyMet 2015), Attachment A). It is also noted in the Geotechnical Data Package for the Tailing Basin (PolyMet 2015l) that: The appropriate approach hinges on the extent, composition and continuity of stringers within the deposit as subsequently described. Several types of evidence support the conclusion that heterogeneity within the deposits is localized, so widespread and continuous stringers of the weakest material (slimes) are unlikely and isotropic parameters are appropriate. (PolyMet 2015l, p. 63, emphasis added) This is a necessary assumption for time-efficient modeling. It is also a critical assumption in terms of keeping the costs of the modeling task in a reasonable range. However, if this assumption is wrong, even in relatively local regions of the dams, then the modeling is wrong. To illustrate the complexity of the tailings near and under the dam structures, Figure 5.2.14-6 for cross section F of the tailings basin, the most critical cross section in terms of potential instability. Cross Section F, which intersects the northern dam of Cell 2E, as shown in Figure 5.2.14-4, was selected to represent the critical cross section for stability analysis purposes as it is the maximum section based on height as measured from the downstream toe to the proposed final crest, some layers of the weaker fine tailings and slimes extend close to the dam, and the original starter dam is underlain by peat. (FEIS, p. 5-657) The dam in the area of Cross Section F (see Figure 5.2.14.6 on the following page) will also require underdrains in order to provide long-term stability (PolyMet 2015l, p. 73). This building complexity only raises the chances for misinterpretation and oversimplification in the modeling. Simpler models are better. The Cement Deep Soil Mix columns are designed to provide more weight bearing capacity in the tailings to attempt to justify further upstream-type dam construction. This is illustrated in (PolyMet 2015l) Figure 5-2. Note also the complexity of the geology illustrated in this figure. Of note is that all of the cross section views of the CDSM the top of the CDSM Zone terminates before the top of the LTVSMC tailings, and bottoms in glacial till, not bedrock. Since this is done consistently we must assume it is intentional, yet there is no explanation in the FEIS or PolyMet 2015l as to why these columns are not extended to the top of the LTVSMC tailings.	S	N
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4165	11	One of the critical design parameters for the Hydrometallurgical Residue Facility is maintaining the integrity of the liner system. PolyMet plans on building the Hydrometallurgical Residue Facility on top of multiple layers of tailings and peat (see Figure 5.2.14-9). In order to stabilize the underlying material PolyMet is proposing to: • Install wick drains (if required); and • Place, monitor, and remove a preload fill in the existing LTVSMC Emergency Basin to preconsolidate existing material, thereby reducing future anticipated settlements to mitigate the potential future strains. (FEIS, p. 5-662) A preload would be placed on the existing LTVSMC Emergency Basin to consolidate the foundation materials before construction of the Hydrometallurgical Residue Facility. Wick drains may be used to help accelerate the consolidation time by increasing the effective hydraulic conductivity of the tailings due to decrease in flowpath length. Some portion of this load would be removed before construction, and the remaining material would be graded to provide sufficient drainage slope and provide a suitable foundation material for the facility. The material would rebound a small amount after the preload is removed. The aggregate settlement at a representative location within the Emergency Basin, considering the maximum anticipated tailings thickness in the foundation, is computed to be 3.9 ft. The material at this location is modeled to consolidate an additional 1.4 ft by the end of operations of the Hydrometallurgical Residue Facility. (emphasis added) ... Strain in the Hydrometallurgical Residue Facility liner system would result from differential settlement in the facility foundation between points along the liner. (FEIS, p. 5-667) Adequate factors of safety should be guaranteed by installing engineered facilities verified by quality control, when possible – not by modeling. A less technologically demanding, and safer, method of insuring the stability of the foundation of the Hydrometallurgical Residue Facility is to remove the problematic material down to bedrock. The material removed could be placed in the tailings basin, and not only would the subgrade be stable, but more room for hydrometallurgical residue would be gained. In the case of the Hydrometallurgical Residue Facility placing the liner on the granite bedrock is possible. Problems with the bottom liners likely could not be fixed without removing all of the waste. Safety, not cost, should drive liner foundation design considerations. The short-term attempt to save money by attempting to consolidate the tailings and peat underlying the proposed Hydrometallurgical Residue Facility might backfire in the long run.	S	O
29749	Unique			GT	Dave Chambers	Center for Science in Public Participation	4166	12	Both the Hydrometallurgical Residue Facility (PolyMet 2014c, p. 11) and the Tailings Basin (PolyMet 2015l, p. 66) use a design earthquake event with a peak ground acceleration of 0.024g (2,475 year return period). The choice of a 2,475-year return design earthquake is not adequate for a structure that must hold in perpetuity. The Maximum Credible Earthquake, not the 2,475-year return event – which is significantly less than an Maximum Credible Earthquake – should be used for the design event for all permanent structures, both dams and waste rock. The Maximum Credible Earthquake is recommended to be a 10,000-year return period earthquake (ICOLD 2001). That using the 2,475-year return significantly underestimates the effect of an earthquake on a tailings dam or water rock pile. This can be seen by looking at the horizontal accelerations (g) in Table 6-2 Summary of Probabilistic Seismic Hazard Analysis Results (PolyMet 2015l). The 975-year return period earthquake has a maximum acceleration of 0.025g. The 2,475-year return period earthquake has a maximum acceleration of 0.055g, over twice that of the 975-year event. The maximum horizontal acceleration from a 10,000-year event would be significantly larger than that for a 2,475-year event. Even if the legal requirement is only for a 2,475-year return design earthquake, from an engineering and safety standpoint PolyMet and its consultants should not accept the minimum required. They should do what safety and conservative management requires.	S	N

29745	Unique			GT	Erin Mittag	Minnesota Center for Environmental Advocacy	3983	41	The collapse or major breach of the tailings dam is likely the most devastating impact that could occur at the PolyMet mine. Recent reports demonstrate that the risk of tailings dam collapse is not nearly as remote as PolyMet suggests. Two hundred and fourteen tailings dams have had failures or accidents since 1940.142 Since 1960, “serious” and “very serious” tailings dam failures have occurred with greater frequency.143 Very large releases occur even at relatively small mines, such as the Mt. Polley mine.144 Moreover, the cost of cleanup for a catastrophic failure averages \$543 million.145 This dollar value is beyond the capacity of most mining companies to cover. Nor is it required that the risk of tailings dam collapse be included in the financial assurance package.146 While the cited Bowker and Chambers report is not about any particular mine, the authors note how critical statistical analysis of tailings dam failures is when evaluating the potential for a collapse at any given mine: Having something more like “actuarial data” to refer to is important in understanding the potential magnitude of loss from an individual dam or a permitting districts portfolio of dams and TSFs [Tailings Storage Facilities]. With such low frequency high severity losses we can never assign risk to an individual TSF based on its design and receiving environment parameters. Unless it has an identified flaw that puts it at near certain risk of imminent failure, we can’t say whether a given dam “will” fail. We can only say what the consequence would be in economic terms if it failed.147 In addition, Dr. Chambers has identified risks unique to the PolyMet Proposed Alternative tailings basin, including a choice to use the cheapest and least safe form of dam construction, and, most importantly, the choice to use wet, instead of dry, tailings storage. Dry tailings storage would eliminate the chance of tailings dam collapse, a benefit that outweighs any downsides due to the potential catastrophic impact of such a collapse.	S	O
29745	Unique			GT	Erin Mittag	Minnesota Center for Environmental Advocacy	3990	44	The FEIS and supporting documents do not address the uncertainties of the proposed liner and cover systems raised by comments on the SDEIS, nor do they present sufficient design specification to meet legal standards for reactive mine waste. As discussed by the expert report by Michael Malusis, incorporated with MCEA’s comments to the SDEIS, there are numerous identified questions and concerns raised by the environmental review documents describing proposed liners and covers.	NS	X
29745	Unique			GT	Erin Mittag	Minnesota Center for Environmental Advocacy	3992	45	The Tailings Basin’s bentonite-amended layers’ documentation: contains inconsistencies about the thickness of layers; lacks design criteria for the layers such as hydraulic conductivity and moisture retention; fails to explain how a 3 percent bentonite addition could create a proper barrier when mixed with coarse tailings; lacks information on saturation that is necessary to assess the layers as a barrier to oxygen; lacks sufficient information on wet-dry/freeze-thaw cycling and root penetration’s effects on the proposed layers; includes no information on field performance benchmarks for the layers’ operation; proposes three methods of creating a subaqueous bentonite seal at the bottom of the tailings pond that are experimental and have not been proven by case studies, while excluding alternatives that are proven to work as needed in this project; and incorrectly assumes that manufacturers’ reported hydraulic conductivity will translate perfectly to field hydraulic conductivity.	S	N
29745	Unique			GT	Erin Mittag	Minnesota Center for Environmental Advocacy	3999	52	Regarding the lack of support for the assumption that liners at the hydrometallurgical facility will actually work as projected, the response to comments merely reiterates the fact that the proponent intends to use a double liner and a leakage recovery system.169 This response is given despite an absence of information in the NEPA documents about the liners and their real-world success rate, or studies showing how they would operate in Northern Minnesota with these specific wastes. Nor does the response to comments address the concerns raised about the agencies’ failure to support the assumption that bentonite will perform as expected, or that freeze-thaw cycles cause erosion and liner breakage. In response to comments that liner leakage rates used were unrealistic, the response merely reiterated that the leakage rate was based on literature values and modeling.170 The very point of the comment was that the leakage rate should be based on more than literature values and modeling; it should include real-world testing and historic data regarding the efficacy of liners at other mines to assess the actual potential for leakage.	S	O
29245	Unique			GT	Gary Kohls		2451	1	In the wake of the Mount Polley tailings dam failure in British Columbia one year ago, Lindsay Newland Bowker, Director of Bowker Associates, Science & Research In The Public Interest and David Chambers, Ph.D., a mining technical specialist, co-authored the report whose primary findings include: The rate of serious tailings dam failures is increasing. Half (33 of 67) of serious tailings dam failures in the last 70 years occurred in the 20 years between 1990 and 2009. The increasing rate of tailings dam failures is propelled by, not in spite of, modern mining practices. The increasing rate of tailings dam failures is directly related to the increasing number of TSFs (Tailings Storage Failures) larger than 5 million cubic meter capacity necessitated to allow the economic extraction of lower grades of ore. 11 catastrophic failures are predicted globally from 2010 to 2019. Predicted total cost of these 11 failures is approximately \$6 billion. The average cost of these catastrophic tailings dam failures is \$543 million. Regulator attempts to recoup cleanup costs from mining operators reveal — through court records and other official documents — dollar totals for cleanup and recovery. Mining companies cannot afford, and cannot secure insurance to cover, the costs of catastrophic failures: Losses, both economic and ecological, are in large part either permanent and non-recoverable, or recovery — to the extent physically possible — are funded by public monies.	S	O
6433	Unique			GT	Hans Olsen		491	6	Catastrophic failure of the proposed PolyMet copper / nickel tailings basin. The public demanded to know how PolyMet would deal with such a failure. These tailings basins fail all the time. There are at least two or three such failures world wide every year. It was known that PolyMet has done a detailed engineering study of the effects of a catastrophic failure of their tailings basin but refused to include that report in the EIS according to engineers working on the project. PolyMet simply asserts that the chances of such a failure are too remote to even be considered in the EIS. Apparently the Cooperating Agencies rolled over and said: " Oh, okay, that's fine with us." 30068	Unique			GT	John Herbst		2793	2	2. In Figure 7, Plant Site Layout, NorthMet Mining Project and Land Exchange FEIS, there appears to be substantial reductions in rock buttressing at the south end of the Tailings Basin compared to the north end. Is there a reason for this? Perhaps higher elevations between the south end of the tailings basin and Colby Lake impeding water drainage to the south, or solid bedrock (impervious to water flow) just south of the tailings basin, preventing any drainage towards Colby Lake?	S	N
30097	Form Letter	1	Variant	GT	Karen Graham		2810	1	The safety of this mine is based on the assessment by the requesting corporation. Numerous reports from independent scientific organizations focused on evaluating environmental impact have submitted reports	NS	X
27721	Unique			GT	Kris Wegerson		2115	7	Human health may also be harmed if there is a failure of the LTVSMC Tailings Basin. It is already leaking and that leakage hasn't been corrected. It is not reasonable to expect 99% of the surface water and 90% of the ground water seepage can be captured. This is contrary to real-world comparable conditions. 225 million tons of tailings will be disposed on top of the current tailings. We have seen how a state-of-the-art tailings basin at Mt. Polley in British Columbia failed.	NS	X
27721	Unique			GT	Kris Wegerson		2116	8	Dr. David Chambers, a renowned geologist, has studied the geo-stability of the tailings basin and found that it is likely to fail. A greater load of tailings and bentonite can only further weaken the basin. The plan to use the old LTVSMC Tailings Basin for disposal of additional tailings is dangerous and inadequate.	NS	X
29080	Form Letter	9	Variant	GT	Liz Dahl		2410	3	Sulfide mining has never been done without wreaking environmental havoc. A stark example is the Mount Polly Mine Disaster in B.C. Canada.	NS	X
29978	Unique			GT	London Bresette		4294	6	The Red Cliff Band should not withstand silently, especially with the specter of the PolyMet Mine being permitted through a tainted process. The Red Cliff Band is aware with special concern that Knight-Piesold engineers, who designed the Mt. Polley Tailings Storage Facility that resulted in last year's mining disaster in British Columbia; is also planning on constructing on top of the old LTV tailing basins for Polymet, utilizing similar flawed design technology that a B.C. Independent Review Panel concluded was the cause of that breach.	NS	X
29980	Unique			GT	Lori Andresen		4302	5	Tailings basin stability is also marginalized in the FEIS. Collapse of the tailings basin at British Columbia's Mount Polley gold and copper mine in August of 2014 is the largest mining waste spill in Canada's history. While analyzing the disaster, engineers made the case for the use of dry stacking of tailings, rather than wet basins. Because of high costs, PolyMet refuses to consider this alternative, and the DNR concurs. For more information on the Mount Polley disaster, see Gary Kohl's "An Open Letter to Governor Dayton, the Minnesota EPA, the DNR and Every Thinking Minnesota Citizen."	S	O
30072	Unique			GT	Lori Andresen		4339	5	Major Mining Disasters. Agencies and politicians would like to permit PolyMet before any more environmental disasters involving hard rock sulfide mining hit the news. In August of 2014, a breach in the tailings basin at the Mount Polley Mine in British Columbia became the largest mining waste spill in Canada's history. Despite approval to restart, there are still no long-term plans regarding site clean-up costs, water treatment, and mining wastes management. ("No Reason to Celebrate One Year After Mt. Polley Disaster" Mining Watch Canada, July 31, 2015) After the Mount Polley disaster, a panel of experts recommended using a filtering process to dry stack tailings, which would be much less of a risk for dam failure than the current wet tailings. Mining companies in Canada are resisting this improvement as being too costly in a wet environment. PolyMet has also rejected using such a system at their proposed NorthMet Mine. All six of Minnesota's taconite tailings basins are wet, potentially placing them at risk for breaches. NorthShore Mining's Milepost 7 tailings basin is particularly precarious, as a dam break would send the tailings downhill and directly into Lake Superior. On February 2, 2012, HibTac discovered a crack on the Western Dam South, which extended approximately 1,000 linear feet, resulting in discharges into adjacent wetlands, as reported by the Army Corps of Engineers, 2012 -00623-DWW. The former LTV Steel Company tailings basin purchased by PolyMet has already been faulted for being unstable. In PolyMet's case, the problem is more serious due to the low grade nature of the copper-nickel mineralization (less than 1%) and the great amount of waste material (99%) and the heavy metals and contaminants associated with the sulfides that would be added to the existing taconite tailings basin. As further evidence of ongoing sulfide mining pollution, a U.S. mining disaster occurred in August of 2015 when 3 million gallons of wastewater and sludge from the dormant Gold King Mine poured into a tributary of the Animas River in Colorado. Workers for the EPA were trying to install a pipe to drain water from the abandoned mine so that they could eventually plug the mine and prevent contaminated water from seeping out. Instead, the force of the water broke through the existing dam, turning the entire river a bright orange with mine waste pollution. Unfortunately, this whole western region is riddled with abandoned mines, all seeping into ground and surface waters, while the EPA is lacking in money to clean up these super-fund sites.	S	O
10187	Unique			GT	Mary Ann Vande Vusse		672	4	How will the DNR deal with the possibility of dam failure?	S	O
26997	Unique			GT	Maureen Johnson		1539	18	The dip in the north edge of the exempt wetlands appears to be due to remains of a tailings dam failure. It also appears an upper bypass dam has been constructed around a weak area near the top of the TB. Note this is the vertical dam series against which the HRF will be built. The integrity of the dams appears breached or breachable. No reinforcement with cement pillars has been proposed for this area, so the HRF liner could shift two ways, inward toward the HRF center or outward into the TB if the pressures shift either way. See my previous SDEIS comments on the evidence that the TB has internal shifting such that sampling wells have been bent so badly they were put out of commission. No cement pillars around the outside will prevent this shifting on the inside. This shifting could gradually but seriously affect the integrity of the liner of the HRF. This indicates that PolyMet thinks the south end of Cell 2W is still settling. So instead of building on Cell 2W, they think that building against Cell 2W with no reinforcement will be stable. This makes no sense to me.	S	O
26997	Unique			GT	Maureen Johnson		1540	19	In addition there may be continual seepage from Cell 2W groundwater mounding along and under the HRF Liner, necessitating the proposed drainage system. If the capacity of this system is insufficient or if it clogs, or if the pumps stop running from a power plant breakdown, the consequences should be discussed.	S	O
26997	Unique			GT	Maureen Johnson		1541	20	However, "The new dams will be located beyond the extent of the emergency basin and will be founded on existing silty sand, gravel glacial till, and Giants Range granite. Foundation preparation for all new dams will consist of removal of surficial peat (if any) until bedrock or glacial till is encountered." (November 26, 2014, NorthMet Project Geotechnical Data Package (Volume 2) Hydrometallurgical Residue Facility, Version: 5 Page 28.) This statement does not indicate that any unsuitable types of glacial deposits will be searched for and removed prior to beginning the dams outside of the emergency basin. Maps in this document show depths of till to be generally 25 to 100 feet thick. I have found no indication that site-specific evaluation of the underlying glacial deposits existing under the Emergency Basin or even under the proposed new dams was conducted. Without validation that there is no unsuitable clay or geological deposit that is subject to drained and/or undrained pressures, one should assume based on the geology of the area that the same conditions that caused the Mount Polley spill (lack of detailed identification of deposits underlying the dams so that design can accommodate them) can occur here with similar drained/undrained conditions. Drains are planned below the HRF, but not below the consolidated Emergency Basin materials. I am not a geologist, but these inconsistencies concern me. In addition, the FEIS should simply state whether or not all of the stability calculations and all actions like consolidation are sufficient to compensate for the similar risk of drained/undrained glacial deposits and shifting pressures that caused the Mount Polley spill.	S	O
26997	Unique			GT	Maureen Johnson		1543	22	The assumption that the liner design will function for 500 years is based on a test of 174 days, less than a year, using an estimate of what Barr thinks will be the important components of the processing liquid waste, not actual analyses. PMet 2015q. p. 44-45. February 13, 2015 NorthMet Project Waste Characterization Data Package Version: 12 Groundwater Impact Assessment Planning summary memo, stated, "it is assumed that the HRF will have negligible leakage and there is no compelling need to model the leakage from this source." This memo makes the decision but does not describe the basis on which the decision was made. It is not in and of itself sufficient basis to exclude the predicted leakage from the FEIS and modeling, especially since the nature of the HRF processing waste water is unknown.	S	O
26997	Unique			GT	Maureen Johnson		1545	24	As a result of the liner stress posed by the proposed location of the HRF on top of shallow marshland, peat, slimes and other unconsolidated glacial materials, failure of liner integrity is more likely.	S	O

26997	Unique			GT	Maureen Johnson		1546	25	In addition, both the HRF process and the chemical trains for filtered sludge involved limestone or lime, creating high concentrations of calcium. The presence of these ions will increase the likelihood of failure of the second liner, the geosynthetic clay liner. "Ions such as those of calcium and sodium are known to have potentially detrimental effects on the long-term permeability of GCLs [geosynthetic clay liners]; the GCL permeability has the potential to increase in the presence of such ions, particularly when these ions are present in high concentrations." (Geotechnical Data Package – Hydrometallurgical Residue Facility, SDEIS reference PolyMet 2012a, p. 54).	S	N
26997	Unique			GT	Maureen Johnson		1547	26	The question of the number of years that the liner will function is still unresolved, though. 500 years is a very long time and unreasonable to predict.	S	O
26997	Unique			GT	Maureen Johnson		1551	39	• The FEIS must be revised to evaluate alternatives to mitigate leakage in the long term from the HRF including completely dewatering and solidifying HRF materials.	S	O
26997	Unique			GT	Maureen Johnson		1561	40	The FEIS must be revised to evaluate the potential that materials deterioration and maintenance lapses over time would increase liner leakage and water quality impacts.	S	O
N/A	Form Letter Template	5	Non-Variant	GT	Multiple	YMCA Camp Menogyn	FL31	1	I'm commenting on the most recent FEIS for the Polymet mine to state my complete opposition to the Polymet mine on the grounds that this type of mining cannot be done safely near some of the most important water systems in North America. I take issue specifically with the planned storage of mining tailings and the subsequent wastewater retention ponds that are guaranteed to house a highly reactive stockpile of acidic sludge. These same type of retention ponds burst at the Mount Polley Mine in British Columbia in August of 2014, and I won't stand idly by as an international mining corporation is allowed to endanger the water and land I depend on.	NS	X
N/A	Form Letter Template	6	Non-Variant	GT	Multiple	Izaak Walton League	FL36	3	The PolyMet Final EIS should be rejected as incomplete because it fails to detail future risks and costs of polluted water treatment and possible leaks and dam breaches. This detail is essential to determine financial assurances necessary to conserve natural resources in the future and to protect our children from paying for the clean up of this proposed mine.	S	O
27901	Unique			GT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3355	76	In the FEIS, the Co-lead agencies have chosen to forego analysis of dam failure, a reasonably foreseeable occurrence, sufficiently to understand the risks of the Proposed Project's tailings disposal and explore alternatives to minimize those risks. Fond du Lac continues to question the design, location, and performance estimates for the Hydrometallurgical Residue Facility.	NS	X
27901	Unique			GT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3356	77	As previously expressed, we do not share PolyMet's confidence in being able to virtually eliminate leakage to groundwater from any type of containment system. Some leakage must always be assumed, and given the site-specific conditions for the proposed location of the HRF, the risk for highly contaminated seepage to exit the HRF and flow to wetlands in the Embarrass River watershed is high.	S	O
27901	Unique			GT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3357	78	The significance of the site topography and natural drainage features is more relevant to our concerns than the regulatory status of the wetlands. The FEIS simply does not address the potential lack of integrity or risk of failure when constructing a hazardous waste facility within a wetland. Assumptions about hydraulic head being removed from the lower liner are not reassuring when the lower liner (geosynthetic clay) has been installed within a wetland and natural drainage ravine.	S	O
24516	Unique			GT	Patrick Kvidera		1045	2	Now that we are having 100 year storms every few years, any holding structure should be built to withstand a 1000 year event.	NS	X
29676	Unique			GT	Paul Nasvik		2564	2	The bentonite clay lining is something that I have used in multiple installation for water containment. It is susceptible to erosion, and shifting. It will dry and shrink when water is not available and then is more susceptible to erosion when exposed to rapidly flowing water.	S	O
29676	Unique			GT	Paul Nasvik		2565	3	The reason for a double containment system is being proposed is because of the potential for one system to develop leaks. Using a synthetic liner system is only good if you have no damage to the liner and it has been water filled and tested for a period of time. Even at that the filling of the pit with mine waste material would have to be done extremely carefully to make sure no punctures are made. Even filled successfully you will still need to worry about shifting material and contact points. One leak, or puncture to the membrane with 600 ft. of head pressure will be disastrous to the ground water. Neither system is fool proof and it would be foolish to put so much at risk on bad technology.	S	O
27085	Unique			GT	Paula Maccabee	Water Legacy	3160	159	As WaterLegacy explained in our comments on the SDEIS, NEPA requires the assessment of "reasonably foreseeable" adverse impacts, which "includes impacts which have catastrophic consequences, even if their probability of occurrence is low, provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason." 40 C.F.R. §1502.22(b)(4). Since our prior comments, new information underscores the need for this disclosure. Yet, the PolyMet NorthMet FEIS provides no assessment of the risk or consequences of any variation from their modeled performance or "expected" conditions. As a result of this omission, the FEIS obstructs consideration of alternatives to mitigate harm, justifies non-disclosure of important information regarding chemical contaminants and provides an insufficient foundation from which to derive financial assurance.	S	O
27085	Unique			GT	Paula Maccabee	Water Legacy	3161	160	International headlines, research reports and expert opinions over the past year and a half underscore the fact that catastrophic failure of mine tailings dams is a significant and foreseeable risk. On Monday, August 4, 2014, on a sunny summer day, the tailings dam at the Mount Polley copper-mine in British Columbia, Canada collapsed. The breach released an estimated 24.4 million cubic meters (6.3 billion gallons) of tailings and wastewater into Polley Lake, which rose by 1.5 meters. Hazeltine Creek, which flows out of Lake Polley, was transformed from a 2- meter-wide stream to a 50-metre-across "wasteland" and Cariboo Creek was also affected. By August 8, the spill had reached Quesnel Lake, considered until then one of the cleanest deepwater lakes in the world. ³⁵ By one year later, water quality in 70-kilometer once-pristine Quesnel Lake had changed. After the dam collapse, Imperial Metals sent water filters to owners around the spill area of the lake: first 50 micron, then 25 micron, then 0.4 micron filters after scientists said a filter less than one micron was needed. These clogged, so the company supplied drinking water. Imperial Metals acknowledged tailings contain arsenic and lead. The Interior Health Authority has issued a bulletin not to eat the fish in Quesnel Lake due to mercury. Many homes and cabins on the lake are vacant or for sale, and residents say both property values and tourism have declined. ³⁶ On November 6, 2015, an iron ore tailings dam collapsed at the Samarco mine in Brazil. The dam collapse started a mudslide that flattened a village of 600 people in the historic mining region of Minas Gerais. The fire chief confirmed that 17 people were killed and 50 injured, while others were still missing. The local miners' union said the sludge was toxic, but the company operating the mine said it was "inert" and contained no harmful chemicals. ³⁷ Two weeks later, it was estimated that 60 million cubic meters (nearly 16 billion gallons) of mine waste had been released, requiring 600 people to be evacuated. ³⁸ On November 30, 2015, Brazil announced that they would file a \$5.2 billion lawsuit against the BHP mine company, and BHP said they would set aside a \$260 million fund for community members affected by the spill. A large number of fish had already died. ³⁹ Laboratory testing in downstream samples of water from the impacted Rio Doce detected mercury, aluminum, iron, lead, boron, barium, copper, arsenic and other chemicals. Arsenic in sampling after the dam breach was 2,639.4 micrograms per liter -- more than 200 times Brazil's 10 micrograms per liter standard. ⁴⁰ These may be particularly gripping examples, but they are not uncommon. A July 21, 2015 report by Lindsay Bowker and David Chambers, The Risk, Public Liability & Economics of Tailings Storage Facility Failures (hereinafter "TSF Failures", attached as Exhibit 19) analyzed recorded tailings storage facility failures from 1940 to 2010 using statistical tools. They found an emerging and pronounced trend since 1960 toward a higher incidence of Serious and Very Serious failures: 49% (33/67) of all recorded Serious and Very Serious failures from 1940-2010 have occurred since 1990. Of all 525 recorded incidents cited, 1990-2010, 17 (33%) were Serious failures, i.e. large enough to cause significant impacts or involved loss of life. Another 16 (31%), were Very Serious failures, i.e. catastrophic dam failures that released more than 1 million cubic meters of tailings and in some instances resulted in multiple loss of life. 63% of all incidents and failures since 1990 were Serious or Very Serious. The total cost for just 7 of these 16 large failures was \$3.8 billion, at an average cost of \$543 million per failure. (Bowker & Chambers, TSF Failures, pp. 1-2, Exhibit 19) The TSF Failures report noted that very large releases can occur even at a small tailings facility. The Mount Polley tailings storage facility was only about 35 meters high with a total capacity of about 74 million cubic meters (Id., p. 2), much smaller than that proposed for the NorthMet project. The report identified factors contributing to the increase in catastrophic dam failures: mining lower grades and falling real prices of metals, pushing older tailings storage facilities to unplanned heights, or stretching the limits of tailings storage facilities that were not built or managed to best practices in the first place. (Id., pp.1, 2,16). These risk factors would all apply to the NorthMet tailings facility. The TSF Failures report projected 11 Very Serious and 12 Serious failures worldwide from 2010-2020 with a likely \$7 billion unfunded cost. (Id., p. 2). Although the TSF Failures analysis did not cover the past few years, the World Information Service on Energy (WISE) has prepared chronology of major dam failures through mid-November 2015, attached as Exhibit 20. Since 2010, WISE has identified 12 major tailings dam failures, including failures in Canada, the United States, and Europe.	NS	X
27085	Unique			GT	Paula Maccabee	Water Legacy	3162	172	As discussed in Section IX, in the comments of Dr. Chambers, there are specific similarities between the proposed PolyMet NorthMet tailings storage facility and the Mount Polley tailings impoundment that underscore the relevance of the Independent Report recommendation.	NS	X

27085	Unique			GT	Paula Maccabee	Water Legacy	3167	161	David Chambers’ provided expert “Comments on the Geotechnical Stability of the Proposed NorthMet Tailings Basin and Hydrometallurgical Residue Facility in light of the Failure of the Mt Polley Tailings Storage Facility” on April 30, 2015 (Chambers, 2015, Exhibit 21). These comments identified concerns related to the proposed NorthMet tailings waste storage facility. As a general matter, Dr. Chambers noted that tailings dams fail at a rate that is approximately 10 times higher than that of water supply reservoir dams. (Id., p.2) Dr. Chambers also stated that upstream-type dam construction poses the highest risk for both seismic and static failure of tailings dams and that most tailings dam failures have been associated with upstream construction. Referring to the SDEIS, he noted that the NorthMet tailings facility would use upstream dam construction for its expansion, and would also need to depend in part on the safety of the design and construction of the old upstream-type LTVSMC dams. (Id., pp. 2-3).Dr. Chambers highlighted the presence of a clay layer beneath a portion of the Mount Polley dam as a significant cause of its failure, explaining that the LTVSMC tailings slimes on which the NorthMet project’s tailings dams will be built have a consistency and behavior similar to clays. (Id., p. 3). The FEIS confirms both that the LTVSMC dam was built with upstream construction and that PolyMet still plans to use upstream construction for its tailings storage on top of these old dams. (FEIS, 4-439, 5-646). The FEIS also notes that there were times during the operation of the underlying LTVSMC tailings facility where “significant amounts of fine tailings and slimes” settled near the perimeter dams and dams were then built with coarse tailings on top of them. (FEIS, 4-427) This inclusion of “relatively large zones” of fine tailings and slimes in the dam’s outer shell “reduces the drainage ability of the shell, increasing the phreatic surface, and reduces the localized shear strength” of the dam. (Id.). The FEIS identifies the northern dam in Cell 2E as an area of potential weakness since it is “underlain by a layer of fibrous peat up to approximately 20 ft thick that extends north beyond the toe of the dam into a nearby wetland and due to the presence of interbedded layers of contractive fine tailings and slimes.” A deposit of glacial till lies beneath the peat, and the crest of the dam in this area is about 90 feet above the surrounding ground surface and “consists mostly of coarse tailings with some weaker layers of interbedded fine tailings and slimes close to the base of the dam.” (FEIS, 4-437). Fully liquefied, this cross-section of the dam (Section F) has a margin of safety at barely the 1.1 minimum required. (FEIS, 5-658, Table 5.2.14-1). PolyMet’s Flotation Tailings Management Plan (PolyMet 2015n) states that there are 34 homes that could be affected by a tailings dam break, and that the time to first arrival of flood flows at the nearest residence would be about an hour. (Id., p. 20). The map illustrating the flood path, provided on the last page of PolyMet’s Plan, is attached as Exhibit 22. However, the FEIS does not include any Dam Break Analysis. “The potential effects of hypothetical failure scenarios have not been assessed in this FEIS.” (FEIS, 5-628). WaterLegacy does not argue that the NorthMet tailings storage facility dam will fail, only that such failure is reasonably foreseeable and may have catastrophic consequences. Assessing these consequences is necessary for decision-makers to understand the risks of PolyMet NorthMet tailings disposal and evaluate alternatives to minimize these risks.	S	O
27085	Unique			GT	Paula Maccabee	Water Legacy	3168	162	The PolyMet NorthMet hydrometallurgical residue facility (HRF) would be a relatively small facility, when compared to the combined LTVSMC and PolyMet tailings waste storage facility. Although information in the FEIS regarding the chemical constituents of the hydrometallurgical residue facility is incomplete, there is every indication that this facility would contain highly reactive constituents at very high concentrations. Co-Lead Agency responses to SDEIS comments state that 164 pounds of mercury would be deposited in this facility each year. (FEIS, A-414). Over a 20-year mine life, up to 3,280 pounds of mercury could be deposited in the HRF. The February 2007 PolyMet RS33/RS65 Hydrometallurgical Residue Characterization (available as WaterLegacy SDEIS Comment Exhibit 27, although not included among FEIS references) disclosed that hydrometallurgical leachate residue would have sulfate levels of 7,347 mg/L. Although we have found no document in the EIS record that provides contaminant levels for WWTP sludge, before reject concentrate is dewatered it will contain levels of arsenic and metals as much three orders of magnitude above limits and standards. At the P90 level, reject concentrate would contain: 1,150 µg/L of arsenic (2 µg/L criterion for drinking water); 16,600 µg/L of manganese (100 µg/L HRL for drinking water); 847 of cobalt (5 µg/L surface water limit); 11,600 µg/L of copper (9.3 µg/L limit in water with 100 mg/L hardness); 1,290 µg/L of lead (3.2 µg/L limit in water with 100 mg/L hardness); 8,230 mg/L of sulfate (10 mg/L limit in wild rice waters). (Water Modeling Data Package – Mine Site, PolyMet 2015m, autop. 452). As described previously in Section IV of these comments, the NorthMet hydrometallurgical residue facility would be located adjacent to a source of seepage with the potential to build up flow beneath its liner and on top of an LTVSMC emergency basin containing as much as 50 feet of fine tailings and slimes, which was sited on top of wetlands and a fault line and constructed using an upstream construction method. (FEIS, 4-439) The FEIS contemplates that “liquefaction of the hydrometallurgical residue” may occur, but states that the embankment dam is “sufficiently designed so that containment would not be lost.” (FEIS, 5-664). The probability of containment failure at the hydrometallurgical residue facility may be low. But the consequences of releasing thousands of pounds of mercury as well as sulfates and other toxic metals could be catastrophic.	NS	X
27085	Unique			GT	Paula Maccabee	Water Legacy	3172	165	In Minnesota, there is a tendency to assume we are all above average without requiring any proof of performance. It is, thus, worth noting that mining facilities in Minnesota, as well as elsewhere have failed, spilled and leaked. In 1993, an LTV Steel Mining Company coal ash heap at Taconite Harbor liquefied and collapsed after an above-normal rainfall. The system that LTV used to collect surface runoff and leachate and pump it back to the top tier of the ash heap had been approved by the MPCA. Arrowhead Electric Coop. v. LTV Steel Mining Company, 568 N.W. 2d 875 (Minn. App. 1997). In 1990, Northshore Mining Company was penalized more than a half million dollars for violations associated with a tailings pipeline break, including late completion of reports and corrective actions.41 In 2012, Hibbing Taconite discovered a longitudinal crack of approximately 300 feet that had developed suddenly on the crest of its taconite tailings facility dam. HibTac installed a buttress and relief trench as an emergency measure to maintain stability.42 On three occasions between May 2013 and April 2014, failures in an Arcelor-Mittal mine tailings pipeline and a breach in the tailings basin perimeter dike caused the release of about 8,500 cubic yards (1,716,779 gallons) of tailings slurry and aggregate from a washed-out dike road into a pipeline ditch and 15.3 acres of adjacent wetlands.43	NS	X
27085	Unique			GT	Paula Maccabee	Water Legacy	3173	166	The FEIS, by omitting any assessment of the adverse impacts of catastrophic or routine failures of containment at the proposed PolyMet NorthMet mine, has created a closed circle in its reasoning. Once certainty of results has been assumed, first by PolyMet and then by the Co-Lead Agencies, neither environmental impacts assessment nor evaluation of alternatives can be done in conformity with law.	NS	X
27085	Unique			GT	Paula Maccabee	Water Legacy	3177	170	Since the SDEIS was prepared, the Mount Polley copper mine tailings basin suffered a catastrophic failure. (See Section IX, supra). On January 30, 2015, an independent panel of experts released their report, the Independent Expert Engineering Investigation and Review Panel Report on Mount Polley Tailings Storage Facility Breach (hereinafter “Independent Report”) attached as Exhibit 25. The Independent Report analyzed the cause of the Mount Polley tailings impoundment failure and stated, “the dominant contribution to the failure resides in the design.” The Report made the following key recommendation: [T]he future requires not only an improved adoption of best applicable practices (BAP), but also a migration to best available technology (BAT). Examples of BAT are filtered, unsaturated, compacted tailings and reduction in the use of water covers in a closure setting. (Id., at iv) The Independent Report explained, “There are no overriding technical impediments to more widespread adoption of filtered tailings technology.” (Id., at 122) Its Expert Panel challenged the practice of maintaining a water cover over tailings to reduce reactivity, stating that so-called water cover runs counter to best available technology principles and that “No method for achieving chemical stability can succeed without first ensuring physical stability.” (Id., at 124). The Independent Report explained the “intrinsic hazards associated with dualpurpose impoundments storing both water and tailings” and identified as the goal of best available technology for tailings management “to assure physical stability of the tailings deposit. This is achieved by preventing release of impoundment contents, independent of the integrity of any containment structures.” (Id., at 121) To accomplish this objective, the Report continued, “BAT has three components that derive from first principles of soil mechanics: 1. Eliminate surface water from the impoundment. 2. Promote unsaturated conditions in the tailings with drainage provisions. 3. Achieve dilatant conditions throughout the tailings deposit by compaction.” (Id.). The Expert Panel recognized that the chief reason why there isn’t wider industry adoption of filtered tailings is that comparisons of capital and operating costs alone favor conventional tailings dam. The Independent Report recommended that cost estimates include “risk costs, either direct or indirect, associated with failure potential,” emphasizing, “Full consideration of life cycle costs including closure, environmental liabilities, and other externalities will provide a more complete economic picture. While economic factors cannot be neglected, neither can they continue to pre-empt best technology. (Id., at 123). The Report concluded that “BAT should be actively encouraged for new tailings facilities at existing and proposed mines” and “cost should not be the determining factor.” (Id., at 125)	NS	X
27085	Unique			GT	Paula Maccabee	Water Legacy	3178	171	On March 18, 2015, WaterLegacy sent a letter to the Co-Lead Agencies summarizing the findings of the Independent Report (attached as Exhibit 26) and requesting that the Co-Lead Agencies analyze the best available technology of dry stack tailings disposal and the use of alternative sites in order to comply with NEPA and in order to identify the least damaging practicable alternative for the project under Clean Water Act Section 404. WaterLegacy specifically requested that analysis of dry stack tailings include a rigorous analysis focused on long-term costs for water quality treatment and maintenance during operations, reclamation and closure as well and on benefits of reduced adverse impacts to wetlands and water quality as a result of seepage, as well as the risk of catastrophic impoundment failure.	S	O
27690	Unique			GT	Robert Topliff		2078	2	WE have seen a serious design problem for the failed dam in BC, which Polymet is holding up for a model for their dam.	NS	X
25207	Unique			GT	Rome Jeffrey D. M.D.		1136	4	Finally, recent mining disasters (the Mount Polley Mine disaster in British Columbia is a prime example) are a stark reminder of the magnitude and consequences of damages caused by mining accidents. The FEIS provides insufficient reassurance to the citizens of Minnesota that our lands, waters and health can be protected by the professed good intentions of the mining industry.	NS	X
29241	Unique			GT	Sarah Poznanovic		3649	5	Finally, also reported by Elanne Palcich, “Tailings basin stability is also marginalized in the FEIS. Collapse of the tailings basin at British Columbia’s Mount Polley gold and copper mine in August of 2014 is the largest mining waste spill in Canada’s history. While analyzing the disaster, engineers made the case for the use of dry stacking of tailings, rather than wet basins. Because of high costs, PolyMet refuses to consider this alternative, and the DNR concurs.”	NS	X
29231	Unique			GT	Scott William Mills		2446	2	It fails to accurately assess the stability of wet stacking tailings both during and after operations. Current mining technology failed at the Mount Poly site in Canada with a tailings collapse.	S	O
29478	Unique			GT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3866	20	WHEREAS, the PolyMet plan for wastewater storage includes an unlined tailings basin, and is protected by only an unstable 40---year---old dam, risking a similar disaster as befell the Mount Polly mine in Canada;	NS	X
29046	Unique			GT	Tim Gihring		2404	2	The analysis does not appear to take into account recent failures of similar open-pit mine environmental controls, including the August 2014 collapse of the tailings basin at Mount Polley in British Columbia. This is the largest mining waste spill in Canadian history, and engineering analysis of the failure suggests that dry rather than wet basins would have made a difference — but neither PolyMet nor the DNR, in the FEIS, appear to have considered these lessons.	S	O

24770	Unique			GT	Tom Thompson		1106	5	Such holding ponds are proving in other places not to always work. Mount Polley is one example of the disaster that could occur if dams holding the Polymet ponds together fail. There is not an adequate plan for protecting the surrounding area from a disastrous breach or protecting Minnesota tax payers from having to pay for resulting damage. Nor does the FEIS adequately deal with the existing seepage from the ponds held back by dams already 40 years old to be used by Polymet.	NS	X
8592	Unique			HAZ	Allen Frechette		584	1	The FEIS is in my experienced opinion, incomplete in its failure to fully evaluate background contamination both known now and that which might become evident in the future as a direct result of preexisting conditions from identified Areas of Concern (AOCs). Because of the absence of this crucial background information, the state would have a difficult and costly time proving that future contamination, which the state believes emanates from the Polymet operations, was not from one of the AOCs that had not been fully evaluated, should Polymet deny responsibility.	S	O
27003	Unique			HAZ	Bruce Johnson		1591	2	My comment 15325 regarding the lack of bicarbonate analysis in the surface water was answered by theme code HAZ01 this answer is nonsensical. Bicarbonate is NOT a hazardous waste, it is a waste produce by the decomposition of minerals from tailing and waste rock. As state in my original question it is regulated under Minn. Rules 7050.0220 Subp. 5. At 5 meq/l. The question remains unanswered.	S	O
27685	Unique			HAZ	Dennis Szymialis		1898	53	no off-site contamination has been documented. p. 4-17. This is misleading. What is the consent decree for.	S	O
27685	Unique			HAZ	Dennis Szymialis		1931	86	p.4-361 reading hazardous waste reference on this page, nickel, arsenic, mercury, et.al. currently locked in the mineral formation meet the definition of hazardous waste.	S	O
27685	Unique			HAZ	Dennis Szymialis		1935	90	p.4-395 Tract 1 is an old dump site.	S	O
27685	Unique			HAZ	Dennis Szymialis		1941	96	-list of contaminants on p.5-9 incomplete.	NS	X
27836	Unique			HAZ	Ellen Hawkins		2198	22	Mention of disposal of some of the toxin-bearing sludge offsite does not include location of the dump site or mention of treatment of this by-product, but it’s a fair guess that there will be further water pollution somewhere, to a degree unknown.	NS	X
29965	Unique			HAZ	Gary Glass		4236	4	Many of the mine/ore processing issues are understated with the gaps in data where hazardous components have seemingly been purposely omitted from data tables to minimize the consideration of the future hazards that are to be expected from the handling of millions of tons of reactive sulfide ores and reactive sulfide waste rock containing many elements/substances known to be toxic to humans and wildlife. The underlying, unarticulated strategy seems to be that omission, and/or minimization by comparison with larger regional or global quantities, i.e., mercury emissions, should be instead substituted for scientifically, valid component characterization data which accurately and completely characterizes the solids to be mined. To illustrate this point, and contrary to what is presently in the FEIS, significant quantities of the element mercury are present in the solids to be mined, and is measured in 20 of 92 rock samples (22%) at the 1 part per million concentration level (Comment #8 SDEIS, SRK2007b). The element uranium is also present at significant quantities, and is measured in five of 92 rock samples (5.4%) at the 10 parts per million concentration level (SRK2007b). These samples may or may not be indicative of the highest concentrations in the ore body to be mined. Many more samples (more than 18,800) were analyzed for sulfide to accurately characterize the solid volumes to be mined and processed. Parts per million concentration levels means for every million tons containing the measured toxic component there is one ton of toxic component present, and should be accounted for in the FEIS. The FEIS makes the assumption that some toxic components will be of little or no concern, and if they were to show up in future monitoring, they would be properly dealt with. The fatal flaw in this approach is that by not properly characterizing the ore body, there will be no justification for a monitoring program to detect these hazardous component hot spots and no action will be triggered to properly isolate and treat the resultant hazardous emissions. The citizens of Minnesota will end up paying the price for improperly or untreated hazards by experiencing worker illnesses or in the cases of the 62 AOCs at the LTVMC site or the 1300 barrels of toxic compounds hidden on the RMC mining site, having to deal with hazardous, polluted land areas and/or paying taxpayers money for remediation (see my comment #9 DEIS). These and other examples demonstrate the current Minnesota rules and regulations are not protective of the environment and therefore reactive sulfide ores should not be mined.	S	O
29965	Unique			HAZ	Gary Glass		4260	23	Sulfide sulfur is also acted on by natural bacteria, Acidithiobacillus ferrooxidans (syn. Thiobacillus ferrooxidans) which lives in pyrite deposits, and is capable of metabolizing iron and sulfur, and producing sulfuric acid (http://en.wikipedia.org/wiki/Thiobacillus_ferrooxidans). This natural process seems to have been ignored in the recommended testing protocol and study results omitted in this SD EIS. Sulfide sulfur once oxidized by abiotic or biotic processes is soluble, acidic, and can move long distances in surface and ground water aquifers. In contact with stream and lake sediments oxidized sulfur is converted back to sulfide sulfur forming solid metal sulfides and dissolved, gaseous hydrogen sulfide which is as toxic as cyanide to aquatic plants (see Sulfide as a soil phytotoxin—a review Leon P.M.Lamers, et. al Frontiers in Plant Science PlantPhysiology July 2013 Volume 4 Article 268) and to aquatic animals (USEPA Gold Book 1986). Measures of sulfide sulfur reactivity including toxic gaseous hydrogen sulfide should be identified as significant constituents of interest for this SD EIS.	S	O
29965	Unique			HAZ	Gary Glass		4263	26	Hazardous Substances and Hazardous Waste Generation. These omitted constituents of interest are conspicuous by their absence in chapter one; denied in section 4.2.13, but admitted to in section 5.2.13. There is no specific approved disposal site identified for the permanent disposal of hazardous wastes generated as described in section 5.2.13. Clearly this is a major omission and must be corrected in detail for each and every hazardous waste created. Hazardous Wastes are omitted as a primary focus and must be added because of high levels of toxic metals and cancer causing materials present in the ore, tailings, and waste rock, including mineral fibers, dust containing high levels of nickel, chromium, and arsenic exceeding levels mandated protective controls.	S	O
29965	Unique			HAZ	Gary Glass		4284	47	Hazardous wastes and Hazardous Materials (4.12). The section 4.12.2 Impact Criteria gives four bullets stating conditions where "a significant environmental impact" would occur. The impression given is that small quantities of substances necessary for the project would be used and are classified as hazardous, and if for some reason or accident, some escaped would cause a (small) amount of environmental damage "if not recovered in a timely manner." (4.12.2). Omitted, and not found else where, is the fact that the object of the project - the Cu/Ni ore itself, is classifiable by its own chemical properties, as a reactive, hazardous mine waste, by the content of at least several components (see # 5 above). This information should be generated and added to the final EIS.	S	O
29965	Unique			HAZ	Gary Glass		4285	48	The section 4.12.4 Cumulative Effects states these effects "...could not be predicted." This is because of the narrow definition used for "hazardous materials" and focusing of the relatively small quantities of these substances while ignoring the real threat from the 294 million tons of reactive, oxygen-consuming, acid-generating, toxic-metal mobilization and transport from within the natural environment's atmospheric oxygen and forces of the hydrologic cycle of water (pg. 4.12-15). The larger view and scope of the impacts should be added to the final EIS, and in comparison with negative wide-spread impacts observed in other states and provinces.	S	O
26295	Unique			HAZ	Nancy Hauer		1295	1	I am submitting my opposition to the Polymet mine. There is complete consensus that the toxic waste will have to be contained indefinitely, far past any of our lifetimes. There is no way to be sure that it will be contained properly into the distant future, and leaks would be highly toxic to people, wildlife, and the environment of the area overall. I consider it highly irresponsible to place this long-term burden on our descendants long after anything valuable has been extracted from the mine.	NS	X
27901	Unique			HAZ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3294	45	Despite repeated requests for a clear response from the Co-lead agencies, the tribal cooperating agencies still do not know what PolyMet will be required to do, or when they will be required to do it, regarding their legacy contamination liabilities. The FEIS does not provide sufficient information for the public to understand whether the NorthMet Project Proposed Action will be required to remediate these and other AOCs before commencing Project operations, or be allowed to defer remediation until closure. It is not clear in the FEIS how the Voluntary Investigation and Cleanup (“VIC”) program requirements will be applied to PolyMet:	S	O
27901	Unique			HAZ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3331	44	The FEIS identifies 29 Areas of Concern (AOCs) that are now PolyMet’s legal responsibility, but still does not provide the necessary clarity about the status of remedial investigations and/or actions necessary to clean up the contamination that occurred over decades of taconite mining and processing.	S	O
27901	Unique			HAZ	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3359	80	There is insufficient information revealed in the FEIS to clearly understand the chemical composition of the HRF waste material, and unreasonable assumptions of liner leakage and performance. And as presented in the FEIS, there are two new sources of contaminants planned for disposal in the HRF: water treatment plant solids (primarily gypsum), and coal ash wastes from the existing LTVSMC site Coal Ash Landfill, one of the previously identified AOCs subject to the Consent Decree. These new, potentially toxic and reactive wastes may represent up to 10% of the HRF solids volume155, yet there is no characterization of the mass or concentration of chemicals resulting from the co-disposal of these wastes with the Hydrometallurgical process wastes. The FEIS, instead of providing this analysis up front, states that if the Project is approved, the residue should then be tested to verify that it is not hazardous.156	S	O
26780	Unique			HU	Alaina Pilate		1454	4	Health risks to children, workers, and communities that rely on wild ricing and fishing are not well analyzed as well as impacts of asbestos-like particles and methylmercury.	NS	X
26780	Unique			HU	Alaina Pilate		1458	10	Please require a Health Impact Assessment, as the plan does not adequately address how its existence will affect public health for Minnesotans, Please fix the plan to accurately assess health risks to workers and the public. Please require the PolyMet plan to better address the mercury pollution problem especially for MN children.	NS	X
30079	Form Letter	1	Variant	HU	Ashlee Kveton		2805	3	Further, I am outraged when I read the shear volume of untreated polluted water that will by the lead agencies own admission be leaving the mining operation and entering the environment, whether it goes to the BWCA or the Lake Superior. The St. Louis River deserves every protection that a river flowing into the BWCA does. For one thing alot more people live down stream of the St. Louis River than down stream from the Rainy. I personally rely on fish from both watersheds-and am a woman of child bearing age. I should not have to worry about my elected public and appointed public officials making it more dangerous than it already is to consume an important source of calories and nutrition that helps me get by on a lower income.	NS	X
26479	Unique			HU	Audrey Kramer		1330	4	A copper-nickel sulfide mine as proposed would contribute to the mercury/sulfate load that is currently creating a problem in the St. Louis River. These toxins would in turn leave residues in fish which we humans would then consume and be demented. (New birth babies along the North Shore already have high levels of mercury in their blood----jeopardizing their brain development.)	NS	X
27377	Unique			HU	Beth Lewis		1700	2	Increased health risk to humans, plants and animals from mercury and other pollutants in the already contaminated St. Louis River watershed.	NS	X

26555	Unique			HU	Bethel Anderson		1352	1	The plan is lacking a true assessment of the health effects of such mining, not only for the miners and nearby residents, but also for the rest of us living downstream. In looking at the authors of the FEIS, I do not see one medical doctor, nurse, or health professional. Likewise, looking at the responders to the previous iterations of the EIS, there is a lack of health professionals represented. A few weeks ago, our Governor was supporting a Health Risk Assessment of the PolyMet proposal, then he reversed that decision under political pressure. Many health care professionals feel we still need it.	S	O
26555	Unique			HU	Bethel Anderson		1354	3	We know that sulfate in a watershed increases methylation of mercury. We know that for 20 years of operation and for over 100 years after closure, PolyMet will be releasing massive amounts of sulfate to the Lake Superior watershed. The Minnesota Dept. of Health found that 10% of newborns in the Lake Superior watershed were already born with unsafe levels of mercury in their blood. Therefore, the plan presented in the FEIS is a direct threat to our children. The FEIS must be revised to address this inadequacy.	S	O
26555	Unique			HU	Bethel Anderson		1355	4	This FEIS fails to protect the health of our citizens in our water-rich State of Minnesota.	NS	X
23226	Unique			HU	Bob McFarlin		905	3	Twin Metals also agrees with the findings of the FEIS that the NorthMet Project’s potential effects on air quality and water quality pose no risks to human health.	NS	X
29361	Unique			HU	C.A.Arneson		3704	2	Methyl mercury was to be monitored during the second phase of NRR1’s pilot study, which reportedly began July 2014 and was to end mid-summer 2015; either methyl mercury has not been monitored, or results are negative enough to put NRR1’s funding in jeopardy. Funding authorized by the Minnesota Legislature, representing the public. Yet, now there will be no methyl mercury numbers released to the public until 2016. Not until after PolyMet’s Final Environmental Impact Statement is released. Coincidence? Meanwhile our Legislature voted to roll back environmental regulations, gut agency oversight, and eliminate public input meant to protect our waters and our children. Early childhood education, Governor Dayton; how about early childhood protection? https://www.minnpost.com/earth-journal/2015/05/legislaturesenvironmental- vandalism-could-undo-dayton-legacy-buffers Unfortunately legislators of a certain mindset dominate the Legislature. “All we’re saying is, OK, let’s take a breather over these next couple of years here and operate the same way we’ve operated for the previous 130 years until all the science is in, all the science is complete, all the rules are complete,” said Rep. Carly Melin, referring to enforcing the wild rice sulfate standard. (AP) http://www.twincities.com/politics/ci_28122728/deal-reached-over-minnesotawild- rice-sulfate-standards A year ago came this press release: “House DFL Leaders, Rep. Melin and Parents with Suffering Children Announce Medical Marijuana Compromise.” DFL Leaders and Melin apparently have forgotten that there are children suffering brain damage because of legislative actions on behalf of the mining industry, perhaps their own children and grandchildren. Minnesota’s children have paid the price for the “way we’ve operated for the previous 130 years.” Now Melin is telling them to “take a breather.” Minnesota’s children cannot afford to subsidize the mining industry with their health and intellect any longer – they never could. Wake up Minnesota, your babies are crying.	NS	X
27667	Unique			HU	Christine Tetzlaff		1822	1	If all of the people involved in this are going to use the runoff water for their potable water; you know, drink it, wash in it, wash their children every day of their lives, then we can talk. But you see, we will be doing just that. Filtering Pollution.	NS	X
26942	Unique			HU	Crystal Yakacki		1490	4	I am also extremely concerned about the public health repercussions from releasing toxins into the environment. Our children, and the bodies of our childbearing-age women, must be protected.	NS	X
25385	Form Letter	1	Variant	HU	David Witt		1164	6	The PolyMet FEIS is adequate under federal and state laws and regulations because: - It analyzed health risks and impacts on children, workers and communities who rely on fish and wild rice for subsistence, including risks from asbestos-like particles and methylmercury.	S	O
30071	Unique			HU	Deborah DeLuca	Duluth Seaway Port Authority	4333	3	It adequately analyzes human health risks. As per the judgment of the Commissioners of the Minnesota Pollution Control Agency (MPCA), the Minnesota Department of Natural Resources (MDNR), and the Department of Health (MDH): the human health implications have been fully addressed through the 10- year review process. Those organizations who oppose the mine can always identify individual "expertise" who will raise contradictory opinions, not necessarily in the interests of pursuing the best science, but because they are set on blocking the mining project. The MPCA, MDNR and MDH staff who have reviewed these documents are likely at best ambivalent about the actual mine project - their review of the FEIS is conducted from a neutral viewpoint and can be trusted. The FEIS specifically assessed potential human health implications of the proposed project due air- and water- quality impacts; the FEIS identified no adverse human health effects.	NS	X
29164	Unique			HU	Deborah Huskins		3600	6	Three state agencies that recently backed down on their request for much more rigorous health impact analysis of the entire project offer unpersuasive rationales, apparently bowing to political pressure. This is dangerous. If Polymet proceeds and these pollutants enter the watershed, there is no way to “undo” the damage. There is no “rewind”, and the damage will have been done. The cumulative effects of these pollutants over time can be even more damaging.	NS	X
30223	Form Letter	1	Variant	HU	Denise R Marlowe		361	1	I want an independent assessment of PolyMet health threats	NS	X
27685	Unique			HU	Dennis Szymialis		1848	3	That exposing downstream consumers to any additional amounts of arsenic as indicated on p.S-170 is a common law assault on the health of downstream consumers and should be enjoined as a nuisance. The judgement and honesty of the cooperating agencies should be suspect as co-conspirators to a crime in violation of crimes against downstream consumers and humanity, common law torts, and the Hobbs Act.	NS	X
27685	Unique			HU	Dennis Szymialis		1858	13	That the cooperating agencies are arbitrarily and capriciously and without substantial evidence setting a president for mining in Minnesota that will lead to the premature death tens of thousands. That the cooperating agencies have notice of the causation of death by their actions and that all of the principles are now on notice of the premeditated nature of their conspiracy to cause the premature death of tens of thousands in violation of the criminal law and civil rights laws of the victims. That the victimization by fraud of tens of thousands of water consumers in Minnesota and Wisconsin in its scope is a crime against humanity.	NS	X
29969	Unique			HU	Don Brown		2731	2	2. The Final EIS does not seem to adequately adequately address issues concerning the health and safety of human resources such as those who would be employed and/or living in or near the proposed mine and those living in or near the relevant watershed area. What substances will be released into the air, water or otherwise and what effect will that have on human (and non-human organisms)?	S	O
29972	Unique			HU	Don Brown		2736	2	2. The Final EIS does not seem to adequately adequately address issues concerning the health and safety of human resources such as those who would be employed and/or living in or near the proposed mine and those living in or near the relevant watershed area. What substances will be released into the air, water or otherwise and what effect will that have on human (and non-human organisms)?	S	O
1847	Form Letter	1	Variant	HU	Dr. Scott Cram		289	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. Their documentation is inadequate and assumes that heavy metal binding to mammalian systems is well understood, it is not. The chemistry of heavy metal binding is not understood at the molecular level. Even more critical are biological effects. Toxicity studies have only been done using model tissue culture systems that have been shown to be inadequate when predicting effects on humans. At a minimum normal human cells (vs. say HeLa cells) should be used for toxicity studies involving heavy metals. Peer reviewed literature citations validate my concerns.	S	N
25120	Unique			HU	Drew Johnson		1132	1	I’m very concerned about the health impact of the Polymet mine and the process (or lack thereof) for accurately assessing it. Please extend the comment period and support an independent health assessment of the Polymet mine.	NS	X
27836	Unique			HU	Ellen Hawkins		2187	10	It fails to analyze in any meaningful way the health risks from air and water pollution on local communities and visitors, even though Minnesota has a long history of issues related to asbestos-like particles and is very aware of the connections between human health vulnerabilities and methylmercury.	NS	X
27836	Unique			HU	Ellen Hawkins		2188	11	At least 5 of the 10 toxins listed by the World Health Organization as dangerous to human health are released into the environment by mining of copper-nickel in sulfide ores (mercury, lead, asbestos, particulate air pollution, and arsenic). Of particular concern are likely impacts to the neurodevelopment of infants and children from heavy metals, including methylmercury, lead, arsenic and manganese. The governor’s opportunity to repair this gap in the FEIS has been thrown away with his decision to disregard the pleas of health professionals.	NS	X
11017	Form Letter	1	Variant	HU	Eric Krenz		747	5	It’s clear that the long-term health effects to residents of this region need to be studied in far greater detail than they have been thus far.	NS	X
27015	Form Letter	1	Variant	HU	Eugene Ollila		1627	2	can. As a physician, I also feel that many of the side effects of toxic substances take decades to show up, long after the mine’s owners have decamped. Iron ores are relatively tame compared to sulfur byproducts and other "waste" materials. We thought DDT on the farm in the 50s was safe. If we believe all the discussion, there will be lots of bridges for sale, as in Brooklyn Bridge.	NS	X
29229	Unique			HU	Gail C. Roberts		3574	8	HU01 – A large number of health experts (including the Minnesota Commissioner of Health) called for a comprehensive Health Impact Assessment (HIA) that should have been conducted as part of the FEIS. Deciding that the environmental review process had already started and that conducting a HIA would lead to delays is NOT the way to reassure people that protection of human health for current and future generations is a priority.	S	O
26371	Unique			HU	George Nemanich		1303	1	I am a property owner in the area adjacent to the proposed copper-nickel mining development. I am concerned about the significance potential for water contamination and subsequent health issues with this happening to the surrounding water flowage in the area. I am a physician and astounded that the Governor and DNR have refused to have the Dept. of Health do a safety review of the project and permitting process. I think that before we allow this project to move forward we need to have a honest and thorough evaluation of the potential negative health and environmental effects.--simple logic would demand this!	S	O
24372	Form Letter	1	Variant	HU	gloriana casey		1031	2	Apparently the leaking of all kinds of chemical things into ground water is shown in the Carolinas and Camp Leguene-----you know. Making people sick with cancers and leukemia. So, of you want a great look at a DO NOT REPEAT THIS ACTION, you can go all over America and find examples of destruction by people making decisions--whose competence is debtable!	NS	X
24372	Form Letter	1	Variant	HU	gloriana casey		1032	3	The after life of so many chemicals seem to be longer than the people, places and animals that are affected!	NS	X
15	Unique			HU	Heidi Aubrey		46	3	I would like you to analyze the cancer rates of populations around strip mining pits vs. the national averages.	NS	X
29277	Unique			HU	Jacob Crawford		2486	2	To date, there has not been an independent assessment of the human health risks from contamination of fish with methylmercury produced by PolyMet’s proposed copper-nickel mine project. That fact alone should render this EIS inadequate.	S	O

29810	Form Letter	1	Variant	HU	Janelle Carlson		2646	2	Sulfur compounds are extremely toxic to humans, animals, and the environment. They are caustic and burn. I know first hand of its toxicity because I was prescribed a sulfa antibiotic and have never recovered from the long term side effects it caused. The sulfamethoxazole, the synthetic product used in the antibiotic is a sulphur-based compound much of which is recovered from stockpiles of toxic waste from oil refineries, chemical plants and metal smelters. It can cause damage to the liver, thyroid, immune system, adrenals, and the list goes on and on.	NS	X
27883	Unique			HU	Jay Newcomb		2214	4	The health effects of mercury and other pollutants on people has not been considered	S	O
29358	Form Letter	1	Variant	HU	Jennifer Hengelfelt		2509	3	I ask that we have a full disclosure of the risks to the economy and public health over time as polluted waters continue to leach over hundreds of years from a closed mine site	NS	X
29514	Unique			HU	Kathleen Miller		2516	6	Sadly, the DNR has ignored public health requests for an Environmental assessment of water quality, which is absolutely irresponsible.	NS	X
32	Unique			HU	KatieWilli@aol.com		94	2	I am very concerned that this sulfide mine would affect drinking water and fish and lead to the negative impact of methylmercury on the developing brains of babies and young children.	NS	X
10709	Form Letter	1	Variant	HU	Kevin Lee		717	6	There are also extensive indirect effects of this mine not accounted for in the FEIS, including the effects of smelting the copper produced at the mine. These effects include water, soil and air contamination that directly affects the public health.	S	O
10709	Form Letter	1	Variant	HU	Kevin Lee		718	7	Residents living near smelters experience higher rates of cancer in addition to other health effects that are derived from their exposure to toxic byproducts of smelting. None of these effects are even mentioned in the FEIS, yet they are well within the law's contemplation of environmental impacts appropriate for discussion in an EIS.	S	O
27721	Unique			HU	Kris Wegerson		2110	2	The FEIS is inadequate because it didn't adequately address human health risks and human health impacts. Nearly 40,000 Minnesota medical practitioners have asked for studies of the health risk and health impacts (the memberships of the Minnesota Medical Association, the Minnesota Academy of Family Physicians, the Minnesota Nurses Association and the Minnesota Public Health Association and hundreds of individuals). We asked for these studies in our March 11, 2014 comments to the SDEIS (Minnesota Health Professionals Comment-PolyMet). The FEIS was released almost 20 months later. The state of Alaska has established a health impact assessment (HIA) program in 2010 and all large natural resource developments projects have HIAs completed during the EIS process. An HIA is seen as one aspect of a "best practices" approach to responsible development in Alaska. (State of Alaska Epidemiology Bulletin NO. 19 July 25,2011) I have had discussions with Dr. Paul Anderson, MD, MPH, the head of Alaska's HIA Program, and Dr. Gary Krieger, MD, senior vice president of NewFields, who is a consultant on many of Alaska's HIA projects. They have stated that a comprehensive, independently researched and produced HIA could have been completed within one year. It could have been completed after the end of the comment period for the SDEIS and up until the time of the issuance of the FEIS.	S	O
27721	Unique			HU	Kris Wegerson		2111	3	Human health impacts are inadequately addressed under Chapter 7.3.4.3 of the FEIS. The PolyMet mine and plant are located within St. Louis County, which ranks 75 out of 87 Minnesota counties for health measures. (United Health Foundation 2014) An HIA establishes baseline community health status so that this can be compared to projected health risks and impacts of a proposed project. This has not be done.	S	O
27721	Unique			HU	Kris Wegerson		2112	4	The FEIS doesn't adequately address the potential harm to human health from methylmercury.	NS	X
27721	Unique			HU	Kris Wegerson		2113	5	Health risk and health impact assessments are necessary and should have been prepared in compliance with the procedures of the Minnesota Environmental Policy Act (MEPA . Minnesota Statutes Chapter 116D.03 Subd.2. Duties. "All departments and agencies of the state government shall: (8) undertake, contract for or fund such research as is needed in order to determine and clarify effects of known or suspected pollutants which may be detrimental to human health or to the environment, as well as to evaluate the feasibility, safety and environmental effects of various methods of dealing with pollutants." Health risk and health impact assessments have not been completed and therefore the FEIS is in violation of MEPA.	S	O
2327	Unique			HU	L S		319	1	Please protect the health of Minnesota infants and children. Please support the Minnesota Department of Health's request for a comprehensive analysis of the human health risks of the proposed PolyMet NorthMet copper-nickel mine.	NS	X
2327	Unique			HU	L S		320	2	It is important to assess: 1.) Risks to vulnerable populations -- infants, children, and people who rely on fish for subsistence -- from increases in mercury contamination of fish in the lower reaches of the St. Louis River, as well as the Partridge and Embarrass River watersheds. 2.) Risks to the health of plant and mine workers from exposure to cancer-causing asbestos-like fibers and metal dust. 3.) Risks to downstream communities and residential well owners from arsenic, manganese, and other toxic metals seeping into drinking water.	S	O
2327	Unique			HU	L S		321	3	Doctors and nurses across Minnesota have asked that a comprehensive analysis of human health risks be performed for the PolyMet sulfide mine project under the guidance of the Minnesota Department of Health. Department of Health Commissioner, Dr. Edward Ehlinger, has recommended to the Minnesota DNR that a Health Impact Assessment be prepared to help policymakers balance health risks and potential benefits of the PolyMet project. Please follow the advice of Minnesota's medical leaders and protect the health of generations to come. Push the Department of Natural Resources to require a Health Risk Assessment managed by the Department of Health as part of the PolyMet environmental review process and direct the Department of Health to initiate a Health Impact Assessment for the PolyMet sulfide mine project to address public health concerns.	S	O
23643	Unique			HU	LeRoger Lind	Save Lake Superior Association	2936	5	Hundreds of physicians in Minnesota have asked the state Health Department for a public health study focusing on the effects of this potential area wide pollution but have been summarily rejected by the entire state administration. In a stunning display of logic the state determined that enough information exists on potential public health effects from sulfide mining in Minnesota and that a public health study would not uncover any significant information that hasn't been considered. That opinion is not shared by thousands of physicians and our membership. An independent study is required and any delays in the FEIS process would have been self-inflicted.	S	O
23643	Unique			HU	LeRoger Lind	Save Lake Superior Association	2947	14	The FEIS does not adequately evaluate the potential effect of the inhalation of asbestos-like fibers generated at the mine site and in the processing plant. Mesothelioma and other lung disease have been diagnosed in studies by the MN Department of Public Health in taconite workers and local residents. The source of these fibers was the Dunka Mine pit and nearby Peter Mitchell Mine pit. Recent MPCA fiber monitoring results show toxic amphibole levels near 12000 fibers per cubic meter. The data was taken on 08/10/2008 in Babbitt, MN which is later than the June 2007 date of the reference document 2007I.RS61 and so was not taken into account in the FEIS reference which makes this reference incomplete at best. The argument that these fibers are cleavage fragments and thus are not harmful has been debunked by many qualified experts including Steve Ring in his comments on the SDEIS. Phil Cook (recently deceased) of the EPA's Duluth Water Lab issued extensive research showing that certain types of these fibers, including ferroactinolite, can be up to 20 times more toxic than even the Libby, Montana fibers which are a toxicity standard. The material at the PolyMet NorthMet mine pit would contain these same fibrous materials interspersed with the sulfide ore PM2.5 dust. Both workers and residents would be exposed to this potent combination of fibers and particles entering their lungs. This FEIS does not acknowledge this as being a health problem. Sulfur based oxides combined with iron based fibers in the lungs represents a new unexplored threat to the public health in the area. A health based standard for the permissible density of these fibers and particles in the mine, processing plant and surrounding residential areas must be developed before any permitting of the mine is considered. Even the World Heath Organization recommends no more than 400 particles in the PM2.5 range as a maximum exposure level for the humans. The EPA test data from the Duluth lab clearly shows that even smaller fibers cause tumors and that the toxicity of the fibers is best determined by their surface area, not their length. The PolyMet NorthMet Mine Project FEIS does not adequately describe a project that protects public health from this source of air pollution. The cancers and lung diseases from this type of air pollution do not surface for decades after the exposure. The addition of sulfur compounds to the mix of iron based asbestos-like fibers has not been adequately addressed in this NorthMet Mining Project and Land Exchange Final Environmental Impact Statement.	S	O
438	Form Letter	1	Variant	HU	Liz Bercaw		205	3	Already I hear stories of large numbers of children living in northern MN having to be treated for heavy metal poisoning, that is only available through a hospital, at great unsupported cost to the families. These, I have heard, already live at a low income level, on reservation land. This not only dishonors promises to a people who our ancestors moved out of the way, taking their land for our own sake and our lifestyle, but dishonors our MN goals of social equity.	NS	X

26648	Unique			HU	Margaret A. Redmond		1398	8	4. Despite being basically brushed off in the FEIS, the issues of mining in rock containing asbestiform minerals do exist. The Minnesota public has not been well treated by its state agencies regarding health effects of these substances when they are mined and turned into breathable particulates. That is, previous Health Department studies have withheld information from the public for years when higher levels of resultant disease were uncovered on the Iron Range. Thus, the issue of this type of mining needs to be carefully analyzed and regulated in any permitting. This would include provision for and funding supporting scrupulous health monitoring of workers, and nearby residents (for air and water issues).	S	O

27901	Unique			HU	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3351	71	As the Band commented at that time, the report from the epidemiologic study of Minnesota iron mine workers actually states that the rate of mesothelioma among mine workers is nearly three times the rate found in the rest of the state. 141 It was a matter of great concern to the Band to find that most pertinent details of this study have now been removed from the FEIS.	NS	X
8645	Unique			HU	Neil Simonson		599	6	None of us want to die from Cancer or eat Green Fish; but the Rangers' group conscience allows for the mining.	NS	X
27085	Unique			HU	Paula Maccabee	Water Legacy	3153	148	WaterLegacy’s comments on the SDEIS identified the following unexamined risks to health: the EIS failed to analyze health risks for on-site workers; the EIS failed to analyze the health risks from mineral fibers; the EIS failed to assess impacts of tailings seepage to residential wells; the EIS failed to analyze cumulative inhalation risks including off-site fossil fuel combustion to meet PolyMet NorthMet energy demands; and the SDEIS inadequately evaluated certain health risks, including risks of arsenic and manganese in drinking water. We highlighted our most serious health concern - the failure of the EIS to evaluate project and cumulative adverse health effects from methylmercury and requested a rigorous and independent assessment of health risks and adverse health impacts. The FEIS does not resolve any of these deficits.	NS	X
27085	Unique			HU	Paula Maccabee	Water Legacy	3154	149	The FEIS addressed none of our concerns about the adequacy of the SDEIS.	NS	X
27085	Unique			HU	Paula Maccabee	Water Legacy	3155	150	The FEIS fails to analyze health risks for on-site workers at either the NorthMet mine or tailings site, although it has now been acknowledged that the land exchange boundary was set to allow PolyMet to meet air quality requirements at the mine site boundary.34 The FEIS provides no summary of Minnesota Department of Health testing results and, in comparison with the SDEIS, further minimizes the health risks associated with mineral fibers. (compare FEIS, 5-513 to 5-19 with SDEIS, 5-435 to 5-443). As explained in more detail in the expert opinion of John Ipsen, M.D., PhD, “the FEIS incompletely addresses particulate air pollution. The analysis provided in the FEIS is inadequate to reasonably address the health risks of the proposed mine – risks to the mineworkers and to people living in the surrounding communities.” (Ipsen, 2015, p. 2)	S	O
27085	Unique			HU	Paula Maccabee	Water Legacy	3165	158	Dr. Ehlinger’s comments on the SDEIS suggested that a health impact assessment be performed “to mitigate or prevent possible negative health outcomes to improve the public’s health.” (Ehlinger SDEIS Comment, Exhibit 17, p.7). As a result of the EIS deficiencies and the human health risks posed by the PolyMet NorthMet sulfide mine project, medical and health organizations and individuals throughout Minnesota have requested a comprehensive and independent health risk and impact assessment be prepared for the project. Excerpts of their letters, which are attached as Exhibit 18, are provided below: Minnesota Nurses Association (March 10, 2014) “The PolyMet NorthMet Supplemental Draft Environmental Impact Statement (SDEIS) contains inadequate analysis of the impacts on public health from the proposal. The colead agencies should conduct and include a health impact assessment (HIA) in the Environmental Impact Statement to fully analyze the public health implications of PolyMet’s proposed mine.” Concerned Doctors & Nurses (March 11, 2014) “We respectfully request that the PolyMet SDEIS be deemed inadequate due to unresolved concerns and insufficient assessment of health risks of the proposal. We would further request that, in revising the PolyMet SDEIS, a comprehensive Health Risk Assessment be prepared under the guidance of the Minnesota Department of Health.” Minnesota Public Health Association (July 2014) “We write to request a comprehensive analysis of the health risks and public health impacts of the PolyMet sulfide mine project before any decisions are made about this controversial project. . . Mercury contamination of fish and impacts on neurotoxicity in the developing fetus as well as in infants, children and adults is a significant public health concern in Minnesota. Minnesota Medical Association (September 25, 2014) “On behalf of the Minnesota Medical Association, I am writing to offer support for the request that a comprehensive analysis of the health risks and public health impacts of the PolyMet NorthMet Sulfide Mine Project be conducted. This assessment will assist the state of Minnesota in making an informed decision as to the proposed project, taking into account any potential adverse effects this type of mining may have on the health of Minnesotans.” Concerned Health Professionals and Scientists (October 20, 2014) “We are concerned that the proposed PolyMet copper-nickel mine project could have significant adverse impacts on human health as a result of pollutants released to air, surface water and drinking water. We believe that analysis performed thus far is insufficient to assess important risks to human health and public health impacts of the pollutants that would be released from the PolyMet project.” Minnesota Academy of Family Physicians – Lake Superior Chapter (March 9, 2015) “We join our colleagues in the fields of medicine, nursing, and public health as well as our state Health Department to advocate for the health of our region. A health risk assessment and a health impact assessment are the next critical steps in understanding both the short and long term consequences that PolyMet’s NorthMet project may have on our health.” Minnesota Academy of Family Physicians – Statewide Organization (July 1, 2015) “The Minnesota Academy of Family Physicians (MAFP) is the largest medical specialty organization in Minnesota, representing over 3000 family physicians, family medicine residents, and medical students. . . As physicians, our priorities are the health of our patients and the communities we serve. We must be proactive in asking, “How will PolyMet’s NorthMet Project affect the long-term health of our patients and communities?” Health Risk and Health Impact Assessments are needed to answer these questions.” The PolyMet NorthMet FEIS’ analysis of health risks suffers from the same inadequacies discussed in other sections of these comments. Unsupportable models and unsubstantiated assumptions affect assessment of impacts of surface water and groundwater pollution on human health. The failure to apply Health Risk Limits and Risk Assessment Advice to groundwater further biased FEIS conclusions. The FEIS denial of methylmercury increases and other adverse impacts, results in a failure to evaluate potentially serious threats to human health, particularly to children’s health. It is rare for Minnesota’s rather conservative medical community to be united in their concern. It is not too late to require an independent and rigorous assessment of the adverse health impacts of the PolyMet NorthMet sulfide mine project.	S	O
2796	Unique			HU	Richard Schuh		344	1	Please protect the health of Minnesota infants and children. Please support the Minnesota Department of Health's request for a comprehensive analysis of the human health risks of the proposed PolyMet NorthMet copper-nickel mine.	NS	X
2796	Unique			HU	Richard Schuh		345	2	It's important to assess: 1.) Risks to vulnerable populations -- infants, children, and people who rely on fish for subsistence -- from increases in mercury contamination of fish in the lower reaches of the St. Louis River, as well as the Partridge and Embarrass River watersheds. 2.) Risks to the health of plant and mine workers from exposure to cancer-causing asbestos-like fibers and metal dust. 3.) Risks to downstream communities and residential well owners from arsenic, manganese, and other toxic metals seeping into drinking water.	NS	X
2796	Unique			HU	Richard Schuh		346	3	Doctors and nurses across Minnesota have asked that a comprehensive analysis of human health risks be performed for the PolyMet sulfide mine project under the guidance of the Minnesota Department of Health. Department of Health Commissioner, Dr. Edward Ehlinger, has recommended to the Minnesota DNR that a Health Impact Assessment be prepared to help policymakers balance health risks and potential benefits of the PolyMet project. Please follow the advice of Minnesota's medical leaders and protect the health of generations to come. Push the Department of Natural Resources to require a Health Risk Assessment managed by the Department of Health as part of the PolyMet environmental review process and direct the Department of Health to initiate a Health Impact Assessment for the PolyMet sulfide mine project to address public health concerns.	NS	X
10464	Form Letter	1	Variant	HU	River Point Resort Outfitting Co.		691	4	Hard, scientific facts have been ignored, including those related to health issues from methyl mercury toxicity to the developing brain. Instead, a political document, all 3,500 pages of it, was produced, and pushed upon the citizens of Minnesota.	NS	x

25207	Unique			HU	Rome Jeffrey D. M.D.		1141	1	I am writing to express my concern about a number of aspects of the Final EIS. The significant potential for degradation of water quality as result of proposed sulfide-ore mining operations in Northeastern Minnesota, both in the near term and, more importantly, in the long term, has very important ramifications for human health. The adverse health impacts of surface and groundwater acidification are a result of, among other things, the likelihood of increased exposure to heavy metals (such as cadmium) and other known carcinogens. It is my opinion that these risks to human health have been dealt with in only a cursory fashion in the FEIS.	S	O
29246	Unique			HU	Ron Brodigan		2459	8	Health professionals have insisted on an assessment of human health effects downstream of the proposed mine, before any mining takes place. MNDNR, in its zeal to hurry up the project review, says it's not necessary. MNDNR has been inappropriately tied to PolyMet and Glencore in this entire series of environmental reviews of the last ten years.	S	O
28855	Unique			HU	Ryan John Mallek		2328	1	in my opinion the EIS was lacking in regards to impact on the local and regional health effects.	NS	X
28855	Unique			HU	Ryan John Mallek		2364	4	I'm a Duluth resident, born and raised in northeast Illinois and moved to this area for its excellent access to outdoors, specifically the BWCA and SNF. I actively hunt and fish and camp in the watershed of the new Poly Met mine and i'm extremely concerned about what this mine will do to affect the quality of food that could be polluted by new mining operations.	NS	X
29289	Unique			HU	Sandy Sterle		2501	7	FEIS needs to include a rigorous health risk assessment as the Governor requested. This needs to be transparent and not just scattered throughout the document.	NS	X
29241	Unique			HU	Sarah Poznanovic		3645	2	A second major deficiency in the PolyMet FEIS is that cumulative health risks to downstream communities, including Duluth, Superior and Fond du Lac, are excluded. These risks include contaminated drinking water, mercury in fish, and release of asbestos-like particles. Issues concerning loss of fish and wild rice as local food are also not addressed.	S	O
29231	Unique			HU	Scott William Mills		2450	6	Given items 1,2 and 3, the risk to human health was not adequately assessed.	NS	X
29832	Unique			HU	Steve Brodigan		2649	1	By not incorporating a Health Impact Assessment (HIA), as requested by the Minnesota Department of Health, the Minnesota Nurses Association and Minnesota Health Professionals, the FEIS strikes me as insufficient. The Human Health addendum on the DNR website indicates that the Co-Lead Agencies, along with the MN Dept of Health, eventually determined a HIA isn't required but would be "a tool that can help inform the public about potential health impacts from a proposed project." Presumably, this is in addition to recently added section 7.3.4. If doctors, nurses and even public health professionals believe that incorporation of such a study is in our best interest to "do mining right" why in the world would we forego it, even if it takes a bit more time and effort?	S	O
26659	Unique			HU	Steve Jay		1428	20	a. Human risks to drinking water, fish are naïve and unrealistic. b. Assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure are not clear. Public health implications are lacking.	NS	X
26659	Unique			HU	Steve Jay		1429	21	c. There are no data regarding the health risks, including methylmercury and asbestos- like fibers on children and workers who subsist on wild rice and fish.	S	O
26659	Unique			HU	Steve Jay		1435	25	I recommend that the lead agencies organize and conduct a Community Health Impact Assessment to fully review the evidence of the short, mid and long-term adverse health impacts of the proposed sulfide mining. There are well- established models for conducting such reviews. They include the National Association of County and City Health Officers (NACCHO) Community Health Assessment and Improvement Planning process. http://www.naccho.org/topics/infrastructure/CHAIP/index.cfm The CDC Health Impact Assessment process is also science based and an independent and objective methodology for addressing the potential human health impacts of proposed projects. http://www.cdc.gov/healthypplaces/hia.htm .	S	O
30580	Form Letter	1	Variant	HU	Susan Amis		2875	1	I object t othe PolyMet mine due to the lack of independent Assessments of Health & Environmental Risks	NS	X
29900	Unique			HU	Susan Lynn		2701	3	We citizens quite literally allow you to take food from people's mouths by permitting mining companies to leak, ooze, pour or gush sulfide and other chemicals into the water. Sulfide interacts with mercury to produce methylmercury, the kind that lingers in the body, literally indefinitely, and harms babies in their mother's womb. Mercury is a byproduct of mining. Mercury harms neurological development. Presently 1 in 10 babies born on the North Shore of Lake Superior have abnormally high levels of mercury in their bodies at birth. The St Louis River has such high levels of mercury at present that no plan can be formulated to remove it, and make the fish safe to eat.	S	O
29356	Unique			HU	Tara Widner		3697	3	PolyMet has provided no statement on the potential public health impact to the people who live and work in the region. Northeastern Minnesota has long been known for exceptionally high rates of mesothelioma—a cancer found mostly in people who live and work around asbestos. Data show that there are 'asbestos-like fibers' in the rock of the eastern Iron Range where PolyMet wants to put its mine. It was almost 50 years ago that Duluth area residents began trying to hold another mining company, Reserve Mining, accountable for damage caused by the tailings waste rock Reserve Mining dumped into Lake Superior for decades. Reserve's cadre of attorneys worked relentlessly to distance the company from those damages. On April 24, 1982 the New York Times reported "...after more than 12 years of litigation in six courts, Federal District Judge Donald Alsop dismissed the suit against the Reserve Mining Company on Friday. He approved a settlement in which the company agreed to pay the cost of filtering drinking water affected by nearly a quarter of a century of dumping asbestos-laden mining wastes into Lake Superior. The company denies that there is any health hazard." The Minnesota Department of Natural Resources has both scientific and historical evident demonstrating the potential negative impact of the proposed PolyMet Min. It seems reckless at best to ignore this evidence.	S	O
29478	Unique			HU	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3861	15	WHEREAS, a large collective of medical--professional organizations and individuals have expressed grave concerns about the potential harm to public health potentially caused by the PolyMet mine project, including risks from airborne asbestos, methylmercury and other heavy metals and toxins, nearly all of which have not been properly addressed by the FEIS; WHEREAS, the potential threats to children, workers and communities who rely on fish and wild rice for subsistence, have not been properly addressed in the FEIS; WHEREAS, health effects from air pollution and haze emanating from the mining operation has not been adequately studied or provided with mitigation plans for mine workers or the health of the general public; WHEREAS, the adverse effects on groundwater from PolyMet's operations upon the safety and quality of well water have not been adequately studied from a public health perspective; WHEREAS, independent expert testimony regarding hydrology, biogeochemistry, mercury and other toxins, public health, and other essential considerations have not be adequately addressed by the FEIS; WHEREAS, mitigation strategies to prevent various forms of pollution, protect the public health, and compensate for ecological losses have been undermined by cost--saving measures that favor industry over the environment;	S	O
24770	Unique			HU	Tom Thompson		1107	6	Other questions need answering. What impact will Polymet have on children, workers, and surrounding communities that rely on fishing, wild rice and drinking water that will be impacted by copper/nickel mining? What will be done about potential asbestos issues? Or will we just wait and deal with it if it arises. Sulfide rock being mined will increase methyl mercury adding to mercury levels in fish and plants. Children in North East Minnesota already have elevated levels of mercury in their bodies. How will this be handled?	NS	X
1170	Form Letter	1	Variant	HU	tony vavricka		275	2	The PolyMet FEIS is inadequate under federal and state laws and regulations because health risks and impacts on children, and communities who rely on fish and wild rice for subsistence, including risks from asbestos-like particles and methylmercury.	NS	X
29270	Unique			HU	W. Charles Huskins		3653	3	Comment 1: The FEIS provides an extremely limited assessment of the impact of the project on human health. In a document over 3500 pages in length, the FEIS devotes only 5 pages (7-13 to 7-18) to a summary of the impact of the project on human health. The impact of the project on human health is particularly important because the FEIS acknowledges that the baseline community health in Lake and St. Louis counties is already "poor relative to other counties in Minnesota" (Page 7-14).	NS	X
29270	Unique			HU	W. Charles Huskins		3654	4	Comment 2: The FEIS does not fully acknowledge vulnerable human populations affected by the environmental impacts of the project. The FEIS acknowledges children as an important component of the human population affected by the project (EO 13045 Protection of Children from Environmental Health Risks and Safety Risks, 1997, Page 5-590). In addition, the FEIS states "Children (individuals under 18 years of age) comprise nearly 29 percent of the study area population, compared to 24 percent for the state" (Page 5-590). However, the FEIS does not acknowledge pregnant women or their unborn fetuses are a vulnerable population with respect to methylmercury exposure. In fact, in a document over 3500 pages in length, the FEIS does not even mention pregnant women or fetuses. The only mention of issues related to the health of pregnant women occurs in Attachment 3, which describes the Tribal Collaborative Agencies Cumulative Effects Analysis. In addition, because mercury accumulates and persists in the human body, all women with childbearing potential (not just pregnant women) should be considered a vulnerable population. This is a major omission because developing fetuses are highly susceptible to neurotoxicity caused by exposure to methylmercury. In addition, the SDEIS does not acknowledge that elderly adults are another vulnerable population with respect to methylmercury exposure. Persons >65 years of age represent a fifth of the populations Lake and St. Louis counties and the FEIS states that the study communities have "more senior citizens (age 65 or older) than the state as a whole" (Page 4-372). Yet, the FEIS does not even mention health risks for elderly persons. This is a major omission because elderly persons may be at increased risk to the effects of methylmercury due to reduced metabolism of toxic compounds, neurologic co-morbidities, a higher pre-existing load of mercury in their bodies, and increased consumption of contaminated fish.	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29270	Unique			HU	W. Charles Huskins		3655	5	Comment 3: The FEIS does not adequately address the impact of methylmercury exposure on human health, particularly the health of vulnerable populations. The FEIS acknowledges that methylmercury has serious adverse effects on human health, including neurotoxicity. The FEIS assessment of the impact of increased exposure to methylmercury on human health is inadequate for the following reasons. A. As noted in Comment 2, the FEIS does not even mention sizable proportions of the population that may be particularly vulnerable to methylmercury exposure. As a consequence, the FEIS does not address the impacts of methylmercury exposure on high-risk populations (e.g., children, pregnant women and fetuses, the elderly), which are likely to differ from the impact on the population as a whole. B. The FEIS uses the “Hazard Quotient”, which is “the ratio of the mercury concentration in fish to a health-based target of 0.2 ppm” (Page 6-86) to quantify the potential impact of the exposure to methylmercury on human health. The FEIS states “a Hazard Quotient greater than 1 exceeds the health-based target” (Page 6-86). However, the FEIS does not provide evidence that the Hazard Quotient is an accurate measure of the effect of exposure to methylmercury on human health. Moreover, it does not state whether a Hazard Quotient threshold of 1 is applicable to all segments of the population, particularly vulnerable populations (see Comment 3.A). C. The FEIS estimates the “maximum incremental cumulative Hazard Quotient from the two projects over existing fish mercury concentrations is 0.08 for recreational anglers, 0.61 for subsistence/tribal anglers, and 0.54 for subsistence fishers.” The FEIS further states that the “NorthMet Project Proposed Action contributes approximately 59 to 92 percent of the incremental cumulative Hazard Quotient.” (Page 6-86).” Accepting the premise that a Health Quotient greater than 1 exceeds the health-based target (see Comment 3.B), a mere two-fold increase in this estimate would indicate that the project will have a substantial effect on the health of humans who are subsistence or tribal anglers. Moreover, this is likely to be a significant underestimate of the risk to large portions of the population—that is, the vulnerable populations identified previously (see Comments 2, 3.A, and 3.B).	S	N
29270	Unique			HU	W. Charles Huskins		3656	6	To address my comments above, I recommend the parties involved in the development of the FEIS take the following actions and revise the FEIS accordingly. 1. Acknowledge all of the vulnerable populations affected by the project and include an assessment of the impact of the project on the health of these high-risk segments of the population or acknowledge that the effects are unknown (see Comments 2, 3.B, and 3.C). 2. Given that existing levels of mercury contamination of water resources and fish are above acceptable levels, acknowledge that incremental increases in sulfate or mercury concentrations of water resources represent adverse impacts of the project. 3. Provide evidence that the Hazard Quotient is a precise and accurate assessment of the impact of methylmercury exposure on human health, including vulnerable populations (see Comments 2, 3.B, and 3.C). If this cannot be done, use other methods for estimating the impact of methylmercury exposure on human health or acknowledge that the risk is unknown. 4. Perform and report the findings of a Human Health Impact Assessment.	S	O

29843	Unique			LAN	Amy Schwarz		2659	2	The land exchange is not in the best interest of the state and to move forward with it contradicts the mission and responsibility of the Forest Service.	NS	X
27822	Unique			LAN	Anita Tillemans		2151	1	How would a land exchange void the responsibility vested in USFS as the steward of public lands presently in their care? With the proposed land exchange, USFS would be forfeiting its authority to mining interests over lands that were set aside for protection. The Forest Service would be trading, not only lands, but a trust that these ecosystems would be protected from exploitation for generations to come. Polymet will be mining water resources, destroying wetlands, by their own admission; and, in effect, degrading natural resources, flora and fauna, with its lease to continuously extract metals in an open-pit mine. They will be requiring permits to do all of this, including permits to take endangered species on lands that the Forest Service was given in trust, lands that USFS would need to trade in order for mining to occur. In addition, this would help establish precedent that could facilitate more land exchanges of this type. By trading these lands, USFS would, essentially, be demonstrating a lack of will in exercising its authority. This land exchange, essentially, would create a barter system that conflicts with the USFS’ role as steward and allows exploitation. By any reasoning, the land exchange cannot be reconciled with this public trust.	NS	X
27822	Unique			LAN	Anita Tillemans		2168	15	Please do not permit this land exchange to occur.	NS	X
30061	Unique			LAN	Anita Tillemans		4317	1	How would a land exchange void the responsibility vested in USFS as the steward of public lands presently in their care? 29731	Unique			LAN	Bill Waddington		2574	2	The land swap with National Forest land clearly short-changes the people of Minnesota.	NS	X
29807	Unique			LAN	Bruce Ludewig		2634	3	I do not believe the effects of the proposed land swap with the U.S. Forest Service have been properly acknowledged or addressed in this proposal. The land swap would effectively reduce the size of the Superior National Forest since the lands traded to the Forest Service are already effectively protected from development due to their scattered locations within the National Forest. The land to be given up by the Forest Service is on the perimeter of the forest, and would effectively reduce the size of the forest in terms of the protections it provides to the overall landscape.	NS	X
26617	Form Letter	1	Variant	LAN	Bryan Wyberg		1371	6	Given the inadequacy of the analysis, and the bias in the FEIS towards approving this unsafe mining proposal, I believe that it is inappropriate to use this crap as the basis for any decisions that involve permanent degradation of public lands. I therefore further object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal.	NS	X
27184	Unique			LAN	Carl Sack		1685	13	The land exchange sets a precedent for possible future exchanges to facilitate sulfide mining, resulting in cumulative impacts and fragmentation of Forest Service lands. It is no secret that mineral prospecting has been widespread throughout northern Minnesota in recent years, including on Forest Service lands. The possibility that this decision will set precedent for future exchanges was not considered in the Forest Service’s Record of Decision. The land exchange directly facilitates the destruction of 914 acres of high-quality wetlands and 1,719 acres of vegetation mapped by the MDNR as Sites of High Biodiversity Significance without creating any such habitats in exchange. The exchange considers only the market value of the surface property rights of the exchanged parcels without economizing and factoring in the value of the ecosystem services that would be lost due to the exchange. If the biological values and ecosystem services lost due to the exchange were factored into the price of the USFS parcel that Polymet wants to mine—as they should be—significantly greater acreages of privately-held lands would be required to make the exchange even.	S	O
310	Form Letter	1	Variant	LAN	Colles B. Larkin		168	1	Although the "Land Exchange" is well intentioned, I believe it is in no way "equivalent" to maintaining acreage that is part of the larger whole, a national forest. The exchange is in no way a replacement, but a "feel good" trade of numbers/acreage which does not hold the same ecological, environmental benefits to habitat that being part of a larger whole does. Dicing up the national forest, contaminating the mining adjacent land and waters with poisonous sulfide will have serious ramifications down the decades.	NS	X
29793	Unique			LAN	Daniel Westholm		2614	3	The land exchange sets a precedent for the waves of mines that may follow if Polymet is approved.	NS	X
29795	Unique			LAN	Daniel Westholm		2622	3	The land exchange sets a precedent for The waves of mines that WILL follow if PolyMet is approved.	NS	X
25385	Form Letter	1	Variant	LAN	David Witt		1168	10	I support the proposed NorthMet Mining Project Land Exchange in the Superior National Forest because: - It is federal policy to allow mining when the project protects wetlands, by using established procedures that replace or exchange other wetlands for those wetlands in the project area that are impacted. - It would not degrade surface and groundwater, violating the Superior National Forest plan and state, federal and tribal water quality standards. - It would not harm endangered, threatened and species of concern, including the northern goshawk, great gray owl, lynx and moose any more than any of the already permitted mining projects on the Mesabi Iron Range. - It is in the public interest to support mining of necessary strategic minerals that contribute to moving forward toward more "green" energy technologies in the long term. It would not impair tribal resources, and would not result in an uncalculated loss of ecological services.	S	O
30753	Unique			LAN	Dennis Good		2895	7	As far as the Land Exchange is concerned, I see that the USFS has already run up the white flag of surrender and adopted Polymet’s Need and Purpose in toto. In effect, the USFS is letting a private corporation dictate what is done with public land and public resources when it has no right to do so. The excuse the USFS is using is a fear of litigation with “no certain outcome” and having judicial precedents set concerning Weeks Act Lands. Someone wasn’t thinking this issue through. The USFS has now set a precedent. All a company has to do from now on is bluster about “fundamental conflicts” and threaten litigation and Voila! Mission accomplished. As far as litigation is concerned, all the summaries of court decisions I’ve seen say that a right to surface mine must be expressly reserved in the deed. If a right to surface mine is not reserved in the deed then surface mining is not allowed. Polymet’s deed has no such provision for strip mining. The original parties to the deed knew that the United States under the Weeks Act was acquiring this land for forestry and watershed protection and surface mining is inimical to forestry practices and watershed protection.	NS	X
23255	Unique			LAN	Dennis Szymialis		910	4	Count Four That the cooperating agencies, or any of them, lack the authority to conduct a land exchange in violation of the WEEKS ACT and the Clarke McNary Act of 1924.	NS	X

27685	Unique			LAN	Dennis Szymialis		1895	50	p. 3-152 "• The cost of physically backfilling the West Pit and other associated costs, including those for additional mechanical water treatment (required to treat increased constituent loads) and financial assurance requirements, could affect the ability of PolyMet to secure financing." "• Backfilling the West Pit would encumber private mineral resources that are deeper than the proposed West Pit. Such an encumbrance is in conflict with the terms of PolyMet's current private mineral leases. The PolyMet lease agreements could be renegotiated, which might involve monetary compensation for the mineral owners if minerals are encumbered. " -the previous two items from p.3-152 violate the Federal Land Management policy act and call into question the merits of the PolyMet project. -does this need to be considered, i.e. as a potential cumulative impact if it is the basis for denying this action it would not be considered speculative? This create a standard by which cumulative impacts should be judged in looking forward/foreseeability.	S	O
27685	Unique			LAN	Dennis Szymialis		1896	51	Standards delineated as part of Forest Plan in 157-159 are superseded by Weeks Act Legislation and exchanged are not protected by the Weeks Act and are not in effect an arms length transaction as proposed.	S	O
27685	Unique			LAN	Dennis Szymialis		1897	52	Lake County Tract 2 lands are tainted by a MEPA violation in that they violate due process by not be properly identified as a connected action and are misidentified as being legally owned by PolyMet. The Co lead agency come to the SDEIS with unclean hands in facilitating a violation of the law which should bring into question their impartiality.	S	O
27685	Unique			LAN	Dennis Szymialis		2056	211	If Lake County has approved or entered into an agreement or contract with PolyMet for the sale of lands to PolyMet in furtherance and assistance of PolyMet's NorthMet project through the environmental review process, it is prohibited from doing so by state and federal law restricting government action or approval prior to completion of the environmental review process. For the PolyMet NorthMet project, the agencies are in the middle of the Environmental Impact Statement review process. The law regarding environmental review requires that government agencies not take final action on a project prior to the completion of environmental review. Minn. Stat.§ 116D.04, subd. 2b and Minn. R. 4410.3100. Moreover, the law requires that an EIS be prepared early in the process and that the information and analysis developed in the EIS be used by the government to inform permitting or approval decisions related to the project or pieces of the project. Minn. Stat. § 116D.04 subd. 2a. The language regarding consideration of the EIS information is mandatory: The government action shall be preceded by a detailed environmental impact statement. The statute does not distinguish between final and alleged "preliminary" or "minor" actions. Further, government action is broadly defined in the law as activities, including projects solely or partially conducted, permitted, assisted, financed, regulated or approved by a unit of government, and units of governments includes all levels of government. Minn. Stat. § 116B.04, subd. 1. The point of these provisions as read together is to ensure that environmental review occurs before there is an impact on the landscape and that all impacts then be considered and inform any government decisions on the primary action and any related or connected actions as well. By allowing a chipping away at the projects or pieces of projects while environmental review is pending or before it is done, the companies and government agencies in these cases frustrate the purpose and intent of full environmental review.	S	O
27685	Unique			LAN	Dennis Szymialis		2057	212	St. Louis County entered into a Wetland Restoration Agreement with PolyMet dated February 7, 2006 and was subsequently sued in Minnesota District Court. District Court Judge Heather Sweetland ruled in favor of the plaintiffs, Wetlands Action Group, motion for plaintiffs summary judgment granted. Further, the court held that a contract is the same asa permit and proceeded to void the agreement and associated actions, because it was a violation of MN Rules part 4410.3100. See Wetlands Action Group, et al., Plaintiffs vs. St. Louis County, et al., Defendants April 17th, 2007. Lake County's entering into an land sale agreement with PolyMet is a discretionary contract and, thus, a permit under Minnesota rules.	S	O
27685	Unique			LAN	Dennis Szymialis		2058	213	The USFS must address whether the Lake County Lands are part of an illegal action and if so, remove them from consideration in PolyMet's proposed land exchange.	S	O
29995	Unique			LAN	Don Schreiner, Mary Negus, Marina Schreiner		2765	1	I am writing along with my wife and daughter to oppose the land exchange between the USFS and PolyMet. I find it hard to believe the USFS is giving in to a mining company to avoid potential litigation. IF the litigation occurs and the protection allowed by the Weeks act is decreased then the public can and should weigh in and attempt to fix the act, not avoid using it! This area is one of the most pristine in the country and it would be irresponsible for the USFS to assist PolyMet in their wanton destruction of this important natural resource and the long term consequences on water quality in the BWCA, this area of MN, and the country. Specifically I propose that: ? The Final Record of Decision should reject the Land Exchange as it conflicts with federal policy to protect wetlands. More than 900 acres of intact and high quality wetlands will be excavated, with thousands of acres more subject to drainage. The land exchange proposes to provide wetlands of a variety of types not within the impacted watershed. The net result of this proposed exchange will be a large loss of wetlands in northeastern Minnesota.	S	O
8768	Unique			LAN	Dyke VanEtten Williams		611	5	The lands you are proposing to trade away, in the guise of "mitigation", are not yours to trade. They are in trust to your department to manage for we the people. It seems clear that we the people really don't want this development and its consequent results and unforeseeable risks. Please look at www.OurChildrensTrust.org. This group of children, along with James Hansen from NASA, have filed suit against the federal administration citing an ageold precedent that government must protect their basic rights to clean water and clean air. A judge in a state case in Washington has just agreed with this principle. Allowing hard rock mining would fly in the face of it - a basic right as old as organized civilization itself! For the sake of the children of my children, do not let this development move forward. It is based on the expectation that what has happened in the past will shape the future, which is now clealy a fallacy. It is time for all of us - especially you - to say: THIS FAR IS TOO FAR!	NS	X
25350	Form Letter	1	Variant	LAN	Elizabeth Heck		1156	4	I am also strongly opposed to the Superior National Forest because Land Exchange due to destruction of wetlands, impairment of groundwater and violation water quality standards. Several endangered, threatened and species of concern species would be harmed by the exchange. Finally, I am opposed to any federal Clean Water Act permit for PolyMet for these same reasons.	S	O
29803	Form Letter	1	Variant	LAN	Elizabeth K Larsen		2624	2	I oppose the planned exchange of land that enables Polymet to circumvent the law that protects the lands it hopes to dig into and destroy. Those lands are protected by the Weeks Act, an Act that has as its intent to protect the headwaters. It is the duty of our elected leaders to protect the land and the people of the United States, this is in my opinion an attack by a corporation on the health, safety and well being of the people of NE Mn and any who eat from or drink from the waters of Lake Superior. The value of the St. Louis River watershed seems incalculable to me? An immense and powerful river, tea-stained with natural tannins, lush wetlands, silvery fish, buzzing bees, and lands where ancient trees lay cool in the earth. The river flows from a shallow wild rice lake near our home, past abandoned and struggling modern mining towns, through a tribal community with roots in the region thousands of years old. The St. Louis River pours into a rare freshwater estuary, then into Great Lake Superior; all along the way it gathers water from an area of about 2.4 million acres in northern Minnesota. Its benefits to all living things seem countless.	NS	X
12727	Unique			LAN	F Jeff Verito		759	1	My research on the NorthMet proposal leads me to believe the same deceptive politics are at play. The only maps I could find were not very clear, complete or large scale enough. Also, I couldn't find an adequate description of the properties to be exchanged, especially the age of the stands, topography and wetland features of what we're receiving versus exchanging. Without an adequate description, there's no telling whether our net gain of 6,722.5 acres for the Federal acreage of 6,650.2 acres is worthwhile.	S	O
12727	Unique			LAN	F Jeff Verito		761	3	From a public standpoint, we could care less if the exchange is necessary to make the project feasible, because I can only assume a clear majority does not favor the project. The necessity of the exchange to make the project feasible sounds the bells and whistles that tell me from experience that the project should not occur. The public cannot be compromised just because a massive company invested thousands of dollars in an attempt to justify its proposal.	NS	X
29965	Unique			LAN	Gary Glass		4237	5	The land exchange (also see Comment #2 SDEIS) requested is larger in area than needed for the project to be conducted, and is apparently to be used to push out the property boundaries to greater distances so that the hazards of pollution expected to be generated by the proposed project are more diluted before crossing the property lines and will take more time to travel before being detected, and trigger some sort of alarm that harm is on its way off the project property. This apparent strategy is inconsistent with Minnesota Rules for dealing with reactive mine ores and reactive wastes to make them non-reactive, and prevent water from flowing through or over wastes, and collect and treat that which does to meet state and federal standards. Property line boundaries should not be used as test points for pollution on the move, but rather, the proposed project's source points/areas releasing the hazardous substances should be where the test points are to be located and monitored/measured. More accurate measurements may be made BEFORE any dilution takes place due to instrument calibration and sensitivity requirements. Mercury, EMFs, uranium, and other hazardous components should be monitored in all air and water potential releases from the proposed project sources. EMF = elongated mineral fibers.	S	O
29965	Unique			LAN	Gary Glass		4245	10	The Land Exchange facilitates the project's implementation and permanent conversion of the forest and wetland areas into unusable waste lands of toxic drainage generating waste rock piles, a pit-lake lagoon which could become a chemo-stratified, toxic water waterfowl trap, and a pit-filled with millions of tons of reactive sulfide-containing rock capable of generating millions of pounds of toxic chemical concentrations. Uncertain hazards are to be left stored in and on site lands with no future productive use planned or possible. If worse case conditions were to develop, toxic metal concentrations and toxic gasses including hydrogen sulfide would seep into surface and ground water aquifers of tributaries to the Saint Louis River polluting the river and waters of Lake Superior. No recovery plans are presented for the most impacted land areas, and no provisions are provided to protect against any probable or worse-case water pollution scenarios. Proper plans to address probable scenarios and related resources must be provided.	S	O
29965	Unique			LAN	Gary Glass		4247	12	The land exchange should not be done unless and until the major flaws in the project design are remedied and the land surface area is entirely planned (with the required funds set aside) to be reclaimed for future productive uses. Major improvements in the proposed plan are suggested.	S	O
29805	Unique			LAN	Gedicks Al		2631	4	The land was originally purchased for watershed protection. Changing ownership of the land from public to private would result in a subsequent loss of Federal protections.	NS	X
28494	Unique			LAN	Ivan Weber		2296	4	The proposed land exchange would constitute an unnecessary and relatively enormous diminishment of forests and wetlands, as well as of watersheds.	NS	X
7393	Form Letter	4	Variant	LAN	Jane Beattie		542	9	The mine site and surrounding lands on the Superior National Forest cannot be traded away to PolyMet for other lands.	NS	X
6294	Form Letter	1	Variant	LAN	Jane Koschak		464	3	I do not endorse exchanging our public federal land for a mine site so that our present lakes district can be turned into a giant mining district. Our region would never recover from this, and when the minerals are removed, we will have a devastated landscape, polluted water, and air and the present sustainable economy of the Superior could never be rebuilt. Instead, we would get hundreds of years of pollution.	NS	X
9309	Form Letter	4	Variant	LAN	Jane Nicholson		628	6	The proposed land exchange is not in the public interest, and would violate the forest plan for the Superior National Forest,	NS	X

27883	Unique			LAN	Jay Newcomb		2213	3	The exchange of land proposed is outside of the St.Louis River watershed	NS	X
23917	Form Letter	1	Variant	LAN	Jim Steitz		970	2	The use of federal land from the Superior National Forest is diametrically opposed to the purpose for which the forest was established. It was precisely to preclude this type of misbegotten, heinous destruction of our shrinking ecosystems that Superior was established, not to act as a land bank for future mining projects.	NS	X
30068	Unique			LAN	John Herbst		2794	3	On p. ES-31 it states: "All of the non-federal lands except Tract 4 have severed mineral and surface ownership, which means that the mineral resources would not be acquired with the surface." My comment is: Does this mean that PolyMet has mineral rights to tracts 1-3 and 5 (Hay Lake, Lake County, Wolf, and McFarland Lands respectively), into the foreseeable future, even though there aren't any mining activities proposed on the non-federal lands as part of the Land Exchange Proposed Action at this time?	S	O
30358	Form Letter	1	Variant	LAN	Karen Peters		2856	1	Is it true PolyMet threatened to sue Forest Service if didn't turn over lands? (What country am in?)	NS	X
29809	Unique			LAN	Karen Williams		2640	5	The PolyMet FEIS is inadequate under both federal and state standards. I oppose the US proposal to exchange Superior National Forest land for the PolyMet proposal and oppose any federal permit that allows PolyMet to destroy wetlands and impair water quality.	NS	X
10078	Unique			LAN	Kathy Van Dame		652	1	Please deny NorthMet Mining Project Land Exchange in the Superior National Forest to protect traditional tribal land uses and precious watershed resources. Kathy	NS	X
29193	Unique			LAN	Kevin Heaslip		2441	4	The proposed land exchange of 6500 acres of Superior National Forest land is not in the public interest. The land was initially purchased for watershed protection. Changing public ownership to private ownership would result in a loss of Federal protection. The U.S. Forest Service is obligated to protect the great worth of the Superior National Forest.	S	O
30066	Unique			LAN	Kevin Viken		2791	4	The land exchange for this project does not exchange land of equal value in utility.	NS	X
29794	Unique			LAN	Kristine Vesley		2618	3	I also strongly object to the proposed NorthMet Mining Project Land Exchange in the Superior National Forest because it conflicts with federal policy to protect wetlands, resulting in direct destruction of 913 acres of wetlands and destruction or impairment of up to 8,264 acres of wetlands. It would degrade surface and groundwater, violating the Superior National Forest plan and state, federal and tribal water quality standards. It would harm endangered, threatened and species of concern, including the northern goshawk, great gray owl, lynx and moose.	NS	X
10736	Unique			LAN	Kurt Doran		722	2	The proposed land exchange will remove lands inaccessible by the public and make other lands accessible, as access to PolyMet's mine site is currently restricted on both east and west ends. The proposed land exchange aligns with the charge, as declared by Congress in the Mining and Minerals Policy Act of 1970, that, "It is the continuing policy of the Federal Government, in the national interest, to foster and encourage private enterprise in (among other goals) the development of domestic mineral resources and the reclamation of mined land." This obviously applies to minerals within PolyMet's proposed mine site.	NS	X
27689	Unique			LAN	Lea Foushee	North American Water Office	3255	11	The land swap enables NorthMet to escape the restriction of the Weeks Act of 1911. The land exchange is simply a ploy to resolve a legal conflict over Northmet's proposal to establish an open pit mine on the site, which is currently prohibited in parts of the Superior National Forest due to the Act.	NS	X
7689	Unique			LAN	LK Woodruff		569	8	Moreover, the proposed mine site and surrounding lands on the Superior National Forest should not be 'traded away' to PolyMet for other lands. The proposed land exchange is NOT in the public interest, and would violate the forest plan for the Superior National Forest, harm endangered species, impair downstream tribal resources and conflict with laws and policies to protect wetlands and other resources.	NS	X
29740	Unique			LAN	Lori Andresen	Save Our Sky Blue Waters et. al.	3886	13	The FEIS does not address the degradation of the water of Superior National Forest and the wetland areas that would be destroyed. This will impact the entire region.	NS	X
29740	Unique			LAN	Lori Andresen	Save Our Sky Blue Waters et. al.	3925	40	The Forest Service succumbed to the decision of a land exchange without examining the loss of wildlife habitat, wildlife corridors, or ecosystem intactness, and without considering the cumulative effects of mineral exploration, taconite expansion, and additional sulfide mining proposals.	NS	X
29740	Unique			LAN	Lori Andresen	Save Our Sky Blue Waters et. al.	3929	44	The part of Superior National Forest that PolyMet would get in the exchange was purchased under the Weeks Act for watershed protection. The exchange would allow PolyMet to degrade and pollute the headwaters of both the Lake Superior and Rainy River watersheds, which is contrary to the purpose for which the land was acquired.	S	O
29740	Unique			LAN	Lori Andresen	Save Our Sky Blue Waters et. al.	3930	45	No proof has been provided that the Lake County lands were sold at a public auction, as stated in the FEIS. We reiterate, if Lake County has entered into an agreement with PolyMet, this would be illegal. This type of action would circumvent current law. The agencies should provide documentation showing whether or not the Lake County Lands were actually acquired through a public auction. If they were not, it would be a violation of Minnesota law and the parcels should be removed from consideration in the PolyMet Land Exchange proposal. From Appendix A from the FEIS – Response to Comments: Theme Statement: If Lake County has indeed entered into an agreement with PolyMet, this would be illegal. Minnesota law requires that state agencies (including county governments) not take final action on a project prior to the completion of environmental review. Lake County actions would be prejudicial to the final approval of the NorthMet Project. The USFS should address whether the Lake County Lands were acquired in violation of Minnesota law and, if so, remove them from consideration in the Proposed Land Exchange. Agency Response to theme statement: The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction	S	O
9792	Unique			LAN	Lori Rumpf		636	5	the proposed mine site and surrounding lands should not be traded away to PolyMet for other lands. The proposed exchange is not in the public interest and would violate the Plan for the Superior National Forest, harm endangered species, impair downstream tribal resources, and conflict with laws and policies to protect wetlands and other resources.	NS	X
23991	Unique			LAN	Lorrie Ogren MA. LPC, LPCC		994	7	In order for PolyMet to open pit mine on protected public land that is now part of Superior National Forest, the U.S. Forest Service is negotiating a convoluted land exchange that would involve the transfer of about 6,650 acres of federal lands from public to private ownership. The Forest Service failed to follow its own authority under the Weeks Act of 1911, which prohibits strip mining on land originally acquired by the Forest Service for watershed and forest protections; the Forest Service could have required PolyMet to develop an underground mine only. Instead, a land exchange would allow PolyMet, a foreign mining company, to destroy nearly 1,000 acres of wetlands and degrade over 6,000 acres of adjoining wetlands — adversely impacting the 100 Mile Swamp and its water filtration system, vegetation, habitat, and ecology.	NS	X
27921	Form Letter	1	Variant	LAN	Louis Mielke		2233	5	Mining effluent would degrade surface and groundwater, violating the Superior National Forest plan and state, federal and tribal water quality standards.	S	O
29397	Unique			LAN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3794	88	In 2000, the Government Accountability Office (“GAO”) issued a critical report assessing how the Bureau of Land Management and the USFS land exchange program requirements had been implemented between 1989 and 1999 identifying several significant problems. The report states that: "...agencies did not ensure that the land was being appropriately valued, or that exchanges served the public interest, or met certain other exchange requirements. In view of the many problems in both agencies’ land exchange programs and given the fundamental difficulties that underlie land exchanges when compared with cash-based transactions, we believe that the Congress may wish to consider directing the Service and the Bureau to discontinue their land exchange programs. Again, in a 2009 review, the GAO found substantial problems implementing land exchanges. One-third of the 31 land exchanges examined had documented issues in the agency's public interest determination. 36 C.F.R. Section 254.3(a) provides “[t]he Secretary is not required to exchange any Federal lands. But while there is no requirement to exchange federal land, voluntary real estate transactions are required to follow federal regulations including the public interest determination.” Neither the SDEIS or the FEIS have disclosed appraisal information so there is no way to comment on this aspect of the proposed land exchange.	S	O
29397	Unique			LAN	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3796	90	Exchanging thousands of acres of diverse, high-quality land—land with some of the few remaining large game corridors in northeastern Minnesota that are available to the Bands to exercise reserved 1854 Treaty rights—for lands that have moderate diversity and lack big-game corridors is inconsistent with the fiduciary responsibilities that are shared by all federal agencies. The FEIS attempts to diminish the significance of the loss of these high-quality lands by stating that “[t]he 6,495.4 acres of federal lands are not accessible for public use via land, while substantial portions of the non-federal lands do have public access via public roads or hiking trails. This distinction is a factor in evaluating land use effects, because public access defines the degree to which the lands in question can actually be used...” ²³⁹ But again, historic trails are key to the exercise of treaty rights and are of historic significance to the Bands connecting what is now Beaver Bay with Lake Vermillion. These trails “are associated with the lives of persons significant in our past” ²⁴⁰ including John Beargrease, ²⁴¹ Peter Gagnon, ²⁴² and Alec Posey. ²⁴³ In more recent history, Bois Forte Band members have used a sugarbush near the plant site and harvested wild rice in the Embarrass River near the LTVSMC tailings basin. ²⁴⁴	S	O
26628	Unique			LAN	Mary Adams		1387	8	Exchanging land in the Superior National Forest for land of equal value raises a red flag. What does that mean and how is equal value determined? What are the potential environmental impacts of such an exchange?	NS	X
26997	Unique			LAN	Maureen Johnson		1581	60	The FEIS should itemize and describe each loss of Superior National Forest that has already occurred and the reasons, to provide perspective on what this land exchange would mean.	S	O
26997	Unique			LAN	Maureen Johnson		1582	61	Speaking of people, loss of SNF also means loss of land for hunting, recreation, and traditional cultural uses for both Minnesotans and Native American tribes. Impairment of fishing and hunting because SNF did not retain the land is predictable and must be discussed. What other future loss of SNF is planned or allowed must also be discussed, so that a full and honest presentation of the shrinkage of the SNF is clear.	S	O

26997	Unique			LAN	Maureen Johnson		1588	62	The proposed exchange meets five of the seven “USDA Forest Service Strategic Plan FY 2007-2012 Goals.” You should provide all of the goals so that we can see which goals are NOT being met and can see for ourselves as to which are important and how the goals meet the Forest plan. We are now in 2015. What are the goals for this 5-year period? I did not see the overall "mission" or "purpose" of the Superior National Forest to contrast with the "strategic plan goals" to resolve the controversy. You have not even mentioned the effect of this exchange on the the SNF as a whole. These must be part of the discussion: From the Introduction to the 2004 Forest Plan: "The purpose of the Forest Plan is to provide management direction to ensure that ecosystems are capable of providing a sustainable flow of beneficial goods and services to the public." "The Organic Administration Act authorized the creation of what is now the National Forest System. The law established forest reserves “to improve and protect the forests within the boundaries, or for the purpose of securing favorable water flows, and to furnish a continuous supply of timber for the use and necessities of citizens of the United States...”" "Multiple-Use Sustained Yield Act In this Act, Congress again affirmed the application of sustainability to the broad range of resources over which the Forest Service has responsibility. This Act confirms the authority to manage the national forests “for outdoor recreation, range, timber, watershed, and wildlife and fish purposes.” " The National Forest Management Act requires that National Forest System land be managed for a variety of uses on a sustained basis to ensure in perpetuity a continued supply of goods and services to the American people. Endangered Species Act One of the purposes of the Endangered Species Act is to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved. The Act requires Federal agencies to carry out programs for the conservation of endangered and threatened species in consultation with the US Fish and Wildlife Service." 3-29 Forest Plan: Standards and Guidelines: "Minerals S-UB-6 Federal mineral exploration and development activities that disturb the surface are not permitted."These goals for the entire SNF would be undermined by relinquishing existing SNF lands to the State. If SNF lands are exchanged, they should be exchanged on conditions that they be maintained with the same purposes as the SNF, which excludes the surface development for minerals.	S	O
26997	Unique			LAN	Maureen Johnson		1589	63	In addition to opposing the transfer of Superior National Forest land to the State of Minnesota, I request: Analyze the following potential significant adverse impacts of the transfer of Superior National Forest land out of federal ownership and the reasonably foreseeable exploitation of that land for maximum profit: 1) loss of biodiversity, 2) impairment of fish, plant (including wild rice), old growth forest, bird, and mammal communities, 3) reduction of critical habitat and corridors for endangered species, 4) air pollution, 5) pollution of surface water; 6) mercury contamination of fish, 8) reduction of public, including tribal, access for hunting, fishing, and ricing, 9) reduction in outdoor recreation opportunities, 10) losses to recreation and tourist economies, 11) impacts to climate change; 12) impairment of tribal consultation and environmental justice, 13) impairment of public health as a result of pollution and resource destruction. •Analyze all potential significant adverse impacts listed above considering cumulative impacts across Northeastern Minnesota of past, present and proposed mining, logging, fossil fuel combustion and habitat destruction.	S	O
N/A	Form Letter Template	9	Non-Variant	LAN	Multiple	Sierra Club	FL44	3	I strongly object to the proposed SNF Land Exchange because it would result in direct destruction of 913 acres and destruction / impairment of up to 8,264 acres of wetlands, degraded surface and groundwater -- violating the SNF plan and water quality standards, and harm endangered, threatened and species of concern. The exchange is not in the public interest, would impair tribal resources, and result in loss of ecological services.	S	O
N/A	Form Letter Template	1	Non-Variant	LAN	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL9	9	I strongly object to the proposed NorthMet Mining Project Land Exchange in the Superior National Forest because: - It conflicts with federal policy to protect wetlands, resulting in direct destruction of 913 acres of wetlands and destruction or impairment of up to 8,264 acres of wetlands. - It would degrade surface and groundwater, violating the Superior National Forest plan and state, federal and tribal water quality standards. - It would harm endangered, threatened and species of concern, including the northern goshawk, great gray owl, lynx and moose. - It is not in the public interest, would impair tribal resources, and would result in an uncalculated loss of ecological services.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3369	95	Out of the lands to be provided to the federal estate in exchange for the lands at the NorthMet Project site, only 160 acres (Tract 4) include both the surface land and mineral rights. The rest of the proposed lands for exchange do not include the mineral rights, and because these lands would not be transferred under the Weeks Act, they would not carry the protections from later mining development afforded the current lands.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3373	93	The adverse effect on the treaty rights is not mitigated by the lands to be provided through the land exchange. The FEIS improperly assumes that because 7,075 acres of land will be provided to replace the 6,495 acres of land that would be exchanged, that the Band’s treaty rights are enhanced simply by virtue of the increase in net acres of land that will be administered by the Forest Service. FEIS 5-672. But a comparison of acreage, without consideration of the functional value of the lands that would be lost, is fundamentally flawed. The lands to be exchanged include 6,025 acres that have been designated by Minnesota as Sites of High Biodiversity Significance. FEIS 5-701. The ecological term ‘biodiversity’ equates to ‘abundance’ and ‘subsistence’ for the Bands. Of these, nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate and therefore effectively to the Bands, if the Land Exchange Proposed Action is implemented. FEIS Table 5.3.4-1. This is significant because many tribally-harvested resources are only available in coniferous bogs (e.g. cranberries, soft-leaved blueberries, sweet flag), and mitigation for coniferous bogs is simply not feasible.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3375	96	Further, the lands to be provided are scattered sites, almost entirely located outside of the St Louis Watershed and therefore will neither provide the functions nor serve the critical ecosystem purposes that the lands which would be lost to the mine now serve. In sum, while the lands to be provided may increase total acreage of Forest Service lands, those lands will not provide the critical habitat – either now or possibly even in the future -- on which important and unique plants, fish and game depend. The exchange of thousands of acres of high quality wetlands and forests containing some of the few remaining wildlife corridors in northeastern Minnesota available to the Bands to exercise reserved 1854 treaty rights for lands that have moderate diversity is inconsistent with fiduciary responsibilities that are shared by all federal agencies. The loss of these lands will impair the Bands’ treaty reserved rights.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3439	157	Table 7.3.5-1 in the FEIS presents the Public Interest Factors That Must be Considered for the Land Exchange Proposed Action. The Band will be providing more detailed comments to the US Forest Service in response to their draft Record of Decision, but notes our significant disagreements with their conclusions, in the FEIS, on securing important objectives, “greater preservation protection” of cultural resources, consistency with relevant executive orders, consolidation of interests in lands and split estates, socioeconomic effects, whether the proposed action is “environmentally sound”, potential effects to water resources, and “positive effects on environmental justice populations”. Overall, the USFS cannot "ensure that these mineral resources can be produced in an environmentally sound manner contributing to economic growth," because the water modeling and impact assessment process is not scientifically defensible.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3448	164	3.3.2.2 All federal lands except Tract 4 have severed mineral and surface rights; this is inconsistent with Forest Plan guidelines for acquisition and Desired Condition ("...eliminate conflicts..."). The lands to be acquired have less protection (Weeks Act) than the lands currently in the federal estate. This is not in the public interest.	S	O
27901	Unique			LAN	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3452	166	In summary, federal land exchanges are discretionary, and federal agencies cannot approve permits that will have impacts to treaty resources without additional evaluation and mitigation.291 No mitigation has been identified in the FEIS for this permanent loss of lands and resources (natural and cultural) to the 1854 Ceded Territory. The public interest determination must include a specific finding that “The intended use of the conveyed Federal land will not substantially conflict with established management objectives on adjacent Federal lands, including Indian Trust lands” (36 C.F.R. 254.3(b)(2)(iii)). This threshold has not been met, and the Fond du Lac Band objects to the implementation of the Land Exchange Proposed Action. Additional comments on and objections to this proposed action will be provided to the US Forest Service in response to the draft Record of Decision published on November 17, 2015.	S	O
27408	Unique			LAN	Nicholas Eltgroth		1725	5	Exchanging a few acres of land is not going to stop the toxic pollution.	NS	X
29263	Unique			LAN	Pat Hawkinson		2468	4	Why is it okay for Polymet to acquire such a huge buffer of land? It's obviously only so that they can meet groundwater quality standards at the property boundaries, but not within their own property boundary, as the flawed state law allows.	NS	X
29676	Unique			LAN	Paul Nasvik		2568	6	Much of the mitigation properties seems damaged and not worth the risk. If there is property that is of value to the DNR then they should strive to acquire the properties using other means.	NS	X
27085	Unique			LAN	Paula Maccabee	Water Legacy	3142	131	WaterLegacy’s prior land exchange comments focused on substantive grounds for rejecting the exchange of Superior National Forest lands in order to facilitate development of the PolyMet NorthMet open-pit copper mine. Our concerns in these comments are with the adequacy of the FEIS to analyze the issues that must determined under laws applicable to a land exchange. As explained in the other Sections of this comment, the FEIS inadequately considered the impacts of the PolyMet NorthMet sulfide mine project – the proposed future use of federal lands. The FEIS’ discussion of the land exchange appears to separate the comparison of federal and private lands from the analysis of adverse environmental impacts of the NorthMet project. This distinction cannot be sustained under applicable law. An authorized officer of the U.S. Forest Service may complete a land exchange pursuant to 43 C.F.R. §2200.0-6(b)(2) only on a finding that: The intended use of the conveyed Federal lands will not, in the determination of the authorized officer, significantly conflict with established management objectives on adjacent Federal lands and Indian trust lands. Such finding and the supporting rationale shall be made part of the administrative record. (emphasis added) Among other considerations for this public interest determination, the U.S. Forest Service must consider the result of the intended use of the conveyed federal lands on protection of fish, wildlife habitats, cultural resources, watersheds, and its fiduciary responsibilities to Indian tribes and the protection of tribal resources, including fish, wild rice and human health. 43 C.F.R. §2200.0-6(b). Failure to consider the environmental impacts of the future use of the federal land proposed to be exchanged fatally undermines a land exchange FEIS, establishing that the agency failed to take a “hard look” at the environmental consequences of the action, in violation of NEPA. Ctr. for Biological Diversity v. United States Dep’t of the Interior, 623 F. 3d 633, 636 (9th Cir. 2010); see also Nat’l Parks & Conservation Ass’n v. BLM, 606 F. 3d 1058, 1063 (9th Cir. 2010).	NS	X
28922	Unique			LAN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3588	13	This loss of wetland function will be a permanent impact to the St. Louis River watershed and no amount of mitigation elsewhere in the state will correct the problem. This impact also appears to be a violation of the federal Weeks Act, under which these lands were originally acquired by the federal government. The Weeks act was passed into law to protect the headwaters of our nation’s navigable rivers.	S	O

28922	Unique			LAN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3592	23	It is our position that the contention of the United States is correct in its assertion that the title and statute does not permit surface or open pit mining. If PolyMet wishes to challenge this through the court system, it is their right. But the USFS should not permit headwaters lands acquired under the Weeks Act, a law originally codified to protect the nation’s headwaters from pollution and destruction, including being forever altered by an open pit mine. If the USFS is correct in their interpretation of the law, the mining company may not damage USFS surface rights. PolyMet could only proceed with an underground mine. If PolyMet finds this to be financially unattractive, then the plan to mine should be postponed until such time as the demand and value for the minerals is sufficiently high that it can be done without sacrificing the surface rights of the USFS. These minerals aren’t going anywhere, so waiting for increased demand, higher prices and new technologies to make this project successful is not too much to ask for the preservation of Minnesota’s environment. We do not believe an exchange is in the best interest of the citizens, and it should not go forward. This would preserve the intended protections originally found in the Weeks Act, allows the USFS to continue to manage the surface estate for the benefits of the citizens, and still retains the option for suitable underground mining in the future.	S	O
28922	Unique			LAN	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3593	24	We also have concerns and questions about the amount and value of aggregate material potentially found on the exchange parcels, who will own them after the land exchange is done, and whether or not they could be mined. There also are questions about some “timber reservations” found in the abstracts. There doesn’t seem to be any discussion addressing these issues in the FEIS. We believe these are valid concerns that should be addressed in the FEIS.	S	O
6163	Form Letter	1	Variant	LAN	Robert Hoekstra		456	1	The U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal should never happen.	NS	X
6298	Unique			LAN	Robin Vora		470	2	The analyses in the EIS shows gains in some resources through private lands made public through the proposed exchange (e.g., a gain of 3 special status plant species). This analysis would only make sense if the natural environments on those private lands were planned for obliteration. That is not the case on most of the these parcels and so this type of analysis showing net environmental gains from the proposed land exchange is misleading. The real overall effects on wetlands from a northeastern Minnesota perspective may be similarly misleading.	S	N
29246	Unique			LAN	Ron Brodigan		2460	9	As to the land exchange proposed to USFS in which small, scattered bits of forest land in other parts of NE Minnesota would be traded for sensitive wetlands adjacent to and part of the proposed mine location, this is a bad deal for the public and neither achieves not furthers any public purpose, as such a trade would normally do. It benefits only a foreign corporation and their “Junior Partner”, PolyMet.	S	O
28554	Unique			LAN	Shari Bachman		2325	2	It is absolutely NOT ok to trade the pristine wilderness for the profit of a foreign company.	NS	X
27367	Form Letter	1	Variant	LAN	Sherry Phillips and Paul Tine’		1698	1	We do not agree that the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal is a good idea at all. While some have suggested that these lands are already degraded from mining, we disagree. We are familiar with these lands and because they have been left in a forested state, they have actually become valuable resources for the wildlife, rare plants and water resources there.	S	O
26659	Unique			LAN	Steve Jay		1421	13	a. The land exchange proposal is not consistent with Forest Service Rules found at 36 CFR 218. Removing 6,495.4 acres from the Superior Forest management and public use is detrimental to the integrity of this forest and current uses.	S	O
27036	Unique			LAN	The Lesters		1634	2	Three open pits will be located within the Superior National Forest on public land. PolyMet is trying to get control of that property through an exchange of other land. Congress would need to approve this, correct? If so, without this approval, the whole project falls through.	NS	X
29478	Unique			LAN	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3859	14	WHEREAS, the land exchange with the U.S. Forest service will provide only a paltry number of acres converted from private to public use, compared to the area put at risk of contamination by the mining activity and debris, nor is there assurance that the land exchanges will be value for value;	NS	X
24770	Unique			LAN	Tom Thompson		1102	1	I am writing in opposition to the FEIS for the Polymet Northmet Copper Nickel Sulfide mining permit because it is inadequate. I also object to the land exchange in the Superior National Forest being proposed to accommodate the Polymet mine. Such an exchange could negatively impact or destroy over 8000 acres of wetlands and conflicts with Federal policies protecting wetlands. It would also harm habitat for a number of endangered, threatened and species of concern. The FEIS also fails to have an adequate plan for mitigating damage to these wetlands.	S	O
27061	Unique			LAN	Tyler Kaspar	1854 Treaty Authority	2995	22	The FEIS should be updated to incorporate the land appraisals and draft decision from the USFS Draft ROD for the NorthMet Project Land Exchange. The analyses and information provided in the land exchange sections (4.3, 5.3, and 6.3) should be updated to reflect these findings It is confusing to see the FEIS still present information on lands that were proposed for exchange (e.g. Tract 5, McFarland Lake) and be issued in conjunction with the USFS Draft ROD (does not include Tract 5). It should also be clarified in Section 5.3.1.2.1 that the proposed exchange loses one large tract of public land for several smaller tracts and the project results in permanent impacts and changes to the resources regardless of ownership.	S	O
27061	Unique			LAN	Tyler Kaspar	1854 Treaty Authority	2996	23	The FEIS puts too much emphasis on the current lack of access to the Forest Service lands (Section 3 .1.2.1). This is seemingly done to minimize the impact of losing it. Access can always change. The text should be revised to make these issues clear in Section 3.1.2.1.	NS	X
27061	Unique			LAN	Tyler Kaspar	1854 Treaty Authority	3004	31	We realize that details have not been finalized, but this project (along with all federal land exchanges) can affect treaty rights. Treaty rights are exercised on public lands in practice, but exchanges even when remaining in public ownership can raise some concerns. The Forest Service has a trust responsibility to the bands and is required to consult on a government to government basis. This relationship is not as well defined with state or local governments. Changes to or loss of federal ownership (and federal oversight, trust responsibility, consultation, etc.) impact the exercise of treaty rights. The loss of federal lands also could result in changes to management, increased development, or even loss of public lands through sale. In addition to any direct resource impacts, these concepts should be kept in mind during land exchange processes.	NS	X
25466	Unique			LU	Carly Hawkinson		1190	5	Minnesotans also have a desired sense of place to their state parks and recreation areas, as well as fishing and hunting locations. Can you imagine the loss of all the polluted tributary rivers, streams and lakes across this expansive watershed area? Jay Cooke State Park was set aside for the people of Minnesota and its visitors to protect its unique features of its diverse plant and wildlife species that live along the impressive and world-known geologic features of the St. Louis River. The negative impacts of sulfide mining would turn this Minnesota gem park into an undesired wasteland.	NS	X
27685	Unique			LU	Dennis Szymialis		1922	77	p.4-314(public access) "There are access points to the North Met Project area, however, via a Forest Service road, the Partridge" -the gating off of the forest service road is a Forest Service NEPA violation. The Forest Service doesn't have any respect for the law either.	S	O
27685	Unique			LU	Dennis Szymialis		1923	78	p.4-315 The study area for socioeconomics extends beyond the area of direct potential project effects to include all of Cook, Lake, and St. Louis counties (see Figure 4.2.10-1). -this is arbitrary because the cultural results of the socioeconomic are not fairly addressed.	S	O
27685	Unique			LU	Dennis Szymialis		1929	84	p4-349 "• Low SIO: The landscape appears moderately altered, and non-natural landscape features may begin to dominate." "The Mine Site and adjoining federal lands are designated by the USFS as areas of Low SIO" -this is an arbitrary characterization ofthe mine site which has nothing on it	S	O
29965	Unique			LU	Gary Glass		4265	28	4) the responsible party for the LTVSMC tailings basin should be required to deal with the existing problems and final closure and recovery of the tailings basis area for productive future uses, and not used to deposit sulfide tailings which most likely will create an acid-generating source of sulfuric acid increasing the leaching of toxic metals from BOTH sulfide mineral tailings and LTVSMC taconite tailings, causing environmental pollution.	S	O
10	Unique			LU	Jana Guseynova		19	4	I stand with the Duluth Downstream Coalition of businesses in their opposition to any hard metal mining on the North Shore of Minnesota, as well as the countless Outdoor Recreation businesses in around the Boundary Waters that oppose development like this around their homes.	NS	X

4422	Unique			MEPA	Alyssa Friske		404	1	Polymet shown through its EIS that they can safely mine with minimal effects to the environment. Polymets operation will be able to pave the way for a new standard of mining, and when it is show it can be done successfully it will open the gates for other exploration and mining projects in northern Minnesota which will allow for even greater economic impact for Northern Minnesota. Please approve polyments final EIS and allow polymet to lead northern Minnesota to a new age of Mining. The Final EIS for PolyMet's proposed mine concludes a thorough and independent review of the project's potential environmental effects. After 10 years of study, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and correctly found that the NorthMet Mine can comply with strict state and federal environmental standards. The Final EIS for the NorthMet Mine is far beyond "adequate." It takes a careful and comprehensive look at the project from every angle. - The Co-lead Agencies have spent 10 years evaluating potential project effects and alternatives. - The Final EIS responds in detail to thousands of public comments and questions submitted during the review periods for the Draft EIS and the Supplemental Draft EIS. - The project's water modeling—which was fully updated for the Final EIS—shows that PolyMet's treatment and mitigation plans will prevent acid mine drainage and meet all water quality standards. - After careful review, the Final EIS concludes that groundwater flows from the NorthMet project will not directly, indirectly, or cumulatively affect the Boundary Waters Canoe Area Wilderness or Voyageurs National Park, and that any possible groundwater flow would be prevented. - The Final EIS also specifically considered the project's potential effects on air quality and water quality with respect to human health, and identified no adverse health risks. - In short, the Final EIS meets all of the requirements of the Minnesota Environmental Policy Act and the National Environmental Policy Act. The time has come to move forward. The DNR should affirm the adequacy of the Final EIS so it can serve as the foundation for the state of Minnesota's permitting process.	NS	X
24727	Unique			MEPA	Amanda Schultz	Itasca County	2945	4	the Itasca County Board of Commissioners declares its support for the adequacy of the final environmental impact statement (FEIS).	NS	X
23357	Unique			MEPA	Ammhsmith@aol.com		934	1	The Final Environmental Impact Statement on PolyMet's copper/nickel sulfide mine proposal is inadequate; it will not protect the lakes, rivers and streams in the Lake Superior watershed and it threatens the BWCA.	NS	X
23357	Unique			MEPA	Ammhsmith@aol.com		936	3	The PolyMet proposal does not adequately consider alternatives to reduce harm to wetlands and water quality, and to human health. Please say “No” to PolyMet.	NS	X
19770	Unique			MEPA	Barb Burns		838	1	The DNR should NOT affirm the adequacy of the Final EIS . It does not do enough to protect our precious fresh water for the future! Jobs are important but not at the expense of our future fresh water. It will not protect pollution any more than other places in the U.S. Or Canada has been able to do. I do not trust that it can be done safely, when we only have 1/10th of 1 percent of fresh water left in the world, don't sacrifice it for money. Vote against it.	NS	X
27135	Unique			MEPA	Bill Latady	Bois Forte Band of Ojibwe	3243	5	To summarize, there are gaps in the FEIS that call into question the adequacy of the cultural resources section.	NS	X
23226	Unique			MEPA	Bob McFarlin		903	1	The NorthMet Project FEIS represents a thorough review of potential environmental effects. Twin Metals agrees with the FEIS conclusions that the NorthMet Mine can comply with strict state and federal environmental standards. ? The co-lead agencies – the Minnesota Department of Natural Resources (DNR), the U.S. Army Corps of Engineers, and the U.S. Forest Service – along with their FEIS consultant, Environmental Resources Management, have properly conducted a professional and objective analysis of all relevant environmental, health and operational issues related to the proposed NorthMet Project. Under the processes outlined in the National Environmental Policy Act (NEPA) and the Minnesota Environmental Policy Act (MEPA), the co-lead agencies have responsibility for performing extensive, thorough and objective EIS analysis of the NorthMet Project. No additional “third party” review of the FEIS, in whole or in part, is necessary. ? The FEIS thoroughly and adequately responds to the thousands of public comments submitted to the Supplemental Draft EIS.	NS	X
23225	Unique			MEPA	Bob Shannon		901	1	As a working environmental chemist, I wish to register significant concerns about the rigor of the Final Environmental Impact Statement Polymet Mining, Inc. - NorthMet Mining Project and Land Exchange (SDEIS) and its conclusions. While I, as an individual citizen, lack the resources needed to perform in-depth review of the FEIS, there are a number of areas that are of significant concern and warrant correction, revision of conclusions, and additional outside independent review. I provided comments on the SDEIS. Although I have concerns about the process used to parse comments into brief statements that would receive comment, I will concentrate on my most significant concern - failure to address uncertainty in long-term modelling data and the co-leads failure to identify this as a scientifically indefensible claim.	NS	X
29876	Unique			MEPA	Brian Hanson	Apex Gets Business	4215	1	In my assessment, the correct steps have been taken to move the PolyMet NorthMet Mine to permitting. The Minnesota Department of Natural Resources, U.S. Army Corps of Engineers and U.S. Forest Service have determined that PolyMet’s mine can comply with strict state and federal environmental standards, while protecting Minnesota’s land and water. Their work is detailed in the FEIS and concludes more than 10 years of diligent study and review. The project’s economic significance to northern Minnesota brings hope to the region and entire state. APEX is excited that this project is one step closer to creating thousands of construction jobs and hundreds of new family-sustaining mining jobs in our region. Let’s get on with it! I am confident in the strength of the project environmental review process. The FEIS is a culmination of the dedicated efforts of many agencies, with significant public input. Thousands of comments and questions submitted during the review periods for the draft and supplemental draft environmental impact statements have been addressed and incorporated in the FEIS. The agencies considered the project’s potential effects on air and water quality with respect to human health and identified no adverse health risks. Water modeling shows that PolyMet’s treatment and mitigation plans will meet all water quality standards and prevent damage to waterways. The FEIS also concludes that any possible groundwater flow will be prevented. The level of detail included in the FEIS is astounding. It is clear the document meets all state and national environmental requirements. The state of Minnesota can model responsible mining practices and innovative environmental protection technologies for the rest of the nation and the world. Our country needs these strategic metals. Northeast Minnesota has the innovative know-how, the workforce, the infrastructure, the environmental ethic and the community support to ensure this project will serve our state in a legal and ethical manner. It is imperative that we move forward with all haste to rebuild our mining economy and stem job losses on Minnesota’s Iron Range. All mining activities bring both risks and rewards. PolyMet will bring significant rewards to the entire state, and the FEIS proves that the risks of copper-nickel mining have been mitigated. Simply put, the rewards far outweigh the risks. The FEIS is more than adequate, and the DNR should affirm this fact so permitting can get underway.	NS	X
27149	Unique			MEPA	Brooke Staupe	Minnesota Power	3198	3	The work performed by the agencies has been exhaustive and thorough, and has responded to thousands of comments and concerns from the public. The time has come to move forward. The DNR should affirm the adequacy of the Final EIS so that the State of Minnesota’s permitting process can continue. Minnesota Power looks forward to the successful startup of the NorthMet project.	NS	X
10157	Unique			MEPA	Bruce Trebnick		668	2	The time has come to move forward. The DNR should affirm the adequacy of the Final EIS so it can serve as the foundation for the state of Minnesota's permitting process.	NS	X
26617	Form Letter	1	Variant	MEPA	Bryan Wyberg		1366	1	The main reason for my immediate opposition to the PolyMet Final Environmental Impact Statement (FEIS) is that it is wholly inadequate under both federal and state standards.	NS	X
5791	Form Letter	1	Variant	MEPA	Charles Huber		434	1	I feel The PolyMet Final Environmental Impact Statement (FEIS) is inadequate under both federal and state standards	NS	X
4368	Form Letter	3	Variant	MEPA	Cindy Jindra		393	1	I am writing to support DNR approval of the Polymet Mining Project. Ten years is more than adequate to study, study and study some more. I am totally supportive of this mining project, not only for the economy of the Iron Range, but also for the benefit it will have for our country, to provide a copper/ nickel source within our borders. I love on the Range, and believe that the Polymet project is safe and should be allowed to proceed.	NS	X
27308	Unique			MEPA	David A. Lien	Minnesota Backcountry Hunters & Anglers	3185	1	We respectfully request (for the reasons detailed in the report below: “Hunters & Anglers Question Northern Minnesota Sulfide Mining Proposals”) that you reject the PolyMet FEIS as inadequate;	NS	X
25851	Unique			MEPA	David Franseen		1233	1	The Final EIS appears to address those elements that may significantly affect the quality of the human environment. Further, it appears that the consideration of state and federal environmental standards shows that this project can move forward with a high likelihood of compliance.	NS	X
25385	Form Letter	1	Variant	MEPA	David Witt		1160	2	The PolyMet Final Environmental Impact Statement (FEIS) is adequate under both federal and state standards;	NS	X
25385	Form Letter	1	Variant	MEPA	David Witt		1173	15	I request the Minnesota Department of Natural Resources accept the PolyMet FEIS as adequate	NS	X
29164	Unique			MEPA	Deborah Huskins		3595	1	The Final Environmental Impact Statement (FEIS) is inadequate in many respects. I will list only several of the many topics on which the analysis presented in the FEIS is inadequate. Given the virtually permanent and predictably devastating consequences of “getting it wrong,” basing decisions on inadequate analysis or foundation is foolhardy. The DNR, US Army Corps of Engineers and the US Forest Service should decide that no amount of analysis can adequately protect the environment and the people of Minnesota from the likelihood of acid mine drainage from the NorthMet Mining Project (hereafter termed “Polymet”), and reject the project entirely. At the very least, these agencies should insist on further analysis by independent experts, not those employed by or paid by Polymet.	NS	X
29164	Unique			MEPA	Deborah Huskins		3596	2	the FEIS does not respond fully to many concerns and objections raised by commenters in earlier stages of the environmental review process. In my comments below, I have pointed out several topics on which this occurs.	NS	X
29164	Unique			MEPA	Deborah Huskins		3599	5	The FEIS does not adequately respond to the comments submitted by respected medical professionals and associations of medical personnel. Nor does it adequately respond to the Tribal agencies’ comments and the concerns they raise.	S	N
23255	Unique			MEPA	Dennis Szymialis		922	18	Failure of the cooperating agency to make the PolyMet documents readily available and yet sighting them in their SDEIS and FEIS being arbitrary and capricious and a serious violation of due process notice requirements.	NS	X
23255	Unique			MEPA	Dennis Szymialis		924	20	That additional time be granted for responding to the FEIS. Additional time would be warranted Pursuant to principles of Due Process and Notice given the complexity of the PolyMet FEIS.	NS	X

27685	Unique			MEPA	Dennis Szymialis		1846	1	That the cooperating agencies including the Minnesota Department of Natural Resources, United States Army Corp of Engineers, and United States Forest Service, arbitrarily and capriciously composed a Supplemental Environmental Impact Statement, a Final Environmental Impact Statement, that fail in many respects to analyze environmental impacts in reference to the PolyMet mining project to avoid violations of federal United States of America law including the Clean Air Act, Clean Water Act, National Environmental Policy Act, Federal Land Management Policy Act, Hobbs Act, and other law.	NS	X
23381	Unique			MEPA	dleingang@nalco.com		945	1	This project has been under scrutiny for far too long - the company has long produced adequate information for the governing agencies to make the proper decision of permitting this project. As a water treatment consultant the extent that Polymet is committed to, along with the continued advancement in technologies, should provide for exceptional treatment of any potential plant discharge. Please move forward with the permitting.	NS	X
11015	Form Letter	1	Variant	MEPA	Donna Cannon		737	4	The PolyMet FEIS is inadequate under federal and state laws and regulations.	NS	X
11015	Form Letter	1	Variant	MEPA	Donna Cannon		740	7	Minnesota Department of Natural Resources MUST reject the PolyMet FEIS as inadequate	NS	X
11015	Form Letter	1	Variant	MEPA	Donna Cannon		741	8	the U.S. Forest Service reject the proposed exchange of Superior National Forest lands for the PolyMet project	NS	X
29996	Unique			MEPA	Elanne Palcich	Save Our Sky Blue Waters	1309	2	We respectfully submit these comments, reiterating our position that sulfide mining cannot be done in water rich northeast Minnesota without severely damaging and polluting our environment into perpetuity. No amount of data manipulation on paper will change that outcome in the environment. At this time, the technology is not available to mine the highly disseminated, low-grade ores of the Duluth Complex without causing severe and significant environmental impacts for this generation, and for those to follow. The PolyMet FEIS is inadequate and should be rejected.	NS	X
27836	Unique			MEPA	Ellen Hawkins		2181	4	The FEIS fails to meet state and federal standards, and in a project with so much potential for doing great harm to Minnesota, this is unacceptable.	NS	X
29452	Unique			MEPA	Erik Hatlestad	Minnesota Public Interest Research Group	3844	2	It is our view that the FEIS does not adequately evaluate the pollution risks to surrounding communities, as well as the sensitive ecosystems of the Boundary Waters Wilderness and Lake Superior. The tentative impacts from pollution, which we feel have been understated, would have a devastating effect on drinking water, fish, wild rice and human health.	NS	X
29745	Unique			MEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4023	77	Since the close of the comment period for the SDEIS, new information has come to light regarding the potential for groundwater to flow north out of the East and West pits after closure, toward and into Northshore Mining’s PMP. The PMP will be dewatered for many years following the closure of the proposed NorthMet mine. Even after the PMP is closed and fills with water, that water will be maintained at a lower elevation than the water in the NorthMet West Pit lake and East Pit pore water, causing a northward migration of groundwater. This water will enter the PMP, from which all water will be discharged to the Rainy River watershed after mine closure, constituting a diversion of water from the Great Lakes basin to the Hudson Bay basin. This issue was brought to the Co-Lead Agencies’ attention by GLIFWC, whose position and modeling results are contained in a letter attached to these comments. Dr. Tom Myers has done additional modeling that also indicates a northward flow from the mine pits after closure.205 Remarkably, the Co-lead Agencies defend their failure to establish the likely flow paths of groundwater from the mine pits by stating that the modeling done was not intended for this purpose. The agencies as much as admit that they did not plan to require PolyMet to accurately characterize the hydrology of the site after closure, when to do so is required to obtain a water appropriation permit.206 DNR will no doubt respond that this is a permitting rather than a MEPA requirement, but when exactly is it that the required hydrological investigation and modeling was going to be done? It legally must be completed before finalization of the FEIS.	NS	X
29324	Unique			MEPA	Frank Ongaro	Mining Minnesota	3671	1	First, the Department of Natural Resources (DNR), the U.S. Army Corps of Engineers and the U. S. Forest Service put forth an exceptional amount of dedication and due diligence in reviewing and analyzing the FEIS. The review and analysis was accomplished in a thoughtful, deliberate and thorough process involving many stakeholders, including members of the public, the business community and state, local and federal governmental units. The FEIS analyzed the required topics identified in the original scoping documents, as well as other topics that were identified in both the public comment period and environmental review process.	NS	X
29324	Unique			MEPA	Frank Ongaro	Mining Minnesota	3683	2	Second, air and water quantity, and potential human health effects of the proposed project were all identified and analyzed in the FEIS. The project's water modeling, which was fully updated for the Final EIS, shows that PolyMet's treatment and mitigation plans will prevent acid mine drainage and meet all water quality standards. Specific attention was paid to the human health impacts of the project. The addition of the new section that concisely analyzed the human health impacts and addressed concerns raised by the Department of Health and others during the public comment period are a positive contribution to the report. The final analysis ultimately identified no adverse health risks. Water quality modeling and monitoring information at the mine and plant sites that also included mitigation and analysis of the potential for northward flow of groundwater are also supplements to the FEIS that addressed many concerns in the comment process. The final analysis shows that all of the concerns regarding these topics and others were more than adequately addressed in modeling and analytical discussions.	NS	X
29229	Unique			MEPA	Gail C. Roberts		3608	1	The Final Environmental Impact Statement (FEIS) for the PolyMet/NorthMet Project and Land Exchange does not meet adequacy standards and should not be approved.	NS	X
29229	Unique			MEPA	Gail C. Roberts		3616	4	Modeling in the FEIS is based on sparse data, and on unrealistic and unverified assumptions. Much of the modeling is based on insufficient amounts of data (e.g., insufficient number of monitoring wells for ground-water), and failure to use all of the available data for the stream flow (as pointed out by GLIFWIC). Other parts of the modeling are based on unrealistic and unverified assumptions related to the theoretical and untested nature of the project design. Research and development should occur before the project begins rather than relying on monitoring systems after mining starts (with all the potential risks) to confirm modeled predictions.	S	O
29229	Unique			MEPA	Gail C. Roberts		3618	6	CR01 – This thematic response is not pertinent to the substance of the issues that I raised in my comments (18052, 18512, 18531, 18537). Using key words such as “Native American” or “Treaty Rights” does not address the underlying issue or concern which was acid mine drainage in three of the four comments. Relying on a computerized, content analysis method of responding to comments results in overly-generalized responses rather than specific responses to comments.	S	N
29229	Unique			MEPA	Gail C. Roberts		3619	7	FIN01, FIN08, FIN10, FIN14 – The explanation of financial assurance given in Section 3.2.2.4 of FEIS is not adequate in addressing the substantive concerns that were raised (18062, 18601,18603,18604). If PolyMet and its corporate sponsors and investors do not have sufficient financial resources to even explore the underground mining alternative, how are they going to have sufficient financial resources to provide financial assurance to the state for indefinite, long-term environmental monitoring, remediation and reclamation?	S	O
23350	Unique			MEPA	Gayle Latendresse		933	1	I am in favor of the Polymet project. I feel that sufficient information has been provided and this project should finally be allowed to move forward.	NS	X
27824	Unique			MEPA	George Kluempke		2156	3	I believe that the FEIS meets all of the requirements of both the Federal and Minnesota Environmental Policy Acts.	NS	X
6433	Unique			MEPA	Hans Olsen		495	10	I'll end this letter with a simple assertion. Our public environmental regulatory agencies will make or break their reputation for integrity and competence on this project. It is readily apparent from reading the FEIS that our public officials have done a lot of good work to bring this analysis to this point. I hope they now live up to our high expectations and keep this EIS open until the issues noted here are fully considered. I think these concerns can be addressed. and this mining could go forward, but we are not there yet.	NS	X
29909	Unique			MEPA	Harold Nordin		2722	11	I would ask that the Minnesota Department of Natural Resources reject the PolyMet FEIS as inadequate.	NS	X
30291	Form Letter	1	Variant	MEPA	Isaac Fuhr		2847	1	The EIS doesn't address all concerns adequately, or completely	NS	X
28494	Unique			MEPA	Ivan Weber		2304	12	The FEIS and the NorthMet project are negligent and just plain wrong on several fundamental scientific points, particularly in sections 4, 5 and 6 of the ponderous EIS document dealing with environmental scientific disciplines, particularly water, sulfide minerals, mercury, selenium and the microbiology and botany of an environment that has the misfortune of being mined.	NS	X
10729	Unique			MEPA	jack@elorantaassoc.com		720	1	I am a geologist and mining engineer with 39 years of mining experience including work in Senegal, Peru, New Zealand, Australia, South Africa and Panama. I have served as CEO for a coal mining company. I have had direct responsibility for environmental effects of mining. It would be a travesty to require further studies beyond the current EIS. Mining in Minnesota would be cleaner and far more responsible than any jurisdiction in which I have operated. The EIS is fully adequate and should be approved.	NS	X
23365	Unique			MEPA	Janet Keough		944	7	I implore you to reject the Final EIS for the Polymet project.	NS	X
15169	Unique			MEPA	Jason George	International Union of Operating Engineers Local 49	2924	3	Ten years of study is enough. The EIS is more than adequate. You have all the information you can possibly have, you have listened and responded to every comment that you could possibly get	NS	X
27883	Unique			MEPA	Jay Newcomb		2211	1	The final EIS for PolyMet is inadequate for the following reasons:	NS	X
27883	Unique			MEPA	Jay Newcomb		2216	6	This makes the EIS totally inadequate.	NS	X
26627	Unique			MEPA	Jeff Schroeder		1375	4	Is there really a problem with viewing environmental regulation from a more conservative perspective, better over regulating and dealing with cleaner water than under regulating and dealing with polluted water? Why does the state have to prove the need for regulation when the corporation requesting a permit requires so much less. Are possible lawsuits by Poly-met a good enough reason to issue a permit when there are threats to the environment that have not been addressed?	NS	X

4300	Form Letter	3	Variant	MEPA	jmonacelli@duncanco_com		403	1	After 10 long years, and millions of dollars it seems as though we may be building a mine soon. The final EIS is far beyond antiques, and covers every foreseeable scenario. Polymet has proven they can mine the Northmet site, while being sensitive to the surrounding environment. While mines are closing throughout the Iron Range, this project would be just what we need to help hard working families in the area. WE KNOW HOW TO MINE... WE'VE LIVE HERE, AND HAVE BEEN DOING IT FOR GENERATIONS!	NS	X
29547	Unique			MEPA	John Chell	Northern Counties Land Use Coordinating Board	3880	1	To characterize this 10 year, \$90 million, environmental analysis as anything less than fully adequate is to do a disservice to over 40 years of environmental, technical, and regulatory progress which has brought this state a standard of environmental excellence that is a national and, undoubtedly, an international model for objectively evaluating proposed mining projects. It is unfortunate that many within the environmental community will perceive the affirmative conclusions of this analysis as a defeat when this study represents the pinnacle of their advocacy. The environmental impact analysis process generally, and this exhaustive and technically complex environmental study specifically, was never intended to be an absolute barrier to future mining in Minnesota. It is, rather, a profoundly deliberative process designed to give our elective leaders, our regulatory agencies, our citizens, and the market itself an objective framework by which to judge whether State and Federal environmental standards can be achieved and maintained within the NorthMet proposal. Three independent agencies: the Minnesota Department of Natural Resources, the U.S. Forest Service and the U.S. Corps of Engineers, lead this massive and lengthy analysis. That all three INDEPENDENTLY concluded that the Northmet mining project can be compatible with both the environmental and natural resources of the region (and the outdoor recreational pursuits based on those resources) is both reassuring and conclusive regarding the adequacy of this EIS. Ultimately, the permitting process, the financial assurance component and the world-wide metals market itself will determine if this proposed mine is both environmentally and economically feasible. The state and its federal partners will, through the multitude of mine permit performance standards, a sound financial assurance facility, and a continued high level of transparency and public dialog ensure that the environmental management component of that decision is fully manifest. NCLUCB supports the determination of the Co-Lead agencies that the NorthMet Mining and Land Exchange Final EIS is adequate and urges those agencies to initiate the mine permitting process.	NS	X
4927	Form Letter	1	Variant	MEPA	John Flaten		419	1	The substantive comments which I made to the SDEIS have not been addressed by or in the FEIS in any meaningful way.	NS	X
27693	Unique			MEPA	John G. Raines	North Central States Regional Council of Carpenters	3279	3	In short, the Final EIS meets all of the requirements of the Minnesota Environmental Policy Act and the National Environmental Policy Act. The DNR should affirm the adequacy of the Final EIS so it can serve as the foundation for the State of Minnesota's permitting process.	NS	X
26225	Unique			MEPA	Kaitlin Seiberlich		1285	2	Some of the major issues I believe the FEIS does not adequately address are the following: purposeful downplaying of potential water pollution, willful ignorance of the state of existing infrastructure, necessity of water treatment after the plant and mine both close, the lack of demand for both nickel and copper, and the reputations of both Glencore and PolyMet. Individually, each of these are large concerns that bear examination. Together, they create a picture that is devastating to any environmentalist worth their salt.	NS	X
10709	Form Letter	1	Variant	MEPA	Kevin Lee		712	1	I am writing to express my deepest opposition to the PolyMet Final Environmental Impact Statement (FEIS), which I believe to be is inadequate under both federal and state standards.	NS	X
27721	Unique			MEPA	Kris Wegerson		2120	12	In summation, the FEIS did not adequately address the significant issues of human health risk, and health impact, likely tailings dam failure, and need for perpetual treatment of water from the mine and plant sites. It is not in compliance with MEPA and Minnesota Rules because it did not adequately address financial assurance as a part of the proposed action. It is not in compliance with the procedures of MEPA which should have required the completion of health risk and health impact assessments. The FEIS must be rejected.	NS	X
10736	Unique			MEPA	Kurt Doran		721	1	I am writing this letter in support of the Final Environmental Impact Statement (Final EIS) issued for PolyMet Mining's NorthMet Project by the Minnesota Department of Natural Resources (MNDNR), along with the co-lead agencies: the United States Forest Service (USFS) and U.S. Army Corps of Engineers (USACE). The Final EIS has adequately addressed potential impacts resulting from successfully permitting the NorthMet project. The Final EIS is adequate to protect Minnesota's natural resources and the project, should it be permitted, will meet all state and federal air, solid waste and water quality standards.	NS	X
10736	Unique			MEPA	Kurt Doran		724	4	In summary, the Final EIS has been adequately completed and shows that the NorthMet project will not adversely impact the intrinsic natural resources characteristic of Minnesota.	NS	X
22434	Unique			MEPA	Kwilas Tony	Minnesota Chamber of Commerce	2930	3	I would like to reiterate that the FEIS addresses all of the topics that were identified in the seeping process, addresses the public comments that were offered and follows the very detailed environmental review process set forth in Minnesota state statute and rule as well as federal law and therefore, should be deemed adequate.	NS	X
27688	Unique			MEPA	Laura Gauger		3254	1	Upon completing my review of the PolyMet FEIS, I have concluded that it is inadequate. I also hereby object to the Draft Record of Decision issued by the U.S. Forest Service (Brenda Halter, Forest Supervisor, Superior National Forest) that would convey 6,650 acres of federal lands in the Superior National Forest to PolyMet.	NS	X
27688	Unique			MEPA	Laura Gauger		3256	2	The PolyMet FEIS claims that the project will be in compliance with state law. To the average Minnesotan, this might mean everything will be okay. But the FEIS fails to elaborate upon the fact that state law and MPCA regulations allow PolyMet an exemption to meeting groundwater quality standards within the company's property boundary. It doesn't mean much to be "in compliance" with a law that has provided you with an exemption to meeting its terms. Yet, this important concept is not discussed or elaborated upon in either the Executive Summary or body of the FEIS. Rather, just a few brief references to it can be found buried in Appendix A of the document, where it states that groundwater quality standards will be enforced "at the Mine Site and Plant Site property boundaries, not within the NorthMet project footprint." The lack of enforcement of groundwater quality standards within the company's property boundary has not been highlighted for public scrutiny in the FEIS even though, according to PolyMet's own computer modeling provided by Barr Engineering, the levels of pollutants in the water at the mine site and tailings dump will be many times higher than standards set to protect people, plants and wildlife. The exemption provided to the company seems to have been swept under the rug when, rather, it deserves close scrutiny due to the water-rich nature of the lands in question. Discussions with the Minnesota Pollution Control Agency (MPCA) have confirmed that, yes, it's not until the polluted water crosses the company's property boundary that groundwater quality standards will be enforced. The agency stated, "That's the way the law works." The upshot is this: When the FEIS claims that PolyMet will be in compliance with state law, it's not that the water within the company's property boundary will be clean. It's that the pollution has been legalized. The public needs (and deserves) to know this, especially because we are not talking about a small tract of land where PolyMet will be exempt from meeting groundwater quality standards. Rather, the "groundwater sacrifice zone" associated with the project encompasses over 21,000 acres of water-rich lands in the Lake Superior watershed (including 6,650 acres presently in the Superior National Forest). The lack of transparency of the FEIS on this very important issue renders the FEIS inadequate. The public simply must be provided with greater detail regarding the size and scope of the groundwater sacrifice zone and what that means in both the short term and long term for the Lake Superior and Rainy River watersheds. Anything less falls short of providing a true assessment of the environmental impact of the PolyMet project.	S	N
27688	Unique			MEPA	Laura Gauger		3258	4	In terms of the sludge and residual solids produced by mechanical water treatment processes at the PolyMet mine site and plant site, the FEIS states that off-site disposal facilities will be utilized for some of the waste, but it does not specify the projected volume of said waste. Nor does it identify where or in which watershed the off-site disposal facilities will be located, the transportation corridor, or if any nearby landfill could even accommodate the large volumes of waste generated over time (potentially hundreds of years). The public needs (and deserves) to know the corresponding details for the PolyMet project, including where the off-site dump(s) will be located. The absence of this information in the FEIS renders it inadequate. In addition, no information is provided in either the FEIS or NorthMet Project Waste Characterization Data Package regarding the composition of the "residual solids" produced by mechanical water treatment processes at the PolyMet mine site and plant site, and only limited information regarding the composition of the sludge is included in the FEIS. The public needs (and deserves) to know the composition of these waste products, especially because of the potentially large volumes that will be disposed off-site. The absence of this information in the FEIS renders it inadequate.	S	O
23643	Unique			MEPA	LeRoger Lind	Save Lake Superior Association	2937	6	A worst case analysis of the potential damage to children's cognitive development, methylated mercury entering the food chain in fish and other toxins entering downstream water supplies would be essential in this environmental impact statement. From that perspective alone this FEIS is definitely inadequate.	S	O
10215	Unique			MEPA	Lisa Lenz		674	1	1) Is the state is doing their own environmental impact assessment and is not relying on the one paid for by Polymet?	NS	X
7689	Unique			MEPA	LK Woodruff		562	2	The recently released Final Environmental Impact Statement (FEIS) is inadequate, and The proposed open-pit mine would result in unacceptable, irreversible environmental harms. Quite possibly for many, many, many years.... Long after we are all dead and long gone:(So there goes any serious accountability.	NS	X
29740	Unique			MEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3881	1	We respectfully submit these comments, reiterating our position that sulfide mining cannot be done in water rich northeast Minnesota without severely damaging and polluting our environment into perpetuity. No amount of data manipulation on paper will change that outcome in the environment. At this time, the technology is not available to mine the highly disseminated, low-grade ores of the Duluth Complex without causing severe and significant environmental impacts for this generation, and for those to follow. The PolyMet FEIS is inadequate and should be rejected.	NS	X
29740	Unique			MEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3918	33	According to the FEIS the level of threat from the mineral fibers is unknown and unknowable. The workers and communities need to be protected, it is not sufficient for agencies to simply say that the possible harm from the project can't be predicted.	NS	X

29740	Unique			MEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3919	34	The FEIS discussion of fibers misstates the current state of knowledge and scientific methodology needed for an assessment of the potential impacts of mineral fibers on public health. The FEIS must disclose and base its conclusions on the best evidence available, rather than continuing to repeat the outdated position that nothing is known or can be known about the toxicity of fibers.	NS	X
26648	Unique			MEPA	Margaret A. Redmond		1397	7	3. How much more danger exists for Minnesota’s waters--given the 2015 Legislative exemption of sulfide mining operations from solid waste regulations? Does this not amount to a “free pass” for pollution? This FEIS was mostly written before that legislation—and clearly does not adequately treat what seems to be a new license to pollute.	S	O
29319	Unique			MEPA	Maya Batres	The Nature Conservancy	3657	1	The Nature Conservancy ("Conservancy") finds that the Final Environmental Impact Statement ("FEIS") for the proposed NorthMet Project ("Proposed Project") is inadequate in important respects, key information is missing or incomplete and that additional analysis is needed to enable informed decisions.	NS	X
29319	Unique			MEPA	Maya Batres	The Nature Conservancy	3658	2	Upon application of these three requirements to the FEIS for the Proposed Project, the document fails to meet the first two. First, the FEIS is not responsive to substantive comments submitted during the public comment period on the Supplemental Draft Environmental Impact Statement ("SDEIS") as required in number 2 above. The Conservancy's comments described concerns and recommended remedies that should be included in the FEIS. However, many of the concerns were dismissed with no relevant explanation leaving gaps in the analysis necessary to evaluate the environmental consequences of alternatives. This lack of meaningful response results in the FEIS repeating many of the failures of the SDEIS.	S	N
N/A	Form Letter Template	1	Non-Variant	MEPA	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL14	14	I request that the Minnesota Department of Natural Resources reject the PolyMet FEIS as inadequate	NS	X
N/A	Form Letter Template	1	Non-Variant	MEPA	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL18	18	I also request that the Army Corps of Engineers hold a public hearing in January 2016 following a 30-day notice as required by 33 C.F.R. § 327.11(a), and that the Corps’ extend the time period within which comments on the PolyMet final environmental impact statement and the Section 404 public notice will be accepted for consideration in the Corps’ Record of Decision until at least ten days beyond the hearing date, pursuant to 33 C.F.R. § 327.8(g).	S	N
N/A	Form Letter Template	3	Non-Variant	MEPA	Multiple	Mining Minnesota	FL19	1	The Final EIS for the NorthMet Mine is far beyond "adequate." It takes a careful and comprehensive look at the project from every angle.	NS	X
N/A	Form Letter Template	1	Non-Variant	MEPA	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL2	2	The PolyMet Final Environmental Impact Statement (FEIS) is inadequate under both federal and statestandards; I object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I oppose issuing any federal permit allowing PolyMet to destroy wetlands and impair water quality.	NS	X
N/A	Form Letter Template	3	Non-Variant	MEPA	Multiple	Mining Minnesota	FL22	4	The Final EIS also specifically considered the project's potential effects on air quality and water quality with respect to human health, and identified no adverse health risks.	NS	X
N/A	Form Letter Template	4	Non-Variant	MEPA	Multiple	Center for Biological Diversity	FL23	1	I am writing to oppose PolyMet's proposed NorthMet sulfide copper mine on the Superior National Forest. The recently released Final Environmental Impact Statement (FEIS) is inadequate, and the proposed open-pit mine would result in unacceptable, irreversible environmental harms.	NS	X
N/A	Form Letter Template	4	Non-Variant	MEPA	Multiple	Center for Biological Diversity	FL30	8	The FEIS is inadequate and fails to demonstrate that the proposed PolyMet mine will comply with all environmental laws and that it will not result in unacceptable environmental impacts. The agencies should reject PolyMet's proposal, and keep the proposed mine site under the current ownership and protections provided by the Weeks Act, Endangered Species Act, the Superior National Forest Plan and other laws.	NS	X
N/A	Form Letter Template	7	Non-Variant	MEPA	Multiple	League of Conservation Voters	FL37	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. The PolyMet Final Environmental Impact Statement (FEIS) is inadequate under both federal and Minnesota state standards; I object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I oppose issuing any federal permit allowing PolyMet to destroy wetlands and impair water quality.	NS	X
N/A	Form Letter Template	9	Non-Variant	MEPA	Multiple	Sierra Club	FL48	7	I request the Minnesota Department of Natural Resources reject the FEIS as inadequate	NS	X
N/A	Form Letter Template	10	Non-Variant	MEPA	Multiple	Building Trades	FL59	7	In short, the Final EIS meets all of the requirements of the Minnesota Environmental Policy Act and the National Environmental Policy Act. I strongly encourage the DNR to determine the FEIS is fully adequate and begin the permitting process for this important project.	NS	X
24759	Unique			MEPA	Nancy Aronson Norr MP	Jobs For Minnesotans	2951	1	I am submitting this comment as to the adequacy of the Final Environmental Impact Statement (FEIS) for PolyMet’s proposed mine on behalf of Jobs for Minnesotans, a coalition representing 55,000 men and women of the trades, 2,300 businesses and hundreds more mayors, local chambers of commerce and citizens. The correct steps have been taken to move the PolyMet NorthMet Mine to permitting. The Minnesota Department of Natural Resources, U.S. Army Corps of Engineers and U.S. Forest Service have determined that PolyMet’s mine can comply with strict state and federal environmental standards. This assessment is detailed in the FEIS and concludes more than 10 years of thorough study and review.	NS	X
24759	Unique			MEPA	Nancy Aronson Norr MP	Jobs For Minnesotans	2952	2	We are confident in the environmental review process for the project and the FEIS is a culmination of the dedicated efforts of many agencies. Thousands of public comments and questions submitted during the review periods for the draft and supplemental draft environmental impact statements have been addressed and incorporated in the FEIS.	NS	X
24759	Unique			MEPA	Nancy Aronson Norr MP	Jobs For Minnesotans	2955	5	The FEIS is more than adequate and the DNR should affirm this fact so permitting can get underway.	NS	X
27901	Unique			MEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3427	139	The FEIS here is not adequate. It does not satisfy the requirements of Minn. R. 4410.2800, subp. 1.A, as it does not fully or fairly present all “significant issues for which information can be obtained,” did not consider other reasonable alternatives, and did not provide accurate and complete information on the environmental, economic, employment and sociological impacts of the proposed Project or the alternatives. As described in detail above, the FEIS fails to base its assessment of the environmental impacts of the proposed Project on sound scientific analysis across a range of significant environmental impacts – including water quality, mercury loading, wetlands, air quality, and wild rice, among others. Instead, the FEIS bases its conclusions on flawed application of its models, incorrect baseline data, and untested assumptions. As set out above, the Band and others have provided scientific analysis which refutes the conclusions reached in the FEIS. The FEIS’s failure to give effect to the relevant available data and the relevant substantial scientific analysis leads the FEIS to conclusions that are arbitrary and capricious and unsupported by the evidence in the record. In addition, the FEIS did not satisfy the requirements of Minn. R. 4410.2800, subp. 1. B. While the FEIS includes appendices which report on the comments made, and contains columns intended to provide the agencies’ responses to those comments, the responses are in substantial respects nonsubstantive, limited to conclusory statements that the matter was considered. But the flaws in the models and studies preclude a conclusion that the MDNR has complied with its obligation to carefully consider the comments made. Further, the FEIS does not satisfy the requirements of Minn. R. 4410.2800, subp 1.C. While notice and an opportunity to comment on the draft and final EIS have been provided, the time allocated for review and comment on the FEIS was not adequate for a proposed project that is the first of its kind in Minnesota, has extensive environment impacts, and is the subject of discussion in a 3500 page document, which, in turn cites to thousands of pages of source documents, many of which were prepared after comments were submitted on the DSEIS. In these circumstances, a period of only 37 days – which began shortly before the Thanksgiving holiday – in which to review this volume of material was not adequate. Because of the fundamental errors in the FEIS, it cannot be relied on to make decisions regarding permits for the proposed mine. The FEIS should be found inadequate.	S	O
28097	Unique			MEPA	Noreen Tyler	Izaak Walton League Minnesota Division	3450	6	Please reject the FEIS as inadequate, and send this document back for further revision, or better, the complete reformulation of this mine plan.	NS	X

27085	Unique			MEPA	Paula Maccabee	Water Legacy	3107	96	The FEIS did not discuss these expert opinions or resolve their concerns.	S	N
27085	Unique			MEPA	Paula Maccabee	Water Legacy	3189	185	The FEIS suggests that the environmental benefits from the West Pit Backfill alternative do not require its consideration, let alone implementation of this alternative: T]he potential environmental benefit is moot or outweighed because encumbrance is not allowed in PolyMet’s private mineral leases and because the costs associated with backfilling, additional water treatment (rates), and encumbrance compensation determined in revised lease agreements may affect the ability of PolyMet to secure financing (MDNR et al. 2013b). As such, the option to backfill the West Pit was eliminated from further consideration in the SDEIS and remains so in this FEIS. (FEIS, 3-162) The referenced 2013 MDNR memorandum cited the conclusion of PolyMet’s consultants that the West Pit Backfill alternative “would significantly decrease net return on the project.” (FEIS ref. MDNR et al., 2013b, p. 3). PolyMet’s consultants emphasized, “There are known extensions of mineralization outside the mine plan both to the south (down dip) and to the west (along strike). A key consideration in the development of an overall mine plan for the Project, including the ability to backfill open pits, is preserving potential future development of these extensions of mineralization.”46 Minnesota’s Environmental Policy Act does not allow rejection of an environmentally preferable alternative on the basis of economic considerations, Minn. Stat. §116D.04, Subd. 6. Under federal law,	S	N
27085	Unique			MEPA	Paula Maccabee	Water Legacy	3238	225	On the basis of the foregoing analysis and the expert opinions, exhibits and other materials cited herein, it is respectfully requested that the Minnesota Department of Natural Resources determine that the PolyMet NorthMet FEIS is inadequate, that the U.S. Army Corps of Engineers and the U.S. Forest Service find the FEIS insufficient to support either a Section 404 permit or a land exchange for the PolyMet NorthMet Proposed Action, and that other state, federal and tribal agencies rely on the information provided herein to deny and object to any applicable permits and certifications for the PolyMet NorthMet project.	NS	X
351	Unique			MEPA	rachel susan		176	2	I do not believe that the final EIS adequately addresses the predicted environmental consequences. Over and over again, it is stated in the report that the consequences would be "mitigated" or have minimal effect. These statements are made without supporting evidence as to why the consequences would be negligible.	NS	X
10133	Unique			MEPA	Richard Crum		657	1	1. The EIS is technically sound and satisfies Minnesota Rules 4410.0200 through 4410.7070. The basis for this comment is beyond the scope of this narrative but it is well supported by the body of comments already addressed and the DNR commissioner has been very articulate regarding the technical adequacy.	NS	X
9828	Form Letter	3	Variant	MEPA	Richard Houck		645	3	Any lawsuits that are filed to cancel or delay this project should and must be dismissed for lack of evidence that this company cannot or will not meet all the environmental needs of the State.	NS	X
29742	Unique			MEPA	Russell Hess	Laborers District Council of MN & ND	3938	2	Now, the Final EIS for PolyMet's proposed mine has concluded a thorough and independent review of the project's potential environmental effects. After 10 years of study, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and correctly found that the NorthMet Mine can comply with strict state and federal environmental standards. The Laborers District Council of MN & ND agrees, it is time to move forward with permitting.	NS	X
29742	Unique			MEPA	Russell Hess	Laborers District Council of MN & ND	3939	3	We believe the word “adequate” falls short of describing the Final EIS. It took a careful and comprehensive look at the project from every angle. The Co-lead Agencies have spent 10 years evaluating potential project effects and alternatives. The Final EIS responds in detail to thousands of public comments and questions submitted during the review periods for the Draft EIS and the Supplemental Draft EIS, including those made by our members in public meetings in Northern Minnesota and in Saint Paul. The science backing up the EIS including the water modeling, study of groundwater flows and the project’s effects on human health is sound and thorough.	NS	X
29742	Unique			MEPA	Russell Hess	Laborers District Council of MN & ND	3940	4	In short, we believe the Final EIS meets all of the requirements of the Minnesota Environmental Policy Act and the National Environmental Policy Act. The time has come to move forward. The DNR should affirm the adequacy of the Final EIS so it can serve as the foundation for the state of Minnesota's permitting process. The sooner this happens, the sooner our members can get to work building the most environmentally friendly mine in the United States.	NS	X
29985	Form Letter	1	Variant	MEPA	Sarah Elizabeth		4311	3	I implore the MNDNR to reject the Northmet FEIS as inadequate. Northmet has simply failed to establish that its project can adequately mitigate the extensive and well-known risks associated with the mining of ore deposits with acid-forming minerals. Please do not risk adding northern Minnesota to the long list of acid mine drainage disasters.	NS	X
3509	Form Letter	1	Variant	MEPA	Scott Slocum		380	1	The PolyMet NorthMet sulfide mining proposal and the Final EIS is inadequate to guarantee environmental safety or long-term economic advantage. It would generate decades of revenue at the higher cost of centuries of pollution abatement, with the risk of environmental disaster in the case of an undetected leak or an uncontrollable breach from containment. The MN DNR should reject the PolyMet Final EIS.	NS	X
23349	Form Letter	1	Variant	MEPA	Shelley Selstad		932	2	Please use all caution and do not approve this project until it can be absolutely clear that serious risk is controlled now and into the future.	NS	X
16753	Unique			MEPA	Stephen Ryan		811	1	The final EIS is adequate and will comply with the strict state and federal standards. This is the place to build a mine where we have the laws and the mining experience needed to complete this project. PolyMet along with the State and Federal agencies have done their job. Now is the time to approve this project and not spend more time and money on the review but on construction.	NS	X
24761	Unique			MEPA	Steve Timmer		1097	3	The widely-reported problems with the water model, the potential effects on human health – just brushed aside by state officials on December 7th – and the failure to explain in any meaningful way how regulators will require financial assurances, all illustrate that the FEIS is not completely vetted, and these underlying problems are either not understood or just ignored.	NS	X
24761	Unique			MEPA	Steve Timmer		1098	4	The fact that the FEIS was ten years in the making is an indictment of the process, nothing more.	NS	X
29478	Unique			MEPA	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3875	28	WHEREAS, the physical length and time taken to produce the FEIS, over 10 years and 3,500 pages, with a second attempt following the rejection of the first draft, is no guarantee of its validity or scientific worthiness;	NS	X
26554	Form Letter	1	Variant	MEPA	Tim Callister		1349	2	A large majority, if not all, mines of this proposed magnitude have a long term detrmental effect on the environment around them no matter what promises are made in the beginning. The State has embarked on a long overdue process to clean up Minnesota's lakes and streams. This type of mining will be in direct conflict with that goal.	NS	X
29270	Unique			MEPA	W. Charles Huskins		3652	2	Please note that my comments, as listed below, were previously made in response to the Supplemental Draft Environmental Impact Statement (SDEIS) in 2014. I find no record, either in the text of the FEIS or in Appendix A, Response to Comments on the DEIS for the NorthMet Mining Project and SDEISA for the NorthMet Mining Project and Land Exchange (specifically Section A.5.11), that these critiques have been addressed.	S	N
30073	Unique			MERC	Brad Sagen		4253	5	NorthMet environmental analysis has failed since virtually it's beginning to consider the potential impact of mercury and especially of methylmercury being released and created from air deposition and sulfate mine seepage. Additional analyses are required to correct this shortcoming.	NS	X
27184	Unique			MERC	Carl Sack		1675	7	The statement is made on page ES-36 that runoff models predict a net reduction in mercury loadings on the St. Louis River downstream of the Embarrass and Partridge rivers due to wastewater treatment; again, there is no way to test this hypothesis given the lack of testing sites on the St. Louis River itself.	S	O
29801	Unique			MERC	Daniel Pauly		699	21	No matter how the samples are interpreted, it is clear that the FEIS has a profound shortcoming in relying almost exclusively on data from SD004 as a supposedly “representative” sampling location. SD004 is not representative of water discharges at the Tailings Basin, but rather is an anomaly. The unfortunate decision by FEIS preparers to select SD004 as foundation of the Tailings Basin mercury analysis results in flawed arguments, erroneous conclusions, and unexamined Project alternatives.	NS	X

29801	Unique			MERC	Daniel Pauly		849	49	A recent Minnesota study showed concentrations of methylmercury in restored wetlands had some of the highest in published literature, suggesting creation of wetlands to receive a mercury and sulfate mixture is a serious concern for the Embarrass River ecosystem and downstream inhabitants.	S	N
29801	Unique			MERC	Daniel Pauly		4106	40	Mercury removal could be between 22 and 99.9 percent, but no one knows and no one has asked. We know that mercury might be removed by the WWTP. Or it might not be removed. There are two ways to find out, either do Comprehensive Pilot Test based upon more realistic conditions, or wait to see what comes out of the WWTP in a couple decades when the maximum discharges start to occur.	S	N
29801	Unique			MERC	Daniel Pauly		4142	15	Mercury is one of the most significant potential water contaminants from the NorthMet Project. Contamination of local surface and groundwater from the Tailings Basin is of particular concern. As noted in the FEIS, the proposed NorthMet Tailings Basin will have significant levels of water seepage indefinitely, and the volume of discharge water will be increasing significantly compared to current conditions. The level of mercury in that seepage water is critical to evaluating the environmental impacts of the NorthMet project, as well as the financial viability of seeking to remove the mercury.	NS	X
29801	Unique			MERC	Daniel Pauly		4167	1	the FEIS continues to outline a plan of action that will almost certainly be in significant violation of allowed mercury discharge levels, which will allow for increased methylation of mercury, and which will require far higher expenditures of funds for site revision and/or remediation than would otherwise be necessary.	S	O
29801	Unique			MERC	Daniel Pauly		4172	6	The FEIS also relies upon a faulty mercury sequestration test that predicts remarkably low mercury levels in Tailings Basin seepage, while ignoring a superior test that does not predict significant sequestration. Specifically, the FEIS gives great weight to a very flawed 8 hour experiment with NorthMet tailings in a flask, while never even mentioning in the FEIS a much more comprehensive test prepared for the NorthMet site that showed mercury levels are likely to be significantly above Great Lakes Initiative standards.	S	N
29801	Unique			MERC	Daniel Pauly		4179	13	Contemporary research, including important research recently conducted in Minnesota, shows that this wetland, with its mixture of mercury, sulfate, and organic matter, is a prime environment for methylation of mercury. In fact, recent research by government investigators in Minnesota in the last few years has shown shockingly high levels of methylmercury in wetlands, including methylmercury spikes at the toe of taconite tailing basins. The FEIS never asks what will happen to that methylmercury. It is likely that some of it is going to be carried to the WWTP, but as the WWTP pilot test itself reports, there is no plan for removing it. What happens to the rest of the methylmercury, which might be the majority? Current research shows it will be absorbed by everything from mosquitos to earthworms, and will then travel up the food chain throughout the Embarrass River watershed.	S	N
29801	Unique			MERC	Daniel Pauly		4181	16	Table 4.2.2-4 was prepared using information in SDEIS and FEIS appendix Barr 2006f, which I received from Ms. Lisa Fay of the Minnesota Department of Natural Resources. Barr 2006f allows for reconstruction of the mercury contamination calculations for each of these sample locations. Despite the fact that Barr 2006f includes significant errors, it is still relied upon in the FEIS. In reviewing the data in Barr 2006f, I identified a fundamental mistake in the summary results: The calculations had a major error because the sample data was presented in two units: nanograms per liter (ng/L) and micrograms per liter (ug/l), yet the calculations ignored these different units. I pointed out this error in my SDEIS comments, but it is clear that the drafters of the FEIS did not consider this issue, and clearly did not correct it. Reproduced below is a portion of page 113 of Barr 2006f, showing the table heading for columns of mercury discharge data for Cell 1E: Data in the left hand column is presented in ng/L, while data in the right hand column is presented as ug/L. For reference, the data on the right can be expressed as "<200 ng/L". Unfortunately, the FEIS preparers interpreted this data as "<.2 ng/L". What was being expressed in the right hand column is that the minimum detection level (mdl) for these samples was less than 200 ng/L. In other words, the analysis did not seek to measure low level mercury concentrations. The problem is that the FEIS preparers thought that the data indicated a minimum detection level of 0.2 ng/L. In other words, the SDEIS and FEIS preparers incorrectly thought this data indicated mercury levels were spectacularly low.	S	N

29801	Unique			MERC	Daniel Pauly		4182	17	Not only is the mean total mercury concentration incorrect in Table 4.2.2-4 FEIS, but it is important to note that FEIS Table 4.2.2-4 also dramatically overestimates the number of non-detect samples for mercury. The error is that the minimum detection levels were far above the actual Great Lakes Initiative levels, so a non-detect in many cases means only that the mercury levels were below the very high 200 ng/L, rather than a modern detection level of 0.5 ng/L. Non-detects for such high minimum detection levels should not be considered to be non-detects when the regulated target level for mercury is 1.3 ng/L. I pointed out this exact problem with regard to the SDEIS, but the drafters of the FEIS appear to have entirely ignored my comment because no changes or corrections have been made. The problem is that someone reviewing Table 4.2.2-4 would mistakenly conclude that the number of samples with detectable levels of mercury was very, very low. This presentation of the data is profoundly misleading, because in fact almost all of those non-detects came from analysis that had very high minimum detection levels. A person reviewing Table 4.2.2-4 is likely to be misinformed about the data, and reach the erroneous conclusion that almost all of the samples at the ten sample locations were below a modern detection level of 0.5 ng/L.	S	N
29801	Unique			MERC	Daniel Pauly		4184	19	the mercury modelling for the Tailings Basin mercury data should be recalculated to include data from all four surface discharge locations at the Tailings Basin site.	NS	X
29801	Unique			MERC	Daniel Pauly		4185	20	A comprehensive review of Tailings Basin surface discharges confirms that mercury discharges are likely to be above Great Lakes standards, and also confirms that SD004 is not a representative of Tailings Basin seepage.	NS	X
29801	Unique			MERC	Daniel Pauly		4186	22	Different conclusions on mercury concentrations at SD004 in the DEIS and FEIS reveal the problem of over reliance on a narrow subset of discharge data: The over-reliance on just a small set of data points, especially from just one or two locations at the Tailings Basin, is problematic because a change in just a couple of samples can completely change the results, and lead to completely different actions. A good example of this statistical phenomena can be demonstrated by looking at how NPDES surface discharge SD004 lead to completely different conclusions between the DEIS and the FEIS. Reproduced below are Table 4.1.31 from the original DEIS, and Table 4.2.2-4 from the FEIS. These two tables show the same datasets for 11 sample locations at the Tailings Basin. Note that almost every location has very similar results between the DEIS and FEIS (with the exception of some errors in the FEIS, mentioned earlier). The one exception to this consistency is SD004, where the mean has gone from 1.9 ng/L from 15 samples in the DEIS, to a mean of 1.2 from 14 samples in the FEIS. I highlighted in red the DEIS data for SD004, which is above the Great Lakes Initiative level; and highlighted in green the FEIS data for SD004, which is below the Great Lakes Initiative level. How can the averages be so radically different? It appears, from the limited data I was able to independently obtain from the Minnesota Pollution Control Agency, that one or two of the samples in the DEIS was considered to be erroneous, and corrected in the FEIS.	NS	X
29801	Unique			MERC	Daniel Pauly		4187	23	As noted elsewhere in these comments, the FEIS reaches incorrect conclusions about mercury seepage from the Tailings Basin. Generally those incorrect conclusions can be traced to improper “cherry picking” of sample locations, as well as errors in calculations.	NS	X
29801	Unique			MERC	Daniel Pauly		4188	24	As explained at page 4-126 of the FEIS, the assessment summarized on Table 4.2.2-23 is useful to show the effect of passage of water seeping through the Tailings Basin. The first paragraph of Page 4-111 states as follows: Comparing existing pond water quality with water quality at the toe of the Tailings Basin helps define the effect passage through the existing LTVSMC tailings has on seepage water quality. Based on the parameters that were monitored in the Cell 2E pond, it appears that passage through the LTVSMC tailings reduces the average concentrations of arsenic, fluoride, and molybdenum, although it is difficult to determine to what extent these reductions are simply attributable to the effects of dilution. The concentrations of several other parameters, such as calcium, manganese, nickel, and TDS, increase as they seep from the tailings pond to the toe of the Tailings Basin. The preparers of the FEIS commented on how calcium, TDS, and manganese all increased when passing through the Tailings Basin; and how fluoride, arsenic, and molybdenum go down. However, there is no mention or analysis whatsoever of the most significant data point: mercury has gone from 1.4 ng/L in pond water to 4.9 ng/L after passing through the Tailings Basin.2 I have highlighted these respective contaminants in yellow, green and red. These results should considered in the FEIS, because they directly conflict with the conclusions that mercury is not a contaminant of concern at the NorthMet Tailings Basin.	S	N
29801	Unique			MERC	Daniel Pauly		4189	25	The FEIS relies upon a faulty mercury sequestration test that predicts remarkably low mercury levels in Tailings Basin seepage, while ignoring a superior test that does not predict significant sequestration. At numerous points in the FEIS and supporting documents, reference is made to a bench study conducted by NTS in 2006 that purports to show “[T]he concentration of dissolved mercury in a treatment flask containing process water and NorthMet tailings decreased from 3.3 ng/L to 0.9 ng/L over an eight hour period.” FEIS at page 5-229, As discussed below, this test had obvious flaws and glaring mischaracterization of the collected data. In contrast, the FEIS entirely fails to even mention that a second carefully designed mercury sequestration test was performed. This test concluded that there was no observable diminishment when mercury-laden water passed through the simulated LTV/NorthMet tailings combination. If anything, the test showed a slight increase in mercury levels. This thorough study, despite having tremendous potential to quantify likely mercury discharges from the combined Tailings Basin, is never so much as mentioned at any point in the FEIS itself. This is a situation where a very low-quality test with favorable results was prominently presented in the FEIS, while a high-quality test with unfavorable results was not even mentioned. In view of the fact that mercury is the most serious contaminant in the St. Louis River watershed to public health, the basis of this important research warrants further examination. The tests are also important because the level at which the Tailings Basin discharges mercury affects numerous other conclusions and design choices, in particular a large number of alternatives that should be considered if mercury will be leaching from the NorthMet Tailings at levels above 1.3 ng/L.	S	N
29801	Unique			MERC	Daniel Pauly		4190	26	6.3 The SRK test that showed no mercury sequestration should have been included in the FEIS, because it is on its face far more probative than the NTS eight hour test. The NorthMet FEIS asserts that one of the fundamental long-term mechanisms for mercury control at the NorthMet Tailings Basin is removal of mercury by the pre-existing LTV taconite tailings. This mechanism is relied upon repeatedly in the FEIS itself, as well as the supporting documents. This mechanism was also proposed in the original DEIS, but was objected to as lacking scientific integrity by the EPA, which requested that further analysis be provided to support this mercury removal mechanism. See page 11 of the “EPA Detailed Comments to the NorthMet Project DEIS”. Despite the EPA’s express request for further support of this theory, the FEIS fails to provide further support, and merely restates the previously challenged analysis. To correct this deficiency, the FEIS should address why preparers believe the 8 hour shake test is a better predictor of long term tailings basin mercury sequestration than the year-long column testing.	S	N
29801	Unique			MERC	Daniel Pauly		4191	27	The site-specific sampling of mercury at the Tailings Basin is consistent with prior taconite tailings seepage research At various points in the FEIS, reference is made to prior research by Minnesota Department of Natural Resources scientist Michael Berndt that looked at mercury releases from mining operations in Minnesota, including from stack emissions and tailings basin seepage. The FEIS relies especially on a 2003 paper by Mr. Berndt entitled “Mercury and Mining in Minnesota”, submitted as a final report to the Minerals Coordinating Committee in June of 2003, and revised in October of 2013. FEIS reference Berndt 2003. As discussed below, the interpretation that NorthMet Tailings Basin seepage will be above Great Lakes Initiative standards is consistent with the data and conclusions of the 2003 report.	NS	X
29801	Unique			MERC	Daniel Pauly		4192	28	Even if the NorthMet Tailings Basin reduces the concentration of mercury in the seepage, that seepage can still exceed Great Lakes Initiative standards, and would still be in violation of the Great Lakes Initiative levels. There is discussion in the FEIS that the Tailings Basin mercury discharges will not be an issue because the discharge concentrations will still be less than the levels in either precipitation or the tailings basin pond water. This statement seems to apply that reduction in mercury levels in the Tailings Basin is sufficient, as opposed to actually meeting the Great Lakes Initiative requirements.	S	O

29801	Unique			MERC	Daniel Pauly		4193	29	Even if the Tailings Basin mercury concentrations are reduced relative to influent, the increased flow of water through the Tailings Basin will significantly increase total mercury discharges. The NorthMet Tailings Basin is expected to have at least twice as much seepage water discharged during operations than is currently seeping from the Tailings Basin. Even if one assumes the concentration of mercury in the Tailings Basin seepage will not change, the total mass of mercury discharged will be significantly increased, likely by double or more.	S	O
29801	Unique			MERC	Daniel Pauly		4199	38	In view of the foregoing comments with regard to mercury contamination, statements made in the NorthMet FEIS that the Tailings Basin is expected to discharge mercury at levels below Great Lakes Standards should be removed from the FEIS. The following statements, among others, should be modified as below (or in accordance with alternative language that is accurate): 10.1 At ES-36, in the Executive Summary, edit as follows, or with other language to make the statement accurate and complete (this same point was raised in my SDEIS comments, but was not adopted): Mercury is another constituent of concern, primarily because many of the lakes and rivers in the area are currently classified as “impaired waters” by the MPCA due to elevated mercury content in fish tissue. The NorthMet Project Proposed Action is located within the Lake Superior Basin and would be subject to the Great Lakes Initiative (GLI) mercury discharge standard of 1.3 nanograms per liter (ng/L). . . . The mercury concentration in seepage from the Tailings Basin is anticipated to be above below the GLI standard. . . . 10.2 At Page 5-10 of the EIS, edit as follows or with other language to make the statement accurate and complete, and follow up with review of Tailings Basin alternatives in view of this correction (this same point was raised in my SDEIS comments, but was not adopted): There would also be mercury in the tailings, although about 92 percent of the mercury in the ore is predicted to remain in the ore concentrate. However, and the mercury concentration in seepage from the Tailings Basin is expected to be greater than less than the standard. 10.3 At page 5-230 of the EIS, edit as follows or with other language to make the statement accurate and complete, and follow up with review of Tailings Basin alternatives in view of this correction (this same point was raised in my SDEIS comments, but was not adopted): Therefore, the total mercury concentration in seepage from the Tailings Basin is expected to be greater than less than the Great Lakes Initiative standard of 1.3 ng/L.	S	N
29801	Unique			MERC	Daniel Pauly		4200	39	The underestimation of mercury contamination in Tailings Basin seepage water resulted in design and testing of a WWTP that has no demonstrated ability to economically remove mercury from the seepage water. In 2012 PolyMet’s consultants undertook a pilot test with the objective of demonstrating that the WWTP can collect sufficient information to demonstrate that a cluster of technologies, focused on reverse osmosis (RO), can demonstrate reliable satisfaction of water quality objectives, support the design of the WWTP, refine capital and operating costs, and support performance guarantees and system warranties. As discussed below, the Pilot Test should have addressed all four of these objectives as it relates to mercury, but unfortunately the Pilot Test failed to provide even a rudimentary test and analysis of mercury removal.	S	N
29801	Unique			MERC	Daniel Pauly		4201	41	Mercury contamination is highly dependent upon species, and PolyMet’s own vendor states that methylmercury cannot be removed across an RO membrane. Methyl mercury is, far and away, the most dangerous form of mercury. It is the form that is most bio-available, and most likely to accumulate in the tissue of fish and infant humans. According to the best information assembled by PolyMet, the WWTP as designed will not remove methylmercury. Instead it will simply be going out with the discharge water, where it will be part of the “makeup” water directed into the Embarrass River. Most disturbing about this issue is the fact that if the WWTP selectively removes colloidal or particulate mercury (as at least one reference predicts), then what will be left will be the methylmercury, which won’t be removed. The result is the potential for technical satisfaction of the Great Lakes Initiative standard of 1.3 ng/L of mercury in WWTP discharges, while having this 1.3 ng/L of mercury be disproportionately methylmercury. Under such a scenario the WWTP will be in compliance with regulatory standards while actually discharging the most toxic form of mercury in abundance.	S	N
29801	Unique			MERC	Daniel Pauly		4202	42	The RO membranes that best remove mercury also have unacceptably low system recovery rates. A Supplemental Comprehensive WWTP Pilot Test is also necessary because PolyMet’s own literature review shows that even if an RO membrane can remove mercury, it may not do it with adequate system recovery. Specifically, the Final Pilot Testing Report includes Table 29, which shows a summary of Metals Removal Literature Review Summary. Note that mercury removal is reported to be greater than 98 percent in Reference 16, but the system recovery is just 50 percent, which means that only about half the water is recovered as permeate, with a very high volume of high-mercury retentate. Even this is measured only using a pilot level test. These issues, such as rejection rate and system recovery are non-trivial, and can dramatically impact long term performance and cost of mercury removal. For example, if system recover rates are low, a two-phase system might be needed, which would significantly increase capital and operating costs. Alternatively, it may be necessary to have different systems for mercury removal and sulfate removal if a single treatment system cannot be found that adequately removes both contaminants. In summary, we simply do not have enough information to evaluate a multi-century waste water treatment plant, either from a technical or financial point of view. A comprehensive pilot test should be performed, and it should be directed both to technical viability, as well as financial predictions. In view of the known seasonal variations in contaminant streams (see, e.g., report of Michael Berndt discussed below, showing large seasonal fluctuations in methyl mercury discharges at the toe of a taconite tailings basin), I recommend that such test run for at least from the start of one summer through the end of a following summer.	S	N
29801	Unique			MERC	Daniel Pauly		4205	45	The FEIS incorrectly states that the Pilot-testing has indicated that treated effluent from the Plant Site would meet water quality standards for all regulated constituents. As discussed above, the WWTP Pilot Test did not determine whether mercury would be removed by the WWTP. The FEIS should be updated to reflect this fact. A partial list of suggestions is provided below: 14.1 Table 5.2.2-29 should be modified to include mercury as a target. Table 5.2.2-28 provides the WWTF preliminary water quality targets. Mercury is not included but should have been included. After mercury is added as a target effluent, design of the WWTF should be evaluated for mercury removal, and a review should be made of FEIS analysis and conclusions that presumed mercury did not need a WWTF water quality target. This review should include evaluation of alternatives that were prematurely eliminated. 14.2 Page 5-147 should be modified to clarify that mercury removal was not tested in the pilot plant. Suitable language could include: “Table 5.2.2-29 presents the target WWTF effluent concentrations for the different mine phases. Pilot-testing of a WWTF with RO demonstrated that all of the target closure effluent concentrations could be achieved with the planned WWTF design, with the possible exception of mercury, for which no pilot testing has been undertaken and for which significant disagreements exist on viability of removal by RO processes.” 14.3 Page 5-226 of the FEIS should be amended to include statements from the Pilot Plant Test that removal of mercury using RO technology is uncertain. Potential language to consider is: “It should be noted that the West Pit overflow would be treated by the WWTF using RO technology prior to discharge, and the RO process is known to remove mercury. However, as indicated in the Pilot Test Report, there are disagreements in the literature about how much mercury can be removed, and the most dangerous form of mercury (methylmercury) has been reported as unremovable using RO methods.” 14.4 Table 5.2.2-51 should be modified to provide correct information of estimated mercury concentration of the combined inflows to the Plant Site WWTP. Table 5.2.2-51 describes Mercury Concentration from Tailings Basin seepage water and Runoff (not interacting with tailings) to be 1.0 ng/L, which is below Great Lakes standard levels. In fact, mercury levels for these two sources will likely be higher than these estimated levels. NorthMet FEIS Comment – Daniel Pauly – Page 42. Correcting this error is essential because these two sources of inflows are expected to account for over 80 percent of the water inflows into the WWTP, and will impact feasibility and design of the WWTP, as well as long term costs to operate the WWTP.	S	N
29801	Unique			MERC	Daniel Pauly		4207	47	Wetlands have been known for some time to be prime locations for methylation of mercury from its inorganic form to its far more hazardous organic methylmercury form. Recent research in Minnesota has shown that some of the highest methylmercury levels ever recorded have been observed in restored wetlands. In addition, recent Minnesota DNR research at tailings basins has shown that seepage water from tailings basins has particularly high methylmercury concentrations during seasons of heightened biological activity. As discussed below, the proposed Tailings Basin capture system has the potential to create very high levels of methylmercury. Once created, the methylmercury will be able to exit the capture area either by 1) biological transport into the Embarrass River watershed, or 2) passing through the Waste Water Treatment Plant, which has not been designed or tested to remove it.	NS	X
29801	Unique			MERC	Daniel Pauly		4209	50	Recent DNR research also shows that taconite tailings basins can have particularly high methylmercury releases that coincide with times of greatest biological activity in wetlands. This research should be considered in evaluating impact of wetlands positioned between the Tailings Basin and containment system drain pipe. Another very serious issue as it relates to methylmercury releases is that recent MNDR research shows that discharges from a taconite tailings basin had a seasonal spike in methylmercury discharges during the summer months when most wetland biological activity occurs. This research is compiled in “Sulfate and Mercury Cycling in Five Wetlands and a Lake Receiving Sulfate from Taconite Mines in Northeastern Minnesota”, Berndt and Bavin, 2011. Reproduced below is a portion of Figure 9 of Berndt and Bavin, showing the seasonal changes in total mercury and methylmercury from May to October. The excerpt above shows how total mercury was essentially constant from May to October, but the amount of methylmercury increased significantly during summer months. It is not clear if more methylmercury is being produced during the summer months, or if it is simply being released in greater quantities, but this increase should be of great concern to anyone proposing a Tailings Basin perimeter wetland. Should this effect also hold true at the NorthMet Tailings Basin, levels of methylmercury must be contemplated, especially during summer months. A further concern raised in Berndt and Bavin with regard to the examined wetland, at a taconite tailings basin toe similar to the NorthMet Tailings Basin, is that the mechanism for the increases in methylmercury are not obvious nor necessarily fully understood. Berndt and Bavin at page 13. It may be that increases in sulfate reduction in summer months lead to accelerated methylmercury production. It appeared that the methylmercury increased across a backdrop of continuous amounts of sulfate reduction and DOC release. In evaluating the containment system as proposed, evaluation of increased methyl mercury loading should be evaluated. Inquiry should be made to assess how much of the methylmercury can be expected to bioaccumulate in organisms in the wetland and how much will go to the WWTP. Based on Figure 4, above, it would appear that most seepage from the toe of the Tailings Basin will be delivered to the wetlands. This is of great concern because summer is the time of greatest biological activity, and the time when greatest bio absorption can be inferred to occur.	S	N

29801	Unique			MERC	Daniel Pauly		4210	51	This methylmercury is likely to be transported out of the containment system wetlands by biological activity. That which remains and is captured, will go to the WWTP where no plans have been made for it to be captured and removed. One potential major impact of the newly proposed containment system is that in addition to creating a large wetland where methylmercury can accumulate and form, the wetland will provide a biological pathway for transport of the methylmercury to the Embarrass River watershed and then into the St. Louis River. Current research (available from the comment author upon request) shows that everything from mosquitos to earthworms can accumulate methyl mercury in high doses. These simple life forms will likely either simply fly out of the containment system (in the case of insects) or be consumed by other mobile organisms (such as great blue herons, egrets, pipers, gulls, ducks, raccoons, etc.) that will allow transport of the mercury up the food chain in the Embarrass River watershed, where it will eventually accumulate in fish and humans. Whereas this avenue of transport totally avoids the drainage pipe collection system and the WWTP, it is a problem for which no solution has been proposed. Note that with 78 percent of mercury being delivered to the wetlands, along with potential methyl mercury spikes that are known to occur at taconite tailings basins, the potential for this bioaccumulation is significant. It is also likely to continue for hundreds, if not thousands of years, and will be far greater than would occur with the lower water flows of the No Action Alternative or the other Tailings Basin alternatives discussed below.	S	N
29801	Unique			MERC	Daniel Pauly		4212	53	The failure of the FEIS to consider non-compliant mercury discharges resulted in improper elimination of alternative tailing basin covers during the ERM process. In December, 2010 the ERM presented recommended alternatives for the NorthMet Mine Tailings Basin Cover Options, including both an evaluation and recommendation. In that 12/2010 report the ERM stated, correctly, that: The Tailings Basin cover system is a very important environmental component of the overall NorthMet Project At least some seepage is expected to occur long term (e.g. centuries) from the Tailings Basin after closure, so the quality of that seepage is of critical importance and will largely determine the need for long-term operation, maintenance, and/or treatment. (ERM at Page 1, emphasis added) The report then states, incorrectly, that: Based on the analysis of the DEIS, the current PolyMet Proposal (i.e. referred to as the Tailings Basin Alternative in the DEIS) was predicted to generally meet groundwater standards with the primary exception of sulfate. . . . [but] no long-term operation, maintenance, or treatment would be needed for the Tailings Basin as currently modeled for any other parameter because they are predicted to meet groundwater standards. (ERM at page 17). The ERM report subsequently evaluated five different alternatives on the basis of sulfate loads, with no mention or consideration of potential for mercury release from the Tailings Basin. In fact, this key planning document discusses sulfate 50 times on its 22 pages, but not once does the word mercury even appear. This is a prime example of why the NorthMet Project should be reevaluated to consider alternatives that will satisfy the NEPA and MEPA screening requirement for mercury. In this case, the NorthMet Project has identified the criticality of the Tailings Basin cover to groundwater seepage, but FEIS entirely disregards likely mercury impacts, even though mercury release is the single biggest threat of public health from the NorthMet Project.	S	O
29164	Unique			MERC	Deborah Huskins		3601	7	The FEIS states that, throughout the duration of the project, measures would be taken to eliminate or reduce the effects on the environment. Mercury contamination can be generated by other sources far away, including activities even thousands of miles away. Increases from these other sources should be anticipated as reasonably foreseeable. Polymet’s proposed measures should be evaluated not in isolation, but assuming that they should be sufficient to counteract the effects of the totality of mercury contamination.	S	N
23255	Unique			MERC	Dennis Szymialis		916	12	Finally, it is arbitrary and capricious for the FEIS to consider the dilution effect without analyzing the counteracting concentration of arsenic and other contaminants through evaporation along with the cumulative effects of combining the contaminants with existing concentrations on consumers downstream.	S	O
23255	Unique			MERC	Dennis Szymialis		919	15	Count Ten The cooperating agencies are arbitrary and capricious in failing to disclose in the FEIS the mercury that will be made air bound by the blasting at the mine sight. Blasting will cause mercury to become monatomic or shattered into single atoms into the atmosphere. This is a hard concept to conceptualize accept one can think of it as breaking thousands of fluorescent light bulbs hundreds of feet in the air daily. The addition of the mercury is dispersed but is nonetheless added to the environment and is a violation of the Great Lakes Compact. This phenomena is the only available explanation for ten percent of Lake Superior north shore having toxic levels of mercury in them. The mercury is being carried from taconite mine blasting with prevailing winds and is breathed directly, consumed in the water or from methylization in fish consumed. This monatomic atomization of is 'likely to occur with other toxic heavy metals like Arsenic and nickel that are prone to ionization.	S	O
27685	Unique			MERC	Dennis Szymialis		1855	10	Count Ten The cooperating agencies are arbitrary and capricious in failing to disclose in the FEIS the mercury that will be made air bound by the blasting at the mine sight. Blasting will cause mercury to become monatomic or shattered into single atoms into the atmosphere. This is a hard concept to conceptualize accept one can think of it as breaking thousands of fluorescent light bulbs hundreds of feet in the air daily. The addition of the mercury is dispersed but is nonetheless added to the environment and is a violation of the Great Lakes Compact. This phenomena is the only available explanation for ten percent of Lake Superior north shore having toxic levels of mercury in them. 27685	Unique			MERC	Dennis Szymialis		1881	36	One challenge that I would make here is that the iron tailings do not sequester mercury any better than any other soil. Elemental mercury is currently not leaching out of the tailings basin because lower levels have had the mercury scoured out through the introduction of sulfates running through them. Mercury is at higher than normal environmental levels in the surface areas of the tailings basin as a result of the absence of sulfates. Once the sulfates are again introduced at the top this mercury will methylate and flow out at higher levels than normal. Water discharge through the lower levels with sulfates will be redirected through the basin increasing the release of methylated mercury currently unexposed in the basin formation at these lower levels. My conclusions are based on studies that I have read on the relationships between sulfates and mercury methylation, DNR studies by Bavin and Berndt and ali other studies, common sense, and not any self serving and deceptive computer modeling. The claim made on p. ES-36 that somehow the mere presence of the PolyMet mine is going to reduce mercury in the Partridge river is simply bizarre and more unexplained hocus pocus.	S	O
27685	Unique			MERC	Dennis Szymialis		1989	148	again, taconite tailings WILL adsorb elemental mercury just like any other solid solution but once methylated adsorption is no longer effective and The addition of sulfates negates any adsorption. mercury in higher than natural amounts WILL be reactivated by The introduction of sulfates which HAS been shown in studies conducted in Sweden, Canada and The U.S. PolyMet and their co-lead agency employees want to self-servingly disregard The established science.	S	O
27685	Unique			MERC	Dennis Szymialis		1990	149	the effect of DEIS changes including containment systems won't work as previously indicated. -the results of the Savin and Berndt study is misrepresented. The study actually indicated that higher sulfate levels eventually dilute, travel downstream and methylate mercury. An honest reading of the study indicates that there is a correlation between the amount of sulfate in the stream and the amount of mercury that is methylated as the mercury is projected downstream. The methylmercury and its concentration is real as is indicated by bioaccumulation in fish downstream.	S	O
27685	Unique			MERC	Dennis Szymialis		1991	150	-because the Embarrass River system is more than double the size of the Partridge River system the 3% increase in the Embarrass and the 5% increase in the Partridge will result in a net increase in mercury.	S	O
27685	Unique			MERC	Dennis Szymialis		1993	145	mercury concentrations in reactive waste rock WILL be much higher. in this rock stratification WILL occur with sulfide eroded mercury methylizing in solution and stratifying. Results shown in lab testing WILL not carry over into natural conditions and are not applicable.	S	O
27685	Unique			MERC	Dennis Szymialis		2031	186	Mercury levels will exceed current levels in the Partridge River and Embarrass River. Embarrass River mercury increases will be more pronounced because of higher mercury levels in augmentation water from Colby Lake that will need to be used because of low estimates in ground flow as the result of a failure to account for drainage pipes running from the tailings basin drainage area to the Embarrass River, because of planned augmentation in years 20-40, and for other reasons previously given in these comments.	S	O
27685	Unique			MERC	Dennis Szymialis		2063	218	PolyMet will violate the Clean Water Act which will diminish the quality of other water uses in the State of Wisconsin along with the quality and quantity of resources such as wild rice and fish which will absorb harmful to human health heavy metals like mercury and arsenic.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4045	106	Our comments on the SDEIS raised a number of issues related to mercury in leachate from mine features, and its potential discharge to surface water through groundwater transport. We also commented on mercury in air deposition and wastewater discharges. These issues affect wetlands, the Partridge River, and the Embarrass River and its tributary streams.255 In addition, we attach and incorporate comments on the SDEIS by Daniel Pauly, who is a board member of Friends of the Boundary Waters Wilderness. Many of our points were ignored in the Response to Comments and the FEIS, in violation of CEQ NEPA regulations.256 The following discussion addresses a few of the most important issues, but should not be taken to indicate that issues not repeated here are no longer of concern. All of the points regarding mercury raised in the above-referenced comments remain an issue.	NS	X

29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4046	107	We pointed out in our SDEIS comments that the air deposition analysis fails to quantify the amount of mercury that will be deposited in the Embarrass and Partridge Rivers from air emissions, despite the obvious availability of this information. This point is reiterated by Keith Gadway in his expert report submitted with the current comments. The FEIS reports on the change in mass loading of mercury in the Embarrass and Partridge Rivers, but does not include the load from air deposition, which misinforms readers. The Response to Comments states “The increase [from air deposition] would not be expected to have any appreciable effect on the loading estimates from permitted discharges to the Embarrass River, Partridge River, or the lower St. Louis River.”257 As far as we can tell, this is simply untrue. According to the FEIS, the “loading estimates from permitted discharges” are an increase of 0.2 grams per year to the Embarrass River,258 and a decrease of 1.2 grams per year to the Partridge River.259 In contrast, the deposition analysis indicates that the increased load from air emissions from the NorthMet Project would be between 5.88 and 21.06 grams per year to the Embarrass River (upstream of Sabin Lake), and between 4.62 and 16.35 grams per year to the Partridge River (upstream of Colby Lake).260 If the estimates for the watershed of these two lakes do not reflect the load to the upstream rivers, please explain why in the NEPA document.261 If they do reflect the load to the upstream rivers, it is impossible to reconcile the numbers with the words “no appreciable effect.”	S	N
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4047	108	The Response to Comments also misrepresents the air deposition analysis as having been done by MPCA.262 The analysis was actually performed by Barr Engineering on behalf of PolyMet.	NS	X
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4048	109	The FEIS also fails to quantify mercury discharging to surface water through groundwater. We pointed out in our comments on the SDEIS that methods are available to model mercury transport to surface water through groundwater. The EPA suggested one such method in its comment letter of March 13, 2015: “If GoldSim is not suitable to model this pollutant, elemental mercury can be modeled using a different water quality model, such as the Water Quality Analysis Simulation Program (WASP), which is commonly used by EPA to model elemental mercury.” Keith Gadway suggests another: “Simplified mercury modeling for point concentrations are available in MINTEQ to evaluate chemical equilibrium and, when coupled with a transport model such as MODFLOW, can provide useful data.” In SDEIS comments, CBD submitted an example of groundwater mercury transport modeling that was done for a mine in Michigan. The FEIS and Response to Comments do not explain why none of these methods were used.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4049	110	The FEIS takes the position that the mass balance studies are an adequate substitute for modeling. But the West Pit mass balance study does not account for the mercury that will escape from mine features through groundwater.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4050	111	The mass balance treats that mercury as being collected and settling out in the West Pit or tailings basin, which is erroneous. The Response to Comments ignores this point, and simply reiterates that the mass balance study was done to characterize mercury releases.	NS	X
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4051	112	It is possible that the greatest source of mercury to the Partridge River from groundwater transport from mine features would be the Overburden Storage and Laydown Area (OSLA). A large volume of peat will be excavated and stored in this area; as pointed out in Keith Gadway’s report, peat is known to sequester mercury and to release it when excavated and exposed to wetting and drying. In addition, the OSLA will be unlined, and a larger volume of groundwater will enter the river from this source than from any other mine feature. Furthermore, mercury from this source will enter the river prior to the time that the Waste Water Treatment Facility (WWTF) begins discharging treated water to the river (which is expected to dilute concentrations of pollutants that enter from the groundwater flowpaths). Discharge of mercury from this source will occur prior to the time of the predicted decrease of 1.2 grams per year in mercury load. While several “Theme Statements” in the Response to Comments point this out, the responses never address it. The response to MERC 20 is typical. The discussion only mentions water that is routed to Pond PW-OSLA, which is routed from there to the Tailings Basin or mine pits. Release to groundwater from either the OSLA itself or from the pond is completely ignored.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4052	115	All of these issues are of critical importance in regard to the mercury levels in influent to the WWTF and Waste Water Treatment Plant (WWTP). Pilot testing of the RO system did not include treatment for mercury, and the level at which the systems will remove mercury is simply unknown.268 The FEIS assumption that the WWTF and WWTP will be able to achieve a 1.3 ng/L mercury concentration in effluent appears to be based on projections that influent will be below at or below that level.269 Although the FEIS states several times that RO technology is “known to remove mercury,”270 the FEIS treats the level of removal as essentially irrelevant, because the analysis has already been manipulated to indicate that the influent will meet the water quality standard. Before this project is permitted, the agencies must correct errors and base mercury levels in influent on scientifically acceptable evidence, followed by a scientifically sound analysis of the mercury removal capabilities of the treatment systems.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4053	116	We note that the mercury removal efficiencies in literature cited in the Pilot Testing Report will not necessarily transfer to the treatment of influent from the NorthMet project. Removal of mercury at very low levels to meet the 1.3 ng/L standard is notoriously difficult, far more difficult than (for instance) achieving 99.9 percent reduction for an influent of 6 ug/L mercury, which still leaves the effluent significantly above the 1.3 ng/L standard.	NS	X
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4055	118	Furthermore, adaptive management cannot be used as a means to avoid the necessity of providing a scientifically defensible analysis of mercury levels in the waste water treatment influent and effluent. Regulatory agencies cannot simply accept PolyMet’s optimistic belief about influent mercury levels and wait until the WWTF and WWTP are built to test the effluent to find out if it needs additional treatment. At that point, several years of discharges at above the water quality standard are likely to have happened, discharges that would not have been permitted had they been properly assessed before the mine was built.	S	O
29745	Unique			MERC	Erin Mittag	Minnesota Center for Environmental Advocacy	4061	123	The NorthMet project will also increase sulfate levels in wetlands, which may plan an even greater role in increased mercury methylation. We note that the FEIS added an analysis indicating a potential increase in sulfate levels in wetlands from air deposition alone at 1.7 mg/L, after dilution from precipitation. While the FEIS treats this as negligible, it is actually quite a substantial addition to wetland waters. We were unable to find any baseline information about water quality in the wetlands at the NorthMet site, and our understanding is that there is none. The “background” sulfate level in surface water in Minnesota is often estimated at 3.0 mg/L or below; we assume this is an approximate level for wetlands at the mine site at least. If so, increases from air deposition alone would be as high as 50 percent. Although MPCA estimates that any waters with a current sulfate level above 40 mg/L are “high risk” waters for increased mercury methylation, this does not mean that sulfate does not significantly increase methylation of mercury at much lower levels. Increasing sulfates from 3.0 to 4.7 mg/L in wetlands would be expected to significantly increase mercury methylation. Note that even with similarly low levels of sulfates in most northern Minnesota waters, we have a dire situation in regards to mercury in fish tissue. Small increases in both mercury and sulfate in the water of extensive wetland areas are virtually certain to increase mercury methylation, and to lead to increased mercury levels in fish tissue and in fish-eating wildlife. Methylmercury is known to build to high levels in this situation, flushing out to area streams and lakes with snowmelt or floods. This phenomenon is expected to increase in Minnesota with global warming. The increases in mercury and sulfate that can be expected from the proposed project are likely to result in significant impacts, and thus must be properly assessed in the FEIS; monitoring cannot take the place of this assessment.	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3516	19	The Embarrass River, Wyman Creek, Whiteface Reservoir, Stony Creek, West Two River, numerous lakes, and the entire St. Louis River all have mercury-based fish consumption advisories. The FEIS does not accurately account for the impacts of increased mercury loadings on subsistence fishing. Furthermore, increased sulfate concentrations increase methylation rates and bioaccumulation of methylmercury. See Mercury section for additional detail.	NS	X
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3528	44	In addition, a mass balance approach is not the most appropriate mechanism for predicting mercury loadings to the Partridge and Embarrass Rivers, and ultimately the St. Louis River. The FEIS did not include mercury in the GoldSim model as it did for other models, citing an insufficient data and a lack of understanding of mercury dynamics. No reasonable attempt was made to model the impacts of mercury due to the NorthMet Project, even though other applicable models exist and should have been implemented. The adherence of the Project to applicable mercury water quality standards cannot be adequately determined without such modeling data.	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3529	49	The FEIS limits its analysis of methylmercury to simple proportionality to total mercury, without considering other factors that affect mercury methylation, incorrectly claiming that the factors and mechanisms affecting methylation are poorly understood. In fact, many factors affecting mercury methylation are known (e.g. sulfate concentration, type and activity of methylating bacteria, pH, organic matter, dissolved oxygen, etc.) and models exist for predicting mercury methylation.	S	O

28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3534	33	The assessment of mercury and methylmercury impacts that would result from the proposed NorthMet project is not adequate. Cooperating tribes and intertribal agencies have raised mercury and methylmercury as concerns since the pre-draft environmental impact statement review of 2008. Methylmercury is a bioaccumulative neurotoxin that disproportionately impacts tribal populations that depend on fish for a subsistence diet. While the FEIS mentions this issue, the co-lead agencies have refused requests to properly characterize the additional influx of methylmercury to the St. Louis River as a result of wetland and saturated overburden excavations at the mine site. Predicted mercury loadings as a result of the NorthMet Project continue to constitute a Major Difference of Opinion (MDO) between the Co-lead and Tribal Cooperating Agencies. Again, the co-lead agencies have not been receptive to tribal input and thus the issue remains. The FEIS states that, based on mercury mass balance analyses, the NorthMet Project would result in a net increase in mercury loadings to the Embarrass River of 0.2 g/year (from 22.3 to 22.5 g/year), which would be offset by a 1.2 g/year net decrease in mercury loadings to the Partridge River (from 24.2 to 23.0 g/year), resulting in a combined overall decrease in mercury loading to the St. Louis River of 1.0 g/year. We disagree with the treatment of mercury in the FEIS and the resulting conclusions in three fundamental ways. In contrast to what is laid out in the FEIS, it is our expert opinion that: I. Increased mercury loadings to the Embarrass River may not be permissible. A net decrease in mercury loadings to the St. Louis River does not justify or make acceptable the increased mercury loadings to Embarrass River. II. The mass balance analyses that lead to the conclusion that mercury loadings will not increase in the St. Louis River are flawed in numerous ways. Mercury loadings to the St. Louis River are in fact likely to increase as a result of the NorthMet Project. III. While mercury loadings to the Partridge, Embarrass, and St. Louis Rivers are discussed, there is no adequate consideration of the fact that more of the mercury entering these systems will be in the form of methyl, rather than inorganic, mercury. This has the potential to greatly impact fish tissue mercury in these systems and the subsequent risk to fish consumers, both human and wildlife. Each of these three points is explained, in brief, below. I. Increased Mercury Loadings to the Embarrass River are not Legally Permittable. The Embarrass River flows through a chain of lakes including Wynn, Sabin, Embarrass, and Esquagama Lakes. Each of these lakes are on the 303(d) Impaired Waters List for mercury in fish tissue. In addition, Wynn and Sabin Lakes are on the proposed 2014 303(d) Impaired Waters list for mercury in the water column. According to the U.S. 9th Circuit Court of Appeals in the case of Friends of Pinto Creek vs. the U.S. EPA (“The Carlota Decision”), a new discharge that would further degrade waters with existing water quality impairments cannot be permitted. The decision further clarified that the Clean Water Act (“CWA”) does not have a provision that allows for “trades” in which increased pollutant discharges to one waterbody can be offset by decreases to another. Therefore it appears that under the CWA, a new source such as the NorthMet Project cannot discharge additional mercury to these mercury impaired waters. According to the FEIS, the NorthMet project would increase mercury loadings to the Embarrass River (which includes the lakes through which it passes) by 0.2 g/year (from 22.3 to 22.5 g/year). This does not appear, based on the Carlota Decision, to be permissible. Similarly, based on the Carlota Decision, it does not appear that the additional loading can be offset by decreases in mercury loadings to the Partridge River, as argued in the FEIS.	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3537	34	According to federal regulations [40 CFR 1502.16 (c)], a proposed action’s EIS must include a discussion of “possible conflicts between the proposed action and the objectives of federal, regional, state, and local land use plans, policies and controls for the area concerned.” It is further stated in 40 CFR 1506.2 (d) that “to better integrate environmental impact statements into state or local planning processes, statements shall discuss any inconsistency of a proposed action with any approved state or local plan and laws (whether or not federally sanctioned). Where an inconsistency exists, the statement should describe the extent to which the agency would reconcile its proposed action with the plan or law.” One such program with which the NorthMet Project is inconsistent is the Lake Superior Binational Program’s Zero Discharge Demonstration Program (ZDDP), as described in the Lake Superior Lakewide Management Plan (LaMP). The ZDDP established Lake Superior as a demonstration project to achieve zero discharge and zero emission of nine toxic, persistent, and bioaccumulative chemicals, including mercury, from within the Lake Superior basin by 2020. The LaMP Critical Contaminants Goal further states that “levels of persistent, bioaccumulative, and toxic chemicals should not impair beneficial uses of the natural resources of the Lake Superior basin.” The FEIS only mentions the ZDDP and the LaMP once, and only in Appendix A (A-405, Theme MERC 01; A-464 Theme PERM 27) in response to previous concerns raised about the failure to discuss the Project’s inconsistencies with these programs. The MERC 01 Thematic Response describes the ZDDP, but in no way discusses how the Project would address the fact that increased mercury loadings to the Embarrass River are in direct violation of the objectives of the ZDDP. Theme PERM 27 raises the concern that the Project is inconsistent with the LaMP, but the Thematic Response states only that, if permitted, the Project would be required to comply with applicable laws and regulations. There is no attempt in the FEIS to reconcile the proposed action with the objectives of LaMP and the ZDDP, as is required for an EIS under 40 CFR 1502.16 (c) and 40 CFR 1506.2 (d).	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3538	35	All surface waters within the Lake Superior basin, including all NorthMet Project area waters, are designated Outstanding International Resource Waters (OIRW) under Minnesota (MN) Administrative Rule 7050.0470. MN Rules 7052.0300 and 7052.0350 prohibit any new or expanded point source discharges of bioaccumulative substances of immediate concern (BSIC), including mercury, to any OIRW. Thus, under MN law, as under the federal law as described above, increased mercury loadings to the Embarrass River, or any other likely affected surface waters, do not appear to be permissible. All waters likely to be impacted by the NorthMet Project lie within the 1854 ceded territories. Several Chippewa tribes retain the right to hunt, fish, and gather throughout this territory, according to the 1854 Treaty of LaPointe. The federal government has a trust responsibility to the Bands to maintain these treaty resources. The fact that the NorthMet Project would increase mercury loadings to the Embarrass River and the chain of lakes through which it flows (Wynn Lake, Sabin Lake, Embarrass Lake), which are already listed on the 303(d) Impaired Waters list for mercury in fish tissue, represents an adverse impact to a critical trust resource and should not be permitted. Treaty fishing rights cannot be fully exercised when mercury contamination causes fish consumption to be restricted to protect human health.	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3539	36	II. Mercury Loadings to the St. Louis River are Likely to Increase as a Result of the NorthMet Project. The FEIS predicts that there will be a small decrease in mercury loadings to the Partridge River and thus an overall net decrease in mercury loadings to the St. Louis River, despite increased mercury loadings to the Embarrass River. In addition to the fact that a “tradeoff” between increased mercury loadings in the Embarrass River and decreased loadings in the Partridge River does not appear to be permissible (as described in Part I, above), critical flaws in the analysis of mercury in the FEIS have led to incorrect conclusions about mercury loadings from the NorthMet Project. It is likely the Project will actually result in a net increase in mercury loadings to the St. Louis River. Numerous critiques of the mercury mass balance analyses were submitted by GLIFWC staff and others as comments on the Project’s SDEIS and PFEIS. None of these concerns were addressed in the FEIS. Therefore, rather than detail each issue here, the main points are summarized. 1. The mass balance is based on flow estimates from flawed hydrologic models. A mass balance, by definition, relies on accurate estimations of concentration and flow. As a result, the accuracy of the predicted mercury loadings from the mass balance analyses is unreliable. See the hydrologic section for detail of the hydrology modeling issues that have been identified. 2. The mass balance at the plant site is dependent upon the assumption that the NorthMet tailings will adsorb mercury in a similar capacity as the existing LTVSMC tailings. This assumption is based on a 2006 bench top study conducted by Northeast Technical Services, Inc. (NTS). Study details can be found in Appendix B of FEIS reference “Barr 2007d.” This study is insufficient to predict the magnitude of mercury adsorption by the NorthMet tailings. The flask test was conducted over only an 8 hour period to model a centuries long process. There was only one sample with no replication and no attempt to mimic in situ conditions. Further, the study results were incorrectly interpreted, stating that after rapid initial adsorption, mercury levels remained stable throughout the experiment. In reality, the mercury concentrations in the water nearly doubled between hours 4 and 8, when the experiment was terminated, increasing from <0.5 to 0.9 ng/L. If this trend continued, the water would exceed the 1.3 ng/L GLI standard for mercury by hour 12.	S	N

28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3544	43	The FEIS further states that the mass balance estimates are conservative because waters will be further treated by reverse osmosis (RO) to remove additional mercury. According to FEIS reference “Barr 2013f”, mercury capture rates by RO are known to be as low as 22%. Further, the capture rate is highly dependent on the form of mercury, with only particulate mercury generally being captured. Capture efficiency for free mercury is much lower. The only available data for methylmercury shows that RO is not capable of removing methylmercury. The lack of data demonstrating the ability of a RO system to adequately remove mercury from captured water is inappropriately compensated for in the FEIS by a number of proposed adaptive management strategies for the RO system should it prove inadequate.	S	N
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3546	46	GLIFWC staff believes that total mercury loading to the St. Louis River is likely to increase as a result of the NorthMet Project, as described in Part II, above. In addition, we assert that the FEIS is deficient in its characterization of methylmercury. The methylmercury data presented in surface and groundwater is insufficient to describe the current conditions and methylating environment. As a result, the potential impacts the Project is likely to have on mercury methylation, such as from changes in sulfate concentrations, hydrology, and water quality are not easily assessed. It is our expert opinion that the Project will result in a higher percentage of mercury in the form of methylmercury in receiving and downstream waters which will result in increased mercury entering the aquatic food web and ultimately higher fish tissue mercury. If a higher percentage of total mercury is released in the form of methylmercury, changes in fish tissue mercury are not directly proportional to changes in total mercury loads, as stated in the FEIS.	S	O
28547	Unique			MERC	Esteban Chiriboga	GLIFWC	3547	47	The WWTP design, which utilizes reverse osmosis, is not only inefficient at removing non-particulate inorganic mercury, it is not capable of removing any methylmercury, as stated in the FEIS reference “Barr 2013f”. This is of particular concern because the seepage capture system isolates a portion of existing wetlands between the capture system and the basin that will receive most of the mercury coming from the tailings basin.	S	N
29965	Unique			MERC	Gary Glass		4235	3	The FEIS must be strengthened by selecting adequate samples to be representative of the solids proposed to be mined, and properly measured to provide credible results for the required assessments, and gathering more information relevant to existing acid mine drained landscapes in comparable environments. Mercury data for solids to be mined is very sparse and inadequate in the FEIS. The mercury content data for chemical reagents, especially sulfuric acid, proposed to be used in processing the ore and ore extracts are absent altogether. These and other data gaps when filled will give a more complete picture necessary for assessing and reducing the proposed project's impacts, including the fish-mercury hazard present in the adjacent and downstream waters.	S	O
29965	Unique			MERC	Gary Glass		4249	14	Mercury as a major "constituent of interest" is covered in four of the eleven bullets: Hazardous Air Pollutants, Mercury, mercury compounds (Hg), Metals/Metaloids, and Methylmercury. With this emphasis, however, the quality of the data presented to document and evaluate the impacts is majorly flawed and lacking. Sampling protocols providing adequate numbers of samples to represent 355 million tons are inadequate. Specific details of what has been done are incomplete, lacking documentation, lacking certified sample analysis, lacking normal reporting of quality assurance checks and controls, and are unacceptable for scientific use and administrative evaluation. Mercury as a major "constituent of interest" is not adequately addressed in any of the chapters, and must be corrected by producing adequate and sufficient data of known high quality using quality assured techniques and procedures.	S	O
29965	Unique			MERC	Gary Glass		4250	15	Modeling and mass inventory results in various chapters of this SD EIS are significantly flawed by the omission of mercury and mercury compounds, oxygen and anoxia, sulfide-metal complexes, hydrogen sulfide, and the resultant impacts in the mathematical modeling and inventory of all mercury- and sulfide- containing components. Mercury is one of the most studied elements and data are available for modeling in the same fashion that other metals of less know character are modeled. The use of the model output, however, is highly subjective and where actual field measurements are available, those field results should be used and relied upon more fully.	S	O
29965	Unique			MERC	Gary Glass		4251	16	Testing methodology for rock sample analysis appears to be flawed, preventing accurate results from being obtained due to inadequate quality control and quality assurance procedures, see SRK 2007b. The data set reported in Appendix D.4 pg 419 omits lines of data, reagent blank data omitted, and omits certified sample analysis data. Of the seven replicated samples, all pairs are identical in every reported parameter (chance happening >10 exp 6) all indicating inadequate and missing quality control and assurance. ICP-MS mercury analysis show 20 samples out of 92 have mercury at 1 ppm with the rest at < 1 ppm. These data have a mean of 0.6 ppm Hg using half the detection limit to represent the less than values. The mean is 0.22 ppm Hg using zero for the blank values. These rock values can be compared with the MEQB 1978 Regional Cu-Ni Study reported mercury in ore at 0.08 ppm. If the 92 samples are representative of the 533 M tons mined, and the mercury content 0.22 ppm Hg, then the annual total quantity of mercury mined would be 7,810 pounds per yr, or 21.4 pounds Hg per day. These estimated values are substantially larger than those sighted in the various chapters. In order to resolve this difference, more careful work and quality assured analysis must be done on the saved splits of samples to quantify the mercury content accurately for the 92 rock samples selected to represent the 355 million tons of ore and waste rock to be mined. Mercury levels and hazards from mercury exposure are significantly understated in the present SDEIS and DEIS, and must be corrected.	S	O
29965	Unique			MERC	Gary Glass		4252	17	The lack of quality data pertaining to the mercury content of the ore and waste rock also pertains to the other solid earth and soil components of the proposed project. In the absence of quality assured mercury data, little can be concluded with confidence. Even a separate test of mercury content using low level analyte mercury testing procedure can not be relied upon (SRK 2007b Appendix G.2) because of the 6-day air drying treatment, see Comment #10. This test was conducted using Week 43 of the weekly leach-testing series of rock samples, and showed that 104 of the 105 samples were above detection at 2.0 ppt in the one liter leachate, apparently indicating continued release of mercury from all of the solids being leach-tested. The 92 solid samples were selected to represent the 533 million tons of waste rock and ore, and all show a positive mercury release during the leach testing. However, additional tests must be made to assure accurate in order to be used in the evaluation of impacts and the assessment of their contributions to present and future contamination of the fisheries resources of the tributaries to and of Lake Superior. The lack of quality data is a very serious problem and must be corrected by deliberate actions to collect sufficient, accurate, quality-assured documented scientific data.	S	O
29965	Unique			MERC	Gary Glass		4255	18	The leach-testing methodology for rock sample leaching treatment appears to be seriously flawed and resultant sampling could underestimate volatile mercury and mercury compounds because the air-drying steps used during 6 days of every 7 days of each treatment cycle in the test procedure. There is no indication that precautions were taken to assure mercury analyte was not being lost during the 6 days of air drying cycles used in the "humidity test" procedure. Mercury compounds are known to sublime and have a positive vapor pressure that would facilitate their volatilization and loss from the solid sample surfaces during the air-drying and air-humidifying cycles (CRC Handbook of Chemistry and Physics, 69th Edition, 1989 CRC Press, pg. D-194). Loss of analyte is highly probable and would result in a systematic sampling error for mercury and mercury compounds caused by the air cycles removing vapors containing mercury compounds directly from the sample solids surfaces before the water volume sample is poured through and collected once per week (reference SRK 2007b, pgs 158-170). Tests must be done to determine if gaseous mercury compounds are being lost during the 6 days of air-drying cycles. Post leach-test solid samples should be analyzed for mercury depletion to confirm mercury content change.	S	O

29965	Unique			MERC	Gary Glass		4258	21	Assessments for impacts of mercury emissions are understated because local washout and dry deposition uptake due to foliar uptake by plants and trees seemingly were not considered (Glass et. al, 1991 WASP 56: 235-249). The original estimate of emissions understated the amount of mercury in both the total mass of rock being mined and the amounts processed. Reliable numbers for mercury content and mercury emissions have not been presented or evaluated for the impact assessments.	S	O
30097	Form Letter	1	Variant	MERC	Karen Graham		2812	3	Not to mention the mercury contamination due to drift from burning coal for power.	NS	X
28994	Unique			MERC	Ken Fritsch		2382	1	The North Met EIS is inadequate as it does not address Mercury Methylation increases down stream. The Mercury model does not take into account increases in the methylation variables of sulfate reducing bacteria, acidity, turbidity and Dissolved organic Carbon.	S	O
27689	Unique			MERC	Lea Foushee	North American Water Office	3275	5	Creates a disproportionate risk from eating methyl-mercury contaminated fish by Tribal and subsistence fishers in the region of its proposed project	NS	X
29978	Unique			MERC	London Bresette		4296	8	The Red Cliff Band of Lake Superior Chippewa is also aware that Lake Superior now has the highest concentration of mercury in Lake Trout of any of the other Great Lakes. Given that present conditions already compel dire warnings for fish consumption levels throughout the regions of Lake Superior where our tribal members fish, it disproportionately affects Tribal Members who count on fishing for their livelihood and the families who count on the availability of this resource for survival and a staple diet. Any increase in mercury concentration is just a step closer to the defacto removal of a treaty right, albeit at a cost of destroying the sanctity of that resource for everyone else as well. This clearly does not just affect tribal members; it places ever increasing risks for any individual of the world community who consumes the fish of Lake Superior. It is already a travesty that the lake's namesake would no longer hold true, yet how could a cavalier handling of scientific facts from the NorthMet Mining Project ever be acceptable in light of these present conditions.	NS	X
29740	Unique			MERC	Lori Andresen	Save Our Sky Blue Waters et. al.	3894	5	One of the most egregious effects of sulfide mining would be the trail of sulfates and mercury (methylmercury) that would accumulate in the environment. These issues are not adequately vetted in the FEIS, nor are the cumulative impacts with taconite mining. This is a human health issue.	NS	X
29740	Unique			MERC	Lori Andresen	Save Our Sky Blue Waters et. al.	3916	31	The PolyMet project will release mercury into the environment. In addition, sulfates released into the watershed increase methylmercury levels in fish. Mercury in the sediments can be methylated by bacteria when the sulfate level reaches a threshold. This produces methyl mercury, which is the form that contaminates our fish and is harmful to other living creatures. A 2013 study by the Minnesota Department of Health found that 1 in 10 infants on the North Shore of Lake Superior are born with unsafe levels of mercury in their blood, potentially impairing normal development.	NS	X
23991	Unique			MERC	Lorrie Ogren MA. LPC, LPCC		991	4	The operation of a copper-nickel sulfide mine in northeast Minnesota would greatly contribute to the mercury/sulfate load that is already creating a problem in the St. Louis River. Methylmercury, which results from a biochemical reaction including mercury and sulfates, bio-accumulates in the food chain —affecting fish and the humans who eat fish. Already, 10 percent of the babies born along the North Shore of Lake Superior have high levels of mercury in their blood, potentially impacting brain development.	NS	X
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3797	101	Within the Lake Superior basin, which includes the Project area waters, MN WQS prohibit any new or expanded point source discharges of bioaccumulative substances of immediate concern including mercury,268 therefore this proposal is not permissible. The FEIS states that, based on mercury mass balance analyses, the Project is predicted to result in an overall net decrease of mercury loadings of approximately 1.0 grams per year to the St. Louis River. This is accomplished by a decrease of 1.2 grams per year in the Partridge River and a net increase of 0.2 grams per year in the Embarrass River.269	S	O
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3798	102	Dewatering peatlands will also amplify water table fluctuations because peat has high water storage capacity and releases water more slowly than other surficial deposits. Drying and re-wetting peat will increase mercury methylation and release. Peatlands store methane and carbon that will be released into the environment when overburden is removed from the mine pits or during periods of dewatering.	S	O
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3813	103	Moreover, Minnesota's mercury TMDL process will not adequately address the fish consumption impairment in these waterbodies, and any new discharges that would result in further degradation to waters with an existing water quality impairment are not be legally permissible under the CWA. In addition, the FEIS states that the current fish tissue concentration in five local lakes results in Hazard Quotients (“HQs”) that exceed 1,272 but provides scarce detail. The maximum incremental cumulative Hazard Quotient from the two reasonably foreseeable cumulative projects over existing fish mercury concentrations is 0.08 for recreational anglers, 0.61 for subsistence/tribal anglers, and 0.54 for subsistence fishers. This is only about a 0.3 to 1.8 percent increase over the existing incremental risk levels, for recreational, subsistence/tribal and subsistence anglers. Of this, the NorthMet Project Proposed Action would contribute approximately 59 to 92 percent of the incremental cumulative Hazard Quotient. In fact, Barr Engineering's July 2012 “Cumulative Impacts Analysis, Local Mercury Deposition and Bioaccumulation in Fish”274 showed modeled contributions from both the Mesabi Nugget Large Scale Demonstration Plant (“LDSP”) on the site and PolyMet. And the Barr report further provides the actual HQs, rather than just saying “they exceed 1.” In one case, the existing HQ equals 46.2—which is 46 times as high as the number where action is recommended. This information should have been explicitly included in the FEIS for public review. The Project contribution of 59 to 92 percent of the incremental cumulative Hazard Quotient is significant. Further, the existing risk is large and has not yet been addressed through a total maximum daily load (“TMDL”) or other reduction program.	S	O
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3814	104	The MDNR conducted mercury studies in the St. Louis River in 2012. The studies found that mercury concentrations were highest in late June and July, reporting 7 ng/L of mercury at Cloquet and 11.8 ng/L upstream of the Partridge River, and then falling through the rest of the summer to 1.4 ng/L and 2.3 ng/L respectively, by late October. Mercury exceeded the 1.3 ng/L standard throughout the study and results indicated the importance of considering seasonal variability when evaluating mercury concentrations in rivers.	NS	X
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3815	105	Further, in 2003, Berndt found that taconite tailings appear to be a sink for mercury in tailings basins in northern Minnesota. And, the loss of mercury through adsorption to solids in the tailings basin and subsequent burial in the sediments resulted in an overall permanent retention of mercury within the basin and decreases the mercury load released to receiving waters.278 However, mercury in the existing Cell 2E pond of the LTVSMC tailings basin has a concentration of 1.4 ng/L of mercury and water collected seeping out of the toe of the tailings basin has a concentration of 4.9 ng/L.279 This contradicts the MNDNR280 by demonstrating that mercury concentrations after seeping through the tailings do not decrease, in fact the concentration more than triples.	S	N
29397	Unique			MERC	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3816	106	Any increase of methylmercury in the Embarrass River, Partridge River, or St. Louis River watersheds constitutes a significant adverse impact to a critical trust resource. Not only must this impact be fully evaluated, but it must be fully mitigated. Limiting fish consumption, particularly to comply with fish advisories for women of childbearing age and children under 15 years old, represents a huge loss of usufructuary rights. This statewide advice for the this population is as follows: one meal per week of bullhead, crappie, sunfish; or one meal per month of northern pike smaller than 30 inches, or walleye smaller than 20 inches; and simply not eating northern pike longer than 30 inches, and walleye longer than 20 inches. A more through cumulative effects analysis should have been required for mercury using the appropriate spatial scale for that would have included the entire St. Louis River watershed and Lake Superior basin.	S	O
26997	Unique			MERC	Maureen Johnson		1557	33	The FEIS must be revised to provide a current mass balance for mercury, including a current analysis of the mass of mercury that would be deposited in the HRF from all wastes, including but not limited to hydrometallurgical process wastes and WWTF sludge.	S	O
26997	Unique			MERC	Maureen Johnson		1579	58	One of the pollutants that PolyMet has admitted it has not found a control for is Mercury. It will release from the tailing basin in the seepage that is not captured to creeks to the already Mercury-impaired Embarrass River and worsen the drinking water and fish conditions of the St. Louis River.	S	O
26997	Unique			MERC	Maureen Johnson		1580	59	Some Mercury will not be able to be captured by the air controls on the production systems.	S	O
27901	Unique			MERC	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3318	32	The Project cannot be permitted, as it would contribute to an existing water quality impairment for which there is no approved TMDL. And once again, the flawed hydrologic model renders the FEIS mass balance approach untenable; by definition, a mass balance model requires accurate flow and concentration data.	S	O
27901	Unique			MERC	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3322	37	The FEIS acknowledges the need to incorporate Project design elements to reduce sulfate losses to both surface and groundwater pathways,99 but the presumed seepage capture rates and unspecified treatment technology do not provide enough support to conclude that the proposed mitigation would be effective. The small tributaries near the mine site are clearly sulfate-limited; any increase in sulfate loading to the watersheds (either by direct discharge or additional atmospheric deposition) will increase net methylmercury production. The FEIS is inconsistent in its discussion of the sulfate/mercury methylation relationship; in FEIS 5-21 that relationship is “only partially understood”, while FEIS 5-313 cites Jeremiason et al (2006) in recognizing that even small increases of sulfate to sulfate-poor wetlands can increase mercury methylation.	S	O
27901	Unique			MERC	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3323	38	The FEIS evaluation of mercury impacts is exceptionally deficient, and the conclusion of ‘no mercury impacts’ downstream in the St. Louis River watershed is not supported by the information presented. Our analysis and the expert opinions of mercury researchers conclude that the FEIS approach is not scientifically defensible, and the NorthMet Project is likely to result in significant and long-lasting downstream mercury impacts to aquatic life, wildlife and human health. Furthermore, the Band would bring attention to the alarming lack of regulatory controls for the very processes that will most likely contribute to the identified mercury impacts, with the sole exception of the \$404 permit and connected \$401 certification.	S	O

27901	Unique			MERC	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3324	35	The FEIS states that the current fish tissue concentrations in the five local lakes that were studied result in Hazard Quotients (HQs) that exceed 1, but gives no further interpretation in the text of the document. The Cumulative Impacts Analysis, Local Mercury Deposition and Bioaccumulation in Fish (July 2012) (Barr report) provides the actual HQs for these local lakes. While Table 6.2.6-1 of the FEIS does contain these values, they are not pointed out in the text or expanded upon. The highest HQ is 46.2, times the health-based target. It is difficult to understand why, despite repeated requests by the tribes, no further discussion is provided of a HQ that exceeds a health-based target by such a large number. The report also ignores the fact that the HQ of 46.2 is for tribal anglers, whereas the highest HQ value for recreational anglers is much lower, at 6.2. This is very obviously an issue of environmental justice, but the FEIS completely ignores issue this other than by saying “Note that the current fish tissue concentration in the five lakes results in Hazard Quotients that exceed 1, leading to the need for the fish consumption advisories currently in effect”.93 The Barr report also states that “the existing health risk under Scenario 1 and 2 to subsistence/tribal and subsistence anglers eating three pounds or more per week of fish from these lakes would be significantly higher – up to fifteen times the EPA assumed safe risk intake level for a pregnant mother or child under the age of 15”. While the incremental risk from the Project may be small, the existing risk is large and has not yet been addressed through a total maximum daily load (TMDL) or other reduction program. Figure 9 from the July 2012 Barr report should be included to give the public a clear idea of the existing condition of the local waters and why the tribes believe that no additional mercury should be added at this time. The FEIS does not provide any rationale for more mercury to be added to a system that is already so high in mercury, but rather only suggests that the TMDL should take care of this. The Band does not believe this will be the case.	S	N
27901	Unique			MERC	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3325	36	The FEIS also fails to evaluate other scientifically documented factors that affect mercury methylation and bioaccumulation. The FEIS approach to evaluating mercury impacts of the Proposed Project avoids addressing complex but well-studied environmental processes by modeling, and instead relies upon an incomplete mercury mass balance to predict future conditions. It superficially references some of the large body of literature related to sulfate, pH, dissolved organic carbon, iron, and microbial activity, but in some cases erroneously interprets it. Research in northern Minnesota peatlands by Jeremiason, Swain and others has clearly demonstrated the enhancement of mercury methylation by sulfate.98 It considers sediments in downstream waterbodies to be exclusively ‘sinks’ for mercury, rather than recognizing that these sediments are also active sources of mercury in the ecosystem.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3018	15	WaterLegacy’s comments on the SDEIS emphasized that the PolyMet NorthMet SDEIS was inadequate to analyze mercury and methylmercury impacts at the project site and cumulatively, in the St. Louis River as well as the Partridge and Embarrass River watersheds. The expert opinion of Dr. Brian Branfireun, one of the world’s leading mercury researchers, identified inadequacies in the SDEIS, including the failure to address the risk of mercury and methylmercury impacts from the project to downstream waters, including the St. Louis River.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3019	16	These comments update WaterLegacy’s concerns based on changes made and not made in the FEIS. Then, they summarize an additional expert opinion provided by Dr. Branfireun (Branfireun, 2015), based on new methylmercury data, issues raised in the FEIS and supporting documents and recently-published peer-reviewed scientific literature.	NS	X
27085	Unique			MERC	Paula Maccabee	Water Legacy	3020	17	In summary, this Section of our comments demonstrates that the FEIS’ dismissal of downstream impacts of mercury and methylmercury is based on scientific errors, inconsistencies and failure to appropriately evaluate significant and well-established mechanisms of mercury production and transport in the NorthMet project area. Dr. Branfireun’s analysis can be summarized as follows: There are no modifications to the FEIS from the SDEIS that change my opinion that the likelihood of downstream water quality impairments from mercury and methylmercury as a result of the proposed NorthMet development is not scientifically or rigorously evaluated in the EIS In conclusion, I reject as unsupported and without scientific justification, any statement or implication in the FEIS that the proposed NorthMet development would not increase risks of methylmercury production and transport in the Partridge and Embarrass River watersheds, particularly in ombrotrophic wetlands near the mine site and wetlands affecting by tailings site seepage collection, changes to hydrology or atmospheric deposition. (Branfireun, 2015, pp. 25, 27)	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3021	18	The FEIS also failed to resolve the deficiencies raised in WaterLegacy’s prior comments. In several instances, the FEIS added new language to justify its prior conclusions without providing any new substantive analysis. Gaps, inconsistencies and misrepresentations of research data identified in WaterLegacy’s comment on the SDEIS were not addressed. The FEIS continued to omit or mischaracterize data and research, thus minimizing or denying the impact of mercury and methylmercury on aquatic life, wildlife dependent on aquatic resources, human health and environmental justice.	NS	X
27085	Unique			MERC	Paula Maccabee	Water Legacy	3022	24	Responses to comments state that estimates for major mercury sources were based on studies done for PolyMet in 2004 and 2005 (FEIS, A-414), but these studies are not included in the FEIS reference documents and neither their methodologies nor numeric values are disclosed.2 The assertion that mercury loadings to the tailings waste facility will be 16.2 pounds per year (FEIS, 5-229) cannot be verified. The level of mercury assumed for peat placed in the unlined mine site overburden and storage area is not disclosed. Mercury mass loading and concentrations in the most highly concentrated waste facilities -- the mine site equalization pond, and the hydrometallurgical residue facility are not disclosed in the FEIS. Documents received by WaterLegacy in response to the Minnesota Data Practices Act (DPA), but not included among FEIS references, suggest that hydrometallurgical residue, for example, would contain a highly elevated level of mercury. A PolyMet 2007 mercury mass balance analysis stated that 85 percent of the mercury from the ore, estimated as 164 pounds per year of mercury, would be contained in hydrometallurgical residue.	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3023	19	The only change made in the PolyMet NorthMet project in response to WaterLegacy’s comments regarding mercury is that the project no longer proposes to use untreated high mercury Colby Lake water for stream augmentation in the wetlands complex north of the tailings waste facility, identified in the SDEIS as a high-risk location for mercury methylation. The FEIS states that Colby Lake water will be treated at the tailings site wastewater treatment plant (WWTP) prior to use for stream augmentation (FEIS, 2-10). However, the benefit of this change is uncertain, since the FEIS fails to analyze how mercury inputs from Colby Lake water transfer would affect tailings pond, tailings seepage and the WWTP. These impacts are likely to be significant. Colby Lake water mercury concentrations substantially exceed the Great Lakes Initiative (GLI) and Minnesota water quality standard of 1.3 nanograms per liter (ng/L). Data provided in the FEIS state total mercury concentrations in Colby Lake are between 4.6 and 8.7 ng/L, averaging 6.0 ng/L (FEIS, 4-37 to 4-38). During operations, maximum plant site water appropriation of water from Colby Lake would be 15.1 million gallons per day (MGD) or 1,300 million gallons per year (MGY) (FEIS, 5-201, Table 5.2.2-40). This maximum is equivalent to 10,486 gallons per minute (gpm) from Colby Lake. Despite the high concentration of mercury in Colby Lake water and the volume of Colby Lake water that would be piped to the plant site, the FEIS’ estimate of mercury in the inflows to the WWTP (FEIS, 5-230, Table 5.2.2-51) does not consider mercury inputs from Colby Lake water. Comparing the FEIS Table for Estimated Mercury Concentration of the Combined Inflows to the Plant Site WWTP to the same Table in the SDEIS (SDEIS, 5-206, Table 5.2.2-52), no adjustment has been made for an increased mercury concentration resulting from the need to treat Colby Lake water. The FEIS’ prediction that the combined inflows to the WWTP will have a mercury concentration of precisely 1.3 ng/L, the GLI water quality standard, is unchanged. This prediction does not seem to reflect analysis, since the maximum volume of Colby Lake water (average mercury concentration of 6.0 ng/L) is estimated at more than four times the 2,425 gpm total combined stream inflow to the WWTP predicted in the FEIS (FEIS, 5-230, Table 5.2.2-51). The FEIS’ failure to assess the ramifications of high-mercury Colby Lake water inputs is exacerbated by unsubstantiated assertions in the FEIS that the PolyMet NorthMet WWTP will be able to treat mercury through reverse osmosis or “equivalently performing technology” so that effluent will not exceed 1.3 ng/L (FEIS, 5-230, 5-238).	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3024	49	His update to this opinion emphasized the inappropriate reliance in the FEIS on a mass balance model that “in the absence of a modeled cumulative error, presents us with mass loadings of sulfate, mercury and methylmercury to the Partridge and Embarrass Rivers that are unusable” because cumulative errors embedded within the estimates “cast serious doubt on the extremely small gains or losses used in the FEIS to claim that the NorthMet impact would have no net impact on downstream loading of inorganic mercury.”	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3026	21	The FEIS asserts with incomprehensible precision that mercury loading in the Partridge River would decrease from 24.2 to 23 grams per year as a result of the PolyMet NorthMet mine project, more offsetting the 0.2 gram increase (from 22.3 to 22.5 grams per year) in mercury loading to the Embarrass River (FEIS, ES-36, 5-462). The FEIS has neither recognized nor responded to concerns about inadequate analysis of mercury air deposition and mercury seepage to substantiate this central claim.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3029	22	The FEIS still states, “Mercury air emissions and subsequent mercury deposition were not assessed for the Mine Site because potential emissions are less than 1.0 lb/yr,” (FEIS, p. 5- 462). The FEIS does not acknowledge that 1.0 pound per year is equivalent to 453.6 grams per year. This is an astronomical number when compared to the FEIS’ mercury loading offset calculations. If far less than one percent of NorthMet mine site mercury deposition found its way into the Partridge River, the net effect of the NorthMet project, with no other revisions or corrections, would increase mercury loading to the St. Louis River. Similarly, the FEIS failed to address concerns raised by WaterLegacy regarding mercury deposition near the NorthMet plant site. The FEIS cites the PolyMet Project Air Data Package (PolyMet 2015e) as its primary reference on mercury deposition. This PolyMet document states that the plant will emit 4.6 pounds per year of mercury and describes two scenarios for mercury speciation that affect local deposition, since oxidized mercury can “deposit readily” at a local and regional level and that some particle-bound mercury may also be deposited locally (PolyMet 2015e, autop.1042). If only 25% of mercury is elemental, the more conservative assumption, up to 3.68 pounds or 1,669.2 grams of NorthMet plant site mercury emissions may be deposited locally each year, within a 10-kilometer radius of the plant site (Id., Appendix C to Attachment U, p. 2, autop. 1091). PolyMet 2015e and the corresponding section of the FEIS analyze the effects of local plant site mercury deposition on the mercury Hazard Quotient in the Embarrass River chain of lakes. Yet, as with the mine site mercury deposition, the FEIS does not evaluate the effects that even a small fragment of the potentially 1,669.2 grams of mercury locally deposited would have on a mass loading calculation that claims mercury in the Embarrass River will only increase by 0.2 grams per year as a result of the PolyMet NorthMet project.	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
27085	Unique			MERC	Paula Maccabee	Water Legacy	3030	23	The FEIS failed to provide high quality information pertaining to mercury requested in WaterLegacy’s prior comments on the SDEIS. The FEIS does not disclose its assumptions as to the mass or concentration of mercury in potential project sources of contamination, including peat, overburden, ore, waste rock, process water, tailings, reject concentrate, filtered sludge, hydrometallurgical residue, coal ash or other potential sources of mercury release from the project. Thus, the FEIS does not permit any verification that mercury projections prepared by PolyMet and adopted by the FEIS (FEIS, 5-226, Table 5.2.2-49, PolyMet 2015m) are consistent with good scientific practice and local geology.	NS	X
27085	Unique			MERC	Paula Maccabee	Water Legacy	3031	25	Next, the FEIS mischaracterized applicable data to claim that mercury in tailings would be adsorbed to tailings. Discrepancies between claims in the PolyMet NorthMet SDEIS regarding mercury and mercury data in underlying documents were not resolved in the FEIS. The FEIS goes even further than the SDEIS in asserting “the ability of NorthMet tailings to adsorb mercury, in combination with the proven ability of the underlying taconite tailings to adsorb mercury, is expected to result in an overall increase in the adsorption of mercury and subsequent lower concentrations of mercury at the Tailings Basin with the addition of the NorthMet tailings,” (FEIS, 5-229). As explained in WaterLegacy’s SDEIS comments, this optimistic claim mischaracterizes the NTS bench study cited in the FEIS. The FEIS reports that the 2006 NTS bench study reduced mercury concentrations by 73 percent (from 3.3 ng/L to 0.9 ng/L) after 480 minutes. And, as in the SDEIS, the FEIS fails to disclose either that the plain water in a control flask reduced mercury concentrations by 22 percent in that timeframe or that the trend in the experiment, when it was discontinued after eight hours, was that the mercury was desorbing from the tailings and may have doubled since the fourth hour of the experiment when mercury was beneath the detection limit of 0.5 ng/L (FEIS reference Barr 2007d, autop. 157, 160).4 Even more problematic, the FEIS’ assertion that adsorption of mercury by the existing LTVSMC tailings has been “proven” is inconsistent with the data and assertions in Section 4.0 of the FEIS itself. The FEIS states, Comparing the existing Cell 2E pond water quality with water quality at the toe of the Tailings Basin can define the effect that passage through the existing LTVSMC tailings has on seepage water quality. Such comparison shows that passage through the LTVSMC tailings apparently reduces the average concentrations of arsenic, fluoride, and molybdenum, although it is difficult to determine to what extent these reductions are simply attributable to the effects of dilution. The concentrations of several other parameters, such as calcium, manganese, nickel, and TDS, increase as they seep from the tailings pond to the toe of the Tailings Basin. (FEIS, 4-127) The FEIS narrative does not state how mercury concentrations are affected as they pass through the existing LTVSMC tailings, but the data is clear. Mercury in the existing Cell 2E pond has a mean concentration of 1.4 ng/L. Mercury in the toe of the existing tailings facility has a mean concentration of 4.9 ng/L (FEIS, 4-126, Table 4.2.2-23) Using simple arithmetic, the FEIS has proved that in passing through the existing LTVSMC tailings mean mercury more than triples.	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3033	27	The FEIS, like the SDEIS text criticized in WaterLegacy’s prior comments, also understates potential mercury impacts from mercury in the West Pit. The FEIS claims a 92 percent burial rate for the total mercury load in the West Pit (FEIS, 5-226, Table 5.2.2-49 Initial and Final Parameter Values for the Mercury Mass Balance). The underlying literature cited, in fact, estimates actual mercury sedimentation rates at 80 to 90% (FEIS ref. PolyMet 2015m, p. 325). More important, the FEIS’ use of the term “burial” suggests that mercury in the West Pit would become permanently unavailable. The FEIS fails to discuss the well-established risk that mercury concentrated in lake sediments will cycle in and out of suspension, become methylated and bioaccumulate, affecting fish and wildlife.6 The FEIS’ has again failed to provide high-quality mercury information, has failed to model mercury releases and has selectively reported mercury data.	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3035	33	The FEIS admits, “small sulfate increases in sulfate-poor wetlands would be expected to increase the production of methylmercury in wetlands,” (FEIS, 5-164). But the FEIS fails to explain that the three Upper Partridge tributary streams that drain relatively undisturbed watersheds --Wetlegs Creek, proposed West Pit Outlet Creek and Longnose Creek (FEIS, 4-83) -- reflect drainage from low-sulfate wetlands. Even according to the revised data in the FEIS, sulfate concentrations are 3.9 mg/L for Wetlegs Creek, 2.6 mg/L for proposed West Pit Outlet Creek and 0.91 mg/L for Longnose Creek (FEIS, 4-84).9 Increased wetlands concentrations from fugitive dust alone, without considering ore spillage or sulfur-compound air deposition would more than double sulfate in all three undisturbed mine site creek watersheds and more than quadruple sulfate in the Longnose Creek watershed. It is undeniable, based solely on FEIS data, that mine site sulfate deposition would be expected to increase the production of methylmercury in mine site wetlands. Dr. Branfireun’s opinion below calculates sulfate deposition from dust as sulfate loading and concludes that sulfate deposition of this magnitude could nearly double methylation in affected wetlands. However, even his analysis is likely to understate potential impacts of sulfate deposition on wetlands, since the FEIS does not provide sufficient high quality data to aggregate the various sulfur-containing emissions or the combined impacts of sulfur-containing emissions, ore spillage and dust on the nearest or most ecologically sensitive waters.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3037	30	The EPA, in comments on the SDEIS, recommended that the FEIS model mercury using either GoldSim or a more suitable model, such as the Water Quality Analysis Simulation Program (WASP)3, which is commonly used by EPA to model elemental mercury. (EPA Comments on PolyMet NorthMet SDEIS, Comment #15, attached as Exhibit 1)7 Dr. Branfireun also commented in his review of the SDEIS that models exist to model mercury and that SDEIS had failed to make a reasonable attempt to model the potential impacts of changes in water chemistry impacting mercury and that models were available to do so. (Branfireun, 2014).8 The FEIS contains no modeling of mercury other than the simplistic mass balance analysis effectively dismissed as unusable by Dr. Branfireun below. Mercury has not been included in the GoldSim modeling for the NorthMet mine site or the plant site (FEIS, 5-223, 5-228), and no other model was used to model either mercury or methylmercury increases.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3038	31	As in the SDEIS, the FEIS assumed a simple linear relationship between mercury air deposition to a water body and fish tissue methylmercury concentrations (FEIS, 6-85). Dr. Branfireun’s expert opinion, summarized below, explains the need to assess scientifically recognized impacts of sulfate discharge and deposition and hydrological effects on wetlands and sediments in increasing mercury methylation.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3039	32	The FEIS provides more data on the various types of sulfur-containing air emissions, spillage and dust from the NorthMet mine site and plant site and more text explaining the potential relationship between sulfate deposition and mercury methylation than did the SDEIS. However, rather than using this data to provide a critical analysis of the aggregate impacts of these various forms of sulfate in methylating environments – namely the wetlands closest to the deposition sources - the FEIS obscures and negates the potential impacts of local sulfur inputs on mercury methylation. The FEIS states that the NorthMet plant site would emit about 7 tons per year of sulfur dioxide, and about 1.9 tons per year of sulfur dioxide from the mine site (FEIS, 5-509). FEIS modeling then focuses on two lakes at least five miles away from the plant site and farther yet from the mine site (Colby Lake and Sabin Lake). The FEIS predicts that sulfur dioxide deposition would increase by 2 percent in each lake (FEIS, 5-510). The FEIS provides no estimates of impacts on wetlands, the methylating environments located proximate to sulfur dioxide sources. The FEIS then discusses sulfuric acid mist, emissions of which are estimated to be slightly more than 5 tons per year (FEIS, 5-510). Again, the FEIS only models deposition on the two lakes a considerable distance from the site, and dismisses deposition of sulfuric acid mist as a small percentage over the watersheds (Id.) Next, the FEIS discusses reduced sulfur compounds, including hydrogen sulfide (1.88 tons per year) and carbon disulfide (5.1 tons per year) with a total volume of 6.98 tons per year from the NorthMet plant site. The FEIS does not estimate the potential deposition of sulfur from reduced sulfur compounds, saying the local deposition “is uncertain, but it is not expected to exceed evaluation criteria,” (Id.). Finally, the FEIS discusses sulfur in particulate matter that would be emitted from the plant site. Again, focusing on Colby Lake and Sabin Lake, but without disclosing the tons per year emitted, the FEIS predicts that deposition of sulfate in particulate matter would be 4 percent of background, once more deemed a small percentage of background. (FEIS, 5-510 to 5-511). However, here the FEIS provides an important additional analysis. Based on the assumption that all sulfur in fugitive dust converts to sulfate and mixes with surface water in wetlands. Assuming that all sulfur in fugitive dust converts to sulfate and mixes with surface water in wetlands, the FEIS predicts a potential increase in wetlands sulfate concentrations of 4.2 mg/L. (FEIS, 5-339)	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
27085	Unique			MERC	Paula Maccabee	Water Legacy	3044	36	These statements contradict the purpose of an EIS and basic scientific integrity. It is beyond dispute that methylmercury is exported to streams as they pass through wetlands and that precipitation events and seasonal wetting cycles release methylmercury from peatlands into streams where that methylmercury can be incorporated into food chains. In fact, these points are both made in a recent Report of the Minnesota Department of Natural Resources (MDNR), one of the Co-Lead agencies preparing the FEIS.11 The FEIS does not discuss the potential that hydrologic changes resulting from mine dewatering and tailings seepage capture would increase mercury methylation. Dr. Branfireun’s opinion below explains the effects of drying and rewetting cycles in increasing mercury methylation in wetland and peatland environments. Given potential mine site drawdown impacts on as much as 5,720 acres of wetlands (Section V, infra) and the combined impacts of sulfate loading and drying and wetting cycles, the methylation processes described by Dr. Branfireun presents a significant risk. Despite statements of concern regarding methylmercury by the U. S. Environmental Protection Agency (EPA) and Tribal Cooperating Agencies,12 as well as by WaterLegacy and medical organizations (see Exhibit 18, attached), the FEIS still makes no effort to analyze potential methylmercury effects from the NorthMet project. As Dr. Branfireun’s expert opinions explain, the NorthMet mine, processing plant, waste facilities and ponds create conditions that increase production of methylmercury, including discharge and deposition of mercury, discharge and deposition of sulfate, and drying and rewetting of wetlands at both the mine site and tailings site. The FEIS fails to model mercury dynamics and claims that current scientific understanding of the factors affecting mercury methylation is too limited to perform an analysis (FEIS, 5-223).	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3045	37	The FEIS analyzes only NorthMet plant mercury air emissions to model changes in fish methylmercury concentration. Without qualifying its conclusions to explain the limited analysis done, the FEIS goes yet farther than any prior EIS document to broadly dismiss methylmercury human health concerns on the basis of the small increases in this limited analysis; “Given that evidence and finding, no potential change in human health risks related to the fish consumption pathway is expected,” (FEIS, 7-16). The simultaneous failure to analyze methylmercury production in the FEIS and its categorical denial of methylmercury effects is unacceptable under either NEPA or MEPA environmental assessment laws. Denial that the NorthMet sulfide mine project will increase mercury and production of methylmercury results in the continued failure of the FEIS to consider adverse effects of the Proposed Project on water quality, human health, tribal treaty and reservation resources or environmental justice. This analysis is fundamental both to consideration of mitigation alternatives and to assessment of whether the PolyMet NorthMet project can be permitted under the Clean Water Act Section 404 and 401(a) as well as under applicable state laws.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3047	39	Dr. Branfireun’s prior Opinion 1 focused on characterization of the current methylating environment associated with and potentially impacted by the proposed NorthMet project and concluded that the data regarding mercury and methylmercury was insufficient to evaluate potential impacts of the proposed project. His updated opinion reviewed new data on mercury and methylmercury used for the FEIS (Barr 2014d) and found numerous errors and internal inconsistencies in the data as well as a failure to perform an uncertainty analysis. He concluded that the data could not be used to assess environmental effects on mercury or methylmercury and that the margin of error alone would discount the firm conclusions made in the FEIS regarding mercury mass balance calculation. (Branfireun, 2015, pp. 2-3, 5-9)	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3048	40	Dr. Branfireun also concluded, based on the methylmercury data in the Partridge and Embarrass Rivers and in mine site creeks, that the NorthMet project area is a highly methylating environment, making these watersheds sensitive both to hydrological impacts due to changes in surface or subsurface hydrology and to additional sulfate either from surface water or deposition. (Id., pp. 3-4).	NS	X
27085	Unique			MERC	Paula Maccabee	Water Legacy	3049	41	Dr. Branfireun" prior Opinion 2 criticized the SDEIS for failure "to consider scientifically documented factors beyond simple changes in mercury in the environment that govern mercury methylation and uptake when evaluating the potential impacts of mercury release as a result of the proposed development," (Id., p. 9). His updated opinion found the FEIS misleading in its implication that there is no relationship between methylmercury and sulfate. He explained that the sulfate limit of 10 mg/L to protect wild rice may still allow increased methylation to take place in wetlands or tributary catchments and that the mine site creeks demonstrate sulfate-limited conditions with a high potential for mercury methylation, where “even small additions of sulfate to sulfate-poor wetlands can increase methylmercury production.” (Id., pp. 9-12). Dr. Branfireun opined that the FEIS “analyzed a very limited scope of the impacts the proposed NorthMet project would have due to changes in hydrology” and stated that augmenting streams to stay within a specified percentage of variation would not preclude increased methylation in soils and sediments adjacent to the streams. He cited evidence from rigorous peer reviewed science that demonstrates the role of drying and wetting of peat soils on sulfate regeneration and mercury methylation, and concluded in light of this evidence and the “contradictory mention and dismissal of the state-of-the-science on mercury methylation, the FEIS is simplistic if not misleading.”	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3050	42	Dr. Branfireun’s prior Opinion 3 concluded that the SDEIS had not made a reasonable attempt to model the potential aquatic system impacts of changes in mercury and sulfate water chemistry due to the NorthMet project. His updated opinion emphasized that “a mass balance model cannot by definition incorporate mechanistically the input and removal processes for mercury, and cannot address the biogeochemical aspects of mercury methylation across the landscape which are at the root of the potential impacts associated with the PolyMet proposal.” He criticized the FEIS’ continuing reliance on this “cheaper and easier” method when much more defensible approaches exists. (Id., p.13). Dr. Branfireun emphasized that neither the FEIS’ statements of certainty based on grams of sulfate or mercury released nor conclusions from this asserted mass balance that the proposed development will not have appreciable impacts on water quality could be supported, given the level of uncertainty in the data. (Id., p.14) Dr. Branfireun also challenged the FEIS’ assumption of proportionality between atmospheric deposition of mercury and mercury in fish tissue as “an archaic approach to this problem” that “does not reflect current scientific thought or the best available tools.” He cited research in Minnesota’s Voyageur’s National Park published in 2014 demonstrating that fish tissue mercury will vary under the same atmospheric deposition, based on hydrology and other characteristics of that specific water body.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3051	43	Dr. Branfireun’s prior Opinion 4 stated that ombrotrophic bogs (peat-dominated, rain-fed, acidic wetlands) play important roles in methylmercury supply, and the SDEIS improperly considered them decoupled from project impacts. His opinion on the FEIS emphasized the significance of bogs as methylating environments, and concluded, Since there is clear evidence that the watersheds in which the NorthMet development is proposed should be considered ‘sensitive’ with respect to the production of methylmercury (see Munthe et al., 2007), it logically follows that impacts on these watersheds and wetlands that could influence the methylating environment should have been considered in the EIS. Even small changes that increase methylation could have marked detrimental and cumulative effects downstream.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3053	45	Dr. Branfireun then explained that monitoring done to evaluate changes in wetland vegetation would be insufficient to detect indirect impacts on methylation. “Even relatively small changes in water table position and wetting and drying frequency in the ombrotrophic wetlands at the NorthMet mine site have the potential to impact sulfate and methylmercury concentrations of receiving waters,” and evaluating these changes would require baseline and future monitoring of flow volumes and water chemistry, including methylmercury and sulfate. He emphasized, “considering the potential for mercury methylation, bog wetlands around the proposed mine site must be considered to have a very high likelihood of indirect impacts from the proposed NorthMet development.”	S	O

27085	Unique			MERC	Paula Maccabee	Water Legacy	3054	46	Dr. Branfireun then explained that methylmercury would be continuously exported from wetlands under base flows and during high flow events, such as spring snow melts, as well as during rain storms and that “all bogs shed water via outflows to downstream systems, and as such strongly influence the chemistry of receiving waters.” He noted that none of these potential impacts of the proposed NorthMet project are considered in the FEIS. (Id., p. 20).	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3055	47	impacts of the proposed NorthMet project are considered in the FEIS. (Id., p. 20). The next section of Dr. Branfireun’s opinion recent applied peer-reviewed research to conclude that “stimulation of methylmercury production by the rewetting process is a ubiquitous process” in Minnesota bog-type wetlands and that “we must expect that a significant proportion of bog wetlands that are within the zone of drawdown from the proposed mine development will also exhibit sulfate regeneration and increased export of methylmercury, under natural rewetting cycles as well as storm events.” (Id., pp. 20-21). Hydrologic changes as a result of drying and rewetting would promote methylation as well as contribute to repeat flushes of methylmercury and inorganic mercury from the proposed unlined mine site storage area. Dewatering of wetlands surrounding the tailings basin through seepage collection and even modest impacts on the water table resulting from dewatering could increase total mercury, methylmercury and sulfate in the Partridge, Embarrass and ultimately, the St. Louis River. (Id., p. 22). Dr. Branfireun applied recent peer-reviewed research to estimate impacts of sulfate deposition in methylation at mine site wetlands. Using background and deposition rates from Barr and PolyMet documents, Dr. Branfireun calculated that the increased sulfate loading resulting from the NorthMet proposal is, in fact 3.76 times background deposition. Based on results in experimental peatlands, he calculated that mercury export from sensitive peatlands near the mine site may increase up to 1.88 times. Given the magnitude of this potential impact, even if less than all sulfur is liberated to the environment as sulfate, there will still be a substantial stimulatory effect on peatland mercury methylation. Effects of sulfate deposition on peatlands will persist to some degree even after loading has ceased.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3058	51	Dr. Branfireun concluded that no changes to the FEIS altered his prior opinions that the PolyMet NorthMet EIS failed to rigorously or scientifically evaluate downstream water quality impairments from mercury and methylmercury or that the NorthMet project would result in potential impacts to ecosystems to human health, as a result of increased methylmercury in surface waters and the food chain. In fact, Dr. Branfireun stated that his prior opinions had been reinforced and strengthened as a result of new methylmercury data in the record and newly published peer-reviewed literature. (Id., p. 25). Dr. Branfireun summarized the known mechanisms of methylmercury production, export and transport to proximate streams and downstream waters. He then concluded, It is my opinion that the NorthMet development could create a substantial risk of ecologically significant increases in water column and fish methylmercury concentrations in downstream waters, including the St. Louis River. Finally, even if appropriate monitoring for biogeochemical changes in wetlands and sediments near the development were to be designed and implemented (a difficult and complex undertaking requiring collection of baseline data not supplied in the FEIS), it is highly likely that lag times for expression of methylmercury increases, multiple mechanisms of transport, and the likelihood of legacy regeneration of sulfate stored in the watershed would preclude effective adaptive management prior to irreversible impairment of downstream waters. (Id., p. 27).	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3164	157	As detailed in Section I, supra, the FEIS has not addressed WaterLegacy’s comments regarding mercury or the scientific opinions expressed by Dr. Branfireun. Dr. Branfireun’s recent opinion concluded that the NorthMet project could present a substantial and ecologically significant risk of increased production and transport of mercury and methylmercury to downstream waters, including the Partridge, Embarrass and St. Louis River. It is beyond dispute in the medical profession that increasing fish methylmercury in these waters would create human health risks. As Margaret Saracino, M.D., a Duluth child adolescent psychiatrist, summarized in her opinion attached with these comments: In terms of methylmercury, exposure is largely due to ingestion of fish with high mercury content. Methylmercury builds in the food chain. When pregnant women eat fish high in methylmercury, the fetus is then exposed to this lipophilic heavy metal. The placenta is not protective and the blood brain barrier is not well formed until after age two years, which makes fetuses, infants and young children most vulnerable to methylmercury’s neurotoxic effects. Neurons in the developing brain multiply at a rapid rate and are particularly vulnerable to toxic effects of heavy metals, hence brain damage is more likely to occur during this vulnerable time. Neurotoxicity is also transferred to the infant through breast milk. The adverse effects of methylmercury depend on timing and amount of exposure. Methylmercury is a strong toxin that influences enzymes, cell membrane function, causes oxidative stress, lipid peroxidation and mitochondria dysfunction, affects amino acid transport and cellular migration in the developing brain. Exposure in utero can cause motor disturbances, impaired vision, dysesthesia, and tremors. Even lower level exposure can result in lower intelligence, poor concentration, poor memory, speech and language disorders, and decrease in visual spatial skills in children exposed to methylmercury in utero. Fetuses, infants, and young children are four to five times more sensitive to the adverse effects of methylmercury exposure than adults. (Saracino, 2015, p. 2). Dr. Saracino explained that neurodevelopmental disorders can be managed, but not cured. (Id., p. 1). In addition to the suffering of exposed individuals and their families, neurodevelopmental disorders resulting from increased methylmercury and lead exposure can result in significant costs to families and communities as a result of needs for occupational therapy, physical therapy, speech and language therapy, special education service, outpatient and in-patient treatment and as a result of reduction in earning capacity. (Id., pp. 2-3). The FEIS neither recognized nor assessed any of these costs.	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3211	196	The FEIS briefly discusses the impacts of air deposition on lakes in the Embarrass River watershed on mercury, concluding that the maximum incremental cumulative increase in the Hazard Quotient over existing fish mercury tissue concentrations is no more than a 1.8 percent increase over existing markedly unsafe levels. (FEIS, 6-86, 6-87) Inexplicably, the FEIS states in the same paragraph that as a result of the tiny scope of emissions risk assessment (AERA) done there is “no subsequent change in human health risks related to fish consumption.” (FEIS, 6-131).	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3212	197	However, the FEIS provides no analysis of impacts on mercury in fish tissue in the Partridge and Embarrass Rivers, immediately proximate to the NorthMet project site, and no analysis of project impacts on mercury bioaccumulation resulting from the factors other than mercury air deposition.	S	N
27085	Unique			MERC	Paula Maccabee	Water Legacy	3213	198	As Dr. Branfireun detailed in his report, the concentration of mercury in fish tissue is not proportional to air deposition. (Branfireun, 2015, pp. 14-15). Sulfate discharge, sulfate air deposition and hydrological changes resulting in the drying and rewetting of wetlands and sediments all contribute to mercury methylation, mobilizing the form of mercury that bioaccumulates in the food chain. (Id., pp. 9-16, 19-27). The wetlands adjacent to the NorthMet project mine site and tailings site are highly methylating environments, and “Even relatively small changes in water table position and wetting and drying frequency in the ombrotrophic wetlands at the NorthMet mine site have the potential to impact sulfate and methylmercury concentrations of receiving waters.” (Id., p. 19). Based on experimental data in similar wetlands, sulfate deposition at the mine site alone could nearly double methylmercury production (1.88 times) in sensitive peatlands. (Id., p. 23). Dr. Branfireun explained the many mechanisms of mercury export from project site wetlands and their transport downstream. (Id., p. 26). He concluded, after the only comprehensive analysis of methylmercury in the entire FEIS record, I reject as unsupported and without scientific justification, any statement or implication in the FEIS that the proposed NorthMet development would not increase risks of methylmercury production and transport in the Partridge and Embarrass River watersheds, particularly in ombrotrophic wetlands near the mine site and wetlands affecting by tailings site seepage collection, changes to hydrology or atmospheric deposition. . . It is my opinion that the NorthMet development could create a substantial risk of ecologically significant increases in water column and fish methylmercury concentrations in downstream waters, including the St. Louis River. (Id., p. 27)	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3216	199	Mercury bioaccumulation in fish can harm the fish themselves, inhibiting fish reproduction. (FEIS, 5-467). As summarized in the opinion of Dr. Saracino quoted in Section VIII, supra, consumption of fish containing high levels of methylmercury (the form of mercury that bioaccumulates in the food chain) can also be harmful to human beings, particularly to the developing fetus, when methylmercury crosses the placental barrier. (Saracino, 2015). In Minnesota’s Lake Superior Region, the cumulative risk of mercury contamination of downstream fish is highly significant and should have been evaluated. A recent Minnesota Department of Health study found that 1 out of 10 infants in Minnesota’s Lake Superior region were born with unsafe levels of mercury in their blood. At a statistically significant level, a greater proportion of Minnesota babies had unsafe mercury in their blood as compared with babies in the Lake Superior region of Wisconsin or Michigan. Mercury levels were also higher in Minnesota in the summer months, suggesting that increased consumption of locally caught fish during the warm months is an important source of pregnant women’s mercury exposure.50 In addition to a 1.3 ng/L standard for mercury in the water column discussed previously, Minnesota has a standard limiting mercury in edible fish tissue to protect human health, which is applicable across the range of waters used for fishing and drinking water, of 0.2 micrograms per kilogram (µg/kg). Minn. R. 7050.0220, subp. 3a, 4a, 5a. This standard is lower than the EPA’s methylmercury criterion for fish tissue (0.3 mg/kg) because of the high rate of fish consumption in Minnesota.51 The Embarrass River chain of lakes downstream of the proposed NorthMet tailings site - Sabin, Wynne, and Embarrass Lakes -- are impaired due to excessive mercury in fish tissue. Colby Lake, into which the Partridge River flows downstream of the proposed mine site, is also impaired due to excessive mercury in fish tissue. (FEIS, 4-29, Table 4.2.2-2). Based on the sampling done for the NorthMet project, the Partridge River and Embarrass River may also be impaired for aquatic consumption due to excessive mercury. Mean concentrations of mercury at surface water sites in the Partridge River (2.3 to 5.4 ng/L) and mean concentrations in the Embarrass River (4.3 to 5.1 ng/L) are two to four times higher than Minnesota’s water column standard of 1.3 ng/L. (FEIS, 4-41, Table 4.2.2-4). Most of the St. Louis River downstream of the proposed NorthMet sulfide mine project is impaired for the designated use for aquatic consumption as a result of excessive mercury in fish tissue. (FEIS, 4-285). Exhibit 28 to WaterLegacy’s comments identifies segments of the St. Louis River that are on Minnesota’s Section 303(d) impaired waters list due to excessive mercury in the water column or mercury in fish tissue.	NS	X
27085	Unique			MERC	Paula Maccabee	Water Legacy	3217	200	The FEIS should have assessed cumulative effects of the NorthMet project on mercury methylation and bioaccumulation in fish tissue in the Partridge and Embarrass River watershed and in downstream waters, including the St. Louis River. The false precision of mercury loading and FEIS “offset” calculations seem designed to obfuscate the cumulative risk to human health resulting from ecologically significant increases in mercury in fish from the PolyMet NorthMet project and the past and present mercury impairments in downstream waters.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3233	220	The FEIS did not evaluated cumulative increases in mercury contamination of fish in Ceded Territory watersheds affected by the NorthMet project, downstream Fond du Lac reservation waters, or on Lake Superior fish spawned in the St. Louis River or its estuary, on which the Grand Portage Band may rely for subsistence fishing.	S	O
27085	Unique			MERC	Paula Maccabee	Water Legacy	3235	222	But the FEIS failed to assess whether the PolyMet NorthMet project would cause or contribute to violation of Fond du Lac’s water column standard for mercury or the Band’s narrative water quality standards, including the prohibition on “further water quality degradation which would interfere with or become injurious to existing or designated uses.” (Fond du Lac Water Quality Standards, Ord. #12/98 as amended, Sect. 301e.1; Appx. 1, Standards Specific to Designated Use; Sect. 105a.1). The FEIS failed to evaluate the cumulative impacts of NorthMet project on St. Louis River Reservation waters that are already impaired due to mercury in fish tissue. By improperly narrowing its analysis, the FEIS also negated the NorthMet project’s environmental justice impacts to tribes due to tribal consumption of mercury-contaminated fish.	S	O

9	Unique			MERC	rayyoungsmn@aol.com		14	1	This company can just declare bankruptcy and walk away from any clean up at any time. Then we tax payers are stuck with the clean up bill.	NS	X
28922	Unique			MERC	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3576	1	Approval of the PolyMet project will aggravate water quality problems, certainly in the St. Louis River watershed, and potentially in the Rainy River watershed. Sitting at the top of both of these watersheds, PolyMet will add higher levels of sulfates to the downstream waters. Sulfates in the Partridge and Embarrass rivers, and in the St. Louis River downstream from them already greatly exceed normal background levels because of drainage from taconite mines to the north. Much additional sulfate will be added to these watersheds as a result of the PolyMet project. Higher levels of sulfates in downstream waters will allow microbes to convert more of the available mercury to methylmercury, which is the bioaccumulating formulation that contaminates our fish, and humans eating those fish, boosting already unsafe levels of methylmercury contamination in these waters. The PolyMet project will also add more mercury to these river systems. Release of mercury sequestered in peat soils, increases in water level fluctuations, and airborne mercury released from the PolyMet mine and plant sites will all contribute to the already high levels of mercury in the system. The St. Louis River was listed for mercury impairment by the PCA in 1998. Since then little progress has been made to come up with a Total Maximum Daily Load (TMDL) plan to get the river delisted. By adding more mercury and sulfate to the river system, the PolyMet project will make it even more difficult to accomplish this challenging goal to make the fish safer for people to eat. The FEIS does not answer the question of how the Minnesota Department of Natural Resources (DNR) and Minnesota Pollution Control Agency (PCA) can meet the goal of cleaning up the water in the St. Louis River, while at the same time adding more mercury and sulfate pollution to it.	S	O
28855	Unique			MERC	Ryan John Mallek		2365	5	Mercury concentrations are already high in the St.Louis river due to industrial pollution and I feel we need to mitigate anything that could increase the current levels beyond their already high limits.	NS	X
29900	Unique			MERC	Susan Lynn		2702	4	The levels in mercury in the fish are such that those in our state who seek to sustain their lives eating the fish cannot do so.	NS	X
27061	Unique			MERC	Tyler Kaspar	1854 Treaty Authority	2986	10	We disagree that the proposed project will result in a net decrease in mercury loading to the Embarrass and Partridge River aquatic systems (Section 5.2.2.3.4). For the Embarrass River, we disagree that the tailings basin will function as a mercury sink. The FEIS does not provide enough evidence to support his conclusion. Regarding flows of the Partridge River, Embarrass River, or their tributaries, we disagree that the project would not significantly impact flow and water level fluctuations, thus leading to an increased potential for mercury methylation and bioaccumulation, which taken together may be sufficient to impact habitat leading to alterations of species composition and food web structure.	NS	X
27061	Unique			MERC	Tyler Kaspar	1854 Treaty Authority	2988	12	Mercury-related concerns are present for created wetlands at the East Pit and mercury concentrations in water discharged from the West Pit. Air-related mercury emissions provided in the FEIS do not account for sources from energy generation or vehicle use at the site. For the Lake Superior watershed, any additional mercury releases to the environment are exacerbating already existing impairments including fish advisories set for recreational fishing. Increased fish mercury levels will also have direct impacts on both the cultural and recreational resources of the region.	NS	X
27061	Unique			MERC	Tyler Kaspar	1854 Treaty Authority	2989	13	We suggest removing or revising this statement. The analyses provided in the FEIS regarding mercury methylation and fish bioaccumulation are not robust enough to draw this conclusion. There are too many uncertainties regarding the water modeling and hydrologic changes that will occur due to the project as well as a lack of understanding of what will influence mercury methylation and fish bioaccumulation.	S	O
27685	Unique			N	Dennis Szymialis		1918	73	p. 4-255 Compare directions and other indications for distances as given elsewhere in the SDEIS. Some distances and directions within the SDEIS appear to be inaccurate.	S	O
28547	Unique			N	Esteban Chiriboga	GLIFWC	3522	25	The tribal cooperating agencies believe it is indefensible to conclude that, amidst a “mining district” with multiple active mine facilities operating in close proximity, that there is no cumulative effect of 24 hour/day, seven days/week of heavy industrial and blasting noise on sensitive wildlife and on traditional cultural practices. See Appendix C of the FEIS for additional detail.	S	O
30504	Form Letter	1	Variant	N	R Nicholas Rowse		2869	1	I am also very concerned with the noise impacts from the proposed mining activities.	NS	X
26780	Unique			NEPA	Alaina Pilate		1452	2	Our concerns are many. They include the failure to fully evaluate many pollution risks to drinking water, human health, fish and wild rice habitats, particularly in response to how much pollution will actually leech out during operations, reclamation, and final closure.	NS	X
25409	Form Letter	1	Variant	NEPA	Amalie A. Duvall		1183	2	Public scrutiny is essential to implementing NEPA. The comment and objection periods are inadequate and confusing. There is not enough time to review over 3,500 pages of documents in the complicated EIS and environmental review process for the proposed PolyMet project. An extension of the public comment and objection periods is reasonable, warranted and should be granted.	NS	X
29843	Unique			NEPA	Amy Schwarz		2661	4	I also encourage you to look into ethical conflicts of interest between the Head of the Division of Lands and Minerals and NorthMet and its environmental consultant.	NS	X
26973	Unique			NEPA	Andrew Comfort		1493	1	The following is an excerpt from the November 5, 2015 letter to Interested Parties from Lisa Fay, MDNR Project Manager: "The FEIS shall be determined adequate if it: A) Addresses the potentially significant issues and alternatives raised in scoping ... in conformance with Minnesota Rules, part 4410.2300, items G and H; B) Provides responses to the substantive comments received during the draft and supplemental draft EIS review concerning issues raised in scoping; and C) Was prepared in compliance with ... Minnesota Rules, parts 4410.0200 ... " The FEIS is inadequate for at least the following reasons: • It is not in conformance with Minnesota Rules part 4410.2300, item G • It does not respond to my substantive comments submitted in response to the SDEIS • It is not in compliance with Minnesota Rules, part 4410.0200	S	O
26973	Unique			NEPA	Andrew Comfort		1497	5	As also noted in my SDEIS comment, the FEIS too, is inadequate due to non-compliance with Minnesota Rules, part 4410.0200, which states: " .. the RGU must consider: ... whether future development is indicated by historic or forecasted trends ... " In my SDEIS comment, I outline a series ofHistoric Trends and a further series of Forecasted Trends. For this FEIS comment, I will add numbering to each of the trend sub-headings as follows: HISTORIC TRENDS: 1) Hull Rust Mahoning Mine (See Figures A-D) 2) High Grade Ore to Low Grade (hemative to taconite) 3) Highway 53 4) Maturi Southwest and Maturi West 5) The Shifting Laurentian Divide 6) Sulfide Ore Mines PolluteFORECASTED TRENDS: 1) Wall Street 2) Polymet Brochure (See Exhibit C) 3) Minnesota Minerals Coordinating Committee (See Exhibit D) 4) Bedrock Geology Map Minnesota Rules 4410.0200 states that the RGU "must" consider historic and forecasted trends. It does not say "may" or "can" or "should", it says "must." I prepared this partial list of six Historic Trends and four Forecasted Trends for the SDEIS. The FEIS is inadequate because it does not address these trends as it "must". With my resubmission of my SDEIS comment, I look forward to a specific response from the DNR with respect to these trends.	S	O
26973	Unique			NEPA	Andrew Comfort		1500	7	In the FEIS Section A.5.6 discussion of themes CU 01 through CU 20, there is reference made to following the guidance of Considering Cumulative Effects under NEPA by CEQ, January 1997. On page 4 of this document CEQ states: "Many times there is a mismatch between the scale at which environmental effects occur and the level at which decisions are made. Such mismatches present an obstacle to cumulative effects analysis. Cumulative effects analysis should be the tool for federal agencies to evaluate the implications of even project-level environmental assessments (EAs) on regional resources." Those preparing the FEIS are suffering from the problem of such a mismatch and missing that the Cumulative Effects of the Polymet proposal impact the regional resource which is the Boundary Waters Canoe Area (BWCA). In addition, on page 19, CEQ states: " ... the analyst should use the best available information to develop scenarios that predict which future actions might reasonably be expected as a result of the proposaL Such scenarios are generally based on experience obtained from similar projects located elsewhere in the region." This aligns the guidance of CEQ with the requirement of Minnesota Rules 4410.0200 regarding historic trends. So the way the FEIS ignores these historic trends goes against both state and federal rules and guidance.	S	N

27822	Unique			NEPA	Anita Tillemans		2158	4	What security is there in a mining economy that depends entirely on the market, one that will not contribute to the real long-term wealth of this area? Such an economy based on mining depends on the whims of a market. Copper mining will pollute the resources essential to our survival, perhaps into perpetuity, while providing profits and wealth to relatively few people over twenty years, more or less. After the mines have gone, as we see today, there will be masses of unemployed people, desperate, in a failing economy. Recycling metals is on the upswing and processes for this type of recovery are being more fully developed as the North Met Project is being pondered. This could make mining for copper less profitable in a very short time. The price of commodities will vary, and markets are fickle. As a consequence, copper cannot guarantee a secure future, and certainly not a green economy in the Arrowhead. Statistics abound concerning the wealth of wilderness tourism; and it cannot be reconciled with a mining scenario. When the copper mines are gone, what will be left? The choice is truly between wilderness and mining. Transport down scenic highways to and from the NorthMet Project will weave a web far beyond the sites that FEIS reviewed. Tourists will be traveling down the Superior National Forest Scenic Byway, along highways and roads to Hoyt Lakes, Embarrass, Ely, Babbitt and Silver Bay. These potential long-term customers will see the effects of mining and it will affect the tourist industry. The sounds of blasting, trucks and drilling are not conducive to wilderness by any stretch; and neither is the potential of streams and waterways polluted with sulfuric acid and other toxins from mining copper. Atmospheric conditions are unpredictable and Polymet will not be able to control these. The sounds of drilling from exploratory wells for copper and other metals can be heard in the BWCAW at this time. If Polymet gets permission to pollute and take lands in the Laurentian Uplands, there will be little peace for these areas, no chance of true wilderness experience and tourism. Jobs that create a steady future do not lie in mining a land that, once mined, is degraded. Fields that once grew wild rice, grow no more. Waters that held rich stores of fish are dead and dying. Ecosystems fail and waters need constant treatment. Wetlands that once held diverse flora and fauna are no more. This is not security.	NS	X

23226	Unique			NEPA	Bob McFarlin		906	4	The NorthMet Project FEIS meets all NEPA and MEPA requirements. The DNR should affirm the adequacy of the FEIS and move forward into the NorthMet Project’s permitting phase. Thank you for your consideration of these comments.	NS	X
60	Unique			NEPA	Bob Shannon		145	1	I just received CDs with a copy of the draft final report. In looking at my submitted comments (submission 47660 – please see text of original and transcribed comments below), I was surprised to see that they were incompletely and inaccurately reported. As a result, the details and substance of my comments were not included, categorized, or addressed in the draft FEIS report. As an environmental professional myself, I most certainly do not envy the folks responsible for responding to the large number of comments, and I appreciate the challenges involved. The fact remains, however, that you have not accurately included my comments in the draft final report. My concern is compounded since if my case is any indication of the accuracy of the larger process, , it would seem reasonable to ask if you have with reasonable accuracy and completeness identified and addressed commenters; concerns as you implied below would be done.	S	O
4	Unique			NEPA	Bob Woodbury		5	3	We need to make a decision on what we know, not what we think we know.	NS	X
4	Unique			NEPA	Bob Woodbury		6	4	This is not just a Northern Minnesota concern. It is not just a Minnesota concern. It is not just a mid-west concern. I am in Maine and I am concerned, very concerned, about the outcome. I'm sure you have received concerns from the west coast as well. That makes it a national concern. And this project is not far from the Canadian border and I'm sure many Canadians are concerned, making this an international problem.	NS	X
10157	Unique			NEPA	Bruce Trebnick		667	1	PolyMet has undergone the most extensive environmental review of any mining interest in North America and has proposed plans to responsibly extract strategic metals to support the continued maintenance infracture and the manufacture of goods necessary to sustain the USA as a leader of the free world. With copper and other ductile metals needed to support US enterprize, we should all rally to promote these interests - mining is necessary to sustain our economy. As solar and other non-petroleum energy supplies are developed, we will need copper transfer and supply grids to develop these alternate energy sources - copper is the second best means to tranfer electrical energy compared to silver. Copper has many other uses such as antimicrobial surfaces and biocide applications, construction/plumbing, wood preservatives, etc. and is an essential nutrient to all higher plants and animal life. After more than 10 years of study to assess whether copper mining will cause permanent damage to our environment, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have found that the NorthMet Mine can comply with strict state and federal environmental standards to be a supplier of strategic metals for the good of all of us. Please allow PolyMet to mine and let us (America/Minnesota) succeed as a nation that is responsible and capable of producing the metals we consume. We should take ownership and the environmental stewardship of our mining interests and not rely on other nations to supply our needs when they are often less able to fully undertake the steps necessary to protect our environment.	NS	X
27184	Unique			NEPA	Carl Sack		1683	11	Aside from the gravity of the risks from a Polymet mine, the reasons given for permitting the mine in the first place are faulty. The mine is not in the public interest; the only interests served by the Polymet mine are those of Polymet investors. The USACE and MDNR state that the mine would produce “base and precious metal precipitates and flotation concentrates...[that] would help meet domestic and global demand” for these products (page ES-11). However, the ore body that would be mined is a particularly low-grade ore body, and thus mining it is an inefficient way to meet this demand when all economic and environmental costs of the project are accounted for. Of the approximately 11.7 million tons of ore processed per year (32,000 tons per day), about 1% will be yielded as copper, 0.15% as mixed copper/nickel hydroxide, and 0.004% as platinum group element precipitate, according to the figures on page ES-23. This is in addition to the approximately 27 million tons of waste rock that will be produced annually, much of it sulfide bearing and thus environmentally dangerous. A more efficient way to meet domestic and global demand for these metals would be to improve metal and electronics recycling programs, which can reclaim much higher percentages of metals than mining the raw ore of the Northmet deposit. In 2013, metals made up 9% of municipal solid waste, according to the US EPA. Demand could also be reduced by more than the amount of metal the mine would generate by improving domestic source reduction efforts, which involve redesigning products to use less non-recycled raw materials. However, continuing to add metals from raw ores to the world market reduces the economic incentive to bolster recycling or reduce demand; new mining represents a choice to forgo sustainable development. Thus, from a metal supply standpoint, the "No Action" alternative should be preferred.	S	O
27184	Unique			NEPA	Carl Sack		1684	12	The reasons given for the Forest Service land exchange are also faulty. The threat of a lawsuit is not a good excuse for foregoing the Forest Service’s obligations to conserve the natural resources on its lands. Corporations threaten lawsuits to get their way on a regular basis, not fully intending to follow through on their threats. If Polymet is indeed willing to sue USFS over its authority to prevent surface mining on lands with privately-held mineral rights, then the question should be settled by a court of law to set legal precedent for any future cases in which this situation arises. The decision to accept a land exchange leaves this important question ambiguous, but also gives the impression that Polymet’s arguments are sound. This is a public disservice and could lead to future scenarios that are disadvantageous to USFS. Unless the law requires USFS to grant surface mining privileges to subsurface mineral rights holders, there is not adequate legal justification for giving the land to Polymet just because they want to mine it, particularly given that the mine would adversely affect the natural qualities of adjacent lands that will continue to be owned by the Forest Service.	S	O
24131	Unique			NEPA	Carlyle Conrad		1004	1	Thank you for the 7 day extension, unfortunately, this time of year is so busy with the holidays that people are missing their moment to express their concerns about this project to you.	NS	X
26016	Form Letter	1	Variant	NEPA	Carmen Elisa Bonilla Jones		1262	2	Our public lands should not be used for corporate benefit and greed. I, as a US taxpayer, have allowed my taxes to be used for the purchase and maintenance of National Parks and Public lands. I have not agreed that the lands could be gazed by cattle, logged, mined or fracked. It is imperative that the government (local, county, state or federal) stand up for the rights of its people and future generations. All mining on public lands must be stopped. These lands are considered a place to relax and get away from the noise, pollution and stress of everyday life. A place to walk and contemplate life's miracles as well as a place to see all the natural beauty and wildlife placed on this planet by our Creator. No one in government has the right to sell off what the American people have bought without first obtaining our permission. I VOTE NO! It is time that all our national parks and public lands are protected from the greed of big corporations and corrupt politicians. Again, the American taxpayer paid for the parks and their up keep. The government does not have the right to lease, sell or exchange any of the land without the peoples consent.	NS	X
29101	Unique			NEPA	Charles Zeugner		2421	2	issue, the EIS make statements that discharges will be within acceptable levels and that environmental damage will be minimal. However, modeling is probabilistic and models can not make definite claims. They can only be used to estimate a range of potential outcomes. In addition, the models can only be as good as the inputs and underlying assumptions. The input data has been questioned, and the assumptions include dubious assertions such as water flowing up hill.	NS	X
26823	Unique			NEPA	Cheryl Kallio	Multiple Groups	2965	6	For all of these reasons, we urge you to determine that this Environmental Impact Statement is “Inadequate” under state law and the National Environmental Policy Act (NEPA). An EIS is inadequate when it fails to adequately assess potentially significant environmental impacts. This letter points to just some of the inadequacies; therefore, this EIS and project should be formally rejected.	NS	X
27347	Unique			NEPA	Dan Andree		1681	1	There has been a lot of studies etc. on the idea of having a mining operation allowed near the BWCA in Northeastern Minnesota so much that it not only gets time consuming just looking and reading about it that its almost confusing not to mention exhausting.	NS	X
29735	Unique			NEPA	Dana Bloom		3888	2	2) Environmental impact of weak ability, on part of regulators, to enforce mining and environmental rules. There are a number of scenarios in which the state, and other agencies, may be unable to effectively enforce mining and environmental rules; the environmental impacts of these scenarios should be included in the EIS. Neglecting to outline the role, or absence of action, on the part of the state and other regulators, in monitoring, enforcing and controlling environmental impacts implies that the mining companies will regulate themselves. Effective state enforcement results in substantially different environmental impacts compared to scenarios where companies regulate themselves; these differences, and ways to maximize regulatory effectiveness, need to be addressed to ensure obstacles to the state’s ability to effectively enforce rules are minimized. What assurances currently exist that the state is capable of effectively enforcing rules to minimize adverse environmental impacts? Vehicle track out on highway 169, between Grand Rapids and the Chisholm area (during active scam mining), shows the state’s current lack of success in enforcing environmental rules with current mining companies. It seems like preventing iron ore dust/mud from leaving a mine site on truck tires, would be relatively easy to enforce, compared to enforcing the host of complicated environmental regulations introduced with a copper nickel operation. If the state cannot effectively enforce the existing rules, how can the public be assured the state would have better success with a more complex mining operation?	S	O

29735	Unique			NEPA	Dana Bloom		3890	4	What are some possible scenarios in which the regulators are unable to effectively control environmental impacts through regulation? A. Lack of funding for adequate regulatory staff B. Staff, empowered to make decisions, who lack the interpersonal, intrapersonal, technical skill and knowledge, and material resources to carry out effective inspections and the corresponding follow-up tasks - For example, staff might lack the ability to remain unbiased after working closely with industry representatives for years, developing friendly relationships and wanting to avoid conflict and confrontation when put into a position of having to address rule infractions. Empowered individuals within government agencies, make decisions that substantially impact the environment. As individual decisions relate to government agencies abilities to regulate PolyMet, what effective procedures does the state have in place to ensure that individual regulatory employees consistently maintain congruence between the regulatory objectives and their actions, and that they are not influenced by personal agendas (like wanting to reduce personal work load or avoid conflict with colleagues or industry)? C. Poor communication between and within regulatory agencies This comment is not about asbestos or air-quality; this comment is about the state’s lack of ability to enforce existing rules, the impact on the environment of poor enforcement, and the need for the EIS to address environmental consequences of weak government agency enforcement in order to be considered adequate.	S	N
29164	Unique			NEPA	Deborah Huskins		3604	10	Full examination of the financial assurance needed from Polymet should be undertaken at this stage, not at a later stage of the permitting process. And, “planned water treatment” may not be sufficient—it certainly is conceivable that environmental standards might change, or that the “planned water treatment” turns out not to be adequate.	S	O
23255	Unique			NEPA	Dennis Szymialis		907	1	Count One That the cooperating agencies including the Minnesota Department of Natural Resources, United States Army Corp of Engineers, and United States Forest Service, arbitrarily and capriciously composed a Supplemental Environmental Impact Statement, a Final Environmental Impact Statement, that fail in many respects to analyze environmental impacts in reference to the PolyMet mining project to avoid violations of federal United States of America law including the Clean Air Act, Clean Water Act, National Environmental Policy Act, Federal Land Management Policy Act, Hobbs Act, and other law.	NS	X

27730	Unique			NEPA	Dr. Kyle R. Crocker		2124	3	I find the present EIS to be very deeply flawed in its essential science. Most egregious is its reliance on PolyMet’s ‘data’ on area soils and hydrology. This is reprehensible, equivalent to blindly accepting BP’s estimate of crude oil spilled in the Deep Horizon catastrophe.	NS	X
3406	Form Letter	1	Variant	NEPA	Duluth Coffee Company Eric Faust		377	2	There is an alternative to the boom and bust extraction economy that benefits foreign corporations and leaves local communities worse off in the end. Our locally owned small businesses are proof positive that a more sustainable model is possible. We, and other locally owned businesses, will continue to reinvest the wealth we create into new jobs over the next 20 years. And there’s another important resource on the table the money the state will spend on environmental review, permitting and regulation of Polymet. We call on Governor Dayton to reject the Polymet proposal, and instead invest that state money in sustainable local small business development on the Range. This investment has the potential to make a larger and longer-term impact than the proposed copper-nickel mining project. WE WILL CONTRIBUTE TO JOB GROWTH AND LESSEN OUR DEMAND FOR MINERALS We will do our part to contribute to job growth in the North, and we will reach out to existing Range businesses to partner with them wherever possible. We will also continue our efforts to lessen our demand for minerals by using resources more efficiently. WE WELCOME CONTINUED CONVERSATION We know our voice is only one of many, but we feel it is necessary to say that this is more complicated than jobs vs. the environment. Both are important, and they are linked, and we hope to engage in an amicable debate about responsible mining and building a more sustainable economy in the North for generations to come. We invite other businesses across the region to reach out to us and become part of the Coalition. Sign up at DownstreamBusinessCoalition@gmail.com. And we thank the customers & suppliers that stick by us. WHO’S INVOLVED? See our members page for a list of businesses involved. MEMBERS 1 PFEIS (Preliminary Final Impact Statement, NorthMet Mining Project and Land Exchange), Minnesota Department of Natural Resources, U.S. Army Corps of Engineers and U.S. Forest Service, June 2015, pp. ES-26 and 5-8. 2 Supplemental Draft Environmental Impact Statement for the NorthMet Mining Project and Land Exchange, Appendix C, November 2013, p. 12 3 PFEIS, Figures 5.2.2-7 and 5.2.2-9	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3943	2	the 37 days offered for this comment period was far too short to review such a voluminous record. Although the public has had other opportunities to comment on earlier drafts of the EIS, this draft has changed significantly since the previous version. The Supplemental Draft EIS, released in late 2013, was an already-bloated 2481 pages with appendices. The FEIS was released at 3568 pages with the appendices. The Co-Lead Agencies drafted nearly 1100 additional pages for the FEIS, in addition to other textual changes that did not lengthen the document but changed the content, sometimes significantly. Although the agencies did make the Preliminary FEIS available for review prior to the comment period, the document underwent additional changes before it was released as a FEIS. The only way to identify these changes would have been to simply sit down and read the document, a Herculean task in and of itself before one even has an opportunity to gather one’s thoughts to prepare comments for the Co-Lead Agencies.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3944	3	Moreover, the FEIS also includes tens of thousands of pages of Reference Materials. Although the Co-Lead Agencies alleged previously that Reference Documents are not part of the record for the public these documents are not ancillary; in many cases they are the only place that substantive work and results are described. Appendix A, in which the Co-Lead Agencies respond to comments by “theme,” makes clear the extent to which the Co-Lead Agencies rely on Reference Materials. At many points where comments point out a lack of detail on any aspect of the mine, the reader is referred to one or more reference documents.3 In other words, the Reference Documents are an integral part of the FEIS for any detail-oriented commenter.. Because of the unacceptably short comment period, Conservation Organizations reserve their right to supplement these comments with additional arguments and materials.	S	O

29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3945	4	Second, we note the extraordinary degree to which the FEIS relies upon work completed by PolyMet or its consultant, Barr. In the reference documents, are Barr Engineering and 48 are PolyMet. Many of those documents were produced in 2014 and 2015. In contrast, there are only five reference documents from ERM, DNR’s consultant, and only one of those in 2014. Although 93 documents are cited to MDNR, the vast majority are publications or database citations, rather than specific work done on this mine site or for this FEIS. It is unclear why DNR would not have used its own consulting firm, ERM, or its own employees to complete at least some of the extensive work done by Barr and PolyMet, given that PolyMet bears the costs. It gives the reader the general impression that, in the wake of public comments on the SDEIS, the Co-Lead Agencies simply asked the project proponent for additional work to defend its project in the FEIS, rather than the Co-Lead Agencies making an effort to give serious consideration or independent evaluation to comments.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3946	5	Third, the Co-Lead Agencies’ efforts at “categorizing” the comments resulted in a failure to respond to technical and specific comments, many of which were made by groups or individuals with considerable expertise. Categorizing comments by “theme” placed general public comments in the same category as specific comments by experts, resulting in a lack of response to expert and technical comments. The Conservation Organizations will point out these deficiencies where they occur below, but this is a persistent problem throughout. As a result, the Conservation Organizations emphasize that our previous comments submitted on the SDEIS in early 2014 remain valid, and largely unaddressed.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3950	8	The FEIS is limited to statements that there will be a financial assurance package of some sort, and that it will meet the requirements of Minnesota Rules. If this was all the information required for an EIS to assess potential impacts and mitigation measures, than an EIS could be quite short. The section on water quality impacts, for instance, could simply state that the mine is governed by the Clean Water Act and therefore will not violate any water quality standards or other state or federal laws. But that is not how adequate EISs are written. Rather, under state and federal law, EISs must provide substantive analysis and scientific support for their statements. It is not enough to allege that the project will have no impact because it will comply with the law; if the FEIS concludes that the project will have no significant impact, the FEIS must demonstrate that the project is designed to comply with the law, and capable of minimizing potential impacts to support its statements. The reason for this is that NEPA is designed to be more than a box to be checked by agencies; an EIS is an action-forcing document designed to ensure that agencies have thoroughly studied the impacts of a project before making any irretrievable commitment of resources.	S	N
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3964-1	24	The existence of ore outside the pit envelope is a critical factor in determining whether an underground mine will be economical, because limitation to the pit envelope artificially limits the amount of ore of a particular grade that is available for mining. Co-Lead Report Table 2 provides net metal value for the five mining scenarios. Dividing this number by the total tons to be mined provides a value per ton. This exercise reveals that at the lower production rates, the minerals to be extracted have a higher per-ton value. The range is from \$60.40 per ton for the 5 million ton scenario to \$41.42 per ton for the 100 million ton scenario. These values are apparently based on how much ore there is in the pit envelope for each of the net metal values. That is, there are 5 million tons of mineable ore within the pit envelope with an average metal content worth \$60.40 per ton; 30 million tons with an average metal content worth \$51.73 per ton; and 50 million tons with an average metal content worth \$47.72 per ton. Including mineralization beyond the pit envelope would affect the amount of ore available at each net-value-per-ton level. As an example, assume that the mine could be extended into an area that would provide 50 percent more ore of a given grade than is available within the pit envelope. The outcome would be that, for example, 30 million tons of ore would grade at \$53.85 per ton (the Co-Lead Report Table 2 net metal value per ton for 20 million tons of ore) rather than \$51.73 per ton. Mining costs might go up somewhat due to the increased area to be mined, but other costs would remain the same. This could add up to \$2.12 per ton in net value, or a total of \$60 million to the mine’s profit in the 7500 tons-per-year scenario. AGP prepared both the mine plan and PolyMet’s NI 43-101 Technical Report, and thus is very knowledgeable about the NorthMet deposit. The AGP report for the underground mining economic analysis provides the following table, which indicates that for one 5000 ton-per-day scenario, more than half of the economic ore lies outside of the proposed pit: A graphic representation is also provided: In light of this evidence, Foth 2012 goes into several obfuscations as to why an economic assessment of an underground mine should be limited only to the ore in the proposed pit. The obfuscation begins with Foth’s special definition of “NorthMet deposit” for the purposes of the Underground Mining analysis: “The term NorthMet deposit used in this report will refer to NI 43-101 compliant measured and indicated mineral resources within the open pit.” The Co-Lead Agencies use information straight from the Foth 2012 report without mentioning this special definition.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3964-2	24	They thus state “The NorthMet deposit is considered to be a near-surface, bulk, low-grade mineralization,” when the reality is that most of the mineralization at the NorthMet site is not near-surface. For example, “NorthMet consists of seven igneous units that dip southeast, with most economic sulfide mineralization in the lowermost unit.” ⁵³ And: Though grades vary, Unit 1 is also mineralized to the east of the deposit, down-dip (south) to depths of at least 2,500 feet, and past the limits of expected pit development in the west. The development of waste rock stockpiles over these areas is not expected to encumber any material that could reasonably be classed as ore because the upper units are barren and the Unit 1 mineralization is from 1,700 to over 2,500 feet below ground surface. Furthermore, the statement in the FEIS that “the geology outside of the open pit has not been characterized enough to support a mine plan” is flatly untrue for at least some areas. According to PolyMet’s 2013 43-101 SEDAR filing, ore within the pit envelope accounts for “significantly less than half of measured and indicated resources. Under Canadian regulations, “measured” and “indicated” resources are used to estimate the economic viability of a potential mine. The focus of the Foth 2012 report on the identification of “mineral reserves” as a limiting factor is just another obfuscation; the term “mineral reserves” carries no additional meaning in regard to the level of characterization of the geology. Rather, “mineral reserves” simply indicates measured and indicated resources for which a mining company has prepared an economically viable mine plan. The reality is that the only reason that the economic assessment for underground mining of the NorthMet deposit has been limited to the ore within the pit envelope is because this is the ore that PolyMet plans to mine in its first stage of open pit mining.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3964-3	24	Mineral reserves were delineated based on economics and other factors specific to open pit methods. This has nothing to do with the level of characterization of the geology. And using the same specified ore body to assess the economic viability of underground mining is an exercise designed to fail. Measured and indicated resources do not become mineral reserves until a mine company has a mine plan showing that they can be mined economically using a particular mining method. To put it another way, with regard to an underground mine, minerals within the pit envelope can no more be referred to as “mineral reserves” than can those outside of the pit envelope. Cutting the assessment off at the boundary of the proposed pit is completely arbitrary. The Foth 2012 report is at best disingenuous in its explanation of the deposit and what is known about it: There is mineralized rock outside of the volume of rock contained within the proposed open-pit. This mineralized rock occurs below the open-pit. While this mineralized rock is excluded from this report, speculatively it may be possible for it to be economically viable to extract decades in the future. Only approximately 10% of the measured and indicated resource is below the open-pit. Compare this to the statement from PolyMet’s SEDAR filing quoted above: “The pit plan is not fully optimized and the 20-year permit application covers significantly less than half of the measured and indicated resources.” The SEDAR filing reports measured and indicated resources of 442 to 694 million tons. Mineral reserves (i.e., measured and indicated resources within the pit envelope) are reported at 274.7 million tons. Perhaps the Foth 2012 statement can be regarded as technically true if only 10 percent of measured and indicated resources lie directly underneath the planned pit; however it is clearly not true that only 10 percent of the measured and indicated resources are located outside the pit envelope at a depth amenable to underground mining. Foth 2012 goes on to discuss “inferred resource” to further confuse matters: “The majority of inferred resource defined by PolyMet (2008) is below the open-pit. There is a lack of geological data to characterize the deep mineralized rock that in turn results in a lack of geological confidence leading to the inferred classification.”		
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3964-4	24	Once again, this may be technically true as applied only to the inferred resources, and yet misleading in regard to measured and indicated resources. In other words, the presence of inferred resources at depth does not mean that significant amounts of measured and indicated resources are not also present at depth. While it is likely true that PolyMet has insufficient information for some areas of mineralization to include them in an economic analysis, it is also true that there are mineralized areas outside of the mine pit for which it does have sufficient information. In the 1970’s U.S. Steel (USS) engaged in a very extensive program of drilling to define an underground mining resource. According to PolyMet’s geology background document “There is every indication that the sampling and analytical work performed by USS was thorough, professional, of a high standard, and reliable.” All of the USS drill core and data is available to PolyMet, and much of it is in PolyMet’s database. As of 2007, USS had obtained more linear feet of drill core and had drilled almost as many holes as PolyMet. The USS drilling was all done with the intent of developing an underground mine, and is thus concentrated in the areas where mineralization was known to be greatest at depth. While about 50 percent of the USS drill core has not yet been assayed, it is available at the Coleraine Minerals Research Laboratory. NEPA requires agencies to undertake necessary research when important relevant information is not readily available but could be obtained. Refusing to assess an important and potentially viable alternative based on lack of information when the missing information is obtainable does not comply with NEPA.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3970	35	The FEIS fails to provide adequate analysis of the effectiveness of mitigation measures, and the impacts of reasonably foreseeable accidents and failures. Where the FEIS relies on mitigation measures as its reason for not disclosing impacts should those mitigation measures fail, it must include a discussion of the efficacy and certainty of the mitigation measures. That discussion must include whether the measures are proven or theoretical and the degree to which they have worked as planned at other facilities. The agencies must also assess the probability of accidents, and make a holistic assessment of accident risk for all mining features.	NS	X

				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-1	36	PolyMet relies on a number of engineered systems to minimize impacts on the environment from the proposed mine. This is no different than what is done for every modern industrial mine around the world indeed it is legally required in virtually any jurisdiction. Each mine plan is designed to address the particular difficulties of the site, the ore body, and the mining and processing methods. The FEIS presents the NorthMet mine plan as though it identifies the perfect engineered systems that will result in a mine with no accidents, no failures, and no errors in the systems as designed, installed, or maintained. Mining companies throughout history have laid out plans to minimize environmental impacts. And yet significant environmental impacts often occur, as demonstrated in recent global mining catastrophes highlighted in the media. Given the size of the proposed mine and its location in one of the wettest parts of the United States, concern for accidents, failures, and unforeseen design, installation, and maintenance errors should be heightened rather than dismissed. NEPA requires that to the extent that errors, accidents, and failures are reasonably foreseeable over the expected life of the project (i.e., more than five hundred years), the potential impacts must be disclosed in the FEIS. The FEIS completely fails to meet this requirement. This shortcoming affects virtually every aspect of the mine plan and the FEIS. It was raised generally and in relation to several specific mine features in our comments on the SDEIS at MCEA 3, 5–6, 22, 40–54 Friends 1–8, 32–37, 39–40 CBD 33–45, 57–59 and in our supplemental letter on the Mt. Polley tailings basin disaster in British Columbia. All of these materials along with exhibits cited therein are incorporated herein. The legal requirement begins with the most elementary aspect of NEPA review an EIS must disclose all reasonably foreseeable significant impacts of a proposed project. Both the CEQ and the courts recognize that this involves some conjecture in many situations, whether or not a particular impact will occur cannot be known with any certainty at the time an EIS is prepared. But this does not allow an agency to ignore the possibility of impacts.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-2	36	In the face of uncertainty, an agency must provide a scientifically defensible assessment of the likelihood of the impact’s occurrence, and a discussion of the potential effects commensurate with the likelihood and severity of those effects.105 In a situation where errors, accidents, and failures could result in significant impacts, “[t]hat circumstance obliges the agency to undertake risk assessment an estimate of both the consequences that might occur and the probability of their occurrence.” While “NEPA does not require consideration of risks that are ‘merely speculative’ or ‘infinitesimal,’” it also does not allow an agency to ignore risks based on unsupported assumptions that errors, accidents, and failures will not occur. To use waste storage facilities as an example, the FEIS Response to Comments Theme GT 15 acknowledges that “If incorrectly designed, constructed or managed, or from other unforeseen circumstances, waste material storage facilities would have the potential to result in increased hydrologic and/or water quality effects and could potentially lead to slope or dam failure.” Pursuant to NEPA, this acknowledged fact necessitates a risk assessment addressing “an estimate of both the consequences that might occur and the probability of their occurrence.” In the NorthMet FEIS, however “hypothetical failure scenarios are not assessed,” apparently because the Co-Lead Agencies believe that “design and safety requirements, including adaptive management procedures” will work perfectly for hundreds of years.109 Theme WR 129 makes the statement “With appropriate monitoring and pre-planned contingency actions, and adequate financial assurance, it is technically feasible to maintain the operation of engineered systems indefinitely into the future.” Unfortunately, technical feasibility has never been enough to prevent accidents and failures. And history is replete with engineered systems that theoretically should have worked perfectly, but nonetheless eventually revealed that the engineers who designed them or the workers who built and maintained them were not themselves infallible, not to mention myriad external forces beyond human control. Human Error It is often noted that while the safety and reliability of engineered systems in-and-of-themselves continues to improve over time, the propensity for human error does not. Across numerous industries, the percentage of errors caused by human error is estimated at about 80 percent.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-3	36	Thus despite the technological advances that have been made in aviation, maritime shipping, medicine, IT, and many other industries, accident and failure rates decrease far more slowly than would be expected given improvements in technology. In a study of “operation events” that represented some sort of operations failure at nuclear power plants, the U.S. Nuclear Regulatory Commission made the following observations 1. Human error contributed significantly to risk in nearly all events analyzed. Forty-one percent of events involved partial or complete loss of either onsite or offsite power, 22 percent involved loss of Emergency Core Cooling Systems (ECCS) and 19 percent involved loss of feedwater. . . . The average human error contribution to the change in risk was 62 percent. 2. Latent errors were present in every event analyzed and were more predominant than active errors by a ratio of 4 to 1. Latent errors were noted in all facets of performance studied, including operations, design and design change work practices, maintenance practices and maintenance work controls, procedures and procedure development, corrective action program, and management supervision. . . . 3. Without exception, the operating events analyzed included multiple contributing factors. On the average, the thirty-seven events contained four or more human errors in combination with hardware failures. Fifty percent of events contained five or more errors. Many events contained between six and eight human errors. 4. Human errors can result in the failure or increased likelihood of failure of risk-significant equipment. For a sample of ten events with the highest event importance, human error was determined to contribute to component failure.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-4	36	There were three events where a single human error contributed to a single PRA [Probabilistic Risk Assessment] basic event, and seven events where multiple human errors contributed to multiple PRA basic events. . . . 5. Design and design change work practice errors were present in 81 percent of events, maintenance practices and maintenance work control errors were present in 76 percent of events, and operations errors were present in 54 percent of events. Additionally, more maintenance and operations errors mapped to basic events in the PRA model than did design and design change errors. 6. Forty-one percent of the analyzed events demonstrated evidence of failure to monitor, observe, or otherwise respond to negative trends, industry notices, or design problems. This suggests that inadequacies in licensee corrective action programs may play an important role in influencing operating events. These findings are mirrored in the recommendations of the Independent Expert Engineering Investigation and Review Panel on the Mt. Polley Tailings Storage Facility Breach in British Columbia. While the focus of the report was on dam design and construction and the underlying geology, the Independent Panel turned its attention squarely toward human error in its recommendations Tailings dams are complex systems that have evolved over the years. They are also unforgiving systems, in terms of the number of things that have to go right. Their reliability is contingent on consistently flawless execution in planning, in subsurface investigation, in analysis and design, in construction quality, in operational diligence, in monitoring, in regulatory actions, and in risk management at every level. All of these activities are subject to human error. Human error is often, if not always, found to play a key role in technological failures. And human error will always be with us, as much as we might wish it to be otherwise. This is why failures invariably bring about improvements in technology that help compensate for human error. In perhaps the most notorious containment failure, double-hulled tankers were mandated after the Exxon Valdez oil spill. Similarly, improvements to rail tank cars are being adopted in the wake of the Lac-Mégantic tragedy. But tailings dams have no such redundancies. Without exception, dam breaches produce tailings releases.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-5	36	This is why best practices can only go so far in improving the safety of tailings technology that has not fundamentally changed in the past hundred years. Improving technology to ensure against failures requires eliminating water both on and in the tailings water on the surface, and water contained in the interparticle voids. Only this can provide the kind of failsafe redundancy that prevents releases no matter what. In terms of portfolio risk, Appendix I shows that this works by reducing the inventory of active tailings dams subject to failure in the first place. Simply put, dam failures are reduced by reducing the number of dams that can fail. The Independent Panel recommends that all future tailings storage facilities be in the form of dry stack tailings because failures due to human error cannot be completely guarded against, and dry stack tailings facilities cannot fail. To repeat the words of the Co-Lead Agencies “If incorrectly designed, constructed or managed, or from other unforeseen circumstances, waste material storage facilities would have the potential to result in increased hydrologic and/or water quality effects and could potentially lead to slope or dam failure.” Recognizing that this potential always exists at conventional dams due to the stubborn problem of human error, the Panel recommended a method that will not lead to hydrologic or water quality effects regardless of human error. It should be obvious from this discussion that as long as engineered systems are dependent on human design, operation, and maintenance, theoretically perfect engineering will not eliminate the risk of accidents, failures, and releases of pollutants to the environment. The risk of human error is always foreseeable. While it is true that the likelihood of a given failure event and the degree of impact it would have are unknown, this does not foreclose a qualitative discussion of the risk. Furthermore, statistical analyses exist for many mine features that allow for a quantitative assessment some of these are discussed below. Modern industry has developed many methods of assessing risks from engineering and materials failures, natural catastrophic events, and human error.		
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3973-6	36	These methods are used routinely by responsible safety and financial managers in many industries, including mining. These methods draw from past experience to quantify the risk of accidents and failures at industrial facilities, including those caused by human error. A good example of the assessment and disclosure of risks based on statistics drawn from past experience is provided by the U.S. EPA’s assessment of the potential impacts of the proposed Pebble Mine in Alaska. The Co-Lead Agencies dismiss this report, saying it does not address a specific mining proposal, and is therefore not applicable. But historical experience at mining sites in general can and should inform the statistical risk of accidents at a particular mine site. While the FEIS may point out situations where it has mitigated risk as compared to other sites, it is not appropriate to evaluate risk in a vacuum. Indeed, there are some cases where statistical risk at a generic mine appears indistinguishable from statistical risks at the PolyMet site. For instance, there is no reason why PolyMet’s pipelines are less likely to break or cause spills than pipelines at other locations. And while PolyMet’s wastewater treatment strategy may be unique to the pollutants at the site, there is no reason why their technology is less likely to break down. In fact, as observed by Dr. Miller, it may be more likely to break down due to its complexity. Similarly, PolyMet’s tailings dam seems just as vulnerable to breach as tailings dams at other locations, if not more so.	S	N

				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-1	38	NEPA requires that an EIS include a discussion of “means to mitigate adverse environmental impacts. “The NorthMet FEIS is replete with mitigation measures; however it does not address the uncertainty of their effectiveness or the risk that they will not operate as intended. Rather, it assumes that all mitigation measures work perfectly, for hundreds of years if not forever. This is not the approach to mitigation measures required by NEPA: [NEPA] does require that an EIS discuss mitigation measures, with “sufficient detail to ensure that environmental consequences have been fairly evaluated.” Methow Valley, 490 U.S. at 352, 109 S.Ct. 1835. An essential component of a reasonably complete mitigation discussion is an assessment of whether the proposed mitigation measures can be effective. Compare Neighbors of Cuddy Mountain v. U.S. Forest Service, 137 F.3d 1372, 1381 (9th Cir.1998) (disapproving an EIS that lacked such an assessment) with Okanogan Highlands Alliance v. Williams, 236 F.3d 468, 477 (9th Cir.2000) (upholding an EIS where “[e]ach mitigating process was evaluated separately and given an effectiveness rating”). The Supreme Court has required a mitigation discussion precisely for the purpose of evaluating whether anticipated environmental impacts can be avoided. Methow Valley, 490 U.S. at 351–52, 109 S.Ct. 1835(citing 42 U.S.C. § 4332(C)(ii)). A mitigation discussion without at least some evaluation of effectiveness is useless in making that determination. Furthermore, the “evaluation of effectiveness” must be supported by substantive evidence: [T]he Court holds that the Corps’ reliance on mitigation measures that were unsupported by any evidence in the record cannot be given deference under NEPA. The Court remands to the Corps for further findings on cumulative impacts, impacts to ranchlands, and the efficacy of mitigation measures. Several examples are provided below for which the FEIS fails to provide information about the uncertainty of the effectiveness of particular engineered systems or mitigation measures. Rather than preparing a risk assessment to account for uncertainty and potential errors, accidents, and failures, the FEIS repeatedly invokes the phrase “adaptive management.” Whatever might go wrong with the project, all will be corrected by adaptive management. This approach also runs afoul of NEPA, because it postpones the disclosure of environmental impacts until after a project has been undertaken.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-2	38	Most of the promises of adaptive management in the FEIS amount to nothing more than the promise to make changes after problems occur. While of course a company must make changes if problems occur, this cannot substitute for revealing the potential for problems before the project is permitted. As the U.S. Court of Appeals for the Ninth Circuit put it, “The agency cannot increase the risk of harm to the environment and then perform its studies. . . . This approach has the process exactly backwards.” In adopting 40 C.F.R. 1502.22(b), which addresses how to proceed in the face of uncertainty, the CEQ stated: It must be remembered that the basic thrust of an agency’s responsibilities under NEPA is to predict the environmental effects of proposed action before the action is taken and make those effects known. Reasonable forecasting and speculation is thus implicit in NEPA, and we must reject any attempt by agencies to shirk their responsibilities under NEPA by labeling any and all discussion of future environmental effects as “crystal ball inquiry.” Furthermore, adaptive management plans are themselves subject to the same risks and uncertainty that pertain to engineered systems as initially planned. The FEIS mentions a number of possible “fixes” for problems that may arise, but once again fails to discuss the uncertainty as to whether they will actually be effective. The FEIS simply assumes that all problems can be fixed. As the U.S. District Court for the Western District of Wisconsin put it in addressing unplanned, unpredicted water quality violations at the Flambeau Mine in Wisconsin: the mining company could not be expected to end its discharges, because to do so would require it to “stop the rain.” If the history of mining and hazardous waste sites has taught us anything, it is the unfortunate reality that not all unforeseen results can be fixed to the point of meeting environmental standards. Although the FEIS relies on promises of “adaptive management” to evade an assessment of risks to natural resources, it does not provide adequate adaptive management plans to cover most of these risks. These statements amount to little more than promises to fix any problems that occur. The FEIS provides no basis for the assumption that impacts can and will be limited to the impacts discussed in the FEIS. The reference documents include several adaptive management plans for different systems, which are reviewed in comments from the Center for Science in Public Participation (CSP2).126 As CSP2 points out, PolyMet’s proposed use of Adaptive Management is problematic because most of its applications do not include important features of adaptive management.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-3	38	Most of the proposed Adaptive Management Plans are in fact more akin to normal project management where project activities and plans are modified as necessary and appropriate based on changed conditions, failed activities, leaks, improvements in available technologies, etc. CSP2’s comments on adaptive management plans are incorporated herein by reference. There are essentially two categories of Adaptive Management measures discussed in the FEIS. The first are systems that are designed with some flexibility involved and with some planning of the steps to be taken if certain contingencies occur. The FEIS refers to these systems as “adaptive,” while other systems are referred to as “fixed.” The adaptive systems are the Waste Water Treatment Plant and Facility, the Category I Stockpile cover, the HRF cover, and the Tailings Basin pond liner. All other systems are considered “fixed,” including the containment and collection systems and the HRF liner. The FEIS does not provide true adaptive management plans for any of the fixed systems, and no arrangement is planned to ensure that they can be paid for if needed. In regards to these systems, CSP2 notes: “It is not sufficient to just monitor activities and commit to possibly implementing from a list of contingencies when a problem is discovered. This is not adaptive management - it is the mine operator responding to a problem without clear commitment to meaningful adaptive process or outcome.” The FEIS includes a section entitled “Contingency Mitigation” starting on page 5-239. These are measures that are “not initially included in financial assurance,” and hence it is completely unclear how they will be paid for, particularly if the condition does not arise or is not discovered until after the mine closes and PolyMet no longer has a source of revenue. The list of potential problems includes: ☐ Overflow of process water sumps or ponds;☐ Water quality problems in streams due to rail transport; ☐ Groundwater quality noncompliance due to liner issues;☐ West Pit water not as expected; ☐ Greater inflow to pits than expected; ☐ New surface seepage locations below the Tailings Basin; ☐ Tailings Basin water not as expected; ☐ Water quality downstream from Tailings Basin not as expected; ☐ Northward flow of pit water. For each of these potential problems, the FEIS suggests mitigation measures that could be used to address the problems if they arise.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-4	38	These suggestions do not come close to constituting an adaptive management plan, and this particular section of the FEIS does not refer to them as such. But throughout the FEIS and especially in the Response to Comments, these suggestions are elevated to the status of “adaptive management,” making it appear that PolyMet and the Co-lead Agencies have a plan to address problems that arise, when that is simply not true. In general, wherever a question is raised regarding the certainty of the mine plan and the engineered systems’ ability to meet regulatory requirements and otherwise protect the environment, the response is that no assessment is needed, because “adaptive management” will be used to fix the problem. For example, Comment Theme GT 15 states, “The SDEIS does not properly address the potential environmental consequences of a geotechnical failure due to unplanned and catastrophic events (e.g. extreme weather events, equipment failure, human error) at the Tailings Basin, Hydrometallurgical Residue facility, stockpiles, or pit.” The response is, “Because the risk of failure is mitigated through application of design and safety requirements, including adaptive management procedures, the potential effects of hypothetical failure scenarios are not assessed in the FEIS.”128 But there is no adaptive management plan that addresses problems that arise due to extreme weather events, equipment failure, and human error. FEIS App. A. As another example, Theme AQ 05 asks about “sulfates and toxic metals . . . that are not captured for treatment.” The response: “The NorthMet Project Proposed Action is designed to capture sulfates and metals with engineering controls and adaptive management.” But there is no adaptive management plan (and no money will be set aside) to address solutes that leach to groundwater. Although the list cited above does mention some potential ways that the problem could be addressed, the FEIS does not review the efficacy of those methods and how they would be paid for. Regardless of whether the suggestions for possible “fixes” described for the problems listed above are referred to as “adaptive management” or as “contingency mitigation,” they do not obviate the need to provide disclosure of the risk of the problem occurring, and the potential impacts if the problem does occur.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-5	38	The FEIS and reference documents provide absolutely no support for the assumptions that these measures will work at this site and that money will be available to pay for them. This violates the NEPA requirement that mitigation measures be described in sufficient detail to determine whether the risks to the environment can in fact be avoided. One of the FEIS sections that relies most heavily on “adaptive management” without an adaptive management plan is the section on indirect impacts to wetlands. According to the Executive Summary, In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented, such as expanded monitoring and hydrologic controls. Additionally, compensatory mitigation would be required if indirect impacts were identified during annual reporting. Permit conditions would likely include an adaptive management plan to account for any additional impacts that may be identified in the annual monitoring and reporting. The words “adaptive management practices . . . such as expanded monitoring and hydrologic controls” come up in several places, but just what those “hydrologic controls” might be is never revealed. Similarly, the introduction to the section on indirect impacts to wetlands states, “permit conditions would include an adaptive management plan, summarized below, to account for any additional effects that may be identified in the annual monitoring and reporting.” As far as we can tell, there are no adaptive management practices identified for indirect wetland impacts, nor is there an adaptive management plan to guide what will be done when monitoring reveals a certain level of impact. Perhaps the words “adaptive management plan, summarized below” are a misprint; what is summarized below in that section of the FEIS is an adaptive monitoring plan. Two paragraphs are provided under the heading “Indirect Effects Mitigation.”		
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3975-6	38	This section begins, “If it is determined that indirect wetland effects occurred based on the criteria effects threshold levels, PolyMet would work with the appropriate agencies to respond, which could require PolyMet to provide compensatory mitigation for any documented indirect effects.” This section discusses only compensatory mitigation – absolutely nothing about adaptive management to maintain hydrology, water quality standards, or vegetation. In sum, despite appearing to promise that adaptive management measures would be used to address indirect impacts to wetlands, no such measures are identified, and it does not appear that this is in fact the plan. This is particularly problematic for certain indirect impacts such as degradation of water quality, which cannot be mitigated under Clean Water Act regulations. Thus if an EIS predicts violations of water quality standards, the Section 404 permit must be denied. The Co-lead Agencies have refused to assess whether the project might result in water quality standard violations in wetlands, but promise to monitor after the project is permitted. And the outcome if violations are discovered will apparently be to require compensatory mitigation. This is clearly not sufficient to meet the requirements of either NEPA or the Clean Water Act.	S	O

				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3980-1	40	Furthermore, even before mining ceases, there is no guarantee that the mining company will have the money for additional financial assurance to cover contingencies as they arise. In fact, a typical scenario at a mine that becomes a Superfund site is that the mine begins with financial assurance set aside to cover reclamation costs, just as is planned for PolyMet. A problem occurs, which in this case could be anything on the list above, or many other possibilities that have not yet been recognized. Environmental standards are violated, and the regulatory agency seeks money from the mining company to address it. Often it is precisely this cost that drives the mining company into bankruptcy. In regard to the length of time over which systems may need to be maintained and/or operated, a number of risks become foreseeable that would not be an issue for a project that would be maintenance-free within a reasonable time following the cessation of mineral extraction. For example, over a 500-year period the risk of societal change resulting in a disruption in regulatory oversight or the failure of financial institutions becomes foreseeable, where it would not be considered foreseeable over a 50-year period. The FEIS does not discuss the fact that governments and other institutions do not last as long as may be necessary to ensure the continued maintenance and/or operation of systems at the NorthMet site. However, the same issue has been thoroughly vetted in the context of storage and disposal of nuclear waste, where governments and experts have uniformly reached the conclusion that long-term storage requiring active maintenance is ultimately not an appropriate option. Quoting from the International Atomic Energy Agency: All human made facilities require maintenance to preserve their integrity. It follows that if the integrity of a structure is essential to protecting the health and safety of people and the environment, ongoing maintenance will be required to avoid gradual deterioration of the protection afforded by the facility.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3980-2	40	Ongoing maintenance requires the continued existence of authorities and institutions that can ensure that essential maintenance is carried out. Since adequate protection of humans and the environment will continue only as long as maintenance is continued on storage facilities, and since some of the radioactive material in storage will remain hazardous for many thousands of years, maintenance — or institutional control — would be required for such periods of time or until permanent disposal is implemented. A review of world history reveals that turmoil and change usually occur in much shorter periods of time and therefore that it is unlikely that any societal infrastructure currently in place or envisaged would last for the time period needed.138 And: The safety of long term storage requires the maintenance of the industrial, regulatory and security infrastructure as described in previous sections. Long term safety also requires that future societies will be in a position to exercise active control over these materials and maintain effective transfer of responsibility, knowledge and information from generation to generation. Long term storage is only sustainable if future societies can maintain these responsibilities. Active controls cannot be guaranteed in perpetuity because there is no guarantee that the necessary societal infrastructure can be maintained in perpetuity. Therefore, for the types of radioactive wastes considered here—wastes that remain hazardous for thousands of years—perpetual storage is not considered to be either feasible or acceptable.139 As consistently acknowledged by nuclear regulatory agencies, “turmoil and change” in human institutions is foreseeable over the time frames for which maintenance activities may be required at the NorthMet site. The risks to the environment from such turmoil and change therefore must be disclosed in the FEIS. Aside from the issue of the longevity of human institutions, activities stretching over hundreds of years also present a much greater risk to the environment due simply to probabilities over time. For example, if the probability of a wastewater treatment plant malfunction and resulting release of polluted water to the environment is 1 per 50 years and wastewater treatment was planned to operate for 25 years, there would be a 50 percent probability of such an event during the lifetime of the project. On the other hand, if wastewater treatment is planned for a 500-year period, 10 such events could be expected.		
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3980-3	40	The probability of a major failure resulting in severe impacts would also be correspondingly higher. Such information is absolutely critical to a determination as to whether the benefits of a project are worth the impacts and risks. If, for example, a tailings basin dam must hold for more than 500 years, and the probability of a catastrophic breach over that time approaches even 5 percent, one would hope that the Co-Lead Agencies care enough for future generations not to leave them with that risk. As one court put it: “Any substantial risk that the dam could fail would be intolerable; and, if the agency were to proceed in the face of that risk, that would constitute an abuse of agency discretion.”140 And from the Independent Panel on the Mt. Polley dam breach: In risk-based dam safety practice for conventional water dams, some particular level of tolerable risk is often specified that, in turn, implies some tolerable failure rate. The Panel does not accept the concept of a tolerable failure rate for tailings dams. To do so, no matter how small, would institutionalize failure. First Nations will not accept this, the public will not permit it, government will not allow it, and the mining industry will not survive it.141 Disclosing the statistical probability of failure over the time period that the tailings basin dam will need to hold (based on past experience, which accounts for human error, rather than on engineering calculations, which do not) would constitute the “hard look” required by NEPA. Instead, the Co-Lead Agencies have avoided learning about the probabilities of accidents and failures over an extended time frame so that they can pass the risk on to future generations without troubling their conscience. The lack of risk assessment is a systemic problem affecting virtually every aspect of the FEIS, and time does not allow identification of all of the systems and uncertainties involved. The following discussion identifies only the most obvious issues. Preparation of a new supplemental draft EIS that provides a comprehensive risk assessment should not be limited to these issues.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3995	48	While the comments submitted on the SDEIS went into considerable detail on how to remedy the mistakes in analysis and research, it appears from the response to comments that no significant additions were made to the FEIS to correct these many omissions and mistakes. Nor does the FEIS or Response to Comments address most of Dr. Malusis’s suggestions. Failure to respond to his specific comments violates CEQ NEPA regulations. “Final environmental impact statements shall respond to comments . . . [and agencies] shall discuss at appropriate points in the final statement any responsible opposing view which was not adequately discussed in the draft statement. . .”163 Moreover, where the FEIS did respond to his points it still fell short of assessing uncertainty and risk and disclosing the potential environmental consequences.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	3998	51	Responses also highlight the fact that the FEIS’s analysis is incomplete. The statement that “Additional geotechnical analysis and design details would be required for permitting, including more detail on the foundation material characteristics, design details to ensure foundation and liner integrity, and details on the installation, operation, monitoring, and maintenance of the liners, covers, and stockpiles”168 admits that the FEIS analysis does not cover significant details that will affect the degree of environmental impact. Without this information, the agencies cannot confidently say what the environmental impacts of this proposed project will be, therefore this assessment does not satisfy NEPA.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4022	75	In response to comments, the Co-Lead Agencies asked Barr Engineering to prepare, among other documents, a Memorandum on the four containment systems, and a sensitivity analysis of various inputs into the water model. The Memorandum on the containment systems begins as follows: The Co-Lead Agencies have requested a summary of the four containment systems that are planned for the NorthMet Project (Mine Site and Flotation Tailings Basin [FTB]) and the justification for how they are represented in the water quality (GoldSim) modeling. This memorandum represents the rationale for the modeling assumptions for each of the following containment systems: ● FTB Seepage Containment System (north and west) ● FTB Seepage Containment System (east) ● FTB South Seepage Management System ● Category 1 Waste Rock Stockpile Groundwater Containment System. The Co-Lead Agencies requested a “justification” for how the containment systems are represented—not a response to substantive questions raised by public comment. Notice also that the Co-Lead Agencies did not request this “justification” from their own staff or consultants, but from the project proponents consultants. According to the project proponent’s consultant, capturing 100 percent of the surface water discharge and 90 percent of the groundwater discharge is a “conservative” assumption. In a second memo prepared by Barr entitled “Sensitivity Analysis of the NorthMet Water Quality Models,” Barr stated that although it would describe its sensitivity analysis to see if various changes to the model would change the outputs: Because of the proposed engineering controls and the adaptive water management strategy, it is not expected that the modeled concentrations in the Partridge River would exhibit much sensitivity to most input variables for the Mine Site water quality modeling, except those inputs that control water quantity and quality from unimpacted portions of the watersheds. If this expectation is borne out in the sensitivity analysis, the results will be positive with respect to the potential for environmental impacts: this will indicate that as long as the engineering controls perform as planned and the adaptive water management strategy is able to achieve its objectives, there is little likelihood that a mischaracterized input variable would result in unforeseen environmental outcomes. In other words, PolyMet’s consultant would do the work, but the outcome was preordained by the assumptions in the model. This demonstrates that the Co-Lead Agencies have not taken a “hard look” at the water quality impacts of the PolyMet proposal.	NS	X
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4025	80	The willingness of the Co-Lead Agencies to accept PolyMet’s promises at face value, without assessing their practicality or the likelihood that they would be effective, abrogates the agencies’ responsibilities to the public.	NS	X

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4033	91	The FEIS must assess water quality impacts from groundwater discharge to the Partridge River at any point where those impacts may be the greatest, including the point where the river comes closest to mine features. The FEIS cannot omit impacts on the river upstream of SW-004 unless it provides adequate data showing that those impacts will be less than the impacts at SW-004 and below. This issue was raised in our comments on the SDEIS at CBD 6 - 9, which is incorporated herein by reference. We asked Keith Gadway, principle of Quantum Environmental, Inc. in Ann Arbor, Michigan, to review the FEIS and our SDEIS comments in regards to this issue. His response is included as an expert report. The methodology for assessing water quality impacts included assigning a number in the model to represent the distance between mine features and the river. This was apparently based on the average distance to the river within the flowpath.223 As such, the accuracy of the location and width of the flowpaths becomes important. FEIS Figure 5.2.2-7 shows the flowpaths as estimated for the GoldSim modeling. Note that point SW-003 is the closest point to the Partridge River from the Category 2/3 stockpile. However, the East Pit/Category 2/3 Flowpath was deliberately drawn to begin just below this point, and no assessment was made of the impact of leachate from the stockpile on surface water quality in this location.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4035	97	The EIS must disclose the predicted quality of publicly-owned water within the property boundary, including groundwater. This issue was discussed in our comments on the SDEIS at CBD 12 - 15 (surface water) and 20 - 21 (groundwater), which are incorporated herein. Allowing a landowner to pollute groundwater to the property boundary and failing to disclose the level of that pollution in environmental review are both unconscionable in this case. The property here covers close to thirty square miles,229 or about half the size of the city of Minneapolis. A number of streams have their headwaters within the property. Both the streams and the groundwater below the property are public resources, as explained in our comments on the SDEIS. In regard to groundwater, the Response to Comments asserts without basis that assessing impacts at the property boundary “is typically used in EISs for mining and industrial facilities.” We are not sure what is meant by this statement, but after scanning a number of recent mining EISs, we do not believe that it is true. We did not find a single EIS that provided quantified information on predicted water quality at the property boundary that did not also provide information for predicted water quality in pit lakes and backfilled pits. Most of the EISs we surveyed predicted no impacts on groundwater quality even within the mining area. The two EISs we found that did quantify impacts to groundwater included information on water quality within or under the mine workings following reclamation.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4038	100	The discussion of “passive” treatment in the FEIS is misleading and should be removed. The “passive” or “non-mechanical” treatment is as yet undeveloped, and there is no evidence that it will ever prove technically capable of treating water at this site to the levels used for the WWTF effluent in the water quality modeling. While the FEIS does state that the agencies are not relying on passive treatment for water quality predictions, and that the need for mechanical water treatment is assumed to be long-term, the placement of the material on passive treatment has the effect of insinuating that this assumption probably will not prove true. This insinuation in concert with the failure to define “long-term” does not provide the “hard look” at the need for perpetual treatment.233 The FEIS and supporting documents assume throughout that unproven passive treatment systems will be implemented. For instance, the FEIS contains a section describing the predicted transition from mechanical to non-mechanical treatment: As described in the Water Management section above, water modeling for the NorthMet Project Proposed Action and the environmental analysis in Chapter 5 assumes that mechanical water treatment would continue indefinitely. PolyMet would include funds in its contingency reclamation estimate and financial assurance package to operate mechanical water treatment for as long as necessary as a part of its Permit to Mine. However, the Permit to Mine would also require PolyMet to present a plan for eventual transition from mechanical water treatment to non-mechanical water treatment, and to adjust its financial assurance on an annual basis in accordance with Minnesota Rules, part 6132.1200 to conform to the transition. This section provides an overview of the transitional approach from mechanical water treatment to the use of non-mechanical treatment technologies. PolyMet would transition from mechanical to non-mechanical water treatment as soon as the company demonstrates that non-mechanical water treatment technologies would effectively treat water to meet water quality based effluent limits and as soon as formal approval is received from the agencies. Non-mechanical water treatment technologies need to be designed for site-specific conditions and actual site water quality. PolyMet accordingly would test non-mechanical water treatment technologies for several years during mine operations and reclamation, until an acceptable treatment performance could be achieved. Non-mechanical water treatment technologies can be evaluated in the following steps: 1) collection of additional local site information (i.e., hydrology and influent water quality), 2) laboratory testing, 3) pilot-scale testing, 4) design of a system for full-scale implementation, and 5) continued evaluation of effectiveness over time. The conceptual design for a non-mechanical treatment system is to treat each flow expected in the long term. The Adaptive Water Management Plan (PolyMet 2015d) outlines preliminary/conceptual information on non-mechanical treatment systems. PolyMet has initiated testing of non-mechanical water treatment technologies on site (in collaboration with Cliffs Erie) and will continue testing these systems and evaluating other non-mechanical water treatment technologies until they could be demonstrated to the satisfaction of the MDNR and MPCA to provide the required water treatment. Provisions would be included in the NorthMet Project financial assurance package to ensure this test work and implementation of the non-mechanical water treatment technologies could be completed.234 The Adaptive Water Management Plan, cited in the FEIS above, treats the transition to non-mechanical treatment as a certainty, with the only question being timing: The ultimate goal of long-term closure (Figure 2-4 and Figure 2-5) is to transition from the mechanical treatment provided by the WWTF to non-mechanical treatment. Because non-mechanical treatment designs are very site-specific and very dependent on the quality of the water to be treated, it is assumed that the WWTF will operate in the long-term and the transition to non-mechanical treatment will take place only after the performance of a non-mechanical system has been tested on site, proven effective, and approved by the agencies. The two non-mechanical treatment systems at the Mine Site are independent of each other. It is expected that the Category 1 Waste Rock Stockpile Non-Mechanical Treatment System will be deployed earlier than the West Pit Overflow Non-Mechanical Treatment System, as described in Sections 6.2 and 6.3. As noted previously, water from the Category 1 Waste Rock Stockpile will continue to be treated by the WWTF until non-mechanical treatment with gravity discharge to the West Pit has been proven to provide appropriate treatment. This may occur during reclamation or long-term closure... Operation of the WWTF will occur year-round with the discharge directed to a small watercourse that flows into the Partridge River until non-mechanical treatment has been proven effective at achieving water quality objectives.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4042	102	While the Conservation Organizations recognize that PolyMet’s statements are not part of the FEIS, they are supported by statements in the FEIS that have no place in an agency document. An agency is obligated to assess the effectiveness of potential mitigation measures.240 In this case, the Co-Lead Agencies have concluded that the potential mitigation measure is not effective at all because it relies upon non-existent technology, yet continue to discuss it at multiple points throughout the FEIS, including the Executive Summary: The NorthMet Project Proposed Action includes long-term mechanical treatment (RO or equivalently performing technology) at both the Mine Site and Plant Site with a goal of transitioning to a non-mechanical water treatment technology requiring less maintenance over the long term. Pilot studies for non-mechanical treatment would be conducted during operations (and post-closure as necessary) to demonstrate the ability to transition to non-mechanical water treatment. Both mechanical and non-mechanical treatment would require periodic maintenance and monitoring activities for as long as treatment is required.241 Also, in response to public comments that treatment would be essentially perpetual, the Co-Lead Agencies responded: Minnesota Rules, part 6132.3200, Closure and Postclosure Maintenance, identifies several goals for non-ferrous mining areas, including the goal that sites be closed so that they are maintenance-free. A maintenance-free site is the goal of the Minnesota Department of Natural Resources (MDNR) for the NorthMet Project Proposed Action, as it is for every mining site. The NorthMet Project Proposed Action includes piloting a non-mechanical treatment system to achieve this goal. PolyMet would include funds in its reclamation cost estimate and financial assurance package to fund mechanical water treatment for as long as necessary, but the Permit to Mine would require PolyMet to present a plan for eventual transition from mechanical water treatment to non-mechanical treatment. PolyMet cannot be released from its responsibilities, including financial assurance requirements, until there is no longer a need for closure/post-closure treatment/maintenance. Financial assurance is a component of any Permit to Mine, to ensure that necessary maintenance can be provided for as long as it necessary.242 Over the course of any project, technology changes and improves, and sometimes projects are implemented differently than predicted in an EIS where technology that is newer, better or less costly becomes available. Yet there is no doubt that the original 500-year predictions for water pollution in the SDEIS quickly became the most controversial aspect of this project.243 The current FEIS still concedes that mechanical treatment is required for at least 200 years at the Mine Site and 500 Years at the Plant Site.244 Thus, it appears that FEIS continually repeats the goal of non-mechanical treatment solely for political reasons to address public concerns about committing to a mine that requires hundreds of years of water treatment, rather than any justifiable belief that this is a proven mitigation measure. 29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4068	130	Finally, the Response to Comments284 complains that a quantitative functional wetlands assessment has not been done because there is not a software program that can accomplish this task for a particular site. While that may be true, it does not then allow the project proponent and co-lead agencies to simply skip the task altogether. The combined effect rises to the level of purposeful, studied ignorance and avoidance of the plain legal requirements of NEPA, MEPA, and C.A.W. § 404.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4070	133	17.2 Avoidance and mitigation of wetland impacts is required by law but not sufficiently covered or assure in the FEIS. The state and federal requirements for projects that affect wetlands have been set forth in earlier comments and in the FEIS itself and will not be repeated in detail here. Nonetheless, the Conservation Organizations emphasize two important components of wetland preservation and mitigation: the need to wholly avoid impacts to unique and rare natural resources and the need to fully mitigate all functions of any affected wetlands resource. The FEIS fails to provide adequate information and analysis of wetland impacts within those legal requirements and associated mitigation to address these requirements.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4071	134	17.2.1 State and federal law require that effects to rare natural communities must be avoided, but the FEIS does not consider avoidance. The FEIS acknowledges that the Minnesota Wetland Conservation Act (“WCA”) requires special consideration for wetlands that are rare natural communities.285 Rare natural communities are native plant communities having conservation rank of S1, S2, or S3, or are communities within an area that has outstanding or high biodiversity significance rating. The FEIS further acknowledges that the entire project area is one of high biodiversity significance and that most of the S2/S3 ecosystem is within the mine site itself or within the direct influence of the mine site activities and effects. More than 50 percent of the Upper Partridge River area of high biodiversity significance will be obliterated by the mine and associated mine features, while a substantial portion of the remaining 50 percent of the high biodiversity significance will be “indirectly” negatively affected by the mine. The FEIS continues, however, to omit any analysis of what this actually means in terms of ecosystem impacts, implications for downstream and surrounding areas and the wildlife and vegetation that is present or depending on these high-quality areas, and fails to address the implications for mitigation. These very questions were originally raised in comments on the SDEIS by Friends and MCEA and remain unaddressed. Plainly, even if the FEIS does not expressly so state, the mine will permanently destroy the rare natural communities identified. The FEIS also fails to address the issue this raises regarding Minn. R. 8420.0515, subp. 3, which provides that mitigation plans must be denied for an activity that involves the modification of a rare natural community if the proposed activity will permanently adversely affect that natural community The foundation for this requirement is plain: rare natural wetlands communities such as those at the PolyMet site, comprised of a large, contiguous assemblage of northern peatland wetlands including coniferous bog (both ombrotrophic and minerotrophic) is impossible to restore or recreate elsewhere. Mitigation of the functions for this wetlands complex is an unworkable and unsupported concept. There is no scientific evidence that it can or has been successfully done. The research strongly cautions against allowing effects to peatland or bog environments because they cannot be rectified. The scientific literature is largely in agreement on this point. As noted by an article authored by EPA and provided on USGS’s website, these types of wetlands “have developed over thousands of years and ...have hydrologic conditions that are difficult, if not impossible, to duplicate,” and that “experts agree” that bog and fen ecosystems are the least likely to be effectively replaced. This is consistent with the report of the National Research Council in 2000 that pointedly stated wetland mitigation to date had been largely a failure, resulting in continuing net loss of wetlands and further emphasizing that bog wetlands in particular do not appear susceptible of restoration or mitigation once harmed. The NRC Report, in surveying the literature, stated wetland types like fens and bogs “cannot be effectively restored with present knowledge”, and recommended avoiding impacts to those resources. In a follow-up article, scientists on the panel stated that the no net loss mitigation program had been in fact fostering a net loss of approximately eighty percent of wetlands. For years, the Corps has followed the advice of the NRC Report that bog and fen-type ecosystems are difficult-to-replace and impacts to them should therefore be avoided. Research published as recently as 2012 continues to demonstrate these problems, finding that restored wetlands, despite real effort (as opposed to the often failed and incomplete efforts allowed by regulatory agencies) still suffer from structural and functional loss of ecosystem function. Despite the requirements for high value and difficult to replace wetlands and ecosystems such as those proposed to be destroyed by PolyMet, and despite the agreement in the science regarding the fallacy of thinking that the destroyed wetlands can be replaced or restored, the FEIS spends no time contemplating, analyzing or discussing these issues and concerns and blithely proposes mitigation business as usual.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4077	140	Second, the narrow approach to defining indirect effects fails to conform to the legal requirements for avoiding and/or mitigating all effects to wetlands. Hydrologic changes are of course an important component of indirect effects to wetlands. With respect to hydrologic changes, the FEIS provides that only those hydrologic changes that result in a 20 percent change in watershed area (converting a function—wetland hydrology—to an areal or geographic measure) will be considered an indirect effect.301 It cites solely to a paper by Richter for support of this standard. Upon review, the paper cited does not apply. The Richter paper concerns flow in rivers (and barriers or alterations affecting flow, like dams), an entirely different ecosystem than peatland wetlands. Nothing in the paper suggests it is transferable to any other ecosystem analysis much less peatlands or other wetlands. And it isn’t even addressing “watershed area” the metric with which the FEIS purports to be concerned. Rather the paper is referencing 20 percent reductions in river flow, an entirely different metric. It is specious for the FEIS to cite to this as support for a number that otherwise appears entirely arbitrary for assessing indirect hydrologic effects to wetlands. The co-lead agencies admit that the paper is really only about river flows, but state, with absolutely no explanation, discussion, or support, that they “believe” it provides a foundation for using the 20 percent number here.302 The co-lead agencies’ “belief” finds no support in the science or the law. The law provides that indirect effects must be avoided and if they cannot be avoided mitigated. It does not set a threshold of 20 percent before the requirements take hold. The co-lead agencies are wrong and arbitrary.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4079	142	The law demands that the function of the entire affected system be taken into consideration in the avoidance and mitigation analysis and requirements. In particular, the FEIS fails to address the effect of taking the larger intact northern peatland and forest assemblage and reducing it to a narrow strip of property, likely with changed hydrology and dust deposition, between two huge mines—PolyMet and Northshore. The entirety of the area, particularly the entirety of the area between these two mines, must be considered indirectly affected with respect to a functions analysis and addressed in the avoidance and mitigation components of the FEIS regardless of hydrological effects determined by after-the-fact spot checking in isolated locations.303 The FEIS fails to analyze and discuss the functions of the large intact assemblage (the interaction and value of a complex mix of forest and wetland, within a headwaters; the role of the plant and wildlife mix and connectedness of the system) and fails to analyze and discuss the effect of eliminating the large intact assemblage, leaving in its place a very small and likely altered remnant. Instead, the FEIS treats each small individual wetland as an isolated ecosystem, an approach wholly unsupported by science or the facts. Finally, the FEIS fails to propose mitigation for these obvious effects. The entirety of the hundred mile swamp complex should be considered indirectly affected due to its large reduction in overall size and should be mitigated (if the project is allowed to proceed as proposed) as its function will plainly be lost.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4084	147	17.3 The FEIS fails to address increased potential for mercury methylation in area wetlands. As the FEIS recognizes, the mine and ore transport facilities will result in airborne particulates and deposition of those particulates in area wetlands.315 While the FEIS provides some information regarding inhibited photosynthesis and the response to comments provides some discussion of sulfate and some other metals running off (largely discounting any potential effect) the response to comments in the FEIS wholly fail to answer the comments that raised potential for increased mercury methylation from the deposition of sulfates and mercury in ore and rock dust.316 The FEIS acknowledges the research, much of it from Minnesota, that demonstrates sulfates and mercury deposition in peat environments is a synergistic combination. Sulfates hastens the methylation of mercury in the peat environment making the mercury bioavailable. While comments on the SDEIS raised this issue and asked for analysis of how deposition from the PolyMet project will affect mercury methylation in area wetlands, the FEIS failed to include this analysis and the response to comments wholly dodges the question.317 The only response claims that mercury that will be deposited from dust and spillage is within the variability of background.318 This doesn’t address the direct question of what effect increased mercury and sulfate, acting synergistically, may have on methylation of mercury in the subject wetlands.	S	O

29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4085	148	17.4 The FEIS’s discussion of financial assurance for wetland mitigation obligations is wholly inadequate and largely absent. In the response to comments, the FEIS wetland section refers to the financial assurance responses at FIN 11 for the discussion of financial assurance related to wetland effects. FIN 11 includes no information on financial assurance other than a statement that it will be required. This is wholly inadequate and not compliant with NEPA and MEPA requirements. While the precise form and amount of financial assurance may not yet be finalized, there is a significant amount of information that can and should be provided to the public about what amounts are likely needed to ensure the monitoring and mitigation necessary for the project to comply with the law. PolyMet and the Co-Lead Agencies also know the various forms of instruments available for financial assurance and the FEIS should include a discussion and analysis of the risks and benefits of each type in order to provide the public an understanding of what instruments are preferable and why.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4092	154	The FEIS does not assess the indirect impacts of burning coal due to its energy demand from Minnesota Power facilities. According to Minnesota Power’s most recent Integrated Resource Plan, at present, Minnesota Power’s resource mix includes 75 percent coal-burning power plants. The utility owns two coal-fired power plants, Boswell Energy Center (4 units, 926 MW total) and Taconite Harbor Energy Center (2 units, 150 MW total). Minnesota Power also has a long-term power purchase from the Square Butte Cooperative’s coal-fired Milton Young Plant in North Dakota (currently, 100 MW, which purchase MP plans to phase out by 2026). These coal-fired power plants emit over 8 million tons of carbon dioxide per year. The plants emit about 325 lbs of per year of mercury, 7,500 tons per year of nitrogen oxides (NOx), and 7,500 tons per year of sulfur dioxide (SO2). PolyMet will cause an incremental increase in the emissions of these pollutants. 326 Although Minnesota Power expects coal to drop to 33 percent of its resource mix, the timing for this estimate is uncertain. In addition, they will be adding natural gas to the mix, their resources will be less carbon intensive, but certainly not carbon-free. Importantly, large industrial customers heavily influence Minnesota Power’s resource planning: In 2014, 54 percent of Minnesota Power’s kilowatt-hour (“kwh”) sales served large power customers, primarily in the taconite mining, iron concentrate, paper, pulp, refining and pipeline industries...Two additional large power customers expected to be operating soon will also be receiving energy from Minnesota Power: PolyMet, a nonferrous mining operation awaiting final permitting, and Essar Steel Minnesota, a major taconite mine and processing plant now under construction. PolyMet is a sufficiently significant customer that it is mentioned by name in the most recent Integrated Resource Plan. The prospect of PolyMet’s future energy consumption is already driving decisions at Minnesota Power, and the FEIS should analyze those effects.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4093	155	The FEIS fails to address, as did the SDEIS, the safe transport and disposal of materials generated from the wastewater treatment process. A filtered “sludge” material will be generated from treating contaminated water at the WWTF. In addition, the pore water from the HRF must be disposed of. The FEIS calls for disposing of these waste streams at either an “offsite” location or at the Hydrometallurgical Residue Facility. Important information is missing in the FEIS about what the contents of these wastes are expected to be, as well as how to ensure the safe transport and containment of them. Whether or not the waste streams meet the legal definition of “hazardous,” it is likely that they will be voluminous and toxic. The FEIS fails to provide information to properly assess the dangers these pose to the environment or human health.	S	O
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4094-1	156	The FEIS fails to take a “hard look” at the environmental effects of transporting ore to smelters, smelting or further processing of the copper ore. The increased copper smelting caused by the removal of copper ore at the PolyMet mine is a reasonably foreseeable impact that should be addressed in the SDEIS. The chain of causation between the extraction of ore at the proposed site and the smelting of the resulting product is much less attenuated than the connection between the construction of new rail lines and coal consumption analyzed by the Eighth Circuit. Copper smelting is clearly certain to occur; for without it the copper precipitate is worthless as an industrial commodity. The FEIS states that the “NorthMet Project Proposed Action would utilize a beneficiation and hydrometallurgical processing technology rather than smelting. Copper smelting at a specific location is not a reasonably foreseeable effect of the NorthMet Project Proposed Action.” It also states that “The off-site transport and use of the metal concentrates is outside the scope of the FEIS.” This response does not meet the requirements of NEPA, as described above. The Hydrometallurgical Facility may replace smelting if it is effective, but it will not become operational for 2-4 years after the beneficiation plant is operational. In the meantime, the copper concentrate produced from the beneficiation process must be smelted. Moreover, the FEIS states that the hydrometallurgical processing technology “would process nickel concentrates.” Based on the FEIS, the Hydrometallurgical Facility is designed to process nickel concentrate, not copper concentrate. A plain reading of Figure 3.2-26 shows that only nickel concentrate enters the autoclave, and copper concentrate must leave the site for further processing, even after the hydrometallurgical facility is built, contradicting the statement cited above from Appendix A that the hydrometallurgical facility replaces copper smelting. As detailed in MCEA comments in 2014, simply because the Co-Lead Agencies do not know the precise location of the copper smelting does not excuse them from analyzing the impacts under NEPA. An indeterminate location of environmental impacts does not affect their inclusion or exclusion in an EIS. In Mid States Coalition for Progress, for example, the court rejected defendant’s argument that increased coal consumption was speculative because specific coal plants that would be built to burn the new coal had not been identified.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4094-2	156	For NEPA purposes, the court held, it is the nature of the impact that is important. It is certain that some entity will smelt the copper, even if the exact geographic location is still undetermined. CEQ regulations specifically address indirect impacts where there is incomplete or unavailable information. The agency should evaluate those impacts to the extent possible, and include a statement of incompleteness. Even if the environmental impacts of the copper smelting are primarily borne by Canada, those extraterritorial effects do not bar their consideration under NEPA. The federal courts note that “NEPA requires agencies to consider reasonably foreseeable transboundary effects resulting from a major federal action taken within the United States.” This would include any transboundary effects from copper smelting taking place outside U.S. jurisdiction. Moreover, the fact that the location of the smelting is unknown may be the result of willful ignorance, rather than a lack of available information. According to Polymet’s NI 43-101, in the first phase of the NorthMet operation (prior to the construction of the on-site hydrometallurgical facility) the copper and nickel concentrates will be sold to Glencore International “under a long-term marketing agreement.” After the second phase processing facility is built, Polymet will also sell the nickel-cobalt hydroxide and precious metals precipitate produced by that facility to Glencore. In fact, the 2008 long-term marketing agreement specifies that Glencore will purchase “all of Polymet’s products (metals, concentrates or intermediate products) on independent commercial terms at the time of the sale.		
				NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4094-3	156	Glencore will take possession of the products at site and be responsible for transportation and ultimate sale.” After publication of the NI 43-101, Glencore International merged with Xstrata PLC to become Glencore Xstrata PLC.Glencore Xstrata owns a copper smelting operation in Sudbury, Ontario called Sudbury Integrated Nickel Operations, with the capacity to smelt 95,000 tons of nickel and copper concentrates, and the Horne Smelter in Quebec, Canada, which produced 194,000 tons of copper anodes in 2012.341 Therefore, the best approach is for the Co-Lead Agencies to simply ask Glencore where it intends to process the materials. If there is a sound and supported reason why Glencore cannot specify the location of smelting, then it does not excuse the Co-Lead Agencies from analyzing the impacts, but it does allow them to analyze the impacts of smelting at a more general level, along with a statement as to what information is incomplete or unavailable consistent with Minn. R. 4410.2500 and If Glencore can specify the likely location where some or all of the ore would be smelted, than the EIS must analyze those location-specific impacts. MCEA’s SDEIS comments describe some of those impacts on pages 100-105, providing a helpful description of the type of impacts from smelting that must be considered. In addition, the FEIS should analyze the potential impacts of additional transportation of the copper and nickel concentrates to smelters. The FEIS discusses transportation of hazardous materials – primarily diesel fuel and PAX – but does not discuss transportation of the final product. The FEIS should address potential transportation modes (rail, truck, freighter) as well as potential routes over land and water. The transportation of ore may generate air pollution, among other risks. The impacts associated with the transport of ore are “prime examples of indirect effects that NEPA requires be considered. “While the Conservation Organizations acknowledge that there is some uncertainty as to the final destination of the processed material, the final products will be the property of Glencore by contract, and an inquiry of Glencore as to the likely destination should be part of the analysis.		
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4094-4	156	Moreover, Glencore owns other mining assets in North America, as well as smelting facilities. Glencore also owns warehousing and port facilities in North America. Glencore advertises that “we have a sizeable custom smelting and refining capacity.” Glencore’s vertical integration of shipping and processing narrows down the potential routes and destinations considerably. At a minimum, where information about a potential environmental impact is incomplete and cannot be obtained, the RGU must include, by law, the following information in the EIS: A. A statement that the information is incomplete or unavailable and a brief explanation of why it is lacking; B. An explanation of the relevance of the lacking information to evaluation of potentially significant environmental impacts and their mitigation and to a reasoned choice among alternatives; C. A brief summary of existing credible scientific evidence that is relevant to evaluating the potential significant environmental impacts; and D. The RGU’s evaluation of such impacts from the project and its alternatives based upon theoretical approaches or research methods generally accepted in the scientific community. Copper ore contains, obviously, copper, which is toxic to aquatic life, but also [arsenic, cadmium, selenium and other toxic heavy metals discussed in Section 15.2.6, above. Thus, a spill or accident involving metal precipitates could be harmful to human health and aquatic life.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4107	167	The Cumulative Effects Analysis in the FEIS is Inadequate. NEPA and MEPA both require an analysis of the potential cumulative impacts of a proposed action.418 The NEPA regulations provide the following definition for cumulative impacts: Cumulative impact is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.419 In order to properly consider cumulative effects in an EIS, NEPA requires quantified and detailed information.420 “Without such information, neither the courts nor the public, in reviewing the [agency’s] decisions, can be assured that the [agency] provided the hard look that it is required to provide.”421 “General statements about ‘possible’ effects and ‘some risk’ do not constitute a ‘hard look’ absent a justification regarding why more definitive information could not be provided.”422 “Nor is it appropriate to defer consideration of cumulative impacts to a future date,”423 as NEPA requires consideration of the potential impact of an action before the action takes place.424 As explained throughout these comments, the FEIS cumulative impacts analysis for a number of resources – including but not limited to water quality, wetlands, and wildlife - is inadequate and fails to comply with NEPA or MEPA. The FEIS provides only general, mostly non-quantified analysis, which falls far short of the detail required. In Great Basin Mine Watch v. Hankins, 456 F.3d 955, 971-974 (9th Cir. 2006), the court struck down an agency’s reliance on generalized descriptions of mining impacts in a region, and instead required the agency to include “mine-specific ... cumulative data.”425 The court highlighted the need for a “quantified assessment of [other projects’] combined environmental impacts” and an “objective quantification of the impacts.”426 The FEIS for the proposed PolyMet mine fails to provide this necessary analysis.	NS	X

29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4123	183	The EIS includes information provided by PolyMet contractors that has not been independently verified by the agencies. The Council on Environmental Quality's NEPA regulation on "Agency Responsibility" clearly establishes agency duties to choose unconflicted contractors, confirm that lack of bias in writing, and supervise contractor work on EIS documents in order to maintain agency control.504 Since Co-Lead Agencies required Polymet "to submit environmental information for possible use by the agency in preparing an environmental impact statement, . . . The agency shall independently evaluate the information submitted and shall be responsible for its accuracy."505 Moreover, any environmental impact statement prepared pursuant to the requirements of NEPA shall be prepared directly by or by a contractor selected by the lead agency . . . It is the intent of these regulations that the contractor be chosen solely by the lead agency . . . to avoid any conflict of interest. Contractors shall execute a disclosure statement prepared by the lead agency . . . specifying that they have no financial or other interest in the outcome of the project.506 Numerous circuits have read these requirements to obligate agencies to properly engage with unconflicted contractors and see to it that the proper disclosures are complete.507 Furthermore, numerous federal courts have required agencies to perform rigorous independent review of contractor and applicant information in order to prove compliance with 40 C.F.R. § 1506.5(a).508 In general, the Final EIS relies far too much on work from PolyMet and Barr Engineering. In some cases, the SDEIS simply adopts statements from PolyMet without any independent verification, such as the estimates of tax revenues for the state509 or financial assurance estimates, as discussed further in Section 2. This is also the case for many of the inputs into the water model, including recharge and vertical conductivity, as discussed further above.	S	O
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4140	200	The FEIS Adopts An Overly-Narrow Purpose and Need Statement for the Co-Lead Agencies That Improperly Eliminates Reasonable Alternatives. The Purpose and Need Statements in the FEIS are improperly narrow, resulting in premature elimination of reasonable alternatives. The Co-Lead Agencies are expected to "briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action."534 While the agency is free to take the needs of the project proposer into account, but those private interests should not define the scope of the purpose and need. Instead, Agencies must look hard at the factors relevant to the definition of purpose... Perhaps more importantly [than the need to take private interests into account], an agency should always consider the views of Congress, expressed, to the extent that the agency can determine them, in the agency's statutory authorization to act, as well as in other congressional directives.535 As the Seventh Circuit has explained, "One obvious way for an agency to slip past the strictures of NEPA is to contrive a purpose so slender as to define competing 'reasonable alternatives' out of consideration (and even out of existence)."536An overly-narrow purpose that focuses on the needs of the applicant to mine a particular resource has the potential to narrow the range of alternatives "to those that would allow the miners to mine" the proposed property.537 The Purpose and Need Statements in the FEIS are categorized by entity, starting with PolyMet. While it is fine for the Co-Lead Agencies to include PolyMet's purpose, it is not appropriate to use that statement as a basis for defining reasonable alternatives. Nor is it appropriate for the Co-Lead Agencies to defer to the applicant's purpose and need, as noted above. Then follows the NorthMet Project and Land Exchange Purpose and Need Statement, which presumably applies to all Co-Lead Agencies.538 The first bullet point is: ? For PolyMet to utilize its leased mineral rights and recover commercial quantities and quality of semi-refined metal concentrates, hydroxides, and precipitates from the NorthMet ore body in northern Minnesota, and to process the recovered ore by reutilizing the former LTVSMC processing plant. This is an improper adoption of PolyMet's purpose and need statement, as described above. This is PolyMet's purpose and need, not the co-lead agencies. The third bullet point is: ? To extract and process metals in a technically and economically feasible manner, such that there would be sufficient income to cover: operating cost (which includes but is not limited to the cost of mining, processing, transportation, and waste management), capital cost (needed to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. This is also an improper purpose and need statement for the Co-Lead Agencies. Putting an emphasis on whether PolyMet's venture is profitable emphasizes PolyMet's investors over environmental concerns. It is clearly designed to eliminate reasonable alternatives such as underground mining and the West Pit backfill from consideration, rather than to allow neutral assessment of those alternatives. By referencing the company's plan, the company's profitability, and the company's processing plant, the agencies do not allow themselves any alternatives. They certainly do not allow for ore to come from any seam but the one identified by Polymet. DNR's Purpose and Need statement is essentially a shortened version of PolyMet's: The Purpose and Need of the Proposed Action is to produce base and precious metals precipitates and flotation concentrates from ore mined at the NorthMet Deposit by uninterrupted operation of the former LTVSMC processing plant. The processed resources would help meet domestic and global demand by sale of these products to domestic and world markets. This is the same Purpose and Need statement in the SDEIS. Thus, The Conservation Organizations repeat the same comments, including those in Section 19.2 of MCEA's SDEIS comments.	S	N
29745	Unique			NEPA	Erin Mittag	Minnesota Center for Environmental Advocacy	4141	201	The Conservation Organizations submit that the FEIS is inadequate in a variety of ways, and the Co-Lead Agencies cannot determine that it is adequate based on the existing record. In addition, the Conservation Organizations request a Supplemental EIS on the topics described above, including the alternative of dry stacking the tailings based on new information from the Mt. Polley Independent Report, as well as the potential for northward flow from the mine based on new information regarding the Peter Mitchell Pit.	NS	X
28547	Unique			NEPA	Esteban Chiriboga	GLIFWC	3500	3	In contrast, a federal EIS document is not reactive but forward looking. The purpose of an EIS is to identify all reasonably foreseeable impacts and scientifically characterize them so that decision makers can evaluate the cost and benefits of a proposed action.	NS	X
28547	Unique			NEPA	Esteban Chiriboga	GLIFWC	3501	4	The EIS does have the additional purpose of identifying mitigation and monitoring activities but this task does not obviate the need for meaningful and scientifically defensible predictions and characterizations of expected impacts. The FEIS has failed to adequately define the impacts (costs) of the proposed PolyMet project in several critical areas. Therefore, decision makers will not have the information they need to make informed decisions.	S	O
27678	Unique			NEPA	Faye Topliff		1757	1	Please extend public comment time, as it is too short for such a long lasting problem.	NS	X
29324	Unique			NEPA	Frank Ongaro	Mining Minnesota	3684	3	Third, during the public comment period over 58,000 comments were received through three well publicized and well attended public meetings and various other public comment opportunities. The DNR, the U. S. Army Corps of Engineers and the U. S. Forest Service did a tremendous job of categorizing all the comments, analyzing them and responding to all comments, and incorporating them into the FEIS when necessary. The co-lead agencies should be commended for providing more than adequate opportunities for the public to comment, listening to and analyzing those comments and incorporating them into the final environmental review document.	NS	X
29324	Unique			NEPA	Frank Ongaro	Mining Minnesota	3685	4	Finally, in conclusion, The Final EIS for the NorthMet Mine is far beyond "adequate." It takes a careful and comprehensive look at the project from every angle. The FEIS addresses all of the topics that were identified in the scoping process, addresses the public comments that were offered and follows the very detailed environmental review process set forth in Minnesota state statute and rule as well as Federal law, and therefore, should be deemed adequate.	NS	X
29229	Unique			NEPA	Gail C. Roberts		3620	10	NEPA14 – The thematic response (with details in NEPA09) to the underlying concern in my comments (18064 – PolyMet has yet to provide a scientifically-valid plan to mitigate the disastrous long-term environmental effects of their proposed sulfide mining project) does not address the scientific validity of the plan. Specifically, the unsupported assumption that all mitigation measures will perform perfectly in perpetuity is not realistic. Claiming that these issues and concerns will be addressed during the permitting process is not an adequate response.	S	O
6437	Unique			NEPA	Hans Olsen		497	1	I am writing to you today to bring a single item from this overall comment to your attention and that is the refusal of PolyMet to address the possibility of a catastrophic failure of the copper / nickel tailings basin that is part of this project. I believe an analysis of such a failure must be included in the FEIS and if it is not this will be a material breach of trust between the Cooperating Agencies and the people of Minnesota. I strongly urge you, as duly elected representatives of the people, to take action to insist that an analysis of tailings basin failure be included in the FEIS.	S	O
6354	Form Letter	3	Variant	NEPA	Harry Melander		479	1	The Co-Lead Agencies have adequately considered the potential project effects and alternatives.	NS	X
6354	Form Letter	3	Variant	NEPA	Harry Melander		480	2	The Final EIS addresses the thousands of public comments and questions submitted during the review periods for the Draft EIS and the Supplemental Draft EIS.	NS	X
29094	Unique			NEPA	Holly Buchanan		2419	4	We can live without the minerals which would be extracted at enormous human and environmental cost in one of the last remaining wilderness areas of the United States.	NS	X
27432	Unique			NEPA	Jack Buck		1743	3	Lastly, am I correct in thinking that the EIS concerns only the best possible outcomes, if everything goes as PolyMet has proposed? How does the statement account for potential spillages or other things that could go wrong? It does state that the project would meet most standards for air quality, water quantity and quality, mercury levels, sulfate levels in wild rice, and directly/permanently affect 913 acres of wetlands. Still, this sounds like it's describing conditions of 100% accuracy.	NS	X
29845	Unique			NEPA	Jack Ray		2667	2	Keep these minerals in the ground, They will become more valuable over time and perhaps one day, will be valuable enough to be extracted profitably and pay for adequate remediation. That is not possible today.	NS	X
387	Unique			NEPA	Jacob Davis		190	2	we are debating this issue based on a flawed and biased environmental review, commissioned by the mining company,	S	O
10	Unique			NEPA	Jana Guseynova		16	1	After reading the changes to the most recent Environmental Impact Statement concerning Polymet's proposed copper-nickel mine in and around the Superior National Forest, I'd like to express my complete opposition to the mine.	NS	X
23365	Unique			NEPA	Janet Keough		938	1	I am writing to request that you reject the FEIS for the NorthMet mine proposal by Polymet. The FEIS is flawed in many ways, but I will outline a few of them.	NS	X
28489	Unique			NEPA	Janet McTavish		2292	2	I also object to the way my input has been solicited. You imply that the project is a "done deal" and that the public can only "fine tune it".	NS	X
29839	Unique			NEPA	Janice Ann Smith		2656	5	The market for copper and nickel is down and will not sustain the costs required to mine responsibly.	NS	X
26627	Unique			NEPA	Jeff Schroeder		1376	5	Relying primarily on data presented by the permit requester seems unwise. It is not in the best interests of Poly-met to examine/document/acknowledge potential problems that the permit process has not required them to address. I hope that you are thoroughly investigating potential environmental threats suggested by those organizations and agencies that are not also charged with promoting mining interests. Their complaints should not be viewed as obstructing a permit process which you feel obligated to bring to a successful conclusion (Poly-met wins).	NS	X

29358	Form Letter	1	Variant	NEPA	Jennifer Hengelfelt		2507	1	I fully understand the above issues and personally ask that they are addressed fully, legally and ethically, without being swayed by lobbyists representing the industry.	NS	X
261	Unique			NEPA	Jim and Diane Malcolm		162	9	If would be much more beneficial to the region to look elsewhere for companies willing to relocate in their area of Minnesota. There is some new businesses doing quite well in northern and northwest Minnesota. Look to the real and long lasting future. Many people would love to live there. New startup companies would be a good place to start for recruitment. We need to stop looking at "today" and plan for the future.	NS	X
26979	Unique			NEPA	Joel Roberts		1501	2	There is no concrete indication of what (if anything) the Co-Lead Agencies may have done to independently verify the data that was provided by PolyMet and its contractors. Indeed, the finished product gives a strong appearance of being largely based on data that was provided by PolyMet.	S	N
26979	Unique			NEPA	Joel Roberts		1508	6	The amount of new material in the FEIS is at least as extensive as what was new in the SDEIS. A comparable amount of time would be required for evaluating it adequately. The present comment period really has been insufficient for this purpose.	S	N
27687	Unique			NEPA	John Finnegan		2072	1	I have reviewed the Final EIS executive summary that you sent me. I read it thoroughly and it is simply the same material as the last one. It still doesn't address the issues that I mentioned in the last EIS.	NS	X
709	Form Letter	1	Variant	NEPA	John Roth		268	3	The proposed mines are simply not needed and prudent, conservative resource management dictates that the minerals should be left in the ground and extracted only if needed by future generations and the environmental risks can be eliminated. The reason why the mines are not needed is that there is no shortage of copper and nickel. According to the International Copper Association and the U.S. Geological Survey, "Since 1950 ... there has always been, on average, around 40 years of copper reserves (which are defined as 'deposits that have been discovered, evaluated and assessed to be economically profitable') and over 200 years of resources left." Resources are defined to "include reserves, discovered deposits which are potentially profitable and undiscovered deposits that are predicted based on preliminary geological surveys." The U.S. Geological Survey further reported in its February 2014 Mineral Commodity Summary that "The International Copper Study Group predicted that global refined copper production in 2013 would exceed demand by about 390,000 tons." It went on to state that "Global production of refined copper was projected to increase by 3.9% and consumption was projected to remain essentially unchanged." In another report issued on March 6, 2014, the U.S. Geological Survey stated that "geologically-based global assessment of undiscovered copper resources estimated that 3.5 billion metric tons of copper may exist worldwide." PolyMet's website says that they estimate 275 million tons of reserves and 694 million tons of resources - a tiny fraction of what the U.S. Geological Survey estimates may be available. What is important to note, as well, is that "copper is one of the few raw materials which can be recycled repeatedly without any loss of performance." (International Copper Association) If the recycling of copper already in the waste stream, or slated for it in the future, could be increased, it would significantly reduce the need for newly refined copper. At present, the U.S. Geological Survey states that "about 32% of the U.S. copper supply" comes from recycled copper. Each year, however, we recycle only a fraction of the waste copper available. The U.S. Environmental Protection Agency reported that the U.S. generated 3.412 million tons of e-waste (waste from old computers, cell phone, TVs, wires and other electrical items) in 2012. We recycled only 29.2% of it. The EPA also estimated that there are probably 100 million old TVs in storage, resting in people's closets and basements, ready to be thrown out. And that doesn't include the number of old computers, printer, phones and other devises. Clearly there is a huge potential for increased recycling, and the value of that recycled material exceeds the value of newly refined metal. According to the United Nations University (September 17, 2009), "A ton of used mobile phones ... - or approximately 6,000 handsets (a tiny fraction of today's 1 billion annual production) - contains about 3.5 kilograms of silver, 340 grams of gold, 140 grams of palladium and 130 kg of copper ... The average mobile phone battery contains another 3.5 grams of copper. Combined value: over US\$15,000 at today's prices." On July 11, 2014 the COMEX spot copper price for newly refined copper was \$3.27 per pound. The price for copper scrap was \$3.021 per pound. And that price does not factor in the enormous benefits achieved by recycling, such as the reduced pollution and costs of landfills. Accordingly, when there is excess production of newly refined copper and large supplies of scrap, why would any prudent steward of our natural resources allow environmentally risky and highly expensive mining to occur? It doesn't make economic sense. We should save the resource for our children and future generations.	S	O
29269	Unique			NEPA	John Wild		2478	4	Do we want to take a chance that this mining will be profitable some time in the future? Low commodity prices right now would indicate that this is not a good time to start mining operations of this magnitude. When the need arises, then consider mining without using a wet process to concentrate the minerals, when we have better technology.	S	O
30027	Unique			NEPA	Jon Auel		2774	2	Historically, the environmental review process has been unable to predict the actual impacts of sulfide mining in water rich environments and has underestimated the impacts, as well as the cost of clean up.	NS	X
26510	Unique			NEPA	Jon Marcaccini		1343	2	in the year 2015 we can and should mine the natural resources we have.	NS	X
26510	Unique			NEPA	Jon Marcaccini		1345	4	This is slated to be 20 year mine, do you thing in 20 years we will abandon our environmental goals and standards? I think not	NS	X
2132	Form Letter	1	Variant	NEPA	Jonathan Baker		300	2	Just because a resource is available, does not mean we should do whatever it takes to harvest it. This state and this country have reached a tipping point where we need to say "enough is enough": if we continue to make compromises, soon enough there will be nothing left to compromise.	NS	X
2132	Form Letter	1	Variant	NEPA	Jonathan Baker		304	4	public lands are purchased and set aside not for the benefit of private interests, but for the benefit of the public.	NS	X
2132	Form Letter	1	Variant	NEPA	Jonathan Baker		306	6	we continue to value benefits to a small group of wealthy individuals over those of the public who enjoys the pristine beauty of northern Minnesota and the vulnerable animals that call the area home.	NS	X
26225	Unique			NEPA	Kaitlin Seiberlich		1291	8	Jobs are a major reason for the introduction of the PolyMet mine to this area of Northern Minnesota. While this is a very understandable reason for the area, it does not make sense economically. There is considerably less demand for copper and nickel in 2015 compared to when the mine was originally proposed in 2010. Copper is one of the most reusable elements we are capable of producing. As of October 8th, 2015, it was estimated the demand for copper would begin to slow down and decline. It has been forecasted that China will not be demanding more copper this year. Nickel is undergoing the same issue – little demand, high supply, declining prices. At this point, it doesn't make sense to open a copper-nickel sulfide mine, especially when Glencore, the financial backer of the PolyMet mine, is temporarily closing some of its own copper mines due to inadequate demand.	NS	X
29982	Unique			NEPA	Karen Katz		4308	4	The PolyMet mine under current proposal is not the right decision for Minnesota. I request that the Minnesota Department of Natural Resources reject the PolyMet FEIS as inadequate. I request that the EPA and Army Corps of Engineers veto or deny and permit to the PolyMet Corporation.	NS	X
29514	Unique			NEPA	Kathleen Miller		2545	11	2. Defer until the mining project sponsor can provide iron clad assurances that 1) technology is in place and will be utilized and is financially reasonable for the company to use 2) the company's financial books are solid and can provide a substantial down payment as a damage deposit that is used and replenished as the project advances. The funds would be used by Minnesota to pay for frequent inspections, water quality testing and funds to "fix" problems as they occur - such as residential contaminated wells, testing of children for heavy metals, etc.	NS	X
27893	Unique			NEPA	Keeley Todd		2217	1	I am against permitting PolyMet to begin mining in the Superior National Forest for the following reasons: 1. I have lived on the Western Mesabi area all of my life. My father made a living in the iron ore mines and supported his family of 8 well enough that as a child I did not notice if there were economic downturns related to his job. In reality, there were some financial difficulties that my father overcame with his skills as a logger. Those options are no longer available to miners should their main source of employment be jeopardized due to global economic factors. In fact, there are very few options for laid off miners to earn a living wage in northern MN.	NS	X
27893	Unique			NEPA	Keeley Todd		2220	4	One industry that is growing at a surprising rate in this area is the Whole Foods market. The food co-ops in Duluth and Bemidji, and the whole foods stores in Virginia and Grand Rapids are outgrowing their locations. Will there be millions of dollars in funding to support their continued growth? Restaurants are serving locally sourced food more and more, and the outdoor farmer's markets in northern MN are growing as well. I know that people are more concerned than ever about where their food comes from. I do frequent those businesses mentioned above and the writing is on the wall – they are ready to expand and would benefit from local organic food sources (livestock as well as produce). Would there be funding available for organic farming year round in northern MN? What an innovative move that would be for our beautiful state! Fresh, locally sourced organic food would do more for the future of Minnesotans than toxic water that will be with us for 200 years.	NS	X

29399	Unique			NEPA	Kenneth Westlake	USEPA	3809	1	The FEIS adequately resolves EPA's comments on the Preliminary FEIS pertaining to base flow and cumulative impacts, model calibration, and contradictory information. EP A'_s remaining comments (see attached) can and should be addressed in the USFS Record of Decision (ROD), in the Corps permit evaluation process which culminates in a ROD, and/or in the context of other permitting reviews as appropriate. EPA retains oversight authority for permitting discharges under the CW A's National Pollutant Discharge Elimination System and air emissions under the CAA. EPA also retains regulatory authority, along with the Corps, under CW A Section 404.	NS	X
10709	Form Letter	1	Variant	NEPA	Kevin Lee		713	2	The federal law on environmental review is quite clear, and the Polymet FEIS falls well short of that law.	NS	X
10709	Form Letter	1	Variant	NEPA	Kevin Lee		715	4	The FEIS also fails in the legal directive to rely on independent, objective assessments of environmental harm. The use of water flow models created and run by consultants hired by Polymet undercuts the purported objectivity of the evidence.	S	O
27721	Unique			NEPA	Kris Wegerson		2109	1	The co-lead agencies should have allowed a 90-day comment period as was allowed for the DEIS and SDEIS. I was able to read thru the previous documents, but not thru the FEIS. A one week extension of the 30-day comment period is inadequate. The FEIS must be considered inadequate if the public wasn't given adequate time to read the document and comment on it.	NS	X
22434	Unique			NEPA	Kwilas Tony	Minnesota Chamber of Commerce	2929	2	During the public comment period over 58,000 comments were received through three well publicized and well attended public meetings and various other public comment opportunities. The DNR, the U. S. Army Corp of Engineers and the U. S. Forest Service did a tremendous job of categorizing all the comments, analyzing them and incorporating them into the FEIS when necessary. The co-lead agencies should be commended for providing more than adequate opportunities for the public to comment, listening to and analyzing those comments and incorporating them into the final environmental review document.	NS	X
27688	Unique			NEPA	Laura Gauger		3259	5	The PolyMet FEIS states that "annual production post processing would total about 113,000 short tons of copper concentrate, 18,000 short tons of mixed (nickel/cobalt) hydroxide, and 500 short tons of gold and PGE precipitate." The production values reported in the FEIS are somewhat meaningless because the FEIS does not indicate the concentrations of the individual metals found within the various concentrates and/or precipitates that will be produced. Here's the analogy: It's like going to a liquor store and being told the volume of a bottle of vodka instead of being told the volume AND proof. The PolyMet FEIS needs to disclose specific and accurate projections for metal production so that the public and state decision-makers can decide if the environmental risks are "worth it" in terms of potential tax payments to the State of Minnesota. It's a basic tenet of cost v. benefit analysis that the FEIS fails to address, rendering it inadequate.	S	O
27689	Unique			NEPA	Lea Foushee	North American Water Office	3205	9	Enables 30 additional mines to be permitted once policy has been established. http://www.pca.state.mn.us/index.php/viewdocument.html?gid=19402 .	NS	X
27689	Unique			NEPA	Lea Foushee	North American Water Office	3271	1	NorthMet's copper/nickel/platinum mine is a one-time-harvest, a virgin resource extraction in its entirety. The ore body is categorized as low to medium grade and is marginal in terms of economics. This is simply the first attempt in a renewed metal extraction frenzy with 30 more permit applications waiting to go. NAWO provided the documentation for this statement in our previous comments on March 12, 2014. The Final Environmental Impact Statement (FEIS) for the North Met Project does not discuss the entire metals life cycle. Reclamation and recycling of the world's metals waste streams have not been analyzed in the alternatives section. A combination of recycled and virgin materials is not an alternative. There is no information presented by the applicant of what percentage of need could be filled using recycled metals.	S	O
2539	Form Letter	1	Variant	NEPA	Leah Nelson		333	4	I am proud to be a Minnesotan - I'm happy to live in a place where my environmental values and priorities are supported in government - a luxury and privilege not many can claim.	NS	X
29080	Form Letter	9	Variant	NEPA	Liz Dahl		2411	4	The hiring of the D.C. law firm Crowell and Moring which is heavily involved in the mining industry is unethical in that it has tipped the state's hand in favor of the mining interests. The conflict of interest that firm is ignoring is absolutely appalling to reasonable people.	NS	X
26935	Form Letter	1	Variant	NEPA	Lois Dalsin		1484	3	It is not an option as to whether or not Minnesota and/or Federal agencies choose to involve the Tribal Cooperating Agencies, American Indian peoples and their governing units in the study, research, discussions, diplomacy, and determinations which are part of the EIS process for the PolyMet/NorthMet Mining Project and Land Exchange. There are treaties and laws to be taken into account. For the FEIS to measure up to its goal and purpose of being "a disclosure document," the environmental and socio-economic impacts of the proposed sulfide mining project, as described in the FEIS, must guide the essential continued disclosure of the differences of opinion over major scientific premises — e.g., does the groundwater flow north, or south, from the proposed mine; and must promote active listening to, and responding to, the concerns of the Tribal Cooperating Agencies and American Indian peoples governing units, as well as individuals.My expectation for continuing "disclosure" includes disclosure and a continuing hearty, robust dialogue on the part of all interested peoples. The health, and the longevity of even our planet, rest upon the actions we take now.	NS	X
29978	Unique			NEPA	London Bresette		4292	4	The Co-lead Agencies being aware of this most important discovery forwarded by the Cooperating Agencies, proceeded in a manner that invalidates the application process by failing to properly address the environmental implications of sound scientific findings. No technical discussion exists throughout the FEIS adequately addressing these grave environmental impacts. This is tantamount to completely ignoring the issue and is contrary to NEP A Regulations and CEQ guidelines. Given the applicant is requesting permits for an open pit sulfide mine~ where its Swiss based partner Glencore-Xstrada will be extracting damage in Indian Country while exporting the copper to China, just underscores the necessity of good faith disclosure and diligent scientific transparency.	S	N
29740	Unique			NEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3909	24	The no action alternative is dismissed in the FEIS, and fails to accurately describe and address what the potential environmental impacts and outcomes would be from the no action alternative.	NS	X
29740	Unique			NEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3931	46	The FEIS for the NorthMet project fails to take a "hard look" at potential environmental impacts and reasonable alternatives, in violation of the National Environmental Policy Act (NEPA).	NS	X
29740	Unique			NEPA	Lori Andresen	Save Our Sky Blue Waters et. al.	3935	50	We submit that the PolyMet FEIS is inadequate and would violate numerous state and federal laws including the Clean Water Act (CWA), the National Environmental Policy Act (NEPA), and Minnesota Environmental Policy Act (MEPA).	NS	X

30072	Unique			NEPA	Lori Andresen		4338	4	Agency Bias and Political Influence. The Lands and Minerals Division of the Minnesota DNR is responsible for permitting our mines. If the agency stopped promoting mining, the agency division would basically put itself out of business. Political leaders would also like to see PolyMet permitted and ready to go before the 2016 elections. Copper-nickel sulfide mining has become a hot-button issue, splitting the Democratic Party in Minnesota. Governor Dayton is trying to play the middle by calling for "Community oversight" that would ensure that PolyMet is meeting pollution control standards. If our agencies can't (or won't) enforce mining companies to meet standards, how will an "Independent Citizens Group" have the knowledge and authority and will to do so? Conversely, the call for a Citizen's Authority acknowledges that our current regulatory agencies, such as the DNR Lands and Minerals Division, are ineffective and need to be replaced.	S	O
9792	Unique			NEPA	Lori Rumpf		637	6	the FEIS is inadequate in that it fails to demonstrate that the proposed mine will comply with all environmental laws and will not result in unacceptable environmental impacts.	NS	X
7533	Unique			NEPA	Margaret Seibel		552	2	What is the P90 composition of the tailings pond water? I didn't see a table for this. Can geese land on this and be unaffected?	S	O
7533	Unique			NEPA	Margaret Seibel		553	3	Was a rare event rainfall (for example, 10 inches of water in a 24 hour period) modeled? Was annual rainfall the only input or was there an option for daily rainfall? The Climate Change Sensitivity Analysis Model seems to just change annual rainfall according to the following statement.	S	O
7533	Unique			NEPA	Margaret Seibel		554	4	Is this true even in high rainfall situations?	S	O
7533	Unique			NEPA	Margaret Seibel		555	5	Snowmelt is seasonably predictable and higher discharge rates will be used beforehand. A high rainfall event is not as predictable. How quickly can freeboard be created?	S	N
7533	Unique			NEPA	Margaret Seibel		556	6	If the East Pit overflows to the West Pit (and the sulfate levels in the East Pit are shown to be high on page 5-122) will there be sufficient freeboard in the West Pit for all this flow in a high rainfall event?	S	N
7533	Unique			NEPA	Margaret Seibel		557	7	This statement refers to the tailings basin. What conditions do the maximum flow numbers correspond to? Spring snowmelt? A high rainfall event? If this flow is returned to the tailings basin, at what rate does freeboard decline?	S	N
7533	Unique			NEPA	Margaret Seibel		558	8	Is there a diagram with flowrate (gpm) for all of the overflows and pipes for a high rainfall event?	S	N
7533	Unique			NEPA	Margaret Seibel		560	10	3) Many concentrations in the FEIS are compared to the CEC scenario such as 18.3 mg/l compared to 18.2 mg/l at a wild rice bed on the Partridge River (5-151), both of which violate the original standard of 10mg/l. Figure 5.2.2-50 shows sulfate the time. The state should have identified the source of the high sulfate levels in the past and started mitigation proceedings so that standards were met. Once the Polymet mine is in operation, and mitigation is required according to standards, will the state act to enforce regulations?	S	O
29397	Unique			NEPA	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3718	3	Despite numerous discussions, citation to NEPA, and providing new, responsible opposing views developed after the SDEIS was issued and responses to comments had been written, the Band's post-SDEIS opposing views cannot be found anywhere in the FEIS. As a result, the Co-Leads' responses to the Band's opposing views are not contained in the FEIS either. Instead, in a written response more than halfway through the FEIS comment period, the Co-Leads provided that: Unresolved opposing views including MDOs presented between May 10, 2005 (the date of the Corps initial Section 404 permit application) and March 13, 2014 (the close of the 90 day comment period on draft Environmental Impact Statement) have been included in the FEIS. Opposing views and MDOs presented after March 13, 2014 have not been included in the FEIS. Agencies' decisions can also consider new substantive information as well. Accordingly, this does not preclude consideration of new substantive information in an agency's decision.8 Although this doesn't preclude the Co-Leads from considering new substantive information, it does exclude the public from the opportunity to assess and evaluate that information before decisions are made and final actions are taken. And the outdated MDOs were cited as part of the decision-making process by EPA to deny the Fond du Lac Band's request for a CEQ referral for the FEIS.9 This is a clear violation of NEPA and demonstrates the desire by the Co-Leads to quell any substantial concerns regarding the impacts of this Project.	S	O

29397	Unique			NEPA	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3721	4	NEPA also requires that an EIS at least discuss mitigation measures with “sufficient detail to ensure that environmental consequences have been fairly evaluated.” ¹⁰ But the FEIS does not take the required “hard look” at all the environmental consequences of the Project, including polluting surface and groundwater resources and drying up or inundating thousands of acres of wetlands in the 1854 Ceded Territory, nor does it analyze alternatives with sufficient detail. Without adequate study of the adverse effects and determination of possible mitigation measures, the FEIS does not provide sufficient information for either public review or agency decision making. The FEIS therefore does not meet the intended purpose of NEPA which is “to ensure that information on the environmental impacts of any Federal, or federally funded, action is available to public officials and citizens before decisions are made and before actions are taken.”	S	O
29737	Unique			NEPA	Mark Kaprelian		2585	3	Underlying the analysis presented in the FEIS is a pervasive assumption that PolyMet will conduct mining operations for approximately 20 years, without interruption, and will then cease operations in an orderly fashion. This assumption frequently is unstated or implicit. Elsewhere it is briefly acknowledged. But the reasonableness of this assumption is never discussed, despite factors such as those above, and despite statements by PolyMet (quoted below) that appear to contradict it. The uncritical acceptance of this assumption is inconsistent with the requirement that the FEIS encourage “good analysis and clear presentation” of the proposed action and include a “thorough but succinct discussion of potentially significant adverse or beneficial effects generated, be they direct, indirect, or cumulative.”	S	O
10187	Unique			NEPA	Mary Ann Vande Vusse		671	3	Can the period for comment not be extended to adequately consider alternatives to minimize environmental harm, reduce polluted seepage from unlined permanent waste facilities and mitigate wetlands destruction?	NS	X
26997	Unique			NEPA	Maureen Johnson		1523	2	In addition, in almost every case in which my and other comments provided additional and often more recent and more applicable references, the FEIS response does not include a discussion as to why the references are not utilized in the FEIS; they are simply ignored. This is a fatal flaw – valid scientific comments are not truly addressed, just side-stepped with Response Themes instead of actual scientific responses. My SDEIS discussion of the importance of Minnesota’s narrative standards is an example.	S	O
26997	Unique			NEPA	Maureen Johnson		1584	65	The FEIS has not discussed available data and narrative standards, including maintenance of species, and failed to analyze the effects and cumulative effects of the pollutants governed by the state narrative standards, as described in EPA’s own guidance. No effort has been made to evaluate the use of any methods to assure compliance with the narrative standards.	NS	X
29319	Unique			NEPA	Maya Batres	The Nature Conservancy	3659	3	By failing to respond to the request for additional analysis and alternatives, the FEIS also fails to “address the potentially significant issues and alternatives raised in scoping” as required in the first requirement above. ² The initial comments of the Conservancy discussed the need for a range of alternatives, but the FEIS continues to dismiss the need for anything more than a “no action” alternative and a token land exchange alternative. Alternatives exist that would mitigate some of the environmental impacts of the project including an alternative to exchange lands of higher ecological value, an underground mine alternative that avoids the most serious impacts to lands of high biodiversity significance, and a range of wetlands mitigation that includes a greater proportion of in-watershed restoration and preservation. Instead, the public is presented with a single mine and mitigation plan that essentially amounts to a “take it or leave it” proposal. Each of these inadequacies also results in failure to meet the requirements of the National Environmental Policy Act (“NEPA”). ^{3 1}	S	O
27468	Unique			NEPA	Michael D. McNally		1761	5	Ojibwe people have good reason to question assumptions where so much is at stake in the potential effect on their rights to the ceded land. Ojibwe people’s health and well-being is tied to their lands. If, for example, whether water quality analysis turns not on the water quality effect but on whether a certain standard is exceeded, or consideration of other projects are to be included in the cumulative effect analysis is obfuscatory analysis in the FEIS. Under NEPA, the public, no less the tribes whose treaty rights obtain in the affected watershed, deserves the hard look at these effects the law requires.	NS	X
27468	Unique			NEPA	Michael D. McNally		1762	6	As a careful reader of these portions of the FEIS, my question from the SDEIS remains: is there evidence of serious consideration and consultation with the tribes. In the FEIS, clearly the consultation and consideration were approached as the scheduling of meetings and the documentation of tribal concerns, and not a serious engagement with the concerns of federally recognized tribes whose views are not those of one among many public interest groups but those with whom the federal agencies involved are under legal treaty based and federal trust obligations to seriously engage, not to push paper to a Chapter 8 where the concerns are summarily dismissed.. The FEIS fails to show serious engagement in Chapter 8. Moving the discussion from the Appendix 8 at least makes this oversight in the NEPA review process clearer, but it doesn’t make it any more substantive. I urge an amended FEIS in better keeping with the federal agencies obligations to the tribes, and elaborating on the reasoning behind the 18 “Major Difference of Opinion” that demonstrates a serious engagement with the tribes and tribal agency concerns..	NS	X
57	Unique			NEPA	Michael Kinzer		139	1	I want this very serious concern and complaint documented on the process used for public comment on the EIS for the proposed sulfide mine by Polymet (and others). How can the DNR expect anyone, let alone the lay citizenry (including myself) to review a 3,000 plus study and comment on it within 30 days. Moreover, part of that period will cover some of the holidays. In light of the length and complexity of the EIS and the very high risks involved for the State of Minnesota, I hereby request on behalf of myself and all Minnesota residents that the DNR extend the comment period to at least 90 days. Unless such extension of the time for public comment is provided, then please deem this comment on the EIS as stating it is de facto inadequate due to the fact that any inadequacies it may contain will be overlooked due to the short time allowed for review.	S	N
27663	Unique			NEPA	Michael McKenna		1816	1	A more in depth E.I.S. should be done to fully and accurately assess all the negative impacts on this amazing hi-quality watershed.	NS	X
8906	Form Letter	1	Variant	NEPA	Mike & Linda Gallagher		568	3	There needs to be an independent review of the project that is unbiased.	NS	X

27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3282	3	In sum, the Band has special expertise on the environmental issues that are presented by the proposed mine. The CEQ regulations provide that the lead agencies shall “use the environmental analysis and proposals of cooperating agencies with . . . special expertise, to the maximum extent possible consistent with its responsibility as lead agency.” 40 C.F.R. §1501.6(a)(2). In addition, the CEQ’s guidelines confirm the importance of incorporating comments of the cooperating agency with special expertise on a subject wherever possible: “If the lead agency leaves out a significant issue or ignores the advice and expertise of a cooperating agency, the EIS may later be found to be inadequate.” See Council on Environmental Quality, 40 Most Asked Questions Concerning CEQ’s National Policy Act Regulations, 46 Fed. Reg. 18026, 18031 (March 21, 1981).	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3283	4	Chapter 8 was updated in the FEIS but only to show the Co-lead agencies’ additional views. The Chapter was not updated to reflect the additional major differences of opinion identified thereafter – namely an additional error in the groundwater modeling, the correction of which showed the mine site’s north flow of the waters to the Rainy River Basin post-closure, which was identified in 2015 when the Band and other tribal cooperating agencies were provided with access to the final hydrologic model. Similarly, while the FEIS includes an Appendix C which contains the tribal cooperating agencies’ comments and supporting documentation representing major differences of opinion, Appendix C was not updated to include any of the additional documentation provided by the Bands following release of the 2013 SDEIS.	S	O

27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3293	14	However, despite extensive review of the several hundred pages of Section 5.2.2, Water Resources found in Chapter 5, Environmental Consequences, it is difficult to find a clear or simple statement regarding the Proposed Project’s ability to meet Minnesota water quality standards. The FEIS does not speak in terms of ‘compliance’, but rather ‘probabilities of exceedances of evaluation criteria’, which are not synonymous with water quality standards. In presenting only modeled probabilities and frequency distributions in their “data” tables and figures, it is challenging, if not impossible, for the general public to understand the significance of the numerical information in the FEIS.	NS	X
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3314	40	However, instead of clarifying this factor, it appears that the Co-lead agencies are attempting to minimize the significance of the necessity for long term/perpetual treatment by repetitively using vague and confusing language in the FEIS. The specific language describing long term water treatment has changed during the development of the document, even though the model results have not. The Colead agencies use creative wording to obscure the results of the modeling; this is misdirection at best and highly inappropriate for the Co-lead agencies to present to the public.	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3341	56	Notwithstanding EPA’s recommendation, the FEIS includes no discussion of means by which the adverse impacts on moose might be avoided or mitigated. Instead, the response to the recommendation was the boilerplate statement ascribed to most of the substantive comments provided by cooperating agencies on the PFEIS: “The information and analysis as offered in the PFEIS is sufficient and appropriate for purposes of environmental review.” This disposition by the Co-lead agencies of a critical deficiency in the EIS process is indefensible.	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3378	121	The failure to determine the financial assurances required for the Project, and its indefinite post-closure water treatment, is contrary to NEPA. It circumvents an important aspect of the public’s ability to review and evaluate the costs and benefits of the proposed Project, and develop an informed opinion as to whether a Project of this magnitude should move forward into permitting. The absence of an analysis on financial assurances further compromises the environmental review, as it precludes any informed assessment of whether the proposed plans for controlling and mitigating the mine’s adverse environmental impacts would be effective – either during mine operations and for hundreds of years after closure.	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3411	148	The fact that Project is not the least environmentally damaging practicable alternative, and would have an unacceptable adverse effect on water supplies, fishery areas and wildlife, are each independent, and more than sufficient, grounds for denying the 404 permit. But if more were needed, the permit should be denied for the additional reason that it would not be in the public interest as required by 33 C.F.R. part 320.	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3430	149	The proposed Project is not based on any public need. Development of this mine is sought by a private company for the purpose of extracting and processing the minerals for profit. The Project does not involve any public work – such as a road, or reservoir, or flood control Project. It is a development sought by and which would directly benefit private interests. The FEIS’s description of the Applicant’s Purpose and Need for the Project, suggests that there might be some greater public good to be served by the mine stating that “[d]emand continues to rise for these metals due to the expansion of the green economy and rising demand from developing countries like India, China, and Brazil.” FEIS, 1-11. But in fact the demand for the these metals is, and has been dropping, and the reduced demand is occurring in developing countries, in particular China, which had previously been a strong consumer of such metals. 266 The decline in the price of copper has led PolyMet’s stockholder and investor, Glencore, like other major international mining companies, to sell some of its mines and to suspend production in others. Id. The decline in the demand for copper and copper prices calls into question not only the public need for this Project, but the private need as well.	S	O
27901	Unique			NEPA	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3453	167	For all of the foregoing reasons, the Fond du Lac Band of Lake Superior Chippewa submits that the FEIS is not adequate and does not comply with NEPA in material respects. The information regarding the potential environmental impacts of the proposed Project require denial of the section 404 permit and denial of the proposed land exchange.	S	O
8645	Unique			NEPA	Neil Simonson		597	4	We'll have to find a source of Copper, Nickel, Paladium and Platinum some day	NS	X
27988	Unique			NEPA	Nick Rowse		2238	1	Because the underground minerals are non-federally owned, there is no requirement by the Cooperating Agencies to include the Bureau of Land Management (BLM) in the NEPA or MEPA process. However, no mention was made in either in the FEIS or in the DROD, that BLM was consulted over the proposed NorthMet mine and land exchange by the Cooperating Agencies. This was a significant oversight because BLM could have provided the best reasonably available resources in evaluating both surface and underground mining.	S	O
27988	Unique			NEPA	Nick Rowse		2242	5	Instead of relying on the current escalating environmental review process (e.g. my drag race analogy), I recommend that the Cooperating Agencies (i.e. USACE, MNDNR, and USFS) implement a stakeholder resolution process and public involvement using the St. Croix River Crossing Project (FHWA-MN-EIS-90-02-FS) and ROD as a template to successfully complete a cooperative environmental review and negotiation under NEPA and MEPA. From 2002 until its conclusion in July under the guidance of the facilitation firm, RESOLVE, Inc., federal, state, and other stakeholders came to concur on all the environmental issues (e.g. resolving a requirement for no additional bridge crossings over the St. Croix National Scenic Riverway or relocating all federally endangered, Higgins eye pearly mussels (Lampsilis higginsii) from the Crossing Project site). On 11/13/2006, Thomas Sorel, Division Administrator, Federal Highway Administration, concluded that all issues relative to the adequacy of the Supplemental Final EIS (SEIS) had been fully addressed and consequently signed the Record of Decision. No comments were received concerning the adequacy of the SEIS. The stakeholder process required only three years to complete with complete concurrence at a minimal cost to federal and state taxpayers.	S	N
29263	Unique			NEPA	Pat Hawkinson		2470	6	What consideration has been made to the cause of the even more recent disaster in Brazil? I realize this isn't South America, but it would be nice to have some scientific explanation of why that could never happen here.	NS	X
29263	Unique			NEPA	Pat Hawkinson		2473	9	To me, the need for a lengthy 10 year 3,500 page environmental review suggests nothing more than the extreme risk inherent in this type of mining, otherwise it would have been permitted years ago.	NS	X
26151	Unique			NEPA	Paul Winslow		1278	4	I also question the value of mining copper in a delicate and unique environment as the St. Louis River and BWCA.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	2981	2	The Final Environmental Impact Statement (FEIS) for the PolyMet NorthMet open-pit copper-nickel mine project is a huge, cumbersome and repetitious document. It would be tempting to put it on a scale and deem it adequate by sheer weight alone. However the PolyMet NorthMet FEIS fails to comply with the National Environmental Policy Act (NEPA), 42 U.S.C. §§4321 et seq., and its implementing federal regulations or with the Minnesota Environmental Policy Act (MEPA), Minn. Stat. §116D.01 et seq., the state environmental review law patterned after NEPA, and its implementing state rules.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	2991	8	Perhaps most important, an EIS may not be used to justify a decision already made. Minn. R. 4410.0300, Subp. 3; 40 C.F. R. §1502.2(g). An agency must exercise independent judgment and independently investigate a proponent’s claims that there are no practicable or less damaging alternatives that would satisfy the project’s purpose. See Sierra Club v. Antwerp, 709 F. Supp. 2d 1254, 1263-1264 (S. D. Fla. 2009), aff’d 362 Fed. Appx. 100 (11th Cir. 2010).	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	2992	9	WaterLegacy’s comments on the PolyMet NorthMet FEIS demonstrate that the environmental review provided for Minnesota’s first proposed copper-nickel sulfide mine fails each of these tests for the quality, integrity, and content of an EIS. Even where the FEIS has appeared to respond to comments, that response has been inadequate, if not affirmatively misleading	NS	X

27085	Unique			NEPA	Paula Maccabee	Water Legacy	3008	3	Under both NEPA and MEPA, the purpose of an environmental impact statement (EIS) is to lead government decision makers to take a “hard look” at the environmental impacts of their decisions before those decisions are made. See e.g. Mid States Coalition for Progress v. Surface Transportation Board, 345 F.3d 520 (8th Cir. 2003); Sierra Club Northstar Chapter v. Kimbell, 2008 U. S. Dist. LEXIS 107239, 68 ERC (BNA) 1664 (D. Minn., Feb. 19, 2009); Citizens Advocating Responsible Development (CARD) v. Kandiyohi County Bd. of Comm’rs, 713 N.W.2d 817, 834 (Minn. 2006). At the most basic level, an EIS must analyze the significant environmental impacts of a proposed action and provide a full and fair discussion of significant environmental impacts. Minn. Stat. 116D.04, Subd. 2a; 40 C.F.R. §1502.1. To ensure this important objective, a final EIS must provide responses to the substantive comments received during draft EIS review. Minn. R. 4410.2800, Subp. 4(B). The EIS must also disclose and respond to any responsible opposing view. Minn. R. 4410.2700, Subp. 1; 40 C.F.R. § 1502.9(b); Ctr. for Biological Diversity v. U.S. Forest Service, 349 F. 3d 1157, 1167-1168 (9th Cir. 2003). Data and analyses in an EIS must be commensurate with the importance of the impact and the relevance of the information to a reasoned choice among alternatives and the consideration of the need for mitigation measures. Minn. R. 4410.2300(H). Impacts must be discussed in proportion to their significance, so the EIS concentrates on the issues that are truly significant to the action in question, rather than amassing needless detail. 40 U.S.C. §1500.1(b), §1502.2(b). An EIS must provide a thorough discussion of both direct and indirect potentially significant beneficial or adverse effects. Minn. R. 4410.2300(H); 40 C.F.R. §1502.16(a), (b). In describing adverse effects, an EIS may not use a listing of mitigation measures and an unsupported assumption of their success to conclude that effects of a proposed action will be minimal. Kentucky Riverkeeper v. Rowlette, 714 F. 3d 402 (6th Cir. 2013); Ohio Valley Envtl. Coalition v. Hurst, 604 F. Supp. 2d 860 (S. D. W. Va., 2009). An EIS must meet basic standards for quality. Environmental impact statements are required to be analytic rather than encyclopedic. Statements must be concise, clear, and to the point, and must be supported by evidence that the agency has made the necessary environmental analyses. 40 C.F.R. §§1500.4(b); 1502.1; 1502.2(a). “The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA.” 40 C.F.R. §1500.1(b).	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3009	4	These requirements have been specifically applied to modeling. An EIS may not manipulate models, rely on flawed mitigation analysis, work backwards to achieve a desired result, or otherwise use scientifically unsound analyses to draw conclusions as to the environmental impacts of a proposal. See Environmental Defense v. U. S. Army Corps of Eng’rs, 515 F. Supp. 2d 69, 74 (D.D.C., 2007), appeal dismissed, 2008 U.S. App. LEXIS 28182 (D.C. Cir, Oct. 10, 2008). NEPA requires up-front disclosures of relevant shortcomings in the data or models. See Lands Council v. Forester of Region One of the U.S. Forest Service, 395 F. 3d 1019, 1032 (9th Cir. 2005); Native Ecosystems Council v. U. S. Forest Service, 418 F.3d 953, 964 (9th Cir. 2005). Absent baseline groundwater information, conclusions in an EIS of “negligible impact” fail to comply with NEPA’s “hard look” requirement. Gifford Pinchot Task Force v. Perez, 2014 U.S. Dist. LEXIS 90631, 2014 WL 3019165, slip. op. 103-106 (D. Ore. July 3, 2014).	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3010	5	In addition, an agency cannot exclude pertinent information from an EIS. The EIS must include information relevant to reasonably foreseeable significant adverse impacts and a choice among alternatives if the information can be obtained within the state of the art and costs of obtaining it are not exorbitant. Minn. R. 4410.2500; 40 C.F.R. § 1502.22(b). Under NEPA, an EIS must include in its analysis reasonably foreseeable impacts that have catastrophic consequences even if their probability is low, provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture and is within the rule of reason. 40 C.F.R. §1502.22(b). An EIS must also meet basic standards of independence and integrity. An EIS cannot be based on conclusory statements of a project proponent, unsupported by substantial evidence. See CARD v. Kandiyohi, supra, 713 N.W. 2d at 837, fn. 18. “Agencies shall insure the professional integrity, including scientific integrity, of the discussions and analyses in the EIS” and “shall identify any methodologies used and shall make explicit reference by footnote to the scientific and other sources relied upon for conclusions.” 40 C.F.R. §1502.246	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3011	6	One of the most significant roles the EIS must play is to facilitate the consideration of alternatives. An EIS must discuss appropriate alternatives to the action and their impacts and must compare the potentially significant impacts of the proposal with those of other reasonable alternatives to the proposed project. Minn. Stat. 116D.04, Subd. 2a; Minn. R. 4410.2300(G); 42 U.S.C. §4332(C)(iii) and (E); 40 C.F.R. §1502.1. Under NEPA, the alternatives section of the EIS related to alternatives is “the heart of the environmental impact statement.” The EIS “Should present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public.” 40 C.F.R. §1502.14. The EIS must (a) Rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were eliminated from detailed study, briefly discuss the reasons for their having been eliminated, and (b) Devote substantial treatment to each alternative considered in detail including the proposed action so that reviewers may evaluate their comparative merits. Id. Under MEPA, The EIS must address one or more alternatives of each of the following types of alternatives or explain why no alternative of a particular type is included in the EIS: alternative sites, alternative technologies, modified designs, modified scale or magnitude, and alternatives incorporating reasonable mitigation measures identified through comments received during the comment periods for EIS scoping or for the draft EIS. Minn. R. 4410.2300(G).	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3012	7	An EIS must also analyze adverse impacts of a proposed action in conjunction with other environmental impacts. An EIS must provide a thorough discussion of potentially significant beneficial or adverse cumulative effects. Minn. R. 4410.2300(H). This analysis includes cumulative impacts that result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions. Minn. R. 4410.022, Subp. 11; 40 C.F.R. §1508.7.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3013	10	The FEIS is highly reliant on the project proponent’s modeling and on unsubstantiated assumptions from the project proponent for its conclusions. The FEIS not only fails to discuss opposing scientific views, it misrepresents peer-reviewed literature, the nature of tests conducted regarding the project, and even the documents contained in its own record. The FEIS discounts information as “unavailable,” where peer-reviewed literature and scientific best practices would have provided higher quality, if potentially inconvenient, analytic information.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3017	14	The PolyMet NorthMet FEIS is inadequate. For federal agencies, it cannot serve as a basis for decisions following the letter and spirit of NEPA, our basic national charter for protection of the environment. 40 C.F.R. §1500.1. For Minnesota agencies, reliance on this FEIS would defeat the purpose for which our environmental review laws were enacted – to “encourage productive and enjoyable harmony between human beings and their environment; to promote efforts that will prevent or eliminate damage to the environment and biosphere and stimulate the health and welfare of human beings; and to enrich the understanding of the ecological systems and natural resources important to the state and to the nation.” Minn. Stat. §116D.01.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3043	138	The Evaluation also recommended data collection and analysis for environmental review, including assessment of background site-specific conductivity and invertebrate community data to the genera if not species level; modeling specific conductance from mine facilities based on representative sampling of waste rock; and estimates of mass loading from all facilities and quality assured data sufficient to evaluate compliance with both Minnesota’s numeric standard and with Minnesota’s narrative degradation and toxicity standards. (Id., pp. 44-45).	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3091	83	The problematic nature of the “contingency mitigation” approach is underscored by the lack of evidence that mitigation options would be effective. It is suggested that if East Pit or West Pit fractures or faults create conduits to groundwater, use of grout “would be evaluated” to mitigate polluted seepage from pits. (FEIS, p. 5-239). However, the cited reference (FEIS ref. PolyMet 2014I) is only a “conceptual plan.” No data is cited to suggest that grout would effectively prevent seepage from a fractured mine pit for any extended period of time, let alone permanently. The “contingency mitigation” proposal for northward flow of NorthMet contaminants into the Boundary Waters watershed exemplifies the risks of this approach. Again, the FEIS proposes that grouting might be used to prevent northward flow even though “its effectiveness at the NorthMet site is uncertain.” (FEIS, 5-240). The next option on the list is lowering the water level in the East Pit and West Pit below the level (1,500 feet AMSL) of the Northshore Peter Mitchell Pit. (FEIS, 5-241). The FEIS notes that this option would “require a higher capacity water treatment facility and possibly additional treatment processes entailing additional expense.” (Id.) The FEIS does not mention that the East Pit and West Pit are both permanent sources of contamination or the fact that the GoldSim model upon which the FEIS relied to assume that oxidation would be minimal in the East Pit was based on a Geochemical Uncertainty Analysis stating that exposure of East Pit walls to air would increase sulfate levels by a factor of at least 823 times, with resulting increases in toxic metals leachate. (FEIS, p. A- 534 citation to Day, Geochemical Uncertainty Analysis, October 10, 2008, Exhibit 11).14 At best, lowering the water level in the East Pit is an improbable mitigation strategy; at worst, it is an additional untenable threat to water quality. The third item on the contingency mitigation list is a system of groundwater extraction wells, the number, geographic extent and configuration of which are unknown. In addition to being unproved, this option would involve building roads, laying water lines, electrical lines and access pads across the 100 Mile Swamp. (FEIS, 5-242). The final option suggested is to dig an infiltration trench between the mine pits and the Partridge River, construct an undetermined number of wells, water supply lines and roads, ensure recharge water is free of particulates to prevent clogging and artificially create a bedrock groundwater mound. (FEIS, 242-243). Although the reference cited (Barr 2015b) to suggest this option might work uses the word “mound,” it is an unrelated document pertaining to mounding beneath the tailings waste facility. The FEIS states, “The exact type, location, scale, and timing of mitigation measures are not known at this time.” (FEIS, 5-240). They may never be known, may never be feasible beyond a conceptual stage, and may never be constructed, particularly since they would not be financially assured. Allowing fantasy mitigation instead of environmental impact assessment is not acceptable under either state or federal law.	S	O
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3100	89	Since WaterLegacy’s comments on the SDEIS, the FEIS has made no change and provided no additional justification for its use of “evaluation criteria” rather than water quality standards and its failure to determine water quality impacts at surface water locations closest to the source of seepage and discharge. The FEIS’ claims that the NorthMet tailings waste facility would not violate water quality standards or would not increase the violations beyond the “continuation of existing conditions” scenario are based on these improper qualifications of the data as well as the unsupported claims regarding chemistry and capture rates of tailing seepage.	S	O
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3110	124	There is every indication that MODFLOW is a robust, practicable and readily available model for analysis of conductivity, hydrology and flow through mine pits, bedrock, and surficial materials at the NorthMet mine site, except in the case where a request is made to evaluate indirect impacts on wetlands from mine dewatering.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3118	108	Both NEPA and MEPA were enacted precisely to prevent this scenario. State and federal environmental review laws require analysis of significant environmental consequences before the fact, not after contaminated seepage permeates surface and groundwater. An EIS that models a realistic range of seepage capture efficiencies and discloses their impacts on water quality, supports the consideration of alternatives to protect aquatic life and human health. An EIS, like the PolyMet NorthMet FEIS, that relies on unsubstantiated assumptions by the project proponent and allows models to be used to produce a desired outcome threatens to create a new Superfund site, with only indeterminate hope of mitigation.	NS	X

27085	Unique			NEPA	Paula Maccabee	Water Legacy	3119	117	Comments below reflect our concern that the FEIS does not analyze the adverse environmental effects of the proponent’s mitigation plan, but instead argues on behalf of this plan. This advocacy is contrary to the requirements of environmental review.	NS	X
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3138	133	Perhaps most troubling in terms of the substantive requirements for a land exchange, the FEIS has failed to analyze cumulative impacts on Indian trust lands and rights retained by Indian tribes in ceded territories.	S	N
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3179	174	However, the argument that a separate dry stack tailings basin would increase the “footprint” of the project does not mean it would increase environmental impacts. The Co-Lead Agencies may no longer remember this, but there are many brownfield sites in close proximity to the LTVSMC processing plant. In fact, several of these sites were identified as alternative tailings locations in the 2005 Final Scoping Decision for the NorthMet project, as reflected in the Exhibit 27 map attached. It was incumbent upon the Co-Lead Agencies, based on comments, the Independent Report and their own evaluation that dry stacking would improve tailings basin stability, to review these and other nearby brownfield sites, environmental risks and life-cycle costs and rigorously evaluate best available tailings disposal technology for the NorthMet project.	S	O
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3194	186	“An agency may not define the objectives of its action in terms so unreasonably narrow that only one alternative from among the environmentally benign ones in the agency's power would accomplish the goals of the agency's action, and the EIS would become a foreordained formality.” Nat'l Parks & Conservation Ass'n v. BLM, 606 F. 3d 1058, 1070 (9th Cir. 2010). The court found against the BLM on the grounds that the agency had adopted the proponent’s “interests as it own” and “As a result of this unreasonably narrow purpose and need statement, the BLM necessarily considered an unreasonably narrow range of alternatives.” (Id. at 1072). See also Simmons v. United States Army Corps of Eng'rs, 120 F.3d 664, 666 (7th Cir. 1997)(“If the agency constricts the definition of the project's purpose and thereby excludes what truly are reasonable alternatives, the EIS cannot fulfill its role.”). Ironically, while the EIS has rejected an evaluation that could anticipate and develop an environmentally protective plan for backfilling Category 1 rock, the FEIS also keeps the door open for ad hoc disposal “of some excess waste rock or saturated overburden in the West Pit in areas where mining has ceased, if necessary as an adaptive measure.” (FEIS, 5-630, F-640).	S	N
27085	Unique			NEPA	Paula Maccabee	Water Legacy	3199	189	Under MEPA and NEPA, an EIS must consider cumulative potential the effect on the environment that results from the incremental effects of a project in addition to other projects past, present or reasonably foreseeable future in the environmentally relevant area that might reasonably be expected to affect the same environmental resources. Minn. R. 4410.2300, Subp. H; Citizens Advocating Resp. Develop. V. Kandiyohi Cty Bd. Of Comm’rs, 713 N.W. 2d 817 (Minn. 2006); 40 C.F.R. §1508.7. Ctr. For Biol. Diversity v. Nat’l Highway Traffic Safety Admin., 538 F. 3d 1172, 1215 (9th Cir. 2008); Ohio Valley Env’tl Coal. V. Hurst, 604 F. Supp. 2d 860, 883-884 (S. D. W. Va. 2009). The FEIS provides an inadequate assessment of the cumulative impacts of the PolyMet NorthMet project. The cumulative effects of mining and other development on mercury contamination of fish, water pollution, wetlands destruction and impairment of tribal resources are significant.	NS	X
9846	Unique			NEPA	Peter Krause		646	1	It seems to me like you are only asking for input from those with an aptitude toward hard science such as water flows and parts per million. That myopic view alone displays a major fault in this process.	NS	X
9846	Unique			NEPA	Peter Krause		647	2	just like with the draft IES a couple years ago, the release and therefore the comment period is timed coincident to the nation's most major holiday season: Thanksgiving thru Christmas. That is a really cheap and disingenuous maneuver.	NS	X
29907	Unique			NEPA	Phillip Larson		2708	1	It would be appropriate in this section to make specific reference to Minnesota Statutes section 93.001 (Policy for Mineral Development), which reads: It is the policy of the state to provide for the diversification of the state's mineral economy through long-term support of mineral exploration, evaluation, environmental research, development, production, and commercialization. The Purpose and Need for the Proposed Action should be amended to reflect that the Proposed Action advances the policy of the State of Minnesota, as codified in Minn Stat § 93.001.	S	N
27521	Unique			NEPA	Randy Holland		1765	1	My comment boils down to why is approving these permits such a rush? None of the rare earth elements being targeted are becoming obsolete. So can't we wait a few decades until some testing is done and/or better filtering technology is available? Corporations are always in a rush due to stock price pressures, yet the public interest is to NOT rush things.	NS	X
27521	Unique			NEPA	Randy Holland		1768	4	If a long-term approach is used, public opinion will trust the decisions. Rushing things looks highly suspicious, if not corrupt, especially considering the lack of comprehensive studies or tests. Please, please, please do the right thing and keep this on the slow track. The minerals aren't going anywhere. Thank you for listening to my concerns.	NS	X
29019	Unique			NEPA	Rev. Elton W. Brown		2384	2	The Minnesota Environmental Rights Act states that economic considerations alone cannot justify the destruction of our precious natural resources. Clearly the PolyMet plan will result in environmental destruction and degradation (loss of valuable wetlands, loss of an important wildlife corridor, the huge amount of electrical energy needed, and the seemingly-inevitable long-term leakage of heavy metals and toxic water).	S	O
10133	Unique			NEPA	Richard Crum		658	2	2. Our society must be able to rely on science and engineering, with transparent review of the results, to understand natural systems, design methods for using natural resources and design mitigation for potential impacts. The alternative is a jeopardy to our economy and national security. This means that the argument that the environmental risk of the NorthMet project is unknown or cannot be remedied is nonsense.	NS	X
27778	Form Letter	1	Variant	NEPA	Robert Graves		2135	4	I don't see a risk matrix evaluation in the FEIS. I don't see what's called perturbation analysis, which looks for what the result would be if the data is incorrect by, say, 1%, 5%, or 10%.	S	O
29727	Unique			NEPA	Robert Tammen		2572	3	The absence of documentation for environmental protection or statewide economic benefit indicates that Polymet's FEIS is Environmentally Unsatisfactory and Inadequate and should be rejected.	NS	X
6298	Unique			NEPA	Robin Vora		469	1	I do not believe the EIS contains enough analysis of the proposed land exchange. An exchange of nearly equal acres is inappropriate and unfair to taxpayers. The land that Polymet would obtain through a land exchange is worth a lot more than the lands the federal government will obtain. The appraisal process used by the Forest Service does not fully consider the value of future uses of exchanged lands. This should be remedied in the EIS. In a fair exchange Polymet should provide the federal government with total acres that are several multiples of what is presently proposed. If Polymet were to turn around and sell their lands to another mining company, what price would they likely get for it? I suspect the proportional gain from the federal lands acquired would be enough to buy far more than 6,723 acres of private land.	S	O
10134	Unique			NEPA	Ryan Clark		665	4	Whether the groundwater flows north or south should not be the determining factor when determining the adequacy of this EIS. Either direction flows to pristine water resources cherished by the citizens of not only MN, but much of the Country. The risk of pollution is far too great to allow a project of this nature to proceed beyond this EIS.	NS	X
10466	Unique			NEPA	Ryan Talbott		696	1	It is simply impossible, however, to review the over 3,500 pages of documents in the FEIS and accompanying appendices within the 45-day objection period. Therefore, SOS and WLP respectfully request that the Forest Service extend the 45-day objection period to allow enough time to review the FEIS and Draft ROD.	S	N

10466	Unique			NEPA	Ryan Talbott		700	3	As the Forest Service surely understands, not all projects are created equal. Some projects are relatively straightforward and do not require the same level of environmental analysis as other, more complicated projects. Limiting the objection period to 45 days for all projects ignores this distinction and undermines the public participation requirements of NEPA. To illustrate this point, the Superior National Forest recently approved the “Mixed Use Motorized Use Project,” which authorizes the mixed use of passenger vehicles and all-terrain vehicles (“ATVs”) on 5.25 miles of Forest Service roads. See, Superior National Forest, Mixed Use Motorized Use Project, available at http://www.fs.usda.gov/project/?project=40836 . This project was subject to a 45-day objection period. See Superior National Forest, Legal Notice for the Mixed Use Project Draft Decision Notice, available at http://a123.g.akamai.net/7/123/11558/abc123/forestservic.download.akamai.com/11558/www/nepa/92918_FSPLT3_2537882.pdf . Without commenting on the propriety of this project, it is safe to say that it is nowhere near as complex as the proposed NorthMet Mine and Land Exchange. Indeed, the revised environmental assessment (“EA”) for the Mixed Use Motorized Use Project was all of 24 pages. See, Superior National Forest, Mixed Use Revised EA, available at http://a123.g.akamai.net/7/123/11558/abc123/forestservic.download.akamai.com/11558/www/nepa/92918_FSPLT3_2485245.pdf . In comparison, the FEIS for the proposed NorthMet Mine and Land Exchange is over 1,900 pages (not including appendices and thousands of pages of reference documents that the agencies have yet to make available to the general public). A project of this scope and complexity, which will advance a type of mining never previously permitted in Minnesota, requires more than 45 days to file an objection. Sulfide mining is controversial in Minnesota and concern is growing over the threat that copper-nickel sulfide mining poses to our environment and National Forests. This FEIS is reportedly one of the largest, if not the largest, ever for a project in Minnesota. Nevertheless, the objection period is the same as it was in the Mixed Use Motorized Use Project – 45 days. In other words, the Forest Service expects the public to be able to digest a 1,900-page FEIS and file an objection within the same 45-day period as it would for a 24-page EA. This is arbitrary and capricious and contrary to NEPA and CEQ regulations.	S	O
10466	Unique			NEPA	Ryan Talbott		703	6	Therefore, SOS and WLP respectfully request that the Forest Service, in compliance with NEPA and CEQ’s regulations, extend the period for timely objections to at least 90 days. Such an extension is clearly warranted to ensure that the public has enough time to fully scrutinize the FEIS and Draft ROD. If you have any questions, do not hesitate to contact Ryan Talbott at 503-329-9162. Thank you for your attention to this important matter.	S	N
29289	Unique			NEPA	Sandy Sterle		2495	3	The FEIS needs to have its predictions of the mine plan tested by an independent third party and the groundwater modeling discrepancies need to be resolved by acknowledging the full extent of where water pollution could flow. The recent sulfide mining spills at Mount Polley and the Animas River should give our state agencies pause to clarify the tailings basin stability. We were given the benefit of this foresight, that is why the FEIS needs to include an independent review rather than depending on wording like “adaptive management” to mask these issues, because both our health and a sustainable tourism and recreation economy depends on clean lakes and water.	NS	X
29289	Unique			NEPA	Sandy Sterle		2504	10	I am concerned with a conflict of interest by DNR’s Lands and Minerals mission to promote mining, yet being significantly involved in this FEIS. With that in mind then, it will be especially key for this document to be transparent and objective by not just promoting benefits of PolyMet, and also clarifying the consequences to our water quality and environment of a new mining industry. This is a significant project, which could change the quality of Minnesota’s north woods and lakes. It is more important to do it right than to get it done.	S	O
29241	Unique			NEPA	Sarah Poznanovic		3648	6	I request an extension of the PolyMet comment and objection periods. The 30 day period is insufficient to review over 3,500 pages of documents, which limits public input.	S	N
30559	Form Letter	1	Variant	NEPA	Shelley Rothstein		2874	1	Please re-open for comments Thank you!	NS	X
14	Unique			NEPA	Spencer Shaver		35	1	After reading the changes to the most recent Environmental Impact Statement concerning Polymet's proposed copper-nickel mine in and around the Superior National Forest, I'd like to express my complete opposition to the mine.	NS	X
26659	Unique			NEPA	Steve Jay		1409	1	a. Both National Environmental Policy Act (NEPA) and Minnesota Environmental Policy Act (MEPA) require that ‘potential environmental consequences of proposed actions’ are considered in the decision-making process. The MEPA process informs permitting and approval and ‘describes mitigation measures that may be available.’	NS	X
28770	Unique			NEPA	Susan Beerhalter Soule		2345	3	I was shocked to read in the Star Tribune this past year that the lakes in the southern third of our state are polluted beyond redemption. Please don’t spread this catastrophe to our beautiful and vital north woods.	NS	X
8492	Form Letter	1	Variant	NEPA	Susan Boyle		576	1	How many 'studies' must be done and re-done to mollify the detractors.	NS	X
26996	Unique			NEPA	Timothy Weulander		1515	3	sorry I dont have the time or means to download a 3500 page file, let alone read through and fully understand the jargon:	NS	X
24770	Unique			NEPA	Tom Thompson		1109	8	Please reject this study as inadequate and reject permitting.	NS	X
24727	Unique			O	Amanda Schultz	Itasca County	2948	1	the proposed PolyMet site is located near the community of Hoyt Lakes, within an existing mining district where operating and former iron mines and processing facilities already exist and, with the existing infrastructure in place, the site is viewed as conducive for such an initiative without threatening our region’s environment ; and	NS	X
24727	Unique			O	Amanda Schultz	Itasca County	2949	2	the Northeast region is well positioned to support the addition of PolyMet Mining to the complement of local employers due to the high availability of skilled and dedicated workers and a comprehensive employment and training system to develop the appropriate workforce; and	NS	X
24727	Unique			O	Amanda Schultz	Itasca County	2950	3	WHEREAS, as the primary administrator of workforce development programs and funding in the region, the Office of Job Training is actively engaged in supporting a responsible natural resource-based economy through the investment of millions of dollars in job training for a skilled workforce. Particularly during the last decade, we have witnessed a decline in job opportunities within our region. For this reason, we welcome responsible economic opportunities such as those provided through the proposed PolyMet initiative.	NS	X
26973	Unique			O	Andrew Comfort		1496	4	My substantive comment to the SDEIS was submitted by email in March 2014 with the written commentary in the body text of the email and a series of 14 map-based figures attached as a pdf I note that the 14 map-based figures were included in the set of 4 CDs comprising the FEIS, yet the written commentary necessary for a reader to understand the figures was not included in the FEIS. Since I have now learned that a pdf attachment to an email submission is accepted, I am submitting this FEIS comment with accompanying new figures and exhibits as a single pdf attachment. Because the text of this FEIS comment and the SDEIS comment make reference to the figures and exhibits, it is necessary and helpful to any interested reader of these to receive them together as a single pdf. Since my SDEIS comments were not responded to in the FEIS, I resubmit them, here, in full as Exhibits A and B. Exhibit A is the original written comment to the SDEIS which was in the body text of my email submission. Exhibit B is the set of 14 map-based figures. Generally, my SDEIS comment considers the inadequacy of the Cumulative Effects analysis. The "themed" responses (CU 01 through CU 20) in the FEIS regarding Cumulative Effects do not address the nature of my SDEIS comment with respect to Cumulative Effects and are therefore inadequate, thus I resubmit the SDEIS comment in whole. I look forward to receiving an actual response from the DNR upon this resubmission.	NS	X
30134	Form Letter	1	Variant	O	Andrew Sinykin		2832	1	The Future > the present	NS	X
23989	Unique			O	Anna Carlson		986	1	We just wanted to write to show our support for Polymet! We don't want the environmentalist voice to be the only one heard. Please consider the voice of the locals in Northern Minnesota, where myself and my family reside. We need these jobs for our community, as tourism provides low wage, part time jobs. Our communities should be more then a place to play for people visiting and the people who live here should be considered more then just hired help so others can enjoy where we live. Mining is a huge part of our community. Right now, other countries with less safety concern for their workers and environment are leading the way as we stand, idled by red tape. The hoops have been jumped through, the studies have been concluded; it's time to issue permits and build.	NS	X
22889	Unique			O	bernicen@frontiernet.net		885	1	I am totally in favor of giving Polymet its permits. Not only have they spent tons of money and jumped though hordes of hoops, but they have proven that they can mine is a safe and economical way. Do we really want to though away a chance to produce these minerals here in the US? If we leave it to third world countries, we are held hostage to war tribes and people who do not care about pollutions and human life. Already some of these foreign countries are asking the United States to help clean up their toxic messes. Their pollution does not stay within their borders, but it travels over the oceans to us. Let us have the advantage of controlling the process and reaping to profits. We can do it safely here.	NS	X
23477	Unique			O	bobdenucci@yahoo.com		955	1	This area needs these jobs. If this mine is found to be environmentally safe it would be crazy not to allow them to mine.	NS	X
30098	Form Letter	9	Variant	O	Brian Harrington		2819	3	Glencore Corporation formed in 2013 through a merger with Xstrata founded in 1926 in Switzerland. As of Oct 2015, the CEO Ivan Glasenberg is trying to calm investors from fleeing due to the company's high debt load. Such confidence building for this venture. Their primary interest commodity trading, secondarily mining.	NS	X
27149	Unique			O	Brooke Staupe	Minnesota Power	3244	1	Minnesota Power has closely followed the permitting process for the past ten years and has concluded that the work of the cooperating agencies has been complete, thorough, and has sufficiently identified and evaluated the potential environmental concerns. Minnesota Power commends the cooperating agencies on their science based, data driven evaluation of the environmental issues surrounding the PolyMet Project.	NS	X
23332	Unique			O	Bruce Harten		929	2	Furthermore there are "Market Indications" of global producer influence by parent co Glencore on suppressing "current taconite production"	NS	X

29361	Unique			O	C.A.Arneson		3706	7	See aerial photos at the end of this document. The photos are raw footage; in other words the negatives. Due to their size, the images have been compressed from the originals in order to send them; the color of the ‘plume’ was lighter in the originals, and the green of the forest has intensified. Franconia Drill Barge is in the photos, just off Bob’s Bay. Unnamed Creek empties into Bob’s Bay of Birch Lake. Franconia drilled an exploratory borehole and sealed it the day before these photos were taken. (Minnesota Exploration Drilling records, 2005-2010). Beginning on (approximately) May 22, 2008, 5MGD were released from the Dunka Pit to prevent eventual overflow to Birch Lake. What effect did this sudden influx have on Birch Lake (per photos)? Suspended solids: In a photograph water with suspended solids will reflect light instead of absorbing it – water will look light; rather than dark as it normally would from the light being absorbed. The ‘plume’ on the water needs to be researched; all exploratory underwater borings need to be inspected. Heavy rain event (see link) occurred mid-month; an inflow may have kept water from flowing out of Birch Lake at the normal rate. http://waterdata.usgs.gov/nwis/dv?cb_00060=on&format=gif_default&period=&begin_date=2008-6-1&end_date=2008-6-30&site_no=05125000&referred_module=sw What is the status of the 1984 “slug” of heavy metals and sulfate at the bottom of Bob’s Bay of Birch Lake? What plans are in place to halt the contamination from releases to Birch Lake from Peter Mitchell? Dunka contamination? There also needs to be acknowledgment and research into the fact that PolyMet will release contaminants to both the Lake Superior and the Keweenaw/Rainy River watersheds; the Final EIS is incomplete and the public has been misled by the agencies charged to protect them, to protect their waters. Thousands of exploratory boreholes are already punched into the Duluth Complex and acting as conduits to our aquifers. Full-scale mining would send contaminants through the numerous faults and fractures (Copper-Nickel Study) and through the exploratory boreholes (many of which are unsealed or partially sealed). Some exploratory boreholes are not being sealed the full length, only 250 feet from the surface; the law allows it, no hydrologist worth his salt ever would. How these boreholes are being sealed is pretty much left to the exploratory companies, with little oversight unless there is a reported problem. When has anyone done a complete investigation? Before we consider a sulfide mine in the Duluth Complex, on Superior National Forest Land, we need to deal with and thoroughly understand the problems we already have with our ecosystems, with surface and groundwater degradation.	NS	X
24131	Unique			O	Carlyle Conrad		1006	3	I have been watching and listening to the information about the man who just died in Chile that used to own the Northface Co. and how he and his wife purchased private land to combine it with other lands to return it to the Chilean Government so they can have a national park system like ours so it’s kept safe from development for the good of all.	NS	X
24131	Unique			O	Carlyle Conrad		1007	4	Thank you for the good work you do every day for the good of the environment of our country.	NS	X
6496	Unique			O	Chaunce		498	1	Always glad to see you have not lost your deserved sense of the historical record. I pray daily that folks will awaken to the prowess of those who have blazed the trail with truth and blood. Reading your actual records of events is like reading the bible. We are told what and who we can not trust and given the direction we must follow for a positive legacy for future generations. After all, if your assertions were not true, why is there no retribution from the accused. There is only one right answer. The continued tenacity of each of you is always appreciated by me. At times when praising the Creator, I ponder the welfare of each of you in my heart.	NS	X
22281	Unique			O	comed32@aol.com		860	1	The approval of the PolyMet EIS is a step towards improving the unemployment problem on the Range. While the band aid of extended benefits may be needed for a short term solution, PolyMet could be a giant stop towards a permanent solution to the Range’s unemployment. I hope that the Department of Natural Resources will make the approval of this EIS the 1st gigantic step to solve the Range’s unemployment problem.	NS	X
21989	Form Letter	3	Variant	O	Craig Fellman		852	1	I personally have got to know and understand the leadership behind POLYMET. These are some great people that have spent tireless hours doing the right thing for the State and the people of MN. They are on the right track and I believe the EIS shows things are set to be in place for an environmentally sound project.	NS	X
28541	Form Letter	3	Variant	O	Dan Wegman		2321	1	The Final EIS for PolyMet’s proposed mine provides a thorough and more than adequate review of potential environmental effects the project may cause. This process has taken far longer than what should be needed to address such a project. The Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and correctly found that the NorthMet Mine can comply with strict state and federal environmental standards. I am an avid outdoorsman that spends considerable time in the awesome wilderness areas of Northern Minnesota and would never endorse a project I thought could endanger the environment I enjoy so much. In my opinion, the Final EIS for the NorthMet Mine shows this is an environmentally safe and viable project with no valid reason to block or delay the project. Every potential reason for blocking or delaying further the start of this project has been properly addressed in the document.	NS	X
28541	Form Letter	3	Variant	O	Dan Wegman		2322	2	In addition to these facts it is my view along with many others that: The economic future of Northern Minnesota requires diversification away from iron ore mining. The NorthMet project provides a long-term viable industry that creates many jobs, both directly at the mine and indirectly to hundreds of other businesses. The majority of taxpayers across our great nation are fed up with economic stagnation created by the current political will to hamper growth through unnecessary and unwarranted regulatory barriers. This issue had been studied for over 10 years and the EIS has addressed all of the issues required by Federal and State regulations. It’s time to accept the adequacy of the report and move forward with the permitting/approval process.	NS	X
23406	Unique			O	Darwin Dyce		951	1	Surely you are aware that other mining companies smell sweet opportunity to take advantage of PolyMet’s NorthMet if permitted. Statements have been made that the NorthMet processing plant would be the “logical” place to help process other mining companies toxic waste. Speaking of other companies, other large mining companies are carrying out exploratory work such as, Talon Metals and Kennicott a subsidiary of international Rio Tinto and Duluth Metals now fully owned by Chilean mining giant Antofagasta. As the environmental impact is considered it must expand beyond the impact of PolyMet, which if approved will signal an opening for more mines and greater long term risk. You are aware that no sulfide mine has ever not polluted.	NS	X
25680	Unique			O	David Siebert		1209	1	This is Ridiculous! The research has been done! Polymet has jumped through all of your hoops! They have proven the ability to mine safely. Stop stalling! Stop DELAYING and let Polymet mine!	NS	X
25385	Form Letter	1	Variant	O	David Witt		1176	18	I request a specific response to my comments.	NS	X
29164	Unique			O	Deborah Huskins		3597	3	I also would like to comment on the Fact Sheets. While they are helpful in summarizing information regarding their respective subjects, they read like marketing materials prepared by Polymet. They assume that all actions implemented will work as planned, no unforeseen natural or man-made disasters will happen that cause the assumptions to be wrong. They assume that Polymet “would do” everything it says it will.	NS	X
7362	Unique			O	dembiczak1@wildblue.net		536	1	My wife and I have been looking at this project proposal since it’s infancy,it has been studied to death. Outsiders that have nothing better to do with their time,and just want to use Northern Minnesota as a play ground,with us as caretakers,have no idea what it takes to live in this part of the state. We want clean water,Clean air,Fish, and the many species of wildlife that make this part of the state their home,to flourish and have a safe environment for ALL. It has been proven time and again that this project can be done to the specifications that have been laid out for it,and it would have been providing much needed ,high paying employment to hundreds of FAMILIES,(thousands of people) in an area that is going to die without these projects. If you use a computer,swipe on a cell phone or use any other type of electronics,and are against the project,because of something that might happen,YOU are a hypocrite. These mines will be mining metals that every one of our electronic devices needs to operate. Why should we rely on countries that don't even like us,to supply such materials? If this project is abandoned due to the GOVERNMENTS inability to get out of the way.SHAME ON THEM, AND US, FOR ALLOWING THIS TO HAPPEN.We have "DO NOTHING POLITICIANS" (that some of us)voted into office,that need to get a backbone and stand up for what is needed in the State of Minnesota. We need to supply these materials to "The United States Of America" from our own soil.	NS	X
14713	Form Letter	1	Variant	O	Dick Gallien		798	1	In 1946 I went on a 10 day canoe trip out of Sommers Bay Scout Canoe Base, when 14 and again when 16. The summer of 1964, I was on staff at the first Mn. Outward Bound Sch. for 2.5 months, with 2.5 days off and 45 days into the Quetico. Sigurd Olsen spoke to us. At 84, I'm busy on my organic farm, but will never forget that pristine area and hope you don't let anyone foul it up.	NS	X
23698	Unique			O	Ed Labernik		965	1	I would like to go on record as stating that I am all for Polymet being granted a permit to open their mine. I've seen the latest research and firmly believe that if they can do it the correct way as to avoid affecting adjacent waterways, then go for it.	NS	X
30253	Form Letter	1	Variant	O	Eric Anders		2743	1	Thank you.	NS	X
26608	Form Letter	1	Variant	O	Eric Snyder		1365	8	Please respond specifically to my comments.	NS	X
				O	Erin Mittag	Minnesota Center for Environmental Advocacy	3941-1	1	The undersigned groups (Minnesota Center for Environmental Advocacy, Center for Biological Diversity, EarthJustice, Sierra Club North Star Chapter, Friends of the Boundary Waters Wilderness, Save Our Sky Blue Waters, Northeastern Minnesotans for Wilderness, Friends of the Cloquet Valley State Forest, Voyageurs National Park Association, and the National Parks Conservation Association) (collectively, “Conservation Organizations”) submit these comments on the Final Environmental Impact Statement (FEIS) for the proposed NorthMet Project and Land Exchange. The Center for Biological Diversity (Center) is a national, nonprofit conservation organization with more than 900,000 members and online activists dedicated to the protection of endangered species and wild places. The Center has an office in Duluth, Minnesota, and has hundreds of members who reside within and/or regularly use, enjoy, and recreate on public lands and waters in northeastern Minnesota, including on the Superior National Forest. The Center, its staff, and its members and the interests of its staff and members would be significantly harmed and injured if the proposed project is approved and allowed to be implemented. Earthjustice is a non-profit environmental law organization, defending the right to a healthy environment for all, using the law to fight for the earth and its inhabitants since the early 1970s. Earthjustice works with individuals and organizations to realize that mission and ensure the implementation and enforcement of our environmental laws. The mission of the Friends of the Boundary Waters Wilderness is to protect, preserve and restore the wilderness character of the Boundary Waters Canoe Area Wilderness (BWCAW) and the Quetico-Superior Ecosystem. We have nearly 3,000 members in Minnesota and across the United States, and regularly communicate with about 27,000 supporters. Our organization values healthy ecosystems, clean water, wilderness character, and primitive recreation. Our supporters enjoy the Superior National Forest and the BWCAW for canoeing, camping, fishing, hunting, bird-watching, and many other reasons, as well as the region’s natural, largely undeveloped character. The risks to many of these activities and attributes from nonferrous mining have been a significant concern for our organization for many years. The Friends of the Cloquet Valley State Forest is a 501(c)(3) non profit organization dedicated to the protection and preservation of the natural and cultural resources of the Cloquet Valley State Forest and promotes responsible enjoyment of this unique treasure.

NorthMet FEIS Comment Matrix											
Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
				O	Erin Mittag	Minnesota Center for Environmental Advocacy	3941-2	1	The Cloquet River flows through our forest and into the St. Louis River. The people and the flora and fauna of the Cloquet River Valley are intimately connected with the fate of our river. Our members’ concerns range from the health of the people to the legacy of the land, water and ecosystem we leave to the coming generations. Many of us make our livings by relying upon sustainable tourism, the natural world, art, and agriculture, and anything that disrupts the ecosystem is a threat to our livelihoods and well being. The Minnesota Center for Environmental Advocacy (MCEA) is a Minnesota-based non-profit environmental organization, the legal and scientific voice protecting and preserving Minnesota’s wildlife, natural resources, and the health of its people. MCEA has members across the state of Minnesota, some of whom live and recreate near the proposed mine. The proposed NorthMet project has environmental implications for many of the areas of MCEA’s work, including water quality, natural resources, energy policy and public health. Northeastern Minnesotans for Wilderness (NMW) is a nonprofit regional conservation organization whose core mission is to advocate for the preservation and protection of public lands, designated wilderness areas, national parks, national forests, and other wild places in the Minnesota Arrowhead Region, especially the Boundary Waters Canoe Area Wilderness, the Superior National Forest, and the Quetico-Superior ecosystem. Since its founding in 1996, NMW has grown to represent over 2400 members and supporters, almost all of whom live in Minnesota. The majority of our members and supporters reside year-round or seasonally in the three-county Minnesota Arrowhead Region, own property in the three-county area, and will be directly impacted by the NorthMet Project. Our members and supporters also visit and recreate throughout the three-county area. Save Our Sky Blue Waters (SOS) is a Duluth-based grassroots non-profit organization dedicated to protecting our region’s waters, forests and wildlife. SOS formed in response to proposed copper-nickel sulfide mining and exploration in Minnesota’s Arrowhead region and the headwaters of Lake Superior and throughout the Superior National Forest.		
				O	Erin Mittag	Minnesota Center for Environmental Advocacy	3941-3	1	The health of the St. Louis River watershed is a key component of our mission. SOS is a non-profit public interest environmental education and advocacy organization. The issue of potential toxic sulfide mining in northeast Minnesota may greatly impact our organization and citizens across the region. The Sierra Club is a national nonprofit organization of approximately 600,000 members dedicated to exploring, enjoying, and protecting the wild places of the earth to practicing and promoting the responsible use of the earth’s ecosystems and resources to educating and enlisting humanity to protect and restore the quality of the natural and human environment and to using all lawful means to carry out these objectives. The Club’s particular interest in this case stems from the proposed project’s potential impacts on Minnesota’s natural resources and public health, including risks to water quality, loss of wetlands, harm to wildlife, and cumulative impacts from mining. The North Star Chapter of the Sierra Club has approximately 14,292 members in the state of Minnesota. The mission of Voyageurs National Park Association is to protect and promote the natural, recreational, and historic resources of Minnesota’s Voyageurs National Park. VNPA and our supporters across the state serve as a voice for this water-based national park and its nearly 250,000 annual visitors who enjoy kayaking, canoeing, boating, camping, and fishing there each year, and contribute more than \$16 million to the local economy. The proposed NorthMet project, individually and cumulatively, may have dramatic environmental implications for the water quality and health of the fish and wildlife in Voyageurs and Northern Minnesota. These implications necessitate sound science and analysis. Since its founding in 1919, the National Parks Conservation Association (NPCA) has been the independent, nonpartisan voice working to strengthen and protect our nation’s natural, historical, and cultural heritage. Together with its more than one million members and supporters nationwide, including 20,000 in the state of Minnesota, it uses the legislative system, the power of public opinion, and the courts to shape public policy to protect national parks.		
29745	Unique			O	Erin Mittag	Minnesota Center for Environmental Advocacy	3941-4	1	The proposed NorthMet project has environmental implications for national parks in Minnesota. Additionally, NPCA is a co-chair of the Healing Our Waters Great Lakes restoration coalition, which has successfully advocated to establish and sustain the Great Lakes Restoration Initiative (GLRI), which has helped improve the water quality of all of the Great Lakes. The NorthMet project would be located within the Lake Superior watershed and pose an ongoing pollution threat to Lake Superior long after the proposed mining period stops. These comments reference and incorporate the attached reports of the following technical experts - Dr. David Chambers, geophysicist focus mining engineering and planning - Keith Gadway, environmental engineer focus groundwater transport of pollutants - Dr. Paul Glaser, wetland geohydrologist focus hydrology and wetlands - Dr. Tom Myers, hydrogeologist focus hydrologic modeling - Dr. Glenn Miller, geochemist, focus water quality and treatment - Dr. Ann Maest, geochemist, focus geochemistry and water quality - Dr. Michael Malusis, geotechnical and geoenvironmental engineer focus barrier and containment strategies and - Victoria Stamper, air quality specialist focus air quality Please consider these expert reports and associated attachments independent parts of the record herein. In addition, the Conservation Organizations are delivering with these comments a DVD of reference materials and additional supporting documents. Please ensure that these reference materials are also included in the record and made part of this submission. If DNR requires hard copies of the reference and supporting documents to ensure that they are made part of the record, please let us know and we will supply hard copies.	NS	X
29745	Unique			O	Erin Mittag	Minnesota Center for Environmental Advocacy	3951	9	The EPA has estimated that total liability for cleanup of all hardrock mines across the US is between \$20 and \$54 billion.	NS	X
29745	Unique			O	Erin Mittag	Minnesota Center for Environmental Advocacy	3989	43	In the realm of transportation, risks to natural resources arise both from accidents and from inherent imperfections in modes of transport. The two most obvious transportation risks that are inadequately assessed in the FEIS are the risks of accidents and the uncertainty of containing ore dust and spillage along the transportation corridor. While the FEIS includes a probabilistic risk assessment for accidents involving diesel fuel and PAX, the results understate the risk of accidents because of the limitation to these two materials. Furthermore, the assumption that all shipments begin in Duluth very significantly reduces predicted transportation impacts. Finally, the risk of accidents in regards to the shipment of waste and of mineral concentrate has been arbitrarily excluded.157 As the FEIS states that both waste and mineral concentrate will be shipped from the facility, accidents involving these shipments are foreseeable and thus must be addressed in the FEIS. Dust and spilled ore from rail transport has been identified as a risk of the proposed project from the start and remains an issue in the FEIS. As with virtually every other system at the mine, the FEIS provides an optimistic estimate regarding the amount of spillage without regard for accidents, less-than-perfect maintenance, or simple uncertainty. Rather than discussing the probabilities that some rail cars at some times will not achieve the predicted 97 percent reduction in spillage, the FEIS assumes that all will go as planned and recommends monitoring “to check for any potential deteriorations of water quality over time from ore spillage.” The Conservation Organizations agree with the Great Lakes Indian Fish and Wildlife Commission (GLIFWC): “GLIFWC does not believe that monitoring of the creeks along the rail line will be effective in preventing or minimizing impacts because once detected in monitoring, the impact will have already occurred. GLIFWC states that cleanup of ore dust in an aquatic environment is a long and difficult process. "Furthermore, monitoring to identify impacts after they occur cannot take the place of disclosure of the risks of impacts in a NEPA document.	S	N
29745	Unique			O	Erin Mittag	Minnesota Center for Environmental Advocacy	4054	117	In its discussion of adaptive management, the FEIS states, “Adaptive management would be implemented as necessary based on monitoring for total mercury to determine whether the treated water could be discharged to surface waters, or whether some additional treatment is needed. "The text goes on to discuss possible treatments, but provides no information on how effective they have proven to be. This is not adaptive management, which would identify the trigger point at which adaptation would be required, along with measures that have been proven to give the necessary results and what they would cost.	NS	X
29745	Unique			O	Erin Mittag	Minnesota Center for Environmental Advocacy	4138	198	It is clear that the State of Minnesota will not shut down an existing mining operation until epidemiological studies show that people are dying at levels that cannot be ignored.	NS	X
10243	Unique			O	Evan Johnson		681	3	I credit the opponents of Polymet for ensuring that 'no stone goes unturned' in regards to the environmental impact statement, but to continue to bring economic and political sway to force against the Northmet project is simply selfish, and bordering on ridiculous. While Polymet has financed their progress, ideologs associated with non-profit organizations have made and used small fortunes against Polymet by effectively manipulating and appealing to the people’s responsibility to protect their own home. They have mis-represented and slandered Polymet on numerous occasions for the sake of gaining political prestige among their peers and to increase their funding. Without the sound minded entrepreneurs of the world like Polymet, these 'environmentally minded' organizations would be lost for lack of prey to leech off. If these 'environmentally minded' organizations were truly concerned for the betterment of the world, they would see that mining in our own backyard with a very mindful eye to the impact on our environment is far more responsible that allowing others to produce the resources we all expect to use daily with next to no oversite and totally out of our control. If they were truly motivated by a love and concern for the environment and those who live in it (all of us), they would recognize that the best use of resources at this point would be to come alongside Polymet financially, politically, and personally to ensure that they operate at the highest of standards as they have indicated they will do in the Final EIS. I am not a terribly liberally minded person, but imagine the final product that could come forth from a strong and real cooperation between Polymet and those who once opposed it, and perhaps still do, but desire and intend to make it literally the best copper/nickel/precious metal mine in the world.	NS	X
12727	Unique			O	F Jeff Verito		771	7	The document is so un-user-friendly that I couldn’t access section 7.3.4 for the effects on human health.	NS	X
29965	Unique			O	Gary Glass		4233	1	The Final EIS document, all 3576 pages, appears to have not benefited from my previous two submissions of review comments on the SDEIS and DEIS. I identified forty data gaps, defects in methodology, and missing relevant knowledge needed to make the FEIS complete, but none of these requested improvements are evident in the FEIS document. None of the specific comments have produced improvements to fill critically important gaps in the data presented. Nor are there added improvements (identified in my DEIS and SDEIS comments) in the knowledge base needed for this proposed project to mine reactive ores in the midst of a highly sensitive freshwater forest ecosystem. See my previously submitted comments in Sections B. SDEIS and C. DEIS, below.	NS	X
24372	Form Letter	1	Variant	O	gloriana casey		1033	4	ALL of this kills life and the planet-----why would any sane person pollute their own nest-----Earth---because even birds are not that stupid!	NS	X
29738	Unique			O	Harold Edwards		2601	2	the investors in Polymet have relatively low risk compared to the people living in northern Minnesota and the taxpayers of Minnesota. We need to change that. We need to monetize the actual risk and transfer it to the investors. Then the marketplace will think twice about this project and probably kill it.	NS	X
29738	Unique			O	Harold Edwards		2605	6	You must convince all the sets of investors that because the stock merely passed through their hands they too have additional liability.	NS	X
29909	Unique			O	Harold Nordin		2713	2	It relies too heavily (almost exclusively) on information and model data provided (or conducted) by PolyMet rather than independent sources;	NS	X
12609	Form Letter	1	Variant	O	Henry Hark		765	3	Notice, I write my own message. Please respond because no one my age (20) believes in your ability to act against big corporations or big money.	NS	X

24235	Form Letter	1	Variant	O	James Cunningham		1018	4	I request a specific response to my comments, especially my recommendation to investigate probable corruption of public officials by PolyMet.	NS	X
30303	Form Letter	1	Variant	O	Janet White		2849	1	Please do not contact me w/ updates or opportunities	NS	X
15169	Unique			O	Jason George	International Union of Operating Engineers Local 49	2922	1	I write on behalf of the more than 13,000 members of the International Union of Operating Engineers Local49. Our members operate heavy equipment, and build the infrastructure in our region, including the mining industry. We have patiently waited for ten years on a decision regarding PolyMet.	NS	X
15169	Unique			O	Jason George	International Union of Operating Engineers Local 49	2926	5	We thank you, and the hard working men and women of the Minnesota Department of Natural Resources (DNR) for your diligent work on this project. The DNR has stuck to the facts despite illogical attacks from activists with purely political agendas. We know that has not been easy, and want you to know your efforts are appreciated.	NS	X
30307	Form Letter	1	Variant	O	Jedidiah Krauss		2850	1	There is a way to get yourself off the political hot seat regarding this proposal. Make it a condition of approval that the CEO, CFO, COO and all members of the board of directors of Polymet as well as those of it's parent corporation, must sign as being personally liable for any and all environmental clean up expenses upon any and all infractions of the MPCA's and the EPA's Pollution Regulations or any and all infractions of the conditions of the permits for the mine regardless of corporate solvency or insolvency. Thus it will be manifestly clear that if those who stand to profit from this venture are unwilling to risk their money then the tax payers should not risk their money either.	NS	X
18111	Unique			O	jeffrey.lipovetz@tkda.com		829	1	Canada. With the understanding that it is not a reasonable point of discussion to disagree that we need responsible mining to support the fundamental standards of living we all enjoy, I strongly support the Polymet NorthMet Mine project. I believe in a global ecology. Therefore, we need to be in control of extracting these base minerals for our collective beneficial use in the most responsible way. This project proposes to do that. Further, the leadership team assembled for Polymet has a proven track record of executing similar projects to the highest environmental standards.	NS	X
25683	Unique			O	Jerome Ekre		1212	1	I support the mining project in North East Minnesota. Reclaim old closed mine and use existing structure for better use. Both are great use of our resources in the United States and will provide jobs for Minnesota workers.	NS	X
25909	Unique			O	jim or bev		1243	1	What is wrong with you people 10+years of delays and moving targets, millions of dollars spent and now another delay, permits should be given and then if the company can live with them they can mine if not they can't. The entire northeastern part of the state needs this project to survive and you people keep listening only to the metro area people that view the area as there playground, get your act together	NS	X
27904	Form Letter	1	Variant	O	Joe Moriarity		2165	4	I request a specific response to my comments.	NS	X
4927	Form Letter	1	Variant	O	John Flaten		420	2	and incorporating and restating those comments which I made to the SDEIS, none of which have not been addressed in the FEIS.	NS	X
27693	Unique			O	John G. Raines	North Central States Regional Council of Carpenters	3278	2	This EIS is the culmination of 10 years of study and analysis by the co-lead agencies. It responds in detail to the thousands of public comments and questions submitted during the public comment period for the Draft EIS and the Supplemental Draft EIS. The updated water modeling in the Final EIS shows that PolyMet's treatment and mitigation plans will meet all water quality standards. Further, the Final EIS specifically considered the project's potential effects on air quality and water quality with respect to human health and identified no adverse health risks.	NS	X
27807	Unique			O	Joseph Butler		2098	6	Again, I am writing in support of the project, find the FEIS more than adequate, and ask that it be accepted.	NS	X
27807	Unique			O	Joseph Butler		2146	1	I am writing to express my support for the poly met project. It is my opinion that the FEIS that has been prepared is adequate should be accepted.	NS	X
30109	Form Letter	9	Variant	O	Karen Graham		2826	3	Glencore Corporation formed in 2013 through a merger with Xstrata founded in 1926 in Switzerland. As of Oct 2015, the CEO Ivan Glasenberg is trying to calm investors from fleeing due to the company's high debt load. Such confidence building for this venture. Their primary interest commodity trading, secondarily mining.	NS	X
14940	Form Letter	7	Variant	O	Kathleen Williams		801	1	The health of Americans is being put at risk in hundreds of projects that introduce toxic substances into our wetlands and the air we breathe.	NS	X
25816	Unique			O	Keith Lerick		1226	1	This process was far too long and dragged out. With todays computers and modern technology, this process should have never lasted 12 years. I am appalled at your delay. I do believe the EIS is more than adequate and the mining community is far more diligent than many give them credit. With that said, let us try to expedite the next steps in this process and get this operation going.	NS	X
16340	Form Letter	7	Variant	O	Ken Winkle		809	1	Do any of the people in the state senate & representatives read any history? I have my doubts. Historically any CEO with mining, oil or gas has been one who practices immoral actions against the land and against people. It is all about the American god of corporate GREED. This is also a part of our history that the oligarchs have been not wanting to share as with all their tax breaks they want indentured servants and a 3rd world country. Water is life for all people, not just the few.	NS	X
24665	Unique			O	Kerry Davis		1072	1	I live, work and own a business in Ely, MN. I feel the current EIS is very sufficient in proving the the copper/nickel mining can be done safely.	NS	X
3955	Unique			O	KR STOKES		395	1	I am in favor of the current PolyMet NorthMet copper-nickel sulfide mine proposal. The PolyMet Final Environmental Impact Statement (FEIS) is adequate under both federal and state standards; I was glad to see the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I support issuing any federal permit allowing PolyMet to begin operations. The PolyMet FEIS is adequate under federal and state laws and regulations because: - It evaluated pollution risks to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure. - It analyzed health risks and impacts on children, workers and communities who rely on fish and wild rice for subsistence, including risks from asbestos-like particles and methylmercury. - It evaluated the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin. - It adequately considered alternatives to minimize environmental harm, reduce polluted seepage from unlined permanent waste facilities, mitigate wetlands destruction, and reduce the threat of catastrophic dam failure. I strongly support the proposed NorthMet Mining Project Land Exchange in the Superior National Forest and any federal Clean Water Act permit for PolyMet. I request the Minnesota Department of Natural Resources approve the PolyMet FEIS as adequate; the U.S. Forest Service support the proposed exchange of Superior National Forest lands for the PolyMet project; and the U.S. Environmental Protection Agency support and the U.S. Army Corps of Engineers approve any Section 404 permit that would allow PolyMet to operate.	NS	X
10736	Unique			O	Kurt Doran		723	3	Finally, the NorthMet project gives Minnesota a unique opportunity to provide framework for the rest of the world on how to extract and provide strategic metals to meet global demands while upholding our state's stringent environmental standards and providing the highest degree of worker safety. This last comment may border on being personal and not science-based, but it should be considered by the scientists, engineers and regulators tasked with successfully bringing this project to fruition as it would reflect positively on the state and subsequent agencies.	NS	X

27688	Unique			O	Laura Gauger		3268	16	There have been some rather curious word choices and changes in wording in the EIS as it has moved from the DEIS stage to the SDEIS to the PFEIS to the FEIS. These word choices and changes are curious in the sense that they have actually muddled the waters instead of adding clarity to the final draft of the document. If these sorts of word choices are to be made, the public deserves to know WHO made them, and WHY. Without some sort of personal accountability (i.e., naming names), too many things can be slipped under the rug, to the public’s detriment. For example, please see page ES-26 of the PFEIS and compare to page ES-24 of the FEIS. The former states the following as the lead-off sentence to the first new paragraph in column 1: “Water quality modeling performed in support of the FEIS indicates that water treatment systems would be needed at the Mine Site and Plant Site indefinitely.” The paragraph ends with the following: “Both mechanical and non-mechanical treatment would require periodic maintenance and monitoring activities for as long as treatment is required (indefinitely).” Please compare this to the rendition that appears in the FEIS (page ES-24). The above-cited lead-off sentence was deleted from the corresponding paragraph, and the word “indefinitely” was removed from the final sentence. Instead, the information is now buried in the middle of the first paragraph of the second column, where it’s much less prominent. The information that water treatment systems would be needed “indefinitely” at the PolyMet project site is critical to impact analysis, as reflected by the fact that the above-cited sentence (or variations thereof) appears about 20 times throughout the body of the EIS. Yet, this crucial information was relegated to second-class status in the Executive Summary of the FEIS, the part of the document that would get the most traffic. Whose idea was this? The public needs (and deserves) to know who is masking critical information so citizens might better pass judgment on the integrity of the EIS process (and therefore the integrity of the document itself). A second example: Please compare p. 5-173 of the PFEIS to page 5-174 of the FEIS. It looks like someone was trying to “muddy the waters” by changing phraseology. The term “water quality standards” in the PFEIS was changed to “evaluation criterion” in the FEIS. The average citizen certainly would understand the former phraseology better than the latter. Again, whose idea was this? The public needs (and deserves) to know who is “muddying the waters” in what appears to be an effort to downplay information that justifiably would raise public concern. A third example: Please compare p. 3-2 of the DEIS to p. 3-4 of the FEIS. The DEIS clearly indicates tonnages of the various metals to be produced by the PolyMet operation (and therefore subject to taxation). Yet, the FEIS indicates tonnages of various concentrates and precipitates without disclosing their actual concentrations. As stated earlier, the production values reported in the FEIS are somewhat meaningless. It’s like going to a liquor store and being told the volume of a bottle of vodka instead of being told the volume AND proof. Again, whose idea was this to use funny numbers to describe production values? The public and state decisionmakers need (and deserve) to know real production numbers so they can decide if the environmental risks are “worth it” in terms of potential tax revenues. Curious word choices used in the FEIS: Who decided to call the location of the PolyMet tailings dump and processing plant the “Plant Site” when the vast acreage associated with the site is tied to the dump (3,000 acres) rather than the processing plant (perhaps 200 acres)? o Who decided to use the term “hydrometallurgical residue” instead of the more broadly understood term, “tailings” to describe the waste generated by the hydromet plant? Surely the latter term would have done a better job at alerting the public to the toxic nature of the waste. o Who decided to characterize groundwater drawdown, changes in water quality and other potential changes to wetlands at the PolyMet project site as “indirect” impacts, when those effects indeed would be directly caused by the mine? The use of the term “indirect” in the EIS does not meet the common dictionary definition of the word and, to PolyMet’s unfair advantage, tends to minimize the connection between the mine and what could be some very serious impacts. ? Curious timing of the release of the FEIS: The PolyMet EIS process has been underway for, what, about 10 years now? Yet, someone decided that the 3,500 page FEIS had to be released now, over the busy holiday season (when people need and deserve to have time with their families) and to give the public a mere 30 days to respond. This curious timing has made it more difficult for working-class people in the community to offer comment on this very important decision. Whose idea was it to release the FEIS in mid-November and impose a 30-day deadline over the holiday season? The above are examples of what appear to be questionable decisions made by one or more people involved in the EIS process. It’s time for the co-lead agencies to “name the names” of those who are responsible for what appears to be a thinly-veiled attempt to mask unpalatable elements of the FEIS with “feel good” language and minimize public participation in the review process. The public needs and deserves to know who is really “calling the shots” here so they might better judge the integrity of the EIS process (and therefore the integrity of the FEIS itself). Without this type of full disclosure and transparency, the FEIS must be deemed inadequate.	NS	X
27689	Unique			O	Lea Foushee	North American Water Office	3206	10	LTV Mining's coal ash waste pit, that closed 15 years ago, is still on the NorthMet site. Historically, LTV's tailings dam broke in 1993 contaminating Taconite Harbor clean up cost the company \$11 million dollars. It is critical should NorthMet be approved to not place mine wastes on top of the unstable LTV waste pit.	NS	X
3306	Form Letter	1	Variant	O	Linda Rolf		367	4	I request a specific response to my comments.	NS	X
29740	Unique			O	Lori Andresen	Save Our Sky Blue Waters et. al.	3883	10	PolyMet is relying on Reverse Osmosis to treat plant site water upon closure, even though RO has been proven ineffective on the scale required--both mechanically and financially. Why isn't RO being used right now for ongoing pollution from taconite mining?	NS	X
29740	Unique			O	Lori Andresen	Save Our Sky Blue Waters et. al.	3885	12	The DNR and MPCA have never forced taconite companies to meet state standards. Until the state agencies change their policies regarding the granting of variances, the PolyMet FEIS is inadequate.	NS	X
29740	Unique			O	Lori Andresen	Save Our Sky Blue Waters et. al.	3892	3	we oppose this land exchange as being in opposition to the best interests of the people living in this region and this state, along with the American public, and the international public that could be impacted by pollution entering from our watersheds. The proposed land exchange would be a taking of the Superior National Forest in order to facilitate controversial mining that would pollute the Superior National Forest and the two internationally important watersheds of Lake Superior and the Boundary Waters. In conclusion, all aspects of the exchange proposal favor mining and logging interests and punish the public at large. The proposed exchange is not in the public interest and the USFS has the moral and legal authority to reject the damaging School Trust Land Exchange. The damages to water, wetlands, forests, wildlife, and future generations from the land exchange are unacceptable.	NS	X
29740	Unique			O	Lori Andresen	Save Our Sky Blue Waters et. al.	3906	21	Wild Rice as a species of Special Concern in Minnesota. Although the quality and diversity of our natural wild rice (Zizania aquatica) stands have deteriorated over the past 60 years, wild rice has not been mentioned as a species of concern. While sulfate connections to the deterioration of the wild rice crop are being studied, we believe that wild rice should be designated a Species of Concern, giving the DNR the ability to protect this species from mining expansion and to require industries to clean up their pollution. Wild rice, or manomin, is the official state grain of Minnesota and deserves our protection. Wild rice is the canary in the coal (or taconite) mine. The loss and/or degradation of vital wild rice stands in northeast Minnesota is a warning sign that something must be done in order to protect the quality of our waters.	NS	X
29740	Unique			O	Lori Andresen	Save Our Sky Blue Waters et. al.	3911	26	The agencies granted an inadequate amount of time for citizens to process and comment on the FEIS. Furthermore, citizens and volunteer advocates for protecting our environment have had to sacrifice family time during a traditional holiday period in order to do our civic duty in regard to submitting comments, while agency personnel continued to follow their regular work schedules. Our groups submitted multiple requests for an extension of the comment period, by which the DNR granted one additional week. This is totally inadequate.	NS	X
29980	Unique			O	Lori Andresen		4227	8	The PolyMet FEIS is lacking in pertinent analysis of significant impacts that will change the quality and character of Minnesota's north woods area — for us and the next 25 generations. These are not matters to be taken lightly. The poisoning of our waters is simply not acceptable. Voice your opposition and objection to this flawed project and review process. Check out www.sosbluewater.org for more information. Call the governor at (651-201-3400 or 800-657-3717) and submit an email on his website form.	NS	X
29977	Unique			O	Lori Andresen		4288	1	Man has gone and done it once again. Just when you think you can develop a modern, safe, environmentally pleasing copper-nickel/precious metals mine the whole thing falls apart and sends a flood of toxic waste downstream. We sure can convince ourselves that we’re smart enough to mine copper-nickel disaster free. We so smart. In the upper watershed of the Fraser River in British Columbia, which happens to be the largest sockeye salmon fishery in Canada, a batch of lead and cadmium and other heavy metals was let loose after an unexpected August 2014 rain event swelled the waste basin to the brim. The earthen dam was simply overwhelmed and that fishery will now have to deal with the stigma that the fish may be contaminated now and into the future. Oh, the supporters of copper-nickel mining in Minnesota finally acknowledged the disaster in very trim words and said they wouldn’t allow that to happen here in this state. Not here. Even though the same waste containment regimes have been proposed. We’re smarter than that here. Our regulations are tough. Real tough. We won’t let that happen in Minnesota, they say. Project supporters said the same thing in Canada, according to scientists assessing the damage for EnvironmentCanada, that nation’s EPA. The waste basin was engineered to withstand the harsh northern British Columbia weather but a rain event like those rain events we’re seeing more and more often these days doomed their predictions of a safe, clean mine in a place where people value the environment more than, say, the Chinese. Mining supporters are always picking on the Chinese or some other less developed nation with the red herring argument that we should mine in Minnesota where the environment will be protected, not devastated, when everybody knows that those global mining giants will mine wherever there’s money to be made and a willing ore body is available. In other words, they aren’t going to suspend mining operations across the developing world just because they’ve decided to zero in on the Duluth Complex in northeastern Minnesota. We just think we so smart. We so smart we might even believe we can mine copper-nickel without harming the environment even a little bit. We so smart. This smart thinking has happened forever, of course, especially since the industrial revolution kicked in. We so smart, we can handle the byproducts of a very smart society. First, we dump it into a hole in the ground or into the rivers, lakes and oceans. When that hole fills up or the river catches fire or the fish die and people start getting sick move to Plan B. Smart societies always have Plan B. In the meantime, Superfund sites are all over the countryside. There may be a Superfund site near you. Of course there is. A majority of Americans now live within 20 miles of a nationally recognized Superfund site. We so smart. We so smart, nuclear energy was developed based on the fact that we so smart, of course we’ll figure out a way to deal with plutonium and its million-year half life. In the meantime, entomb those spent fuel rods in concrete and whatever you do don’t take one of those fuel rods out of the water even for a minute. Be smart. Don’t so that. We so smart, here we are 60-70 years later and still without a clue of what to do about radioactive waste. We so smart. We so smart we’ve now succumbed to a farming model that poisons the very soil we grow our food in. Man, that smart! Put poison in ground along with seeds, grow that food or food product and then eat it keeping fingers crossed that bad food doesn’t harm the population. We so smart. We so smart we can pump chemicals into deep wells to force crude oil out of shale and be energy independent and not see any potential side effect at all! Pump chemicals into the ground and nothing bad will happen now and in the future. Amazing. We so smart. We just so darn smart we can fool ourselves into thinking that we can do anything as long as there’s money involved. Money, money, money. Money just money. Can’t take it with you. Money not smart. We dumb.	NS	X

29980	Unique			O	Lori Andresen		4304	7	Since the opening of a sulfide mine district in the Arrowhead Region of the state is highly controversial, politicians would like to see the issue resolved before next fall's major elections. Since the commissioner of the DNR is appointed by the governor, the process is not one simply of scientific analysis. And since the DNR Lands and Minerals Division actively promotes mining activity, the FEIS is not a neutral process.	NS	X
30072	Unique			O	Lori Andresen		4335	1	The PolyMet final Environmental Impact Statement (FEIS) was released to the public November 6th, 2015. How did PolyMet ever get this far? And why? In 2010, the U.S. Environmental Protection Agency (EPA) rated PolyMet's draft EIS as EU-3, Environmentally Unsatisfactory-Inadequate. Here are some quotes from the comments: "The EPA believes that the project will exceed water quality standards because of discharges during the life of the mining operation and on a long-term basis, including the post-closure period. These water quality impacts are largely related to water that contacts acid-generating waste rock ... and to wastewater escaping the tailings basin through seeps and in ground water. ...the analyses of the hydrogeological profiles at both the mine and processing site are inadequate to determine the full extent of impacts or to justify mitigation options. Consequently we believe that the DEIS likely underestimates water quality impacts and the project is likely to have additional unmitigated long-term discharges. EPA has identified information gaps relating to groundwater impacts, groundwater-surface water interaction, tailings basin stability and containment, and groundwater discharges to surface water. Furthermore, EPA does not agree with the compensation described for wetlands impacts... The DEIS did not provide information on financial assurance..." The above are the same concerns brought forth by environmental groups as they made their way through hundreds of pages of the DEIS. These concerns included: "There is inadequate analysis. There is no substance to conclusions that claim there will be no water pollution. The scale of the mining operation is such that it will be impossible to contain water pollution. The tailings basin purchased from the former LTV Mining Company by PolyMet is already leaching sulfates and other pollutants into the watershed and is not designed to contain the amount or type of tailings that would be produced by PolyMet. The wetland loss at PolyMet's NorthMet mine (nearly 1,000 acres direct/ 6,500 acres indirect) would be the single largest loss ever permitted by the St. Paul Army Corps of Engineers. The US Forest Service could deny an open pit mine operation on our public lands within Superior National Forest, rather than negotiating a land exchange that would privatize 6,500 acres of Superior National Forest lands, impacting wildlife and wildlife corridors. Acid Mine Drainage (AMD) and heavy metal pollution will be a problem for hundreds to thousands of years."	NS	X
30072	Unique			O	Lori Andresen		4341	7	Market Weakness. Of further concern are weak market conditions for metals. Glencore, the major investor in PolyMet, has lost 60% of its share value over the past year. The company over-expanded when the market was high, taking on a debt load that has now become a burden. Any delay or problems in PolyMet's NorthMet project might mean that Glencore would pull out of the project in an attempt to further dump its debt. See "Counterpoint: PolyMet's Minnesota copper-nickel project is risky business," Star Tribune, October 28, 2015 for more information.	NS	X
30072	Unique			O	Lori Andresen		4342	8	Summary. Decisions are being made right now that will likely impact the next 25 generations to inhabit this area. We are placing our immediate desire for metals above the long-term need for clean water. Decision makers are swallowing the philosophy of mass consumerism that requires ever-expanding consumption of goods--a concept which is out of balance with the natural world and resources of the planet. We currently do not have the technology to mine highly disseminated low grade metals out of sulfide ores without degrading and polluting our environment for the next 500 years (or longer). Nor do we have the technology or the political will to clean up the pollution that is already here. Northeast Minnesota contains the headwaters of three great watersheds--north to Rainy River, east to Lake Superior, and south to the Mississippi. The Arrowhead has been known as one of the most magnificent areas of the state, for its majestic forests, wetlands, and waters. Superior National Forest is a treasure for the citizens of this state and nation. We all bear responsibility for what we will leave behind for the generations ahead. Clean water is a valuable resource in its own right. It is time to say "No" to PolyMet for once and for all. Take the time to submit a comment on the PolyMet FEIS, which was released on November 6. No public meetings have been scheduled during the comment period, ending on December 14. Check www.sosbluewaters.org or other environmental sites for more information.	NS	X

NS	X
29319	Unique			O	Maya Batres	The Nature Conservancy	3666	10	The Land Exchange described in the FEIS fails to compensate for the loss of ecosystem services, including loss of carbon storage contributing to climate change, as required by United States Forest Service Planning Rules and a Presidential Memorandum. The proposed Land Exchange will result in a significant loss of ecosystem services associated with a large intact wetland-upland complex. Services lost include carbon storage and watershed and habitat function. However, these services are not considered in the FEIS. The failure to account for ecosystem services is not compliant with the 2012 USFS Planning Rule and as recently directed by Presidential Memorandum. It is also not responsive to the Conservancy's substantive comments about the loss of peatland systems and key ecosystem services. Under the proposed Land Exchange there will be a loss of 2,163 acres of northern peatlands from the federal estate of which 1,961 acres are conifer bog and 202 acres are open bog. Northern peatlands have the highest carbon density of any ecosystem and thus retaining intact peatlands is critical in this era of climate change. Carbon storage is one of the many important ecosystem services provided by wetland systems, peatlands in particular. Therefore, loss to the federal estate of 2, 163 acres of peatlands represents a significant decrease in a key ecosystem service that is not accounted for in the Land Exchange. The FEIS states that 83% of the impacts to conifer bogs would be mitigated through offsite restoration projects. This figure does not take into consideration the substantial uncertainty in the success rate of peatland restoration or the losses during the time lag before restoration is complete. Further, the FEIS presents an optimistic view of the likely success of peatland restoration, when in reality there is little evidence of long-term success in restoring functioning ecosystems with peat accumulation. The FEIS does present methods that show promise for successful restoration including hydrologic restoration and reintroducing Sphagnum moss species. However, it will likely require 20-30 years just to determine whether peat accumulation is occurring. Since peat accumulates very slowly at rates of 0.5-1 mm/year, compensating for carbon lost on the project site may require several centuries. Longer term monitoring is needed to determine if restoration projects can lead to functioning peatlands that provide the same ecosystem services as natural systems. 14 Even if these efforts at peatland restoration were successful, the carbon lost through direct impacts at the project site would not be replaced during the lifetime of the mine due to the slow accumulation of organic matter in peatland systems. As a result, the FEIS is inadequate for its failure to address the loss of peatland systems and the key ecosystem service of carbon storage provided by the peatlands in the proposed Land Exchange, and its failure to develop an alternative with appropriate mitigation which fully compensates for the loss of these ecosystem services. II. Summary of Necessary Action on the Land Exchange. 1. The FEIS should include an alternative providing additional land in the Land Exchange to compensate for critical habitat losses to the Superior National Forest, including mature upland conifer forest, forest in long rotation classification , and imperiled and at-risk native plant communities. 2. The FEIS should accurately describe the loss of ecosystem services provided by peatlands including carbon storage and watershed and habitat function. 3. The FEIS should include a Land Exchange alternative that fully compensate for the loss of ecosystem services, especially carbon storage.	S	N

29319	Unique			O	Maya Batres	The Nature Conservancy	3673	15	The FEIS is inadequate because it fails to substantively respond to comments establishing the need for the inclusion of an Ecological Risk Assessment. A. Sound engineering practice requires a risk assessment as an essential element of project design. The American Society of Civil Engineers (ASCE) asserts that "effective risk characterization and management is fundamental to engineering."35 The ASCE makes a point of distinguishing between risk assessment, which is used to characterize risks (both likely and unlikely); risk analysis, which ranks the relative risks of a specific system; and risk management, which is an approach for weighing and mitigating risks. 36 The FEIS does not include a risk assessment or risk analysis. Rather, the FEIS references the Adaptive Water Management Plan (AWMP) for its discussion of risk. The AWMP, while ostensibly a tool for risk management, does not include nor address the fundamental need for characterizing the risks it purports to manage. To be effective, risk management should come only after a thorough risk assessment and risk analysis have been completed. The failure to include a risk assessment in the FEIS denies decisionmakers and the public vital information necessary to evaluate the potential environmental consequences of this project. For a project whose environmental impacts will extend centuries beyond its projected twenty-year operational phase, ignoring this step could result in serious environmental consequences that are not characterized or evaluated in the FEIS.) The FEIS acknowledges that the proposed mine will produce pollution that could potentially impact water quality for centuries. In response to this environmental threat, the FEIS anticipates near-perpetual operation of the tailings dam and water containment, collection, and treatment systems. Given the expected centuries of operation, there is a substantial risk that one or more of these engineered systems will fail due to natural causes; equipment malfunction, breakage, or age; human error; or lack of funds for maintenance and repair. In light of this risk, the Conservancy and others have urged the agencies to provide a risk assessment of the project in the FEIS. Such a risk assessment would include the probability and environmental consequences of potential failures for each of the following aspects during all phases of the project: the mine site, plant site, transportation corridor, tailings basins, stockpiles, and water containment and treatment systems (hereinafter referred to as "Ecological Risk Assessment"). 8. An Ecological Risk Assessment is an essential and feasible element of the FEIS. As discussed above, a risk assessment is considered a fundamental engineering practice. The ASCE has noted that it is important, "to adequately address risk in how systems are planned and designed and how consequences are managed", and "urges government agencies and private entities at all levels to incorporate risk management in all decision-making processes."37 The ASCE goes on to say that "risk management practices must be clearly communicated to the public" including encouraging and facilitating public participation in review of risk assessment procedures. 38 The United States Environmental Protection Agency's (USEPA) Bristol Bay Assessment demonstrates the feasibility of producing an Ecological Risk Assessment for a large, complex open pit mine at a level of detail sufficient for inclusion in an EIS.39 The assessment, which the USEPA prepared recently for the proposed copper mine in Bristol Bay, Alaska, uses historical evidence to assess the probability of failure over time for the engineered systems commonly found at mines40 and the expected environmental consequences of such failures. In addition to using historic evidence, the assessment also considers future risks from current mines that are designed using state-of-the-practice engineering.41 Because the Proposed Project relies on these same types of engineered systems to protect surface and groundwater quality, the Conservancy and others have called for the inclusion of a similar Ecological Risk Assessment here. By including an assessment in the FEIS, the public would then be afforded the opportunity to review and comment on how risk and environmental consequences compare among alternatives. It would be straightforward to update and adapt the EPA's Bristol Bay analysis, apply it to the Proposed Project, and then use it to determine the consequences and costs of potential system failures. However, the FEIS does not include a risk assessment of any kind and implies that the engineered environmental safeguards will flawlessly perform in perpetuity. This implicit use of a "best case" scenario ... 'skews' the data toward fewer environmental impacts and thus impedes a 'full and fair discussion of the potential effects of the project.'42 To avoid such an unwarranted skewing of the analysis, the FEIS should include an Ecological Risk Assessment to inform the agencies and the public about the long term environmental consequences of the mine.43 In the response to comments asking for a risk assessment, the FEIS dismisses the request and merely responds that "[n]either NEPA nor MEPA. ... requires the evaluation of worst-case or failure event scenarios."44 This answer is non-responsive: commenters were not asking for a "worst case analysis", but a realistic risk assessment that could "generate information and discussion. of those consequences of greatest concern to the public and greatest relevance to the agency decision ... rather than overemphasizing speculative harms."45	S	O
29319	Unique			O	Maya Batres	The Nature Conservancy	3674	16	Environmental regulations support the inclusion of an Ecological Risk Assessment as an essential element of determining the environmental consequences of the Proposed Action. Environmental regulations support including a risk assessment in the FEIS. A fundamental requirement of any environmental impact statement is to "rigorously explore and objectively evaluate" the environmental consequences of the proposed action, including its direct and indirect effects.46 Indirect effects are those which are caused by the Proposed Action and are later in time or farther removed in distance, but are still reasonably foreseeable. 47 Reasonably foreseeable effects include not only those effects where there is a significant risk of their occurrence48 but also those "impacts which have catastrophic consequences, even if their probability of occurrence is low." Over the centuries during which the engineered systems at NorthMet must operate, it is "reasonably foreseeable" that the systems will fail and pose significant adverse consequences to surface and groundwater quality. As documented in the Bristol Bay Assessment, failures of water collection, transport, and treatment systems are fairly common occurrences at mines during their operation and post-closure periods, and become ever more likely the longer they are required to perform. The Bristol Bay Assessment also finds that while tailings basin failures may have a low probability of occurrence, a tailings basin failure could result in a greatly degraded habitat for decades. The catastrophic failure of the tailings dam at the Mt. Polley Mine in 2014 is a recent example of a low-probability, high consequence failure that could have been prepared for if risks had been adequately characterized and then mitigated as part of the planning, design, and environmental review process. 51 Both the Bristol Bay Assessment and Mt. Polley case show the need to fully assess the risks associated with mining because the potential failures of the engineered systems and their environmental consequences are "reasonably foreseeable" and therefore must be rigorously analyzed in the FEIS. Federal regulations require that "[i]f the incomplete information relevant to a reasonably foreseeable significant impact is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement."52 Here, a risk assessment is essential to a reasoned choice among alternatives since it provides important information about the likelihood and size of "reasonably foreseeable" impacts to surface waters and groundwater over the centuries-long duration of the Proposed Action. 53 Moreover, development of a risk assessment is reasonably obtainable and neither exorbitantly nor excessively costly because the time and money has already been spent developing data and an assessment for Bristol Bay that is readily-adaptable for use here. Due to the un-assessed risks posed by the Proposed Action-both the common risks of failure of the water collection, transport, and treatment system and the catastrophic risk of a tailings dam failure a rigorous Environmental Risk Assessment should be included in the FEIS and an opportunity for public comment on the assessment should be provided.	S	O
29319	Unique			O	Maya Batres	The Nature Conservancy	3675	17	An Adaptive Water Management Plan does not compensate for the lack of an Ecological Risk Assessment. As an alternative to an Ecological Risk Assessment, the FEIS claims that the NorthMet Project Adaptive Water Management Plan (AWMP)55 is sufficient to address future negative impacts on water quality. However, the AWMP is largely a plan describing engineering monitoring and controls that will be in place to detect and manage the environmental impacts to water quality as they arise; i.e. a risk management approach, not a risk assessment. Also, there is nothing in the AWMP to address the severe consequences of a tailings dam failure. In effect, the AWMP proposes how one might respond to a failure, rather than informing decision-makers and the public of the nature of all risks in advance of approving the project. Asserting that problems will be detected and addressed as they arise is no substitute for a rigorous, transparent Ecological Risk Assessment of systems that could fail and the consequences that would follow. Relying on risk management procedures alone, rather than accurately characterizing risks and consequences is similar to the situation that occurred at the Mt. Polley Mine. There, the independent review panel investigating the disaster wrote that "[mitigating risk of tailings basin failure] was contingent on consistently flawless execution in planning, in subsurface investigation, in analysis and design, in construction quality, in operational diligence, in monitoring, in regulatory actions, and in risk management at every level. All of these activities are subject to human error."56 Without an assessment of the probability and consequences of risks associated with the potential human and natural causes of engineered systems failures, the FEIS similarly assumes a flawless performance of these engineered systems over centuries and thus fails to provide a reasoned evaluation of the environmental consequences of the proposed mine. II. Summary of Necessary Action on Risk Assessment 1. The FEIS should include a thorough Ecological Risk Assessment adapting the approach used by the USEPA for Bristol Bay to characterize risks of failure and their environmental consequences.	S	O
29319	Unique			O	Maya Batres	The Nature Conservancy	3679	19	8. The FEIS fails to provide a detailed risk assessment - a necessary component when developing a financial assurance plan. As discussed in Section 3, the FEIS fails to include an Ecological Risk Assessment, a vital factor in developing a contingency amount for an adequate financial assurance package. The FEIS simply dismisses the need for such an assessment and the applicability of a similar assessment to the one for the proposed Pebble Mine in Bristol Bay, Alaska.67 The FEIS claims that "the referenced document does not address any specific mining proposal and thus cannot appropriately be applied to the North Met Project Proposed Action."68 This dismissal is nonresponsive to the Conservancy's and others' comments: the fact that there was no specific mining proposal at Bristol Bay has no bearing on the direct relevance of such an assessment to the Proposed Action. If anything, the fact that a risk assessment could be performed in the absence of an EIS or permit application at Bristol Bay, should make it easier, more relevant, and more practical to perform a similar assessment on this developed Proposed Project, especially if it will aid in the development of a complete financial assurance plan.69 Equally important, this dismissal ignores the basic point of the comment. For projects with extremely long or perpetual timeframes for operation and maintenance, it is critical to perform an Ecological Risk Assessment in order to realistically estimate the size of the contingency which must be covered by the financial assurance. The EPA Bristol Bay analysis provides an example and recent data on the frequency and types of mine failures, which is exactly the kind of analysis needed here where the operation, maintenance and monitoring of engineered systems may be required in perpetuity. This analysis and data is not only reasonably obtainable and not excessively costly, it is available, current, and easily adapted to this situation. Under such circumstances, it is critical and feasible for the FEIS to include an Ecological Risk Assessment for this project to ensure a finished financial assurance package capable of covering the cost of a potential system failure. 2932	Unique			O	Mike McDonald		356	1	I support the current PolyMet NorthMet copper-nickel sulfide mine proposal. The PolyMet Final Environmental Impact Statement (FEIS) is adequate under both federal and state standards; I do not object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal; and I support issuing any federal permit allowing PolyMet to develop wetlands and improve water quality. The PolyMet FEIS is adequate under federal and state laws and regulations because: - It succeeds to evaluate pollution risks to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure. - It succeeds to analyze health risks and impacts on children, workers and communities who rely on fish and wild rice for subsistence, including risks from asbestos-like particles and methylmercury. - It does evaluate the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin. - It succeeds to adequately consider alternatives to minimize environmental harm, reduce polluted seepage from unlined permanent waste facilities, mitigate wetlands destruction, and reduce the threat of catastrophic dam failure. I do not object to the proposed NorthMet Mining Project Land Exchange in the Superior National Forest because: - It does not conflict with federal policy to protect wetlands, resulting in direct destruction of 913 acres of wetlands and destruction or impairment of up to 8,264 acres of wetlands. - It would not degrade surface and groundwater, violating the Superior National Forest plan and state, federal and tribal water quality standards. - It would not harm endangered, threatened and species of concern, including the northern goshawk, great gray owl, lynx and moose. - It is in the public interest, would not impair tribal resources, and would not result in a loss of ecological services.	NS	X

N/A	Form Letter Template	10	Non-Variant	O	Multiple	Building Trades	FL53	1	The Final Environmental Impact Statement (FEIS) for PolyMet's proposed mine represents a thorough and independent review of the project's potential environmental effects. After 10 years of study, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and correctly found that the NorthMet Mine can comply with strict state and federal environmental standards.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3366	87	Furthermore, the adaptive management plan in the FEIS is, in and of itself, inadequate. An adaptive management plan, to be effective should include: clearly defined monitoring and reporting protocols; specific action criteria/triggers; detailed mitigation measures the effectiveness of which have been evaluated; management requirements and decision tree; identity of technical advisors and decisionmakers; and financial assurance for entire plan, including contingencies. The “adaptive management plans” for hydrological characterization of the site, for indirect wetlands impacts, and other potential Project impacts, contain none of these elements.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3431	150	First, the risk of serious environment harm is real. As discussed in detail in Section 1 above, the FEIS’s discussion of the impacts of the proposed mine on water quality, mercury, wild rice, and air quality, among others, suffers from a lack of proper scientific analysis. These flaws lead to incorrect conclusions in the FEIS that, for example, the mine will not increase mercury concentrations in fish within the St. Louis River watershed, see FEIS at 5-10, and “would not directly, indirectly, or cumulatively affect the water” in either the Boundary Waters Canoe Area Wilderness or Voyageurs National Park, see FEIS at ES-36.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3432	151	Second, the risk of environment harm is compounded by the fact that for many potential adverse environmental impacts, the FEIS substitute of vague plans on “adaptive management” in lieu of science based analysis of the potential impacts of the Project. See Section 1.K above. In other words, after the mine is approved and in operation, monitoring would be done to determine potential adverse impacts, and if such were to occur, then future mitigation measures would be identified, developed and implemented on an as-needed basis. But this approach does not avoid or prevent mine related environmental impacts. Monitoring can only detect impacts after they have begun to occur and the adaptive management activities would only be a reaction to an impact. At that point, it may well be too late to prevent or mitigate the damage in any cost-effective or meaningful way.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3438	156	In general, the language found in Chapter 4 of the FEIS regarding accessibility suggests that Tracts 2, 3, 4 and 5 plus a portion of Tract 1 have similar accessibility as the federal lands proposed for exchange (i.e., no improvement in public access). High quality/high biodiversity lands will be exchanged for lands with moderate quality and biodiversity. Proposed lands to be brought into the federal estate will not have Weeks Act protection, and do not include mineral rights. These factors do not support a public interest determination, nor do they comport with the federal trust responsibility. The FEIS fails to evaluate the entirety of impacts as a result of the Land Exchange; i.e., that over 6,000 acres of high quality forests and wetlands will be permanently destroyed or degraded, that downstream ecosystems will be degraded, that treaty resources will be permanently lost.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3441	159	In the 1854 Ceded Territory, Fond du Lac, Bois Forte and Grand Portage band members can exercise treaty rights on private land, but only with landowner permission unless the land is generally open to public use; therefore, maintaining public land ownership is critical for the exercise of treaty rights. The Forest Service should consider exchange for private lands only in order to maintain - or better yet, increase - the total public land acreage within the 1854 Ceded Territory, if it is adequately considering trust responsibility and tribal interests in its determination.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3443	161	In FEIS 3.2.2.1.2, Existing Conditions: the statement regarding recent harvest of timber in mine site area in 2008 directly contradicts statements in Chapter 4 (4-629) “...no ongoing forestry activity on the federal lands and not evidence of recent past forestry activity” and Chapter 5 (5-678) regarding “...no current economic activity (e.g., forestry, etc.) on the federal lands. The Band questions, more importantly, the statement “...federal lands are not accessible to the public for economically measurable use, such as forestry or recreation...Thus while the federal lands may hold some theoretical economic value for timber harvest, their practical economic value is zero.” But as discussed in detail in Section 1.N, ecosystem services valuation is a necessary but missing component to this review process.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3447	163	As to FEIS section 3.3.1.1, the Band disputes that the Land Exchange meets Criteria A for a land exchange, without benefit of an ecosystem service value comparative analysis. Further, the Band and the other tribal cooperating agencies have consistently maintained that protection of cultural resources and the healthy habitats and watersheds necessary to sustain them are not met by the proposed Land Exchange. Certain rare cultural resource types (trails, ceremonial sites) will be both directly and indirectly adversely affected.	NS	X
27901	Unique			O	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3451	165	The FEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River watershed/Lake Superior Basin, where the loss of first-order headwaters streams, second-order streams and wetlands have the potential to significantly adversely impact downstream water quality, fisheries, and wildlife that are important to the Bands. The Land Exchange Proposed Action would relinquish water resources within the Lake Superior basin for wetlands and surface water resources outside the Lake Superior basin and the St. Louis River watershed, although still within the 1854 Ceded Territory. Federal lands include 4,164 acres of wetlands within the Lake Superior basin; non-federal lands contain 4,669 acres of wetlands, of which only 373 acres are within the Lake Superior Basin, demonstrating there would be a permanent loss of 3,791 acres of federally managed wetlands within the Lake Superior Basin.286 It is well known that wetlands play an important role in protecting the quality and condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants. Wetlands also function as thermal refuge for moose when summertime temperatures exceed 14oC, the point at which moose become thermally stressed,287 and wetlands provide an important forage resource for moose during the open water season.	NS	X

25852	Unique			O	Rask Shelley		1237	1	I strongly encourage the State of MN grant to Polymet a permit to begin mining. I also strongly believe that they have meet all the necessary criteria of the EPA and are in a good position financially. Not sure as to why the State of Minnesota keeps moving this process out on them, but they do and each time Polymet completes what the State asks for and meets the requirements. PLEASE MOVE THIS PROJECT ON, THE IRON RANGE NEEDS THE WORK!!!! And the State of Minnesota would benefit from the money generated from this project.	NS	X
3335	Form Letter	1	Variant	O	Ray Cleveland		369	1	Please approve PolyMet's plan. No company in its right mind would proceed with a project haphazardly with the astonishingly high degree of scrutiny the offered by the lefty dirt worshiping goons deployed by environmental extremists.	NS	X
28922	Unique			O	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3584	9	Finally, we have grave concerns about the DNR solution in the FEIS to a number of unanswered, unresolved technical questions, that they will be solved through “adaptive management”. While it is possible some issues can be resolved by technological advances and innovation, it is also likely experts would encounter problems for which there is no practicable solution.	NS	X
28922	Unique			O	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3585	10	Because this is a low-grade ore deposit, the financial return to PolyMet will be marginal even with high metal prices. With low prices, like those we are currently experiencing, there will be a strong economic incentive to shave corners wherever possible. This could negatively affect environmental protections, mine safety and staffing levels, and lead to the familiar boom-bust cycle many mining operations and communities across the globe experience. When the State scrambles to help miners harmed by the iron/steel bust cycle, there is added incentive at the legislative and administrative levels to help the miners and company at the expense of the taxpayers and the environment. Marginal strategies are often employed to make the mining operation profitable again.	NS	X
28922	Unique			O	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3591	16	A major shortcoming of this FEIS process is that Minnesota has not taken the time to step back and assess the overall impacts that copper-nickel mining could have on our lands and water, or to identify those special places in Minnesota where the natural resource values are so significant that mining should never be considered there. The value of the ecosystem services provided by these lands should be part of the equation in deciding whether or not to mine them, what type of mining would best preserve these services, and whether or not a land exchange can replace them.	NS	X
24784	Unique			O	Richard Nolan	US House of Representatives	2956	1	I write to voice my support for the state and federal review process for PolyMet's NorthMet project and the Final Environmental Impact Statement {FEIS}. In my view, the decision whether or not to go forward with PolyMet and new mining on the Range is about process, not politics. PolyMet has always been candid in its willingness to comply with every rule, regulation and financial assurance the process requires to protect our environment and the clean water we all depend on. Moreover, the FEIS represents a plan - and execution of that plan will require vigorous monitoring and enforcement. With those factors in mind, the reasons to support the project are clear.	NS	X
24784	Unique			O	Richard Nolan	US House of Representatives	2958	3	Second, our nation needs the copper, nickel and other precious minerals within the Duluth Complex to meet our needs in defense, manufacturing, high technology, health care, environmental "green" industries and medical research. In the future, essential minerals for groundbreaking new cancer treatments should come from northeastern Minnesota, reducing our reliance on platinum compounds we must now import from South Africa. The hybrid cars, wind turbines, solar panels, phones, computers, scanners and other high tech devices that have transformed the world all require cooper and nickel. Yet despite the rich deposits we have right here in our own backyard, we are still importing 35% of all the copper used in America, and almost 1 00% of the nickel. That makes no sense. Moreover, access to minerals is a potential national security issue. The U.S. Geological Survey reports that the United States is 100% dependent on foreign suppliers for 17 critically important minerals - and more than 50% dependent on foreign sources for at least 24 others.	NS	X
24784	Unique			O	Richard Nolan	US House of Representatives	2959	4	The third big reason to support the PolyMet project is our obligation to the earth and environment - or as Pope Francis likes to say, "our common home." By continuing to import the minerals we need for our products and technologies from China and other nations that sacrifice clean air, water and timber resources for short-term gain, we perpetuate a system that exploits the planet and harms workers. By doing copper and nickel mining the right way, PolyMet can establish a global standard for environmental stewardship worthy of our workers, our region and our great nation. Therefore, with these considerations in mind, I urge the co-lead agencies - the Minnesota Department of Natural Resources, the U.S. Army Corps of Engineers and the U.S. Forest Service - to move forward so the NorthMet project can be permitted and operational at the earliest possible date.	NS	X
30514	Form Letter	1	Variant	O	Rita Mays		2872	1	thunder Lake, Cass Co cabin owner	NS	X
23987	Unique			O	Rob Simonich		985	1	Hi, I would like to comment on the permit process. I think this has gone on long enough? I'm glad you have crossed all the T's and dotted all the I's. It's time to give out the permits, so we can get on with opening the mine. We all want safe /clean mining. It's time to continue the process.	NS	X
5812	Unique			O	Russ Mattson		437	1	We are asked to decide what is the best for our communities. That of course is loosely interpreting the governor. But there is a bigger question here. The issue presented, by some, is the choice between economic development, good jobs and the environment and health. To frame the choice as correct or incorrect, right or wrong is simplistic. The question, as are all policy questions, is not so clear as it would first appear. Is the choice between employment and fresh air and clean water? Is it that simple. Maybe the question should be turned around. Can you have a clean green environment and healthy individuals and communities without good jobs, without concerned families, and an engaged community? And would it matter if the environment was clean and green but no community? Sort of a nature park or zoological exhibit? Can you have a productive stable economy with opportunity for our children and their children without both? I suggest that the environment is not so narrow as some would make it to be. A stable economy builds communities, families, futures and ensures that all benefit, not only the environment of the community, and families, but the health of the people and that of the physical environment and ecosystems. Much concern is voiced about the potential for pollution from the mine. But lets take a closer look at our environment. The mine proper would encompass less than 1000 acres of mostly previously mined land. The Mining would reuse an existing tailings basin and utilize state of the art pollution prevention in the entire process. It would produce mainly Copper, Nickel and lesser amounts of Cobalt, Silver, Platinum, Palladium and Gold. By contrast Farming/Agriculture in Minnesota (per farmlandinfo.org) covers 40,000 (25,600,000 acres) square miles of Minnesota. And almost 1,450,000 square miles in the entire US. In the process farming has a tremendous impact on the environment. This industry applies more than 8.91 million tons of minerals(from the USDA), such as potash and phosphorus to this land. Both of which are mined. Neither of which are easily recycled, unless one removes these elements from the ocean in which they end. 80% and 30% of the Potash and Phosphate(Phosphorus) respectively are imported. These totals do not include the nitrogen injected into the soil coaxed out of the atmosphere by the Huber-Bosch process with the use of natural gas. This amount is an amazing 12.89 million tons. 50% of the nitrogen fertilizer, as well, is imported. In addition there are other additives, chemicals, such as; herbicides, fungicides, pesticides which control or kill; pests, molds, insects, bacteria, viruses. Approximately 76 million pounds of Atrazine and Endosulfan(from the EPA and CDC), in round numbers, are applied to the land and crops. In the process of Farming/Agriculture much of what is added finds its way via erosion the Mississippi into the ocean as indicated previously. As well this industry, Farming/Agriculture has caused to be removed via erosion several cubic miles of topsoil, with any of the remaining additives in that topsoil. This mix of topsoil, fertilizers and pesticides also finds its way to the ocean. This industry, Farming/Agriculture farming uses in planting, harvesting, transport, processing and packaging about 15% of all the petroleum products consumed in the US. This summary does not include the potential impact of genetically modified products which have been planted on this same land, or the known impairment of aquifers, lakes and rivers by Farming/Agriculture in the state of Minnesota. In comparison any copper nickel mining of whatever extent would cover less than 1/1,000,000 th of the land surface covered by that of Farming/Agriculture. As well the Mining places no additives on or in the soil. No herbicides, no pesticides, no chemicals. Are we missing something here? Is the wrong industry being monitored? Of course we want food and the products that come from Farming/Agriculture. We want the products from the farm and we use the products every day from Mining. We all want the iconic farmland of Minnesota. But we could get those products from elsewhere; (as well do with many critical metals and minerals) Chile, New Zealand, Mexico, Argentina, Brazil, Russia, or Europe and let others deal with impacts. This is even more curious when we look at where these metals, copper, nickel, palladium and gold are used: Cell Phones, Flat Screen TVs, Solar Panels, Wind Farms and Electric Cars In particular each cell phone, of which there are over 100,000,000 in the United States, use .572 oz. of copper, .01 oz. of silver, .001 oz. of gold and .0005 oz. of palladium (from Electronic Recyclers). Multiply that by 100,000,000 and we see a substantial amount of these metals. For a typical 2.5MW Wind Turbine more than 1200 pounds of copper(from copper.org), and slightly more for a Solar Farm with a similar capacity. And electric car such as a Prius? About 64 pounds of copper and 22 to 32 pounds of nickel depending on which source one uses. (Not to mention the rare earth metals used by both the cell phone and electric vehicle.) Some of these metals are recyclable, such as copper. 44% of the copper used in the United States is recycled copper. Today there is no practical way to recycle the minerals used in Farming/Agriculture; Potassium and Phosphorus. No one is so out of touch as to suggest seriously outsourcing farming. Hopefully the same can be said of mining these essential metals. Mining is not old fashioned, out of date, or irresponsible of the environment. It is crucial to a modern economy, an absolute necessity. Both industries, Mining and Farming/Agriculture need attention to the processes, need boundaries, need practical regulation and monitoring. We want a community that is viable, stable, healthy and to the greatest extent practical resourceful and self sufficient.	NS	X
29742	Unique			O	Russell Hess	Laborers District Council of MN & ND	3937	1	Our organization has a keen interest in seeing the Polymet project come to fruition. Hundreds of construction jobs will be created in a region that sorely needs them. Our members have watched this project move through the approval process over the last ten years, both because of their interest in potential job creation and for their interest in protecting the environment of the communities they live in.	NS	X
10466	Unique			O	Ryan Talbott		701	4	SOS and WLP are concerned about errors and confusion in the FEIS citations and project record as well as numerous reports of problems with webpages and accompanying digital documents, possibly indicating a problem with agency servers. These concerns are highlighted by the fact that the Minnesota Department of Natural Resources just published a Notice of Errata Sheet containing reference-related corrections in the FEIS. See http://files.dnr.state.mn.us/input/environmentalreview/polymet/feis/errata.pdf . The fact that just days after the publication of the FEIS, the agencies had to correct numerous references supports the need to extend the objection period to allow more time to adequately review the record and draft an objection.	S	N
25619	Unique			O	Sara Leow		1204	1	Please approve the final EIS for the Polymet project. The in-depth review and analyses of the potential impacts of the project more than adequately demonstrate of the new mine as well as reuse of existing facilities with related infrastructure improvements can be constructed and operated in an environmentally responsible manner.	NS	X

25102	Unique			O	Sue Carver		1131	1	I find it particularly offensive that you have scheduled this comment session during the fall and winter Holiday season. It is difficult for everyone concerned, staff and citizens alike, to find adequate time to review the mountains of literature and to then compose a concise and comprehensive reply. I can't but help to think that the timing of this comment session was done with no good forethought.	NS	X
4818	Form Letter	3	Variant	O	Susan Kern		416	1	Enough of the red tape to get the approval for Polymet to get up and running. Let's show the world how to do copper and nickel mining safely. We have heard enough from the environmentalists and the potential for disaster. Let's please move forward with Polymet and progress.	NS	X
29478	Unique			O	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3849	4	WE urge Governor Dayton to recognize the inherent conflict of interest within the mission of Minnesota Department of Resources, Division of Lands and Minerals, and to reject the DNR's FEIS as inadequate in nearly every one of its aspects;	NS	X
29478	Unique			O	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3853	8	WE urge the Minnesota State Legislature to enact a law similar to the "Prove It First" legislation State of Wisconsin (1997), by which it must be demonstrated that before opening a new mine of any kind, the mining company must be able to point to a similar mine to what it is proposing in the United States or Canada that has operated for 10 years without polluting and has been closed for 10 years without polluting.	NS	X
29478	Unique			O	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3874	27	WHEREAS, the DNR is unable to provide a fair Environmental Impact Statement due to the conflict in its mission to promote, and not just regulate mining in the state; WHEREAS, DNR Commissioner Tom Landwehr's statement that he expects to certify the FEIS as adequate as early as February 2016 demonstrates a prejudice before the public comment period has expired, and those comments considered; WHEREAS, the Minnesota Legislature has repeatedly attempted and often succeeded in weakening pollution and mitigation standards for political and private gain rather than the public benefit of rigorous environmental protections; WHEREAS, Minnesota's political efforts to repeal or weaken regulations meant to protect the environment from mining activities provides a global template on how responsible, ethical, and successful mining practices can be avoided and ignored; WHEREAS, because the vast majority of information in the EIS was provided and funded by PolyMet itself and other industrial sources, doubt is cast on the objectivity of this crucial science, suggesting bias toward an unrealistic best---case scenario; WHEREAS, the permitting process for iron and taconite mining in the past has allowed activities with expired permits, extensive variances, waived fines, leaking tailings basins, and wastewater releases, demonstrating unwillingness from state agencies to properly oversee the mining industry; WHEREAS, there is a clear conflict of interest in the assessment over the water flowage modeling, which predicts areas affected by polluted run--- off from the mining operation, with no independent scientific analysis allowed by the company, or included in the FEIS; WHEREAS, claims by mining companies in Minnesota and in other states that they have not violated water quality standards is too often due because of exemptions from those standards; WHEREAS, the mine in Michigan toured by Gov. Dayton and touted to be a good example of responsible sulfide mining, has in truth many unaddressed or ignored air and water pollution problems, with insufficient oversight and many permit irregularities;	NS	X
29478	Unique			O	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3879	34	WHEREAS, the final public comment period for the FEIS is far too short, no further hearings for consideration of several new studies have been planned, thousands of pages of reference materials are missing, separate comments are required for each agency, plus several other obstacles hindering public input, all indicate a faulty and non--- transparent procedure.	NS	X
25616	Unique			O	Thor Sorenson		1202	1	A recent article said that close to 50% of young people have given up on the American Dream. Polymet will provide 300 plus jobs for our children to keep that dream alive. This company has done everything asked and more; to help prevent harm to the environment. This is a blessing for Northern Mn. Somebody somewhere will mine these precious metals that are needed in our hi-tech culture. They have my support !!!	NS	X
30606	Form Letter	1	Variant	O	Tom Evans		2881	1	Don't ring ??? Bell!	NS	X
30607	Form Letter	1	Variant	O	Tom Kriegl		2882	1	We need to do more recycling & reuse of materials	NS	X
25821	Unique			O	Tom McMullen		1229	1	It is my understanding there have been numerous studies completed for this project & the water treatment systems proposed are highly engineered. It is time to move forward with this project. I understand many of the concerns that have been stated regarding pollution but nothing is without some risk. The old mine sites that people are pointing to as examples were not engineered to today's standards. Let's create some jobs in this state, we need them.	NS	X
4282	Unique			O	Turk_ Bryan J		402	1	I can't see all the worries, because technology is amazing and has come a long way. The people that work at the mine, will all live around here, and not want to damage their homeland. Technology is cheap, so redundant systems are cheap insurance and a definite option. We need the jobs up here and in this country, so let's finally break ground on this project.	NS	X
25857	Unique			O	Valerie Ouellette		1240	1	I am in total support for permitting and mining for the Polymet mine.	NS	X
28822	Form Letter	1	Variant	O	Walt and Marcie Moe		2359	2	Taxes for the Taconite Mines are based on tonnage. What are taxes the metals mined by Poly-Met to be based on? That should be in place before Poly-Met starts production!	NS	X
30025	Unique			O	will land		4239	1	Kindly act to halt mining in NE MN so as to halt poisoning its water and air. Up into 1950s, Lake Superior had the world's largest fresh water herring, most delicious. In 50s,I worked on Sivertson fishing boats out of Duluth. Also in 1950s, I worked as carpenter tender in building docks in Two Islands, Beaver Bay, Silver Bay on No. Shore Lake Superior when the port and docks were beginning to be built to put taconite pellets into ore boats for shipment to steel mills. Sadly the poisonous metal sulfides that flowed from the Silver Bay Taconite plant into Lake Superior killed the herring.	NS	X
23032	Form Letter	1	Variant	PD	Aaron Pendl		893	5	Furthermore, it's a temporary endeavor. I do not know the details around the length of time the mine would operate. But I do know at some point the resources will be gone, but the potential for disaster will remain.	NS	X
27822	Unique			PD	Anita Tillemans		2154	11	Just as the tailings pond at the LTV plant site outgrew the boundary of the St Louis Watershed into the Vermilion Watershed, will the pits and ponds at the North Met mine site, so close to the northern boundary of the St Louis Watershed, outgrow its boundary as well, reaching into the watershed of Rainy River?	S	O
27822	Unique			PD	Anita Tillemans		2164	10	What would be the result after 500 years of seepage from the degraded rotted and rusted infrastructure of a copper sulfide mine?	NS	X
30061	Unique			PD	Anita Tillemans		4240	4	Recycling metals is on the upswing and processes for this type of recovery are being more fully developed as the North Met Project is being pondered. This could make mining for copper less profitable in a very short time. The price of commodities will vary, and markets are fickle. As a consequence, copper cannot guarantee a secure future, and certainly not a green economy in the Arrowhead.	S	O
30079	Form Letter	1	Variant	PD	Ashlee Kveton		2806	4	When it comes to copper nickel mining on the Iron Range we only get one chance to do it right. We have to ask ourselves do we really want to stake the future of copper nickel mining in Minnesota on the Shoulders of a company like Poly Met. Poly Met has never run a mine before, a Poly Met is not Minnesota based, a Poly Met seem more than happy to supply suspect data to the public agencies tasked with protecting our environment, Poly Met chose to propose the cheapest (and, also the most environmentally damaging) type of mine to open (aka open pit mine) despite safer alternatives being known, and also while knowing full well that the technology/type of extraction/processing/waste this mine will produce has proven unsafe for the environment repeatedly.	NS	X
30079	Form Letter	1	Variant	PD	Ashlee Kveton		2807	5	Poly Met claims they can remove these metals and all that waste rock containing sulfides safely and yet, the lead agencies predict that the site will require expensive water treatment for at least 500 years.	NS	X
29153	Unique			PD	b4holden@gmail.com		2432	3	Copper nickel mines around the world have an abysmal history of leaving destructive pollution behind. !	NS	X
27418	Unique			PD	Brian Wesley		1733	1	I am sure the company that is proposing mining is sincere in trying not to let there be a spill or breakdown in the mining. However, the possibility is there, and once polluted or destroyed, the area is gone forever.	NS	X
27418	Unique			PD	Brian Wesley		1734	2	I am sure the company that is proposing mining is sincere in trying not to let there be a spill or breakdown in the mining. However, the possibility is there, and once polluted or destroyed, the area is gone forever.	NS	X
2113	Unique			PD	Bruce Harten		292	1	The Final EIS for PolyMet's proposed mine concludes an inadequate review of the project's potential environmental effects. After 10 years of study, the Minnesota Department of Natural Resources, U.S. Army Corps of Engineers, and U.S. Forest Service have looked at the evidence and incorrectly found that the NorthMet Mine can comply with strict state and federal environmental standards. The Final EIS for the NorthMet Mine is grossly inadequate from the beginning ! in that it puts a Potential pollution problem in the footprint of an existing pollution problem! - The Co-lead Agencies have spent 10 years evaluating potential project effects and have completely ignored the existing tailings pond. Earthen bermed tailings ponds LEAK and Fail Period ! (an integral Poured Concrete tailing pond shrouded in the crushing and balling mill facility that reuses water from which all sulfides have been removed is requisite !)	NS	X
26617	Form Letter	1	Variant	PD	Bryan Wyberg		1369	4	The future is conveniently ignored in their plans. They say pollution will be a problem for hundreds of years, yet somehow avoid taking action to ensure the effectiveness of their promises of protection from the tailings of mining operations beyond a few decades into the future.	NS	X
29101	Unique			PD	Charles Zeugner		2422	3	the proposer claims that environmental harm will be mitigated during and at project completion. Given that the current mine location has unremediated impacts, this claim sounds dubious. Further, neither this mining company, nor its major financial backer are adequately capitalized. Given the history of mining companies walking away from their projects, it is difficult to see how this will not occur in this case.	NS	X
27347	Unique			PD	Dan Andree		1682	2	The history of such mining companies is that once they are done mining they are not that concerned about what is left behind. Also what they leave is such an eye sore not to mention hazardous to nearby watershed areas etc.	NS	X
29801	Unique			PD	Daniel Pauly		4174	8	A combination of errors and faulty analysis cause the FEIS to erroneously conclude that Tailings Basin mercury discharges will be below 1.3 ng/L. These errors result in numerous misstatements and faulty conclusions in the FEIS. Two of these deficiencies lead to notable flaws: 1) failure to design and test a Waste Water Treatment Plant (WWTP) that will adequately determine viability of mercury removal;	NS	X
29801	Unique			PD	Daniel Pauly		4175	9	2) design of a discharge capture system that incorporates a wetland that will receive the majority of the mercury and sulfate from the Tailings Basin, and which will meaningful increase mercury contamination in the Embarrass River watershed.	NS	X

29801	Unique			PD	Daniel Pauly		4176	10	The WWTP will use reverse osmosis to remove contamination from Tailings Basin seepage. The FEIS discusses a pilot test for the WWTP that was conducted in 2012. Unfortunately, the WWTP pilot test never evaluated mercury removal using reverse osmosis. In fact, as the Pilot Test report itself states, the WWTP designers don't know how much mercury can be removed by the WWTP. The report states that maybe as little as 20 percent, or maybe as much as 99 percent, of mercury might be removed. One guestimate is given by a salesperson for PolyMet's membrane manufacturer of "about 70 percent" for mercury removal. Even then, according to the FEIS documents, removal of methylmercury does not appear possible using the planned WWTP design. In other words, removal of the most hazardous species of mercury, the one that bio accumulates in fish and humans, has not even been considered in the WWTP design.	S	N
29801	Unique			PD	Daniel Pauly		4178	12	The second problem that has been overlooked relates to changes in the NorthMet proposed Tailings Basin since the DEIS was prepared. Specifically, the currently proposed NorthMet Tailings Basin has been modified since the DEIS to create a containment system outside of the Tailings Basin. The containment system will include an up to 160 acre wetland that will be receiving the mercury and sulfate laden waters from the combined LTV/NorthMet tailings. These seepage flows will increase relative to the current LTV tailings basin, and create a much larger wetland than currently exists. The NorthMet project's own model data shows in great detail that most mercury and sulfate will be delivered directly to this wetland, and not to the containment system drains.	NS	X
27308	Unique			PD	David A. Lien	Minnesota Backcountry Hunters & Anglers	3250	9	Copper-mining operations, sometimes called "hard-rock mining" or "sulfide mining," have left toxic scars across the country, with acids and sulfides leaching into streams, contaminating rivers and lakes, killing fish, and leaving dead zones. And PolyMet says acid-mine drainage (AMD) will be occurring at its proposed Hoyt Lakes mine "for up to 2,000 years." Less than 1% of the ore would be produced as copper, etc., with waste rock comprising the remaining 99%.	NS	X
30753	Unique			PD	Dennis Good		2894	6	It is known that Polymet has private lease agreements with mineral rights owners S.W. of the West Pit. It seems that the West Pit will become at some point, a new opening for new mining activities. I didn't see this mentioned in the FEIS. It sounds like a reasonably foreseeable future action to me.	NS	X
23255	Unique			PD	Dennis Szymialis		915	11	Finally the reference to green sand filtering in paragraph 5 p. 5-170 is arbitrary and capricious in that it does not indicate that green sand filtering will be an element of any PolyMet filtering and is methodologically deficient fn that the ph and flushing systems for treatment are not specified. Furthermore, that the lack of green sand filtering at the tailings treatment facility will result in larger amounts of arsenic discharge, the health impacts of which the FE IS and SDEIS have failed to consider.	S	O
27685	Unique			PD	Dennis Szymialis		1871	26	What is the deal with putting the filtrate from the mechanical treatment in "licensed landfills." This simply delays the release of toxins like thousands of tons of arsenic into the environment. What licensed landfill would take the stuff and what kind of vicious monster would be doing the licensing anyway. Maybe the Duluth Chamber of Commerce will volunteer the Gary New Duluth landfill that emits a plume down Sergeant Creek into the St. Louis River.	S	O
27685	Unique			PD	Dennis Szymialis		1880	35	The "cutoff wall placed into existing surficial deposits" indicated at 3-117 will be inadequate and the modeling indicating that 90%of runoff water will be collected is irrelevant. In order to collect 90% the wall would need to project below the originally placed as loose taillings fill down to bedrock, all fractures in the bedrock would need to be sealed off hold a great deal of water pressure, have the drain tile at the bottom of the wall which is standard foundation engineering, and the wall would have to be extended to the east side of the tailings basin. The collection of this water is necessary for treatment assuming for now that treatment would even be effective which is disputed in other areas of these comments.	S	O
27685	Unique			PD	Dennis Szymialis		1882	37	The "WWTF is now proposed to be upgraded to a RO process during closure to manage sulfate concentrations in the effluent " described at p. ES-24 is inadequate. It is unacceptable that toxins other than sulfates that will not be captured by RO including carcinogens Nickel Sulfate and Arsenic III shall be allowed to flow unimpeded. It is unacceptable that sulfates will be left untreated at any time. It violated due process and all relevant standards of agency deference to provide standards for treatment which are vague, ambiguous, and speculative. The amount of water going into the WWTF will overwhelm any treatment facility that could be built. The amount of water going into the system is dramatically understated.	S	O
27685	Unique			PD	Dennis Szymialis		1883	38	The following statement made on page 3-4 of the SDEIS represents the type of misleading information that mining companies provide to deceive the public. "Bentonite would be incorporated into the exposed outer side-slopes of the Tailings Basin as it would be built up to create a barrier that would limit oxidation. This limiting of oxygen transfer would reduce pollutants generated from the Tailings Basin." The pollutants will not be reduced. Their introduction into the environment will merely be delayed. Further more limited limitation of oxygenation is part of the formula for mercury methylation. Eventually exposure and oxygen reaction will occur.	S	O
27685	Unique			PD	Dennis Szymialis		1886	41	On the internet I found some MP documents that appear to indicate revenue of \$568,174,000. It is my recollection that it was reported back in April of 2008 that the PolyMet power rate agreement would cause our power rate to increase by more than 10% or roughly 1-5 billion dollars over the 20 year life of the mine.	S	O
27685	Unique			PD	Dennis Szymialis		1887	42	Minnesota power 2012 revenue figures http://www.mnpower.com/Environment/ResourcePianAppendices (p. 7 of 19/122). "Post-reclamation activities would include monitoring and maintenance of reclamation and water quality until the various facility features were deemed environmentally acceptable, in a self-sustaining and stable condition." p.3-59 -environmentally acceptable to who?	S	O
27685	Unique			PD	Dennis Szymialis		1889	44	The WWTF really is a sham which is revealed when one considers process water: "would be collected and treated at the WWTF. Treated water would be pumped to the Tailings Basin at the Plant Site."p.3-53. and taillings basin water will be pumped to the WWTP(at the plant site). This process fails to allow for the discharge of any water to the environment? It makes no sense to refilter the water already filtered. This is included because there is no intent to do it.	S	O
27685	Unique			PD	Dennis Szymialis		1890	45	The sludge waste would be disposed of off-site in a solid waste landfill until the Hydrometallurgical Plant became operational (see Section 3.2.2.3). When available, sludge waste would be filtered and moved by truck along the Transportation and Utility Corridor and introduced to the autoclave in the Hydrometallurgical Plant to recover metals or placed directly into the Hydrometallurgical Residue Facility (see Section 3.2.2.3.7) P. 3-53. -It is planned that the toxins that are captured will be allowed to merely leach out in an uncontrolled environment. These toxins will leach out as a result of incomplete neutralization.	S	O
27685	Unique			PD	Dennis Szymialis		1933	88	p.4-383 "To facilitate the expedited consolidation of the in-place LTVSMC tailings, wick drains would be installed within the Emergency Basin. This would reduce drainage path lengths and increase the drainage ability in the LTVSMC tailings and underlying compressed peat." -it appears that the tailings basin had these wick drains built into it.	S	O
27685	Unique			PD	Dennis Szymialis		1946	101	p.5-13 "Hydrologic evaluation criteria include a comparison of proposed hydrologic changes with both existing natural conditions and historic hydrologic alterations from permitted mining practices," -is this a comparison with this actual sulfide ore body or some arbitrarily picked iron mine.	S	O
27685	Unique			PD	Dennis Szymialis		1949	104	p.5-25 "PolyMet has indicated a desire to transition to non-mechanical treatment once pilot-testing and modeling indicate water quality standards could be met, which potentially could include application of the wild rice seasonal standard, but these are beyond the scope of this SDEIS." -Why is PolyMet so confident in achieving other water quality standards with modeling and not this one?Is it because their modeling is all bullshit to begin with or is it because modeling is based on iron mines which wouldn't be able to meet the sulfate standard without treatment?	NS	X
27685	Unique			PD	Dennis Szymialis		1954	109	p.5-54 "the rate of oxidation and constituent release was estimated from studies of seepage release measured in Dunka Mine rock, which is a nearby source of waste rock with similar chemical composition" -if Dunka Pit mine rock were similar the adjacent rock would be readily accessible and being mined for sulfide ores.	S	O
27685	Unique			PD	Dennis Szymialis		1962	117	p.5-68 "In GoldSim, the containment system is conservatively assumed to be 90 percent efficient,"this system is described as follows, p.3-117 "It would consist of a cutoff wall placed into existing surficial deposits, with a collection trench and drain pipe installed on the upgradient side on the cutoff wall." The cutoff wall would be made of "The cutoff wall would be constructed by excavating a trench down to bedrock and backfilling it with a compacted soil material,p.3-46" and Figure 3.2-28. This would occur in the following environment: "Jennings and Reynolds (2005) mapped the surficial deposits around and beneath the Tailings Basin as Rainy Lobe Till, which functions as the surficial aquifer and is generally a boulder-rich till with high clay content. Data from the 12 monitoring wells installed north and west of the Tailings Basin indicate that the primary lithology in this area is sand with varying amounts of silt and gravel. In a separate geotechnical study of the LTVSMC tailings, several soil borings into the surficial till identified the composition as layers of clay and sand, plus cobbles and boulders that prevented recovery of an intact sample (Pint and Dehler 2009). Near the toe of the Tailings Basin, average depth to bedrock is approximately 25ft, as reported in site boring logs (Barr 2009f). The area farther northwest ofthe Tailings Basin is believed to be one of the few areas in the region with significant quantities of outwash (sand and gravel) and thicknesses ranging from 0 ft to greater than 150ft (Olcott and Siegel1979) (see Figure 4.2.2-12). The surficial till is often overlain by wetland/peat deposits. Peat deposits were encountered in some borings, ranging in thickness from less than a foot to several feet."p.4-95 -it seems a fairy tail that it could be conservatively assumed that a wall made of compacted dirt would hold back an average of 25 feet of ground water, that a trench could be dug to be tucked around boulders 25 feet down in the ground, that the ground water would flow uphill as indicated in Figure 3.2-28, or that there is even a remote chance of in any way modeling this result. My god, what will they have us believe? Oh, and they still don't explain the pipes draining away from the tailings basin into the Embarrass River or what will be done with those. I know it doesn't take 300 years for water to travel 3.25 miles through a pipe. I would say maybe an hour.	S	O
27685	Unique			PD	Dennis Szymialis		1964	119	p.5-79 "Filtered sludge from the chemical precipitation process would be sent off site for disposal or stored at the Hydrometallurgical Residue Facility. The reject concentrate stream from the WWTP would be transported to the WWTF via rail tank cars where it would be added to the West Equalization Basin." -this procedure simply delays discharge of contaminants to the environment.	S	O
27685	Unique			PD	Dennis Szymialis		1965	120	p.3-115 "A pond would be maintained within the Hydrometallurgical Residue Facility so that the solids in the surry would settle out, while the majority of the liquid would be recovered by a pump system and returned to the plant for reuse." -with all the mixed materials going into the Hydrometalurgical Residue Facility how is any of it of good enough quality for reuse. Why are so many materials consumed on p.3-312 if they are capable of being recycled. This is another misleading aspect of this SDEIS.	S	O
27685	Unique			PD	Dennis Szymialis		1967	122	p. 5-81 Reject concentrate from the Plant Site WWTP RO system would be treated at the Mine Site WWTF and the resulting filtered sludge would be taken off site for disposal. -this is a plan to put contaminants right back into the environment. How about the Hay Lake Tract 1 site. That is already a dump, literally.	NS	X

27685	Unique			PD	Dennis Szymialis		1969	124	p.5-82 "Once the Hydrometallurgical Residue Facility is reclaimed" -This cannot be reclaimed. It will in theory (if all goes as represented by PolyMet) contain the consumables on Table 3.2-13, treatment sludge from the WWTF, ect. How does PolyMet really expect to be able to determine if this is leaking in a timely manner? -again the, WWTF will be inadequate to treat pit runoff to be discharged into the Partridge River. It will contain exceedances for mercury, carcinogenic nickel compounds, arsenic, and other toxins. "Surface runoff would be routed away from the mine pits using a combination of existing and new ditches (see Figure 5.2.2-15)." -This will cause contaminants to run into the Partridge River as 20 years of contaminant mining dust from blasting will have accumulated and be subject to erosion into these ditches and the river. "A more detailed evaluation of this requirement would be conducted prior to mine closure." - another due process notice violation.	S	O
27685	Unique			PD	Dennis Szymialis		1971	126	p.5-89 "distillation crystallization unit to eliminate the liquid reject stream. The moist waste solids from this system would be disposed of off site." -googling distillation crystallization does not identify any existing technology by that name. Again, solids should not be disposed of offsite where PolyMet would escape responsibility for their monitoring and release. -the pilot testing has no more foundation for reliability than the modeling.	S	O
27685	Unique			PD	Dennis Szymialis		1974	129	p.5-98 "1.25 inches of spilled material over a 2,000-m2 area." -the amount and effect of this spillage is underestimated as this is highly reactive rock and inadequate precautions against spillage are indicated.	S	O
27685	Unique			PD	Dennis Szymialis		1976	131	p.5-152 -pilot testing referred to fails to identify treatment conditions, assumptions made in the testing, types of arsenic oxidized or not, As V or As III, therefor it lacks notice and fails to provide a basis for comment.	NS	X
27685	Unique			PD	Dennis Szymialis		1977	132	p.5-157 -any leakage in the hydrometallurgical facility would be disastrous and irreparable once the process started. More information is needed on the types of liners proposed.	S	O
27685	Unique			PD	Dennis Szymialis		1987	142	seems to be telling us that The WWTP is expected not to work.	NS	X
27685	Unique			PD	Dennis Szymialis		2012	167	effectiveness of tailings basin containment system overestimated, etc., as indicated in these comments.	NS	X
27685	Unique			PD	Dennis Szymialis		2021	176	discussion of reclamation is a joke. when have any ofthe co-lead agencies ever reclaimed a Mine in Minnesota. After a century of neglect they come to The table and should not even expect to have a scintilla of credibility in this regard.	S	O
11015	Form Letter	1	Variant	PD	Donna Cannon		736	3	WE DO NOT need more minerals--we need better management of what we have & what we discard.	NS	X
3562	Unique			PD	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2897	1	The proposed PolyMet NorthMet copper-nickel mine, and others like it, are vastly different from ferrous mining, and have the potential to spread toxic metals throughout our watershed. In copper-nickel mining, water that passes through the site leaches toxic metals, including mercury, from the metallic sulfide ore.	NS	X
3562	Unique			PD	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2899	3	We trust that PolyMet intends to meet all applicable regulations, but our concerns are based on the track record of similar projects.	NS	X
3562	Unique			PD	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2900	4	We welcome them to show us one metallic sulfide mine of this type that has operated for 10 years and been closed for 10 years without exceeding government pollution standards. Indeed, under Wisconsin's 'Prove It First' law, no such example has yet been identified.	S	N
3562	Unique			PD	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2901	5	Like the rest of the resources we rely on, we want mining to continue to become more technologically advanced and more environmentally friendly. But until the technology is proven, we simply don't believe the Land of 10,000 Lakes is the place for a test case.	NS	X
23088	Form Letter	1	Variant	PD	Elinor Ogden		896	1	The history of sulfide mining in the western US resulting in Superfund sittings; the failure of dams meant to hold back pollution drainage in Canada and Brazil;	NS	X
27836	Unique			PD	Ellen Hawkins		2202	26	Impacts of mitigation measures such as application of lime to acid mine drainage on aquatic life are not adequately analyzed, yet experience in other mining situations indicates these impacts would likely be significant.	S	N
28378	Unique			PD	Em Westerlund		2250	3	the EIS does not include plans to mitigate future failure of NorthMet mining infrastructure, ecological changes due to climate change, or equipment malfunction. The EIS should have identified the potential outcomes if these should occur, and a contingency plan from NorthMet in order to minimize harm caused by these problems.	NS	X
26608	Form Letter	1	Variant	PD	Eric Snyder		1360	3	2. Not only is the mining operation itself reckless for the above and other reasons, but so is the review process thus far. One example is the concurrence of the DNR with the view that dry stacking of tailings should be scuttled in favor of much riskier wet basins. This is unacceptable and raises the question as to whether the DNR is prioritizing the interests of the environment and public health, or whether it is doing something akin to working as a lobbyist for PolyMet. It certainly raises the appearance, at the very least, of corruption. It's not the DNR's interest to help make a determination as to whether wet basins will help save PolyMet money. The DNR must first and foremost protect the environment and public health.	NS	X
29745	Unique			PD	Erin Mittag	Minnesota Center for Environmental Advocacy	3969	28	The Co-Lead Agencies have improperly eliminated dry stacking or paste tailings as an alternative to using the pre-existing LTV tailings basin. Under NEPA, the FEIS must: examine all reasonable alternatives to the proposal. In determining the scope of alternatives to be considered, the emphasis is on what is “reasonable” rather than on whether the proponent or applicant likes or is itself capable of carrying out a particular alternative. Reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. ⁸³ Although PolyMet wishes to use the old LTV tailings basin because it is located on the site that they have agreed to purchase, alternative methods of storing waste are technically feasible, environmentally preferable, and avoid what is possibly the most devastating impact that could occur at a mine site—the collapse of a tailings basin, resulting in widespread impacts that could travel and diffuse for tens or even hundreds of miles when waste spills into moving water. We have attached a letter from Dr. David Chambers of the Center for Science in Public Participation. Dr. Chambers has extensive knowledge of both the tailings dam collapse at the Mount Polley mine in British Columbia in 2014 as well as PolyMet’s tailings dam design. In his report, Dr. Chambers observes that there is no engineering reason for tailings dams to fail at the rate that they do, and that this is a “prime indicator that something is wrong with the way tailings dams are designed, constructed, and/or operated.” ⁸⁴ Dr. Chambers also notes that the tailings basin construction method used at the PolyMet site is the least safe construction method, and that PolyMet will continue to use this method. “Extending a risky design on top of an old design that itself poses higher risk, against the recommendation of the Mt. Polley Expert Panel for dry closure, for a facility that has not yet received regulatory approval, would not be recognizing the long-term risks being posed to the public.” ⁸⁵ Dr. Chambers also recommended that the Hydrometallurgical Residue Facility should be constructed using dry stack methods. ⁸⁶ Dr. Chambers’ review was submitted to the Co-Lead Agencies on April 30, 2015, after the release of the report of an independent expert panel that investigated the cause of the Mt. Polley disaster. Although this was after the close of the comment period for the SDEIS, it was submitted well in advance of the FEIS in hopes that the Co-Lead Agencies would recognize the value of the Mt. Polley recommendations and the inherent risks in PolyMet’s use of an old tailings dam designed to store tailings in a way that is no longer considered safe. The Co-Lead Agencies, in response to Dr. Chambers’ work, provided only a single paragraph. They concluded that dry stack tailings did not offer a significant environmental benefit as an alternative. The analysis is dismissive, failing to provide support or analysis consistent with NEPA’s requirements. ⁸⁷ The three reasons given are addressed below:	NS	X
28547	Unique			PD	Esteban Chiriboga	GLIFWC	3543	42	There is little confidence in the predicted tailings basin seepage capture rates, causing this mercury source to be underestimated. Predicted compliance with water quality standards is entirely dependent on the assumption that >90% of the seepage will be captured. The seepage capture efficiencies assumed in the FEIS are overly optimistic considering that the seepage capture systems at the MINNTAC tailings basin and the southern toe of the LTV basin have not been able to achieve these high efficiency rates. Any water that is not captured by the proposed capture systems that enters the waters of the U.S. is subject to NPDES permitting.	NS	X
10243	Unique			PD	Evan Johnson		679	1	The preliminary environmental review given to this project is unprecedented for that of its type. The co-lead agencies as well as the opponents have brought every reasonable possibility of environmental detriment to attention, and Polymet has calmly, thoroughly, and scientifically addressed each concern to the best of their ability. And truly, the completeness of the environmental protection aspect involved in the mining, processing, and long term mitigation and treatment of 'left over' products (tailings, industrial use waters) is beyond that given to any other mining facility on the Iron Range, or those of similar make in the US, and even across the world.	NS	X
10243	Unique			PD	Evan Johnson		680	2	Polymet themselves has financed the majority of this extensive, lengthy process out of their own resources, again showing their dedication to the project, and their desire to construct a facility that can be used as an example to the world as an environmentally sound, profitable mining facility that can bring both economic growth and stability to the Iron Range through increased mining capacity and diversification of product. There is no known reasonable basis aside from personnel preference that can be brought against Polymet that would discredit their preparation to date.	NS	X
29229	Unique			PD	Gail C. Roberts		3621	11	PD01, PD10 – Although some changes were made in the proposed plan from the SDEIS to the FEIS, the design is largely theoretical and unproven in actual mining operations.	NS	X
29965	Unique			PD	Gary Glass		4264	27	The existing LTVSMC Tailings Basin is an important component of the proposed project and should be identified as a significant constituent of interest for several important reasons: 1. hundreds of millions of tons of LTVSMC tailings containing 13% iron are available for re-processing using the techniques developed by Magnetation LLC, a Minnesota company (102 NE 3rd Street, Suite 120 Grand Rapids, MN 55744) on the Western Iron Range which reprocesses spent iron ore tailings for valuable mineral resources of the State of Minnesota; 2) the existing tailings basin is build on peat soil and is not stable and leaks into the ground water aquifer requiring a yet-to-be proven "slurry-wall" sealed to bedrock to prevent ground water leakage necessary if reactive sulfide mine tailings are deposited as well. This "slurry wall" is a major undertaking and has not been proven or shown to be cost effective; 3) the known hazards from toxic dust generated from moving and building dams from LTVSMC tailings which are known to contain hazardous asbestiform mineral fibers should be avoided.	S	O

29965	Unique			PD	Gary Glass		4267	30	Mining 355 millions of rock in 300,000 ton blocks, blasting through layers of minerals and non-minerals with explosives using an open pit approach will undoubtedly mix small amounts of high sulfide inclusions with rock categorized as "waste." Tests of mixtures of small amounts reactive minerals with waste rock were not done but the expectation is that small quantities of reactive minerals will dominate and determine the chemistry of the pore water, and result in higher than expected metal and acid concentrations in, and from, the waste rock storage areas than are predicted from tests of lower reactivity rocks. The resultant drainage and runoff must be completely collected and treated everywhere mined reactive solids are deposited and stored exposed to air and precipitation, including areas where dust will collect along the haul roads and tracks. Tests show reactive sulfides are capable of acid formation for centuries(SRK 2007b, pg 97) and must be treated with appropriate caution to prevent structural and environmental damage by minimizing any possibility of exposure.	S	O
29965	Unique			PD	Gary Glass		4272	34	It is instructive to compute the approximate total masses of the important components being proposed for extraction, processing, storage, and disposal to be able to assess the magnitude of the proposed project's potential for environmental problems. The quantities of rock to be mined, moved, stored and processed are listed on page 1-1 as 228 million tons of base and precious metal ore, and an additional 394 tons of waste rock and lean ore over the life time of the mine, 20 yrs. On a daily rate basis, the tonnages are 32,000 and 91,200 tons per day, respectively. The finished product annual yield from the proposed effort are stated on page 3-2, in tons, as 38,821 copper, 9037 nickel, 400 cobalt, and, in ounces, 22,184 platinum, 87,129, palladium, and 13,824 gold. Comparing the annual ore tonnage to the copper yield gives a beginning ore percentage of copper, 0.33%, and nickel, 0.077%. Assuming CuS and NiS as the predominant chemical forms for each, the mass of sulfide in the ore calculates to about 24,000 tons annually, with a potential to form about 72,000 tons of sulfuric acid. It is not at all clear where and to what fate the sulfide annually processed mass will be become or whether of not it will be neutralized. Assuming the extraction process to be 99% effective this would leave residual copper and nickel concentrations of 33 and 7.7 ppm, respectively, in the extracted sludge. If the waste rock and lean ore were one-tenth the concentrations of the metal sulfide ore being processed, then the potential for sulfuric acid formation by air oxidation in the piles 1-4 would be potentially 24,000 tons x 0.1 x 1.7 = 4,080 tons sulfide, and the potential for 12,000 tons sulfuric acid, added annually, (but not necessarily formed or released annually, since reaction times can take several years). Since there would be no metal extraction, the copper and nickel concentrations if 10 % of the processed ore would be, 330 and 77 ppm, respectively, in the waste rock and lean ore. Clearly these concentrations of metals in conjunction with oxygen reactive sulfide-containing lean ore would be of great concern from the potential for environmental damage to the aquatic environment from the piles containing 394 million tons of waste rock and lean ore. The calculations illustrated above for total mass quantities, using actual known values for metal and sulfide content of the ore, waste rock and lean ore, should be added to the final EIS, with the assessment and interpretations necessary to evaluate and mitigate probable environmental impacts.	S	O
29965	Unique			PD	Gary Glass		4273	36	All mine waste piles exceeding nickel concentrations of 1 part per million and other components exceeding specified concentrations in M.R. 7045.0214 EVALUATION OF WASTES should be handled and treated as hazardous wastes under Minnesota Rules. Any waste solid or liquid samples with concentrations exceeding the ppm values given in MR 7045.0214 are classified as hazardous wastes and must be properly treated and disposed of as such. The following components and concentrations in ppm (mg/kg) exceeding these values are defined as hazardous waste: antimony, 0.10 ppm; arsenic, 0.50 ppm; barium, 7.6 ppm; beryllium, 0.010; cadmium, 0.050 ppm; chromium (total), 0.33 ppm; cyanide (total), 1.8 ppm; lead, 0.15 ppm; mercury, 0.009 ppm; nickel, 1.0 ppm; selenium, 0.16 ppm; and silver, 0.30 ppm; thallium, 0.020 ppm; and zinc, 70 ppm, respectively. Any and all expected wastes predicted to exceed these concentrations must be properly disposed of in a properly designed, licensed, hazardous waste facility, according to Minnesota laws and regulations, with permanent monitoring to assure compliance, and the protection of present and future health and welfare. Specific components predicted to be present in the various mine wastes need to be added to the final EIS.	S	O
29965	Unique			PD	Gary Glass		4274	37	The remaining ore and waste rock (from section "Rail Transfer Hoppe Demolition and Reclamation," page 3-37), including Category 1, 2, 3, & 4 piles of sulfide-containing rock, and including ore spillages along all rail tracks and haul roads that are expected to contain acid-forming sulfide rock and dust accumulations must be collected and placed in approved, lined disposal areas where all surface and ground water runoff is collected and treated in the WWTF for elevated concentrations of acid and metals including H2SO4, Cu, Ni, Co, Mn, Fe, Al, and others toxic components. Any of these reactive sulfide-containing materials remaining after the mining operations are completed must be located in protective enclosures where all water leachate is collected and treated at the WWTF, on a permanent basis, for the foreseeable future, otherwise toxic acid and toxic metal pollution will result and downstream river reaches and Lake Superior will be adversely affected. These considerations need to be used to strengthen the technical design approach, and added to the final EIS	S	O
29965	Unique			PD	Gary Glass		4275	38	As stated in section (pg 3-37): covering acid-forming sulfide-containing ore and waste rock with two feet of soil and vegetated according to Minnesota Rules, parts 6132.2700 and 6132.3200 is not an acceptable treatment for reactive, acid-forming sulfide-containing ore and waste rock and will lead to acid and metal contaminated surface and ground water runoff, and eventually led to acid and metal polluted streams and lakes. These reactive mine wastes must be properly contained and treated to mitigate any remaining reactivity as indicated by the presence of sulfide-containing materials and comply with the specific provisions of M.R. 6132.2200 for reactive mine waste. Measurements of total sulfide, and correlations with measurements of chemical oxygen demand (COD) are absent and would be useful in determining the total quantities of oxygen capable of reacting with atmospheric oxygen for the different categories of ore, waste rock, and mine tailings as a function of particle size and condition. This information should be generated, evaluated and added to the final EIS.	S	O
29965	Unique			PD	Gary Glass		4276	39	Proper disposal as stated on page 3-38 for "Nuclear sources" and "Partially used paint, chemical, and petroleum products" must include complete inventories, safe packaging, and be shipped off-site to an approved, licensed hazardous waste disposal site. Disposal on-site is unacceptable and will lead to surface and ground water contamination and pollution. The final EIS must identify the specific approved, licensed hazardous waste disposal site for these residue waste containers and mixtures of materials containing these hazardous components. The public does not want a repeat of the fiasco on the Reserve Mining Co. site where hundreds of barrels of hazardous wastes were disposed of in an unacceptable manner which could have caused irreparable harm to Lake Superior, and did cost the Minnesota taxpayers more than \$10 million for cleanup and proper disposal because company went bankrupt.	S	O
29965	Unique			PD	Gary Glass		4277	40	The Waste Water Treatment Facility (WWTF) if operated properly will generate solid wastes containing the extracted components from water contaminated with toxic metals and other dissolved and suspended particulates. This solid sludge must be properly disposed in an approved, licensed solid waste landfill suitable for handling this waste. The cost for operation and disposal of contaminated sludge is absent from page 201 showing Closure Costs Estimate Summary Tab. 3.1-14 and omits the post-closure costs of continuing operation of WWTF and disposal costs for contaminated sludge. Both costs during the time of mine and plant operation (20 yr) and continuing after mine site closure for the several decades need to be specified and planned for, because of the remaining reactivity of the sulfide-containing rock present in the 294 million tons of waste rock and mine tailings generated by the proposed project. The costs for these operations need to be described and added to the final EIS.	S	O
29965	Unique			PD	Gary Glass		4279	42	The use of impermeable liners to collect and control all infiltration into and through the piles, layers, and storage of reactive solids containing reactive sulfide mined ore and waste rock is absolutely critical that these liners do not leak. And if for any reason that water should contact the acid laden sulfide-containing particles resulting in leaching toxic concentrations of metals, the supporting structure under the storage piles must be constructed to collect all contaminated water and conduct it to the WWTF without any contact with the natural soil surface or be allowed to contaminate the ground water aquifer directly underlying the foundations of the storage piles. Liner leakage is referred to on page 209, and ditches to convey contaminated leachate water is not acceptable under any circumstances. Safeguards must be build into the plan to make sure it is impossible for any leakage what-soever to escape the second or third barrier to catch any highly concentrated toxic aqueous condensate, leachate, or storm water resulting from blowing rain or snow which may contact the reactive acid-sulfate containing bulk storage materials such that leakage will never occur. These additional considerations need to be included in the final EIS.	S	O
29976	Unique			PD	Gina Byrne		2752	2	if Polymet really wants this exchange to happen then its not enough for them to just remove the infrastructure and tray the water when they are finished. They propose to take something out of the the earth so it only seems right that they should be responsible to not just reclaim but improve the area when they are finished. I think that they should be responsible for addressing existing environmental conditions for lands associated with previous LTVSMC operations outside of the NorthMet project area.	NS	X
27658	Unique			PD	Graden West		1794	1	My only comment on mining on this issue is that I'm always concerned about the future. Polymet may be able to control "erosion" or "leakage" from these mines for several decades but what and or who will be around to manage problems in 2 or 3 hundred years or longer? Who will pay for problems? It shouldn't be John Doe. It should be Polymet!	NS	X
2798	Form Letter	1	Variant	PD	Gretchen Flynn		349	3	If this sounds ridiculous look at the abandoned gold mines in the west. They are still dumping sulfides decades after they have closed.	NS	X
29738	Unique			PD	Harold Edwards		2604	5	Investors do not know if any particular company will succeed or fail. They way they handle this risk is to diversify. They simply invest in a large number of companies, some will fail, but most will succeed. They invest a few thousand dollars in Polymet with sober expectation they might lose it all. They will make money somewhere else. Know this: they are prepared to lose the few thousand dollars they have invested in Polymet. You must convince them that they will not lose just a few thousand dollars but ten to a hundred times that amount. You must convince them that they will have continuous liability for any environmental mishap. Many of you will, as will the investors themselves, argue that investors have no additional liability beyond what they paid for the stock they bought.	NS	X
15	Unique			PD	Heidi Aubrey		44	1	There is plenty of copper in the world as is.	NS	X
29240	Unique			PD	Henry V. Mott		3633	6	PolyMet's proposed system to deal with this inevitable production of leachate - hydraulic isolation and capture for mechanical/passive treatment - relies upon the same, likely "here today and gone tomorrow", water treatment system that is proposed to protect the environment from the acidic west pit water. The term "industry standard" is used in responses to queries by cooperating agencies to describe this set of waste rock pile reclamation measures. Here, industry standard simply means a small improvement over "business as usual" which is to excavate materials, scatter them on the Earth's surface and leave them there with protections only as adequate as required to get through the active and near-term post mining periods. Mining's "business as usual" practices have historically and universally resulted in severe environmental problems everywhere the mining industry has unearthed sulfide-bearing geologic formations. This waste rock pile should not be left (in any way, shape or form) strewn upon the surface of the Earth.	NS	X

29094	Unique			PD	Holly Buchanan		2418	3	There is no amount of safety measures that can prevent any number of horrendous accidents from happening. This project amounts to the Minnesota equivalent of the Alberta tar sands oil fields or mountain top removal in Appalachia both of which have proven an ecological disaster and atrocity against the people living in the midst of them.	NS	X
52	Unique			PD	Holly Wells		123	1	Please include in project documentation, the planned dissolution of the site and all project resources (buildings, inventory, waste products, etc) once project is completed and required clean up activities to ensure leaving site/land in condition that is not dangerous to neighbors or the environment.	NS	X
52	Unique			PD	Holly Wells		124	2	With growing awareness of how inter-related our planet's ecosystems are; my request is that this project have written clear procedures to ensure the land and any structures or storage area's created or directly build into the land are proven safe to anyone who may enter the project site/land area during or after project completion.	NS	X
27432	Unique			PD	Jack Buck		1741	1	First off, I was wondering about what the statement means exactly when it says "[The EIS] assumes mechanical treatment would be required indefinitely at both the Mine Site and Plant Site. This is because the water modeling was not designed to predict how long the proposed NorthMet project would require water treatment." Does this truly mean there is no foreseeable end to water treatment efforts in that area? I read an article or two that said PolyMet would have to go through 500 years of cleanup from acid mine drainage... Is that truly the case, given the circumstances and technology?	NS	X
19	Unique			PD	Jack Parker		61	4	Do you expect the public to make a reasonable decision without even seeing what you are selling? How about an artist's concept of the finished product?	NS	X
36	Unique			PD	Jack Parker		102	2	Please require maps and sections showing grade and thickness at the diamond drill holes, to allow intelligence to select what is ore and what is not ore - and go on from there. They imply that they have done so but show no evidence, so suggesting duplicity. In essence the study is incomplete.	S	N
26995	Unique			PD	James S.		1511	1	Pollution of the pristine environment is inevitable, even if later rather than sooner. There is no container for the polluted water and chemicals that will last forever, and even in a container they will eventually pollute the aquafir. This is evident in recent stories about pollution of a river and aquafir from a gold mine, barrels of atomic waste leaking and involved in underground fires, and other such examples.	NS	X
25973	Unique			PD	Jamie Hendrickson		1255	1	How can we trust that there will NEVER be a containment issue? One accident spells disaster for a wide area around the proposed mining site. I don't think the risk is worth the reward.	NS	X
29839	Unique			PD	Janice Ann Smith		2653	2	The plans for containing mining waste have not been shown to be environmentally sound.	NS	X
29839	Unique			PD	Janice Ann Smith		2654	3	There is no guarantee that the corporations involved would be able to sustain the required waste containment for the number of years required.	NS	X
28734	Unique			PD	jdmalcolm@wildblue.net		2332	1	To our knowledge every mine of this type has failed. Despite reassurances from the company, and advances in technology, we all know there can be no guarantees. The fact that the state is asking for huge sums of money for cleanup and a commitment from the company for generations to do this cleanup, tells me they expect leaks.	NS	X
26627	Unique			PD	Jeff Schroeder		1377	6	There are mines with permits attempting to deal with sulfate contaminated water right now aren't there. How successful have they been?	NS	X
29254	Form Letter	1	Variant	PD	Jeffrey Morrison		2464	2	Sulfide mining has a terrible history in many states. I have not seen any evidence that the waste produced by this type of activity can be handled or treated safely over a long period of time. Sooner or later there will be a spill.	NS	X
23917	Form Letter	1	Variant	PD	Jim Steitz		973	5	At the very least, you must evaluate waste management alternatives such as lining the waste rock storage areas and tailings disposal basin. The cost to Polymet of proper waste security is not consequential compared to the value of preventing heavy metal and acid leakage. The rivers and lakes of the Minnesota north country are vulnerable to adverse drops in pH as demonstrated by past impacts of acid rain, and they will lack buffering protection against acid leaching from the tailings left behind for indefinite decades after Polymet may have left town.	S	O
29034	Unique			PD	Joel J. Olander		301	3	It could take up to 500 years before the risks to our water are resolved.	NS	X
29034	Unique			PD	Joel J. Olander		2403	2	This is unproven technology and has not been successful in any other mine project.	NS	X
26979	Unique			PD	Joel Roberts		1502	3	In my SDEIS comments I said that the presence of Rainy Lobe till, containing many boulders and cobbles, would provide serious obstacles to construction of the seepage barrier (a slurry wall), and to keying it into the bedrock. A brief excerpt is quoted under Comment ID 18386, which was assigned to thematic response PD07. A typical quote from that response says that “the slurry cutoff wall and collection trench approach has been used for many decades, beginning initially as a means to facilitate construction of deep foundations in locations of shallow groundwater and difficult soil conditions, and subsequently expanding to other uses such as the containment of contaminated groundwater emanating from unlined waste disposal facilities (e.g., landfills, stockpiles, etc.).” However: • There is no specific mention of the use of this method in any sites that are closely comparable to PolyMet’s proposed tailings basin site. • While Thematic Response PD07 says that the presence of boulders and cobbles is handled, along with some other site-specific conditions, it does not say how those conditions are handled. This Response PD07 is much less specific than some other thematic responses.	S	O
963	Form Letter	1	Variant	PD	John Tonsager		264	3	The ore has been and will continue to be in the ground and available forever. There is no demand for this ore that outweighs the risks. Leave it there until sometime in the future when it can be safely extracted and not create such a huge risk to us and the environment.	NS	X
26510	Unique			PD	Jon Marcaccini		1344	3	It can be done in an environmentally sound manner that will be the showcase for the world and all future local mining projects. This is not a 1850 gold mine somewhere in Wyoming this is a 21st century mining project with everything this century has to offer in way of protection, monitoring and safe mining practice.	NS	X
30065	Unique			PD	Jon Schubbe		2777	1	The EIS does not state how long cleanup will take. At least 500 years is not consistent with MN clean water legacy.	NS	X
25944	Unique			PD	Joseph Loisel		1245	1	I am very pro mining here in Northern Minnesota and in favor of the Poly Met mine. It has been a long time in the permitting process and with modern technology it can be an on going process to make sure the mining industry complies with MPCA and EPA regulations.	NS	X
22565	Form Letter	1	Variant	PD	Kathleen Hills		727	2	This kind of mining has never been done without severe environmental degradation, and Polymet has given no evidence that they will be the first to accomplish that.	NS	X
29514	Unique			PD	Kathleen Miller		2539	4	3. Current practices: I am pleased that the mining company can state they have the technology to clean waste water. Let us see a 50 year demonstration of this best practice on existing mines to really understand how the technology can be employed and improved upon.	NS	X
26854	Unique			PD	Kenneth Swanson		1473	1	I have not seen any more information on the sulfur run off created from this type of mining that shows Poly met has the method that will keep from ruining our state water shed.As far as I know every tailings pond is designed to leak not hold water.so how is this going to contain any run off from the overburden of this mine.	NS	X
26854	Unique			PD	Kenneth Swanson		1475	3	It seems that all other copper mines have a bad history of pollution so how is this one going to be different. Why can't we try to figure out how to clean up the problem mines we have now before ruining a great place in northern Mn. The minerals aren't going anywhere people have known about these deposits since the 40's they will be there long after we figure out how to mine with out ruining the surrounding area.	NS	X
379	Unique			PD	Kevin Kramer		182	1	The type of mining that Polymet proposes has never been tested. This type of mining has never been done before in Minnesota.	NS	X

29850	Form Letter	1	Variant	PD	Kyle Lind		2679	10	A LIE CAN NOT LIVE FOREVER, AND THE GOOD PEOPLE OF MINNESOTA WILL NOT HESITATE TO PUT AN END TO ALL COPPER NICKEL MINING IN MINNESOTA WHEN THIS MINE AS CURRENTLY PROPOSED FAILS. THAT MEANS ANY FUTURE COPPER NICKEL MINES NO MATTER HOW WELL DRAFTED OR HOW SAFE WILL BE JEOPARDIZED BY THE FAILURE OF POLY MET AND THE LEAD AGENCIES TO GET THIS PROJECT RIGHT BY BEING HONEST WITH MINNESOTANS, AND DEMANDING NOTHING BUT THE BEST FOR MINNESOTA, INCLUDING EMPLOYING THE EXPERT RECOMMENDATIONS BY THE COMMITTEE ANALYZING THE RECENT MOUNT POLLEY DISASTER. The future of copper nickel mining on the Minnesota Iron Range is riding entirely on the shoulders of Poly Met, a company that has never operated a mine before, a company that knowingly used bad data in assisting the lead agencies in preparing their Environmental Impact Statement, a company that knows damn well the atrocious environmental and public liability record, that hard rock copper nickel mines just like the one they are proposing have had every single time they have ever been constructed.	NS	X
29904	Unique			PD	Larissa Hindman		2707	1	Indefinite water treatment to waste water/tailing pond and piles is bad science. Sulfide mining is not good for Minnesota.	NS	X
27121	Unique			PD	Laverne Wagner		1663	2	As discussed many times, safe Sulfide mining is a myth and not proven to work. Polymet is based on the unknown with horrendous long term consequences.	NS	X
27682	Unique			PD	Lois & Everett Jenkins		1845	2	One need only to examine the abysmal record of copper nickel mining throughout the planet. A few jobs can never compensate for the disastrous assault on our entire region forever.	NS	X
29740	Unique			PD	Lori Andresen	Save Our Sky Blue Waters et. al.	3901	16	The FEIS allows for a pollution trail along the rail spur between mine and plant, by allowing PolyMet to use refitted rail cars. This does not adequately protect the environment.	NS	X
29370	Unique			PD	Lori Olinger		2518	3	The FEIS states that the basin will need monitoring and repair. I don't think the FEIS adequately covered the long-term monitoring and repair and has any type of information on plans for fixing if/when problems occur.	NS	X
27921	Form Letter	1	Variant	PD	Louis Mielke		2230	2	It's is great that PolyMet will be able to create new wetlands in replace of the old ones; however, what about future effects of tainted groundwater? Can PolyMet create some brand new aquifers that are adequate for tribal and state standards? Also, what about the chance for tainted groundwater to ruin more wetlands than have been planned to restore? If this proposal is passed, please do not let PolyMet NorthMet, nor Glencore get away with destroying the land and leaving incomplete restoration job. What will this copper and nickel be used for? Get them legally bound as tight as you can to restore the land. Please, don't put the burden of restoration on MN taxpayers.	S	O
26648	Unique			PD	Margaret A. Redmond		1393	3	b. What possible assurances could be given regarding 200-500 years of reliable and successful maintenance? What examples exist of mechanical systems (much less highly complicated ones) operating 200-500 years? Though this could be glossed over to the permitting phase, it would seem this phase should require an accurate and realistic plan.	NS	X
26648	Unique			PD	Margaret A. Redmond		1400	10	6. There has never been a mine of this type which has not polluted its watershed. Never. The so-called "model" Eagle Mine in Michigan visited by Governor Dayton discharges wastewater into the groundwater aquifer without cleaning it. That feeds the streams flowing into the Salmon River. (It is my assumption that these mines ALL met their respective EIS's...)	NS	X
26648	Unique			PD	Margaret A. Redmond		1402	12	7. The so-called-clean mining at that Eagle Mine also changed the design of its filters for particulates from the mine itself from the highly effective bag-house filters to NO filters for its emissions. Evidently, this was done between the initial impact statement and the permitting phase. How is that acceptable? Are we seriously supposed to consider this as a good model that will reassure us? How gullible are we?	NS	X
12	Unique			PD	Mark Roalson		27	1	1. While the FEIS claims PolyMet will treat contaminated water for as long as it takes to keep that water from polluting the environment (during operation and after plant closing), there is no Minnesota mining precedent or model of this "after treatment". As a matter of fact, a recent article in the newspaper Timber Jay brings out the fact that mining companies are incapable of doing this. During the existence of the old LTV mine, copper ore was dug up along with taconite in the Dunka Pit, (now owned and monitored by Cleveland Cliffs and their contractors). Sulfate and heavy metal runoff was supposed to be mitigated by the operation of water treatment systems	NS	X
12	Unique			PD	Mark Roalson		29	3	By court order the mine has sunk two cleanup wells and brings up dirty water and runs it through two reverse osmosis plants to purify dirty water into potable water. 80% of all water can be recovered as usable. 20% of all water is left as an unusable, unmarketable brine of sulfate and heavy metals that has to be stockpiled at the mine site. The PolyMet FEIS does not address this common issue of pollution plumes from sulfide ore mines contaminating the surrounding water tables and aquifers. There is nowhere in the PolyMet FEIS covering this issue.	S	O
26628	Unique			PD	Mary Adams		1380	1	The location of the proposed mine, south of the BWCA, in the midst of northern forests, pristine lakes and rivers could very well contaminate waters with heavy metal, mercury and sulfates. We are told that would not occur due to holding ponds never to be broached, and water treatment going out for hundreds of years. What kind of guarantee is that?	NS	X
27066	Unique			PD	Matthew Miltich		1645	4	I beg you to do the right thing and deny permits to projects such as this one until the science of mining advances to the point where Minnesotans' birthrights to clean water, clean air, and healthy land are truly assured.	NS	X
26997	Unique			PD	Maureen Johnson		1525	4	The Hydrometallurgical Residue Facility (HRF) is planned to contain some of the most concentrated and toxic wastes produced by the PolyMet project. Yet, the FEIS discloses the complete chemical composition of only some of these materials and only recently upon commenters' request conducted a critical analysis on only the disclosed materials to determine whether or not they would pose hazards to the environment. The PolyMet plan selects an unsuitable location for the HRF, increasing risks of instability and liner failure at this permanent waste storage facility. The FEIS inappropriately denies the potential for releases as result of liner leakage from the HRF.	S	O
26997	Unique			PD	Maureen Johnson		1527	6	Barr Engineering. 2006. Environmental Sampling and Analysis Hydrometallurgical Process Liquids and Solids Sampling Results Pilot Test – NorthMet Deposit. Draft-02. May 15, 2006. This reference and a discussion of its contents have not been provided to inform the public about the hydrometallurgical processing liquid. This processing liquid becomes waste liquid remaining in the pores of the HRF residues; upon collection at the bottom of the HRF, it will be treated at the WWTP unless some leaks through the bottom composite liner. Without adequate information on the wastewater a determination of appropriate regulation at the HM facility cannot be made. Similarly, no characterization or volume/mass estimate have been provided for the all of the wastes proposed for deposit in the HRF, nor their effect on the other wastes and their regulatory status. So we do not know whether the liner proposed will be adequate, and the probabilities of leakage increase.	S	O
26997	Unique			PD	Maureen Johnson		1564	43	on the basis of data that is 30 years old. See WR 071 acts as if no climate change is occurring now! Theme PD11 response, ap. 2546, Tailings Basin pond is designed to hold the PMP event, which is a catastrophic event consisting of 38-inch storm event within a 72-hour period. However, the remaining containments are designed only for a 100-year, 24-hour storm event plus one foot of freeboard.(PD 22 response, ap. 2552). This is inadequate to protect resources and a storm event can cause overflow and contamination of soils, surface water, and ground water with the contained waste. All containments of untreated water, especially the hydrometallurgical residue facility, should meet the PMP event of 38-inch storm in 72 hours.	S	O
26997	Unique			PD	Maureen Johnson		1565	44	4.4.2 Hydrometallurgical Residue Facility (HRF) Similar to the FTB, the HRF will function as a closed system, with the pond level managed to remain at the design level (Section 4 of Reference (4)). Precipitation falling within the HRF will flow to the HRF pond. Overtopping of the dams will be avoided by operating the HRF pond with sufficient freeboard to accommodate pond water level bounce due to a severe precipitation event, as described in Section 4.1 of Reference (4). Water level bounce from storm events is expected to be minimal, because the tributary area for the HRF is relatively small, as described in Section 2.5 of Reference (4). The cell is sized to accommodate up to 3 feet of freeboard so that some wave run-up and water level bounce can safely occur. Initial operations will be used to refine the minimum freeboard requirements. Major storms can also cause electrical outages, causing pumps to stop, so all containments of waste must be designed to accommodate at least a 1 in 1000 year storm.	S	O
N/A	Form Letter Template	9	Non-Variant	PD	Multiple	Sierra Club	FL50	9	the U.S. Environmental Protection Agency veto and the U.S. Army Corps of Engineers deny any permit that would allow PolyMet polluted discharge and wetlands destruction.	NS	X
27901	Unique			PD	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3402	123	These concerns – as to whether the mine will generate sufficient revenues to cover the cost of the necessary environmental protections – are heightened by the absence of any discussion in the FEIS of the potential profitability of the mine including the costs of the waste water treatment facilities and other environmental controls that are essential elements of the Project. The uncertain viability of the propose mine is further heightened by the decline in the price of copper.	NS	X
8645	Unique			PD	Neil Simonson		594	1	Please approve PolyMet's permit. Even though Canadian they possess the technique's to wash out the Sulfer.	NS	X
29871	Unique			PD	Niki Roussopoulos Geisler		2688	2	we urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 2. Strong safeguards are in place in the event anything goes wrong	NS	X
29143	Unique			PD	Patricia Coppo		2428	1	It is impossible to guarantee that the PolyMet mining operation will never have an accident that would result in catastrophic damage to an environmentally sensitive water shed.	NS	X
29676	Unique			PD	Paul Nasvik		2563	1	PolyMet is projecting control methods that are based on historical norms. Containment of toxic materials will be stored in wet pits that are Double Lined and yet they are projecting loses of 10gpm and 20gpm leakage in the two containment areas. That converts to 14,400 gallons per day and 28,800 gallons a day respectively.	NS	X
26151	Unique			PD	Paul Winslow		1277	3	I have little confidence that Polymet can insure run off containment for the long term. Where will Polymet be after the mining is over and the pollution remains for hundreds of years?	NS	X

27085	Unique			PD	Paula Maccabee	Water Legacy	3207	192	The preceding discussion of the FEIS’ rejection of the West Pit Backfill alternative underscores that expansion of mining at the West Pit is foreseeable and anticipated in legal agreements. A proponent of mineral development may not choose an arbitrary limit on what is economically recoverable, but must base an EIS on the full range of likely production. Native Vill. of Point Hope v. Jewell, 740 F.3d 489, 501, 504 (9th Cir, 2014). NEPA requires that agencies engage in reasonable forecasting of cumulative mining impacts. N. Plains Res. Council, Inc. v. Surface Transp. Bd., 668 F.3d 1067, 1078-1079 (9th Cir. 2005). While the FEIS considers the environmental impacts of mining 225 million tons of ore (FEIS, ES-17), PolyMet’s official Technical Feasibility Report48 defines the deposit as 694 million short tons of indicated and measured resources and 230 million tons of inferred resources, or a total of 924 million tons of ore that meets PolyMet’s accepted grade within their current lease holdings at NorthMet. (PolyMet 43-101 Report, p. 14-38). The Edison Report commissioned by PolyMet to provide information for investors (Edison Investment Report, Nov. 2013, WaterLegacy SDEIS Comments, Exhibit 54) explicitly contemplated mining expansion, “A sustained higher metal price regime has the potential to allow expansion of the existing pit phases both laterally and to depth.” (Id., p. 15-3). The Report advised, “We believe the size and scope of the ore body could support a much larger project, which would create meaningful additional value.” (Id., p. 5) The Report continues, “We believe there is a good chance PolyMet will be able to expand the size of its resource by 50-100% based on what we learned on a site visit.” (Id.) The Edison Report explained that the proposed PolyMet NorthMet processing plant had historically operated at 100,00 tons per day (t/d), and that an operating rate of at least 90,000 t/d should be attainable. (Id., p. 3). The Edison Report stated, “We believe the most likely follow-on project PolyMet will pursue is the expansion of mining and milling to 90,000 t/d, with the second most likely third-party ore processing of 50,000 t/d or 100,000 t/d.” (Id., p. 10) The Report noted that there are 11 mineral properties near PolyMet’s mill and that “government permitting agencies may encourage the developers of other mining properties in the area to work out an arrangement with PolyMet to use its pre-existing mill and tailings pond” in order to “limit the footprint of mining and processing in the area.” (Id., p. 10) The Edison Report valued PolyMet stock based on the potential expansion of processing to 90,000 tons per day (Id., p. 1), stating “We assume PolyMet would begin working on permitting the expansion to 90,000 t/d within six months of receiving its permits for Phase I, permitting would take two years and construction would take one year. On this basis, it could complete its expansion by May 2018.” (Id., p. 12)	NS	X
27085	Unique			PD	Paula Maccabee	Water Legacy	3208	193	Although Edison Investment Research terminated coverage of PolyMet Mining in June 2015,49 none of the factors contributing to a reasonable forecast of PolyMet’s planned expansion at the NorthMet mine, processing plant and tailings facility have changed. This planned expansion should have been considered to evaluate the cumulative impacts of the proposed action on mercury methylation, water quality, wetlands destruction and impairment of tribal resources.	S	O
29273	Form Letter	1	Variant	PD	Rhoda Liebo		2481	2	Every other similar mine has led to dreadful, long acting poisons released into the environment, and the release of very toxic heavy metals. The neighbors are left holding the bag.	NS	X
28922	Unique			PD	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3577	2	On Dec. 6th, 2015 meteorologist Paul Douglas posted on his website that Minnesota has experience four 1000-year floods in the past eleven years. This is well beyond any predictive expectation. Duluth and surrounding areas experienced massive flooding in 2012. Since this and even lesser storms are not adequately modeled in the designs, one can only imagine the consequences of a 500 or 1000-year flood on the Iron Range. The collection and treatment facility would likely be overwhelmed, or dikes fail, releasing untreated toxic contaminants, including heavy metals, into the headwaters. The FEIS fails to model this changing climatic reality which increases the likelihood that mine runoff will expose the state’s waters and citizens to unnecessary health risks into the distant future.	S	O
9828	Form Letter	3	Variant	PD	Richard Houck		643	1	I have toured the proposed mining sight and am convinced that Polymet knows what it is doing and has taken all reasonable and proper precautions to adequately protect the environment.	NS	X
29908	Unique			PD	Rick Fry		2709	1	It is not logical to assume that this endeavor will not leak. It is not a matter of if it will leak, but when it will leak. There should be no leakage at all. They claim it will only leak a little which is acceptable according to the EIS. No leakage is acceptable.	NS	X
27778	Form Letter	1	Variant	PD	Robert Graves		2136	5	I do not see a worst case scenario evaluation. The Monte Carlo likelihoods in the FEIS indicate probabilities of everything working correctly.	NS	X
29523	Form Letter	1	Variant	PD	Robert Risch		2547	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. It is totally unrealistic to assume that Polymet will be in existence even 50 years from now, not to mention 200 to 500 years from now, How can a nonexistent company guarantee anything in the way of long term environmental protection, or even care, for that matter, that far into the future? Those originally held responsible for allowing this to happen at the permitting level will have left their legacy for approving a highly probable environmental disaster. The short term gains do not in any way justify the end result that is generations from now.	NS	X
27690	Unique			PD	Robert Topliff		2079	3	It is my understanding that Polymet has not accurately sited their dumpsite so they could move it after getting hurried permission to proceed.	NS	X
27690	Unique			PD	Robert Topliff		2082	6	Toxic waste on the land and in the water is different from Iron Ore on the land or in the water.	NS	X
29246	Unique			PD	Ron Brodigan		2452	1	PolyMet is not modifying the proposed project to limit its likely air, water or soil pollution.	NS	X
29289	Unique			PD	Sandy Sterle		2494	2	There are no non-ferrous mines in a water environment, which have not polluted.	NS	X
28554	Unique			PD	Shari Bachman		2324	1	I know that many precautions and assurances have been put into place to guarantee that the Poly Met Mine will not pollute the water in the BWCA but that is all just on paper. The truth of the matter is the Poly Met group can NOT guarantee that there won't be a leak, spill or major catastrophe that would pollute the water and any risk of that puts many jobs and businesses on the line for failure.	NS	X
23004	Form Letter	1	Variant	PD	Steve Voiles		880	1	Approval is based on strategies that contain toxic wastes that cannot be avoided. We cannot bet our children's futures on the containment strategies that must last 100s of years. It is ingenuous to pretend we can know these strategies will work in an unknown future.	NS	X
27094	Unique			PD	Steven Lyons		1654	1	The fact that there has NEVER been such a mine in the history of the world that HAS NOT FAILED and polluted the surrounding environment catastrophically, is the only fact we need to focus on!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!	NS	X
29325	Unique			PD	Steven Ring		3686	1	I find that the Final EIS has several deficiencies that indicate that the design of this mine and mill will not satisfactorily protect Minnesota’s environment.	NS	X
29325	Unique			PD	Steven Ring		3688	3	Mine pit water must be treated forever: It is truly incredible that an EIS for a proposed mine could be considered “adequate” with a design that will require treating water for an unknown amount of time (> 100 years). It is time to acknowledge that the technology to mine these minerals safely is not represented by the NorthMet project plan.	NS	X
29325	Unique			PD	Steven Ring		3690	5	4) Cumulative effects: I know that you are constrained to evaluate cumulative impacts based only on projects that are well developed. However, this project is taking place in a region with many similar mineral deposits and a high likelihood that some will be developed. Sulfide ore mining is inherently much more risky to the environment than hematite or taconite mining. As such, design failure can have a much larger impact. Therefore, the design of the mine, processing facility and tailings basin should be required to meet a much higher standard than iron oxide mining. In addition, if the risk of failure at one sulfide mine is X, the risk of failure at five mines would be 5X. Because of the catastrophic nature of possible sulfide mining failures, the design requirements for sulfide mining must be extremely high. This, first mine in the region, must meet those extremely high requirements. Unfortunately, I see no discussion of these requirements in the FEIS, and lots of discussion in the press of potential design weaknesses.	NS	X
27036	Unique			PD	The Lesters		1633	1	I don't believe PolyMet or the State of Minnesota is going to be alert to those problems for 500 years. Somewhere in that time, also, major damage will have been done to the environment and, likely to the health of people affected by those poisonous tailings.	NS	X
26986	Unique			PD	Tom Smith		1510	2	project. a water treatment plan proposed to be effective for 500 years! most mining companies do not last 5 years!	NS	X
29599	Form Letter	1	Variant	PD	William Fischer		2554	1	a proposed 500 year cleanup period is reckless in measure exceeded only by the proposed contamination of long duree'. Not only does this time horizon exceed the lifespan of the United States by approximately two fold, but it exceeds individually important human timeframes by at least an order of magnitude, possibly two orders of magnitude if one considers a usual electoral cycle indicative of usual decisionmaking and outcome-expectant timeframes.	NS	X
27563	Unique			PD	William K.		1770	1	In my opinion, the Final Environmental Impact Statement for the Polymet project shows several substantial improvements in the project since the previous draft version. Among these I consider the placement of the double lined hydrometallurgical residue facility at a brown field location and the use of bentonite in the tailings basin significant advances.	NS	X
27563	Unique			PD	William K.		1771	2	Alas, the EIS still fails to address how long term treatment of waste from the project is going to be carried out. The EIS quite honestly admits that “mechanical treatment would be required indefinitely at both the Mine Site and Plant Site.” I respect such candor. Unfortunately, however, the EIS completely fails to explain how and by whom this long term treatment will be accomplished.	NS	X
29973	Unique			PD	William Robbins		2750	7	By planning for a 30 to 35-year period of mining, rather than a 20-year period, the removal rate of copper/nickel would need to be reduced. I understand that the up-front costs would be recovered more slowly, and this would generate reduced profits. Benefits would result, however, to the long-term economy, the people in the area, and the environment. The longer period of extraction would decrease uncertainties associated with the long-term needs of maintaining the site after active mine operations cease.	NS	X
558	Unique			PER	Abbie Debiak		235	4	In our opinion state required monitoring should remain completely separate from independent monitoring (ie; the state should not mandate independent monitoring, it should be locally-driven).	S	O
558	Unique			PER	Abbie Debiak		236	5	In our case, independent monitoring became possible only after it was clear that local opposition had failed and the mine would be a reality.	NS	X
558	Unique			PER	Abbie Debiak		237	6	Linking independent monitoring to a proposed mine’s approval process can imply tacit community support (social license) and this was definitely not the case with CEMP (the region continues to be about evenly split regarding the mine).	NS	X

558	Unique			PER	Abbie Debiak		242	2	Governor Dayton was impressed with the independent Community Environmental Monitoring Program (CEMP) on his recent tour of the Eagle mine (www.cempmonitoring.com). The CEMP program monitors for mine-related impacts to groundwater, surface water, air quality, wildlife and plant life. After the tour, the Governor indicated that he would insist on a similar independent monitoring program if he decides to allow an open-pit copper mine near the Boundary Waters Wilderness Area.	NS	X
558	Unique			PER	Abbie Debiak		243	3	the SWP feels that requiring an independent monitoring program should not be a factor in his decision. It should be stressed that while the CEMP program was designed to detect environmental impacts from mining activities it is not capable of preventing such impacts.	NS	X
558	Unique			PER	Abbie Debiak		244	7	In 2006 the SWP developed the Salmon Trout River Watershed Management Plan which included the recommendation to “prohibit all sulfide-based mining” in this sensitive natural area (http://superiorwatersheds.org/admin/wp-content/uploads/2014/06/Salmon-Trout-River-Watershed-Management-Plan.pdf see page 41).	NS	X
558	Unique			PER	Abbie Debiak		252	15	The first decision facing Governor Dayton is whether to allow an industrial zone immediately adjacent to a wilderness area. In our opinion independent monitoring should not be part of that decision process.	NS	X
25311	Unique			PER	Al Gustaveson & LeeAnn Baker		1152	1	The DNR also glosses over modeling that shows the proposed plant site would need to be treated for pollutants for at least 500 years. If the DNR were to follow Minnesota state law — Chapter 6132.3200 Closure and Postclosure Maintenance: "the mining area shall be closed so that it ... is maintenance free" — PolyMet would not be permitted. Are you kidding...500 years? Stop this nonsense.	NS	X
26780	Unique			PER	Alaina Pilate		1434	8	Please fix the plan to recognize Glencore as a responsible party for permitting.	NS	X
8814	Form Letter	1	Variant	PER	Alan Breuer		616	1	I believe that if all the regulations are met ,that have been put in place by different agencies federal and state then it's time to move forward with permitting and get jobs coming to Minnesota!	NS	X
8592	Unique			PER	Allen Frechette		590	4	The amount of financial assurance necessary to ensure sufficient funds to address the future costs of site reclamation, ongoing monitoring and potential mitigation in response to contamination discovered through the monitoring has yet to be determined. The FEIS acknowledges that the details needed for this assessment can only be determined with additional technical information normally provided during subsequent permitting. However, Polymet should have provided the necessary engineering details for this critical issue as part of the EIS. Thus until the issue of existing AOCs and their relevance in complicating existing and future contamination discovery, which could be associated with the Polymet proposal, is addressed, this remains an unresolved issue, which could also complicate future regulation of Polymet should a permit be issued.	NS	X
29	Unique			PER	Allen Killian-moore		89	4	Similar to what I had read in the previously issued Supplemental Draft EIS, the Final EIS statement doesn't make it clear how on earth the potential post-mine water treatment would be handled. I as understand it, two wastewater treatment plants to treat polluted water from the mine site and the tailings basin would operate when the mine is running and would continue operating after the mine closes. But, treatment will be needed at the mine site for a minimum of 200 years and at the plant site for a minimum of 500 years and this seems like an awfully long time, post-mine, in order to guarantee accountability and safety. We're talking somewhere between 2 to 5 centuries in which the water would need to be consistently and effectively managed in order to ensure safety for people and the ecosphere.	NS	X
29	Unique			PER	Allen Killian-moore		90	5	I don't see any consistent mechanisms laid out in the plan to ensure that safety and regulation, and water cleaning will continue unhindered for such a long, long period of time, and therefore I still do not thing, all things considered, that this mine should be allowed or permitted to operate in Minnesota.	NS	X
7012	Unique			PER	Allen Killian-Moore		531	4	I don't see any consistent mechanisms laid out in the plan to ensure that safety and regulation, and water cleaning will continue unhindered for such a long, long period of time, and therefore I still do not thing, all things considered, that this mine should be allowed or permitted to operate in Minnesota.	NS	X
24727	Unique			PER	Amanda Schultz	Itasca County	2946	5	We support the success of these projects, for the above stated reasons and believe by meeting Minnesota's strict environmental standards through a comprehensive environmental permitting process, PolyMet will be poised to play a significant role in contributing to the sustainability of our region's economy by mining the metals we need every day without harming our region's air and water quality.	NS	X
24206	Form Letter	1	Variant	PER	Betty J. Van Wicklen		1009	1	none of these agencies has the right to bypass the Clean Water Act or any other state or federal regulations safe-guarding The health and well-being of National Forests or Wetlands through mitigation which subverts the intent of the regulations guarding these ecosystems.	NS	X
6310	Unique			PER	Bill Parise		475	1	the state and federal standards proposed are more than adequate to protect the environment.	NS	X
4	Unique			PER	Bob Woodbury		3	1	Have there been other projects of this nature and if so, have they been successful? To what degree? Is that acceptable? If not, the project should be denied. If it has a degree of acceptability, how would that apply to this project?	NS	X
4	Unique			PER	Bob Woodbury		4	2	I could go on in this vein, but my point is that we need to rely on what we know. “With the technology we have today...” is not acceptable because the outcome is unknown. No best guesses, no projections based on known facts. Their outcomes are unknown.	NS	X
28898	Unique			PER	Brad Carlson		2372	3	the pollution controls in minnesota are fine on the books but are not enforced nor are there even permits in place for most of the local operating mines! to say that the agencies involved will take care of this responsibly is a farce - they are bought and owned by the mining interests.	NS	X
23332	Unique			PER	Bruce Harten		928	1	After reviewing all of the EIS you have provided...and weighing all the data....I have concluded a "Permit to Mine" will cause far more harm than good to the "State of Minnesota".	NS	X
23332	Unique			PER	Bruce Harten		930	3	NO POLYMET PERMIT...without Closed Loop facility and Enclosed Concrete Tailing Pool !	NS	X
27003	Unique			PER	Bruce Johnson		1593	4	- The FEIS assumes that the property boundary is the compliance point for surface water discharges. This is incorrect. The point of compliance for discharges to surface waters is where the discharge enters waters of the state or nation. This is documented	S	O
27003	Unique			PER	Bruce Johnson		1610	22	Numerical standards are not the only applicable surface water standards surface water is also regulated by narrative standards. In Minnesota whichever of these standards is more restrictive takes precedent.	S	O
27003	Unique			PER	Bruce Johnson		1613	25	Direct discharges or shallow underground upwelling’s from flooded pits must meet water quality standards once they enter waters of The state i.e.”. and must meet All surface water standards.	S	O
27003	Unique			PER	Bruce Johnson		1614	26	Water in abandon pits become waters of the state once The permit is terminated through Mine closure. Thus they must also meet All numerical or narrative standards. The state should not be left with contaminated sites that do not meet standards.	S	N
27184	Unique			PER	Carl Sack		1686	14	For these reasons I request the Minnesota Department of Natural Resources select the "No Action Alternative" and deny any mining permits to Polymet.	NS	X
29988	Form Letter	1	Variant	PER	Carol Iwata		2762	2	Polymet's financial backer and sole marketer Glencore has been implicated in environmental disasters, labor violations, and human rights abuses around the world.	NS	X
10364	Unique			PER	Claudia Egelhoff		685	3	Giving a permit to operate a risky mine to a financially shaky company would put Minnesota’s water and taxpayers in jeopardy.	NS	X
535	Unique			PER	Craig David		231	2	There is one reason we must not allow the mine to be built. That reason is the INDEFINITE TREATMENT OF WASTE WATER from the mining process. It is outrageous that the DNR, and the State of Minnesota, would even consider such a proposal. Human beings, if we look at their capabilities, will in no uncertain terms be unable to maintain toxic water treatment for 500 plus years.	NS	X
2816	Unique			PER	David Collins		351	1	Minnesota’s permitting process is cumbersome and unpredictable, and being exploited and further complicated by endless meddling from opponents to everything. Time to move the process forward in a timely and ordered manner and resolve this issue soon, hopefully it support of the project which seems to have proven its viability.	NS	X
25851	Unique			PER	David Franseen		1236	4	Notwithstanding these future permitting concerns, I support the issuance of a DA permit by the USACE, the land Exchange ROD, and the continuation of the MDNR’s considerations of the financial assurances; as the FEIS clearly meets the requirements of Minnesota Rules.	NS	X
25385	Form Letter	1	Variant	PER	David Witt		1162	4	I also support issuing all federal permits allowing PolyMet to utilize wetlands that help to preserve water quality.	NS	X
29164	Unique			PER	Deborah Huskins		3613	16	In addition, the diligent, independent regulatory oversight needed from our federal and state agencies must be ensured. Too often, we have experienced state agencies not able to fulfil their oversight responsibilities, for various reasons (lack of adequate resources, political pressure, press of other priorities, etc.). We also have seen a history of waivers or variances granted, avoidance of sanctions, and unwillingness to hold polluters to obey the law. The environment threatened by Polymet is too precious to risk anything less than full, diligent, attentive monitoring and follow-through by the agencies responsible.	NS	X
30753	Unique			PER	Dennis Good		2893	5	Under MN Rule 6132.3200, “To receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrological impact and the release of substances and is maintenance free”. I can’t see any of these conditions being met and judging by the comment letters I’ve read, neither can anyone else. Has this rule changed?	NS	X
27685	Unique			PER	Dennis Szymialis		1866	21	Why should we have to tolerate "evaluation criteria" that they created in the first place. Is every watershed available for contamination of "evaluation criteria."	S	O
27685	Unique			PER	Dennis Szymialis		1869	24	The MDNR that told us that the DEIS would protect us is going to be the agency that will be paid to monitor compliance.They will present us with test results that are self serving.	S	O

27685	Unique			PER	Dennis Szymialis		1876	28	Murder for hire with the public being forced to pay for it in the form of a secreted power rate agreement. Ifthis is such a good deal and if in fact the PolyMet (the NorthMet mine and plant site will hereafter simply referred to as PolyMet) project is actually in an economically viable deposit, the project should not need subsidy. There have been indications that PolyMet that in late 2004 was a dormant penny stock was resurrected as an insider scheme to enrich government officials and others. Present and past subsidies to PolyMet including public historical public ownership to allow PolyMet to avoid paying past property taxes, the Minnesota policy (which exists in no other state)to server mineral interests which devalues land and passes the tax burden of land ownership and cost of government services off on non-mining supported businesses, drilling subsidies paid for by the state of Minnesota, millions of dollars of public money not fully publicly disclosed by the IRRRB granted directly to PolyMet, the failure to adequately and in advance require financial assurance and the pollution subsidy which will destroy other valuable public resources and cause other businesses and the public to subsidize PolyMet with higher health care costs, the diminution or public recreational and tourism opportunities, etc, all contribute to a violation of the National Land Management Policy Act. St. Louis County alone has 940,000 acres of tax forfeited land, the shattering of the hopes and dreams of thousands of land owners, hundreds of them farm owners and business supporters of agriculture.	S	O
27685	Unique			PER	Dennis Szymialis		1877	29	This SDEIS conspires to violate the Weeks Act, Clean Water Act, Clean Air Act, and a number of other laws.	S	O
27685	Unique			PER	Dennis Szymialis		1878	30	The failure to utilize more costly measures to mitigate environmental degradation to attain cost savings on the basis that the project cannot proceed without these cost savings also calls into question the merit ofthe project under the National Land Management Policy. These include inadequate liners, the failure to utilize the underground mining alternative and a number of other measures including many failed to be disclosed by the SDEIS which violates due process legal notice requirements. It means nothing that PolyMet has paid themselves 22 million dollars or any amount to allegedly improve the DEIS. Http://lawreview.vermontlaw.edu/files/2012/02/flynn.pdf	S	O
27685	Unique			PER	Dennis Szymialis		1879	31	The PolyMet SDEIS does not even meet the old standard of deference to mining companies, see Flynn at p. 834 "The previous definition focused mostly on the needs of the mining company and whether the proposed mine operated in a "usual [and] customary" manner.110 The SDEIS does not require PolyMet to bolt, wire, and shotcrete the pit walls to inhibit the migration of water and pollutants in and out of the pit as was done by Kennicot at its Flambeau Mine. This would have an additional benefit if done simultaneously with mining of inhibiting the collapse of the pit wall of the type that occurred in Utah at a Kennicot Mine in 2012. It is more essential that it be done by PolyMet because of the weaker wet rock. I expressed this concern in my comments to the past PolyMet EIS and those concerns seem to have simply been dismissed and disregarded in the current SDEIS. The collapse of a pit wall would be welcomed by PolyMet as a justification for a mine expansion. The environmental ramifications of which would be extensive. The failure of PolyMet to bolt and shotcrete pit walls does not even follow "usual and customary" mine operating standards in the area. In the DE IS the EPA issued a finding of EU-3 (Environmentally Unsatisfactory- Inadequate Information).	S	O
27685	Unique			PER	Dennis Szymialis		1888	43	at applicable groundwater and surface water compliance points.p.3-59 -compliance limited to selective points is not compliance.	S	O
27685	Unique			PER	Dennis Szymialis		1999	154	plans for future efforts should not be allowed. these efforts depend on DNR or MPCA enforcement which, based on historical enforcement of environmental protections and laws should be expected not to occur. Furthermore, the agencies paid participation in The EIS process gives them a vested interest in its success, the failure of which they will have an inherent propensity to deny.	S	O
29969	Unique			PER	Don Brown		2730	1	1.Minnesota law is clear that clean up/reclamation after mining activity cannot be perpetual. It appears that the proposed post PolyMet mine cleanup would be perpetual under any common/reasonable understanding of that term. That is, the Final EIS does not and apparently cannot indicate when the proposed cleanup with end. Absent an end date, any proposed cleanup must be presumed to be perpetual. Moreover, it appears that the materials used in allegedly protecting the environment, eg., liner of the mine waste storage pit would need to last forever (perpetually) in order to protect the water resource. Similar concerns exist with respect to other processes (reverse osmosis) and materials such as containment pits. What proof is there that these processes and materials will last until cleanup is finished (perpetual)?	S	O
29972	Unique			PER	Don Brown		2735	1	1.Minnesota law is clear that clean up/reclamation after mining activity cannot be perpetual. 11015	Form Letter	1	Variant	PER	Donna Cannon		742	9	the U.S. Environmental Protection Agency veto and the U.S. Army Corps of Engineers deny any Section 404 permit that would allow PolyMet polluted discharge and wetlands destruction.	NS	X
12961	Unique			PER	Dorie Reisenweber		781	1	Attached are comments explaining why the Clean Water Act has been watered down and does not work to protect water from sulfide mining. It also explains that Minnesota laws and regulations should protect our water, but through various manipulations such as granting variances and permitting and irregular monitoring practices may not. The future depends on clean water.	NS	X
12961	Unique			PER	Dorie Reisenweber		784	4	Underground water is the common property of the people, not a private party or company. By law it must not be allowed to become contaminated whether within the party's or company's boundary, at the boundary or outside the boundary. All of Minnesota's ground- water is considered a public resource. Groundwater is not owned by the surface or by the mineral owner. Our state law does not say owners are allowed to pollute groundwater inside their property so long as it meets legal requirements at the property lines where agencies might monitor it. If that were so, what if a company bought lots of land and polluted the groundwater so that pollution would be less at the boundaries where it might be monitored? No agency should allow such an environmental crime within a property or at its borders to be perpetrated on future, or even current, users. Ground water is a public resource.	S	O
4314	Unique			PER	Ed Casper		328	1	It's time to get Polymet up and running. All concerns have been answered.	NS	X
27836	Unique			PER	Ellen Hawkins		2180	3	the Clean Water Act Section 404 permit should not be issued by U.S. Army Corps of Engineers or allowed by U.S. Environmental Protection Agency.	NS	X
27836	Unique			PER	Ellen Hawkins		2192	16	A Clean Water Act Section 404 permit should not be issued by U.S. Army Corps of Engineers or allowed by U.S. Environmental Protection Agency that would allow PolyMet to engage in an operation that would result in large scale destruction of wetlands and degradation of water resources.	NS	X
3143	Form Letter	1	Variant	PER	Eric Ament		362	3	The government is in place to protect the people....the majority. It is also in place to step in and make difficult decisions for the people and their well being. If laws need to be changed to protect the majority then we need to think about those. It shouldn't be as much about is this legal right now or not. Laws change. If a mine goes in and disrupts a population there is no going back. Yes, there are some short term economic gains. But we need to project our budget into the future and all I see is the majority of people paying for a small few people to get rich.	NS	X
26608	Form Letter	1	Variant	PER	Eric Snyder		1363	6	In conclusion, this mining permit process has caused me to fundamentally lose confidence in state officials and the integrity of our public institutions. The permitting process raises serious doubts as to whether the DNR and state officials have the interests of MN in mind, or whether, as happens all too often in our corrupted and failing democracy, private profiteers can overrule the best interests of environmental and public health.	NS	X
26608	Form Letter	1	Variant	PER	Eric Snyder		1364	7	I urge all government officials to reject the permit for the PolyMet mine.	NS	X
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	3976	32	Finally, the current design for the tailings basin does not meet the requirements of Minnesota Rule 6132.2200. Dry-stacking is an alternative made reasonable by virtue of the fact that it is the only way that this mine can comply with Minnesota law. This rule states: B. A reactive mine waste storage facility must be designed by professional engineers registered in Minnesota proficient in the design, construction, operation, and reclamation of facilities for the storage of reactive mine waste, to either: (1) modify the physical or chemical characteristics of the mine waste, or store it in an environment, such that the waste is no longer reactive; or (2) during construction to the extent practicable, and at closure, permanently prevent substantially all water from moving through or over the mine waste and provide for the collection and disposal of any remaining residual waters that drain from the mine waste in compliance with federal and state standards. Mine waste includes tailings.89 "Reactive mine waste" is defined as waste "that is shown through characterization studies to release substances that adversely impact natural resources."90 In other words, "reactive waste" is not limited to waste that creates acidic conditions. Heavy metals can leach from rock under many conditions, some of which do not involve a low pH; whenever those conditions result in a great enough release of metals to adversely affect natural resources, the rock is deemed "reactive." Thus the PolyMet tailings will be "reactive" even if they do not result in acid drainage, because they have been characterized (by PolyMet's modeling) to release (at a minimum) copper, nickel, lead, and arsenic at levels far above surface and/or groundwater quality standards.91 Rule 6132.2200(2)(B) provides two possible means of handling reactive mine waste after closure. Either the waste rock, tailings, and exposed rock must be left in such a way that they are not "reactive" (i.e., they no longer leach heavy metals), or the facilities must be closed in a way that "permanently prevent[s] substantially all water from moving through or over" them. Taken together, the import of the regulations is that nonferrous mine waste and mine pits must be closed in a way that does not result in a significant amount of water that will have to be treated before it can be discharged to the environment. The Statement of Need and Reasonableness for this rule makes it clear that the point of Rule 6132.2200(2)(B) was to preclude perpetual or long term water treatment as a closure option: [M]erely collecting contact water and treating it in order to meet water quality discharge standards, without a substantial effort to minimize the amount of water contacting the waste, has been rejected. While this method may provide acceptable results during active operations, when the permittee is present, the potential for long-term failure of such a system, when the operator is no longer available to correct the situation, is too great. Because of the necessity to provide a permanent solution to the water quality concerns related to reactive mine wastes, the two required methods of storing these wastes are the only reasonable methods currently available.92 The current plan for the tailings basin allows the tailings to remain reactive and allows a significant amount of water to move through the tailings. It thus does not meet the regulatory requirements. The Co-lead agencies should assess the dry stack alternative as the only suggested alternative that might meet the requirements of state law.	S	N

29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4005	57	While the DNR regulation (discussed above in the section on the Dry Stack Tailings Alternative) requiring either that the tailings be rendered nonreactive or that essentially all water be prevented from moving through the tailings175 is not mentioned in the FEIS, we would like to point out that the bentonite amendment strategy will not meet this requirement. As Dr. Malusis explains, the design proposed for the Flotation Tailings Basin does not sufficiently prevent the incursion of water. Indeed, it is designed to allow a fourth of the annual precipitation to percolate into and through the basin, and is likely to be even less effective than designed. Environmental Impact Statements must demonstrate compliance both with NEPA and with other environmental laws.176 The failure of the proposed project to meet regulatory requirements in this case is a good illustration of the wisdom of this NEPA requirement. No FEIS should be deemed adequate when it envisions an illegal outcome as a preferred alternative.	S	N
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4024	79	Our observation is that once a mine or a mineral processing plant is built in Minnesota, no branch of state government will require the company to do anything that it says it cannot afford. A case in point is Mesabi Nugget, which promised to build a water treatment system to address discharge problems within five years of startup. The plant was permitted and began operating, but when it came time to build the water treatment system, the company couldn't afford it, and ten years later continues to operate with a variance. Another is Reserve Mining, which promised on obtaining its permit to discharge tailings into Lake Superior that if the tailings did not settle on the lake bottom as expected, it would "take whatever action might be necessary to remedy those conditions." The length and complexity of the legal proceedings to force it to do so are legendary.	NS	X
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4029	81	Financial assurance is given as the answer to all questions. Moreover, Minnesota regulations require financial assurance only for planned remediation. We note that the mitigation measures proposed to address potential northward flow "would not be initially included in the financial assurance package, but, if required in the future, these measures would be added to the financial assurance package." But even if the need for the measures was established before mining ended, neither we nor the Co-Lead Agencies have any reason to believe that PolyMet would be able to afford the financial assurance when the need is discovered. At that point, the mine will be operating, and even the Great Lakes Compact is unlikely to require mitigation when the company says it will close rather than pay for such measures. It is also possible, even likely, that any northward flow will not be discovered until after PolyMet has ceased operations. Once the mine is no longer producing ore in twenty years, obtaining any sort of financial assurance will be impossible because PolyMet will not have a source of revenue.	S	N
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4030	82	PolyMet has to promise to keep its pit water from flowing toward the Rainy River, because according to the terms of the Great Lakes Compact, it could not otherwise be permitted. The Great Lakes Compact prohibits diversions of water out of the Great Lakes basin for anything other than public water supply. There is no minimum volume on this prohibition; another section of the Compact indicates that volumes as low as 5.7 gallons are included. The Co-Lead Agencies need to take a realistic look at the proposed mitigation measures, PolyMet's financial situation, and the very foreseeable risk that a diversion of Great Lakes water will result from permitting this mine.	S	N
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4036	98	If the Co-Lead Agencies are saying that assessment of groundwater quality impacts at the property line is standard practice for DNR and MPCA for projects in Minnesota, we do not believe that there has ever been another industrial or mining project permitted in the state of Minnesota with comparable predicted impacts to groundwater. Sulfide mining is unique, and new to Minnesota. The "typical" approach is entirely inadequate for this atypical project. And in any event, an approach does not necessarily meet regulatory requirements just because that is the way it has been done in the past. Whatever MPCA's practice is in permitting discharges to groundwater, that practice does not provide a limit on the impacts that must be discussed in an EIS. There is no valid reason for treating impacts to groundwater any differently than impacts to surface water (including wetlands), wildlife, and other public resources found within the boundaries of a proposed private industrial site.	S	O
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4043	103	Furthermore, non-mechanical treatment will not meet the goal of maintenance-free closure. To repeat the Executive Summary: "Both mechanical and non-mechanical treatment would require periodic maintenance and monitoring activities for as long as treatment is required."245 While less intensive or less frequent maintenance might be required for a non-mechanical system, in some respects this could add to the potential that failures and problems would go undetected. In any event, representing that non-mechanical treatment would meet the maintenance-free goal of the regulations is simply false.	S	O
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4058	120	As explained in our comments on the SDEIS, in the absence of site-specific data the wetlands at both the mine and plant sites must be considered to already violate the water quality standard for mercury. The FEIS includes a prediction that a certain number of acres of wetlands may suffer water quality impacts due to groundwater transport and air deposition. Mercury from the project will enter the wetlands from both sources, contributing to water quality standard exceedances in violation of the Clean Water Act. PolyMet's attempts to avoid the law by refusing to model or otherwise provide scientifically defensible estimates of releases of mercury (to both wetlands and streams) or other solutes (to wetlands) should not be countenanced by regulatory agencies. The Co-Lead Agencies' willingness to adopt PolyMet's position does not do justice to the people of Minnesota, who expect to see our environmental laws respected and enforced.	S	O
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4059	121	We recognize that the amount of mercury in this case is small compared to the mass of mercury circling the globe and coming down in precipitation, but we do not agree that this makes it insignificant. Mercury in the environment is a serious public health issue, especially in Northeastern Minnesota. It is a cumulative problem; the mercury load to any particular water body comes from thousands of sources. When the Great Lakes Initiative (GLI) was adopted, it was with the recognition that drastic measures were needed to address this issue, and a complete prohibition was placed on new or increased discharges of mercury to any water body in the Lake Superior basin, including the Embarrass River. The mining industry might find it inconvenient, but the decision was made after a lengthy process with extensive public input, and that public now expects the law to be followed. This is Co-Lead Agencies' clear duty.	S	O
29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4060	122	In Minnesota the prohibition on new or increased mercury discharges extends to wetlands through the application of water quality standard regulations. This is particularly appropriate in regards to mercury, because wetlands play such a significant role in producing methylmercury, which in turn makes fish unsafe to eat.	S	O

29745	Unique			PER	Erin Mittag	Minnesota Center for Environmental Advocacy	4083	146	17.2.4 The FEIS fails to explain how the proposed mitigation complies with the law. As stated above, state and federal law requires mitigation for lost or degraded wetland functions when those effects cannot first be avoided. PolyMet currently proposes to mitigate only direct impacts to site wetlands and proposes to mitigate the majority of those negative effects outside of the Lake Superior watershed. The only explanation for why the Co-Lead Agencies believe this is acceptable is because mitigation sites were “difficult to find” within the watershed. This runs counter to the Friends’ and MCEA’s own expert analysis ³¹² and the FEIS fails to provide adequate detail for the public to understand and judge whether rejection of certain sites was proper. Further, even if it is true that there are no acceptable mitigation sites within the watershed, there is nothing in the law that then excuses PolyMet from application of the avoid and mitigate requirements. If the impacts cannot be avoided, they must be mitigated. If they cannot be mitigated they cannot be allowed. The Co-Lead Agencies’ position in the FEIS appears to be that the law is only a strong suggestion or guidance, to be complied with if to do so is relatively easy. This approach would render the law meaningless and that is outside the Co-Lead Agencies’ authority. The apparent lack of mitigation opportunities within the watershed further raises questions with respect to PolyMet and the Co-Lead Agencies’ failure to address expected indirect impacts (discussed above) now, before the impact occurs. Again, that is not compliant with the temporal requirements for mitigation in the law and the FEIS provides no explanation for how the Co-Lead Agencies think it might be. Further, it highlights the fact that mitigating for likely future indirect impacts will be difficult within the bounds of the law. If the Co-Lead Agencies properly require mitigation for the entirety of indirect effects to the Hundred Mile Swamp functions and for expected indirect effects given what is already known about flow between PolyMet’s east pit and Northshore, thousands more acres of wetland must be mitigated. If the Co-Lead Agencies already know that mitigation sites are severely limited, moving forward and allowing impacts nonetheless is irresponsible and not compliant with the law. As MCEA states in the SDEIS comments, thousands of acres of wetlands may be affected with no potential mitigation option identified much less provided before the effects occur. In addition to the out-of-watershed and temporal violations inherent in the current approach, the FEIS pays lip service to mitigating functions lost, but it provides no real discussion of how PolyMet will in fact “mitigate” or “restore” coniferous bog wetlands, and in particular how PolyMet will recreate a groundwater-fed fen. The suggestion of as much borders on ridiculous. The scientific literature is replete with statements about how it is nearly impossible to mitigate bogs, how it has rarely (if ever, depending on how success is defined) been done successfully, and that therefore, damage to these wetland types should always be avoided. The Conservation Organizations are unaware of any example of a fen being mitigated. And the FEIS appears to recognize this when it continues to talk about “targets” for mitigation ³¹⁴ admitting that if the coniferous bog and swamp restoration is unsuccessful then targets will simply be readjusted to be whatever PolyMet actually comes up with in the mitigation effort. The so-called targets concept does not comply with the law’s requirement to fully replace lost functions and is in fact more of a “moving target” for mitigation. Finally, given the out-of-watershed proposal and obvious difficulty with actually mitigating the functions that will be destroyed within a timeframe wherein those functions will actually be replaced, the FEIS provides a somewhat incoherent discussion of mitigation ratios. At some level the FEIS provides for 2:1 but then engages in lengthy speculation regarding reducing those ratios to 1:1. The charts showing mitigation acres actually show that coniferous bog will not be mitigation on a 1:1 basis; it appears that PolyMet will rely on coniferous swamp at their Aitkin site for some of those acres, a failure to meet the mitigation requirements of replacing full function. The Co-Lead Agencies must require 2:1 as the minimum replacement ratio for all wetland effects from the PolyMet project. There is no scientific, legal, or factual support for anything less.	S	O
28547	Unique			PER	Esteban Chiriboga	GLIFWC	3510	10	Throughout the FEIS, the co-Lead agencies state that they expect the proposed project to meet all applicable water quality standards. This expectation is based on modeling and GLIFWC does not believe that the modeling is robust enough to support such a statement. However, even assuming that the modeling accurately represents the real future of the project, it is illogical to assume that standards will be met because the modeling assumes effective operation of water capture and treatment facilities in perpetuity. As stated above, the idea that water treatment plants will operate for hundreds of years is not believable. Therefore, the statement that water quality standards will be met is also not believable.	NS	X
12727	Unique			PER	F Jeff Verito		769	5	Also of concern is your own publicized information, including the “potential for wetland fragmentation, changes in hydrology, changes in stream flow and wetland water quality due to atmospheric deposition of dust and rail car spillage.” To have the company monitor the wetlands is to put wolves in charge of the chicken coop. An independent agency that operates in the public interest (not the MDNR) needs to oversee the consequences of such development.	NS	X
27678	Unique			PER	Faye Topliff		1841	4	What right does PolyMet have to bring toxic ruin to our Lake Superior, plus the other Great Lakes? Consider the other states and Canada among those to be devastated, yet have no vote to protect themselves and their environments.	NS	X
29229	Unique			PER	Gail C. Roberts		3615	3	1. It is stated in the FEIS that the underground mining alternative was ruled out because PolyMet could not afford the cost of developing an underground mine. It appears that rather than incurring the cost of an underground mine, PolyMet and associates are being allowed to claim they can provide high remediation costs in perpetuity rather than investing money in developing a mining project that would have reduced environmental impact in the first place. Long-term monitoring and remediation require considerable financial assurance for the State of Minnesota and likely an amount beyond the resources and capabilities of PolyMet and associates to provide. The untapped mineral resources of Minnesota should remain intact until such time as more well-tested methods of mining and containment of acid-mine waste are available. During that time market forces may change so that underground mining of the known mineral deposits will become economically feasible and be safer for the environment in the long run.	NS	X
29229	Unique			PER	Gail C. Roberts		3622	12	SO01 and SO02 – The thematic responses to my comments about economic impacts (18040, 18060, 18598, 18599) address only a “best case scenario” and assume that mitigation measures are going to work perfectly all of the time. The long-term impact on the BWCA if contaminated water enters an aquifer flowing north (as in the recent GLIFWIC analysis of water flow) and the subsequent socio-economic impact on tourism and recreation can not be easily dismissed and should be studied further.	S	N
25403	Unique			PER	Gary Anderson		1179	1	I do not believe copper-nickel mining can be done safely in the water rich environment of northern Minnesota. Until safe mining practices are proven- I urge the DNR to deny mining permits.	NS	X
27824	Unique			PER	George Klumpke		2157	4	I urge you to accept this FEIS as submitted and continue forward with the permitting process.	NS	X
27661	Unique			PER	Gerard Snyder		1808	2	According to its public filings with the U.S. Securities and Exchange Commission, PolyMet is a Canadian corporation with a 34-year history that includes "no history of producing minerals," "no mining operations of any kind," and "no operating history upon which an evaluation of (its) future success or failure can be made." [Form 20-F at 9.]	NS	X
6433	Unique			PER	Hans Olsen		489	4	The bad news is that the Cooperating Agencies seem poised to approve this FEIS and move on to the permitting process and are content to accept no as the final answer on the following specific environmental issues which were repeatedly and strongly raised in the 53,000 public comments on the PolyMet SDEIS. Commissioner Landwehr has as much said so.	NS	X
6433	Unique			PER	Hans Olsen		492	7	In my opinion if this stands and the permitting process is allowed to proceed without addressing this contingency, that will constitute a failure to exercise due diligence in the exercise of the fiduciary responsibilities of the principals in the relevant Cooperating Agencies.. This is a serious and substantive omission and a sad day indeed. I'll go further and say, in my friendliest tone of voice, that If this were the FEIS for the Twin Metals project in the Kawishiwi drainage, it would be taken as a declaration of war.	NS	X
29738	Unique			PER	Harold Edwards		2602	3	As things stand today, chances are that Governor Dayton will approve the project. He will cherry pick best case scenarios of “good” mining practices to justify his decision. Notwithstanding the fact that there is a report in today’s news on the catastrophic effects a mine dam breach in Brazil: http://www.latimes.com/world/brazil/la-fg-brazil-spill-20151220-story.html Dayton will probably argue that that is Brazil. Here in America, in Minnesota, we do better.	NS	X
29738	Unique			PER	Harold Edwards		2603	4	Polymet promises badly needed jobs and tax revenues for Minnesota. What governor wants to refuse that let alone have the courage to do so? If Dayton turns the project down, he will kick the can down the road and leave the decision to someone else.	NS	X
402	Unique			PER	Ian Andrus		195	1	I think it is completely unreasonable for the State of Minnesota to approve a mining operation that will in the end leave a polluted site that will need treatment for 500 years. The future is unknown and it would be foolish to assume we will be able to maintain a water treatment program that long. Once it's polluted there is no going back. As a resident of northern Minnesota, clean water is one of the things I value most and is becoming more a more rare. I also think that we should be monitoring pollution on the site not the boundaries.	NS	X
27432	Unique			PER	Jack Buck		1744	4	In your honest opinion, how sound are hard rock mining practices? The peer review of a study conducted in 2006 explained, "It is clear that the hardrock mining companies and perhaps the regulatory agencies overseeing them did not adequately emphasize environmental aspects during mine planning and mining operations" (Atkins et al. 4)..	NS	X
19	Unique			PER	Jack Parker		62	5	Go back to your computers and drawing boards and show us what you have to offer. And you Tom, defender of the land, show us how you are going to ensure a satisfactory future for the environment, locally and downstream. I know you cannot do that.	NS	X
7393	Form Letter	4	Variant	PER	Jane Beattie		544	11	Please comply with all environmental laws and do not let the min result in environmental damage.	NS	X

15169	Unique			PER	Jason George	International Union of Operating Engineers Local 49	2925	4	The time for discussing the EIS is over, it is now time to move forward to the permitting process. We believe the science is clear, and that this project can be built safely. We also believe that during the permitting process, financial assurances will be worked out that sufficiently protect Minnesota taxpayers. There will be no logical or scientific reason why this project should not ultimately be approved.	NS	X
27686	Unique			PER	Jason McCall		2070	2	We have regulations now that are not enforced. The fines are pennies on the dollar and probably all fines, fees, and penalties are totally tax deductible.	NS	X
27883	Unique			PER	Jay Newcomb		2215	5	These omissions violate current laws and endanger the health of Minnesotans.	NS	X
27785	Unique			PER	Jenny Gamer		2140	2	furthermore why would we trust the company Glencore, that has such a terrible record?	NS	X
27785	Unique			PER	Jenny Gamer		2141	3	And if we agree to risk our land and water why would we do so to benefit companies and people who are far away and won't have to live with the consequences?	NS	X
27691	Unique			PER	Jessica Diamond		2085	2	As has been exhaustively documented, PolyMet lacks experience operating a mine. Approval of this application would set a terrible precedent, opening the door to other mining companies that similarly want to mine near the Boundary Waters Wilderness area. Individually and collectively, this type of mining in this region is a terrible prospect.	NS	X
23917	Form Letter	1	Variant	PER	Jim Steitz		974	6	DNR must also incorporate a realistic cumulative risk assessment over the time span that wastewater treatment will be required. The risk increases proportionally to the total time horizon of the project, and environmental impact assessments of mines frequently fail to appreciate the increasing cumulative likelihood of an event that may be unlikely at any one moment in time.	S	N
27687	Unique			PER	John Finnegan		2076	5	I have no faith in the DNR being the lead agency in this EIS statement. I hope this project is denied the permit to mine.	NS	X
29272	Form Letter	1	Variant	PER	John Helland		2479	1	I do not think our great state, which highly values our supreme natural resources, should permit a company that has never opened or operated a mine to proceed with copper sulfide mining that not only is a potential threat to two worldwide iconic water bodies, but also is a toxic threat to the health of Minnesota citizens	NS	X
30068	Unique			PER	John Herbst		2792	1	My comment is this: If pilot studies, i.e. ongoing experimental methods both unproven and undocumented over the long-term (up to 500 years or more), are to be used to replace proven technology (mechanical treatment), what agencies or governmental bodies will be the judge of these new, unfounded and unproven (over the long-term) non-mechanical water treatment methods?	S	N
30027	Unique			PER	Jon Auel		2773	1	I believe Minnesota should require a higher standard and demand actual proof BEFORE issuing any mining permits.	NS	X
25944	Unique			PER	Joseph Loisel		1246	2	It will be much more environmentally sound than the foreign companies that are producing similar products with little or no concern of sound environmental practices.	NS	X
26225	Unique			PER	Kaitlin Seiberlich		1292	9	The PolyMet mine is not a self-contained entity. Instead, it is largely funded by the Swiss company Glencore. Glencore has several staff members with dubious reputations that should make people reconsider the project in general. The company itself was founded by Marc Rich, and the company has gone on to be implicated in environmental disasters, human rights scandals, and labor violations. Many people are wondering why this company has been allowed to move forward with destructive procedures like mining after being founded by a man with less-than-pleasant motivations. Marc Rich was pardoned by President Bill Clinton after bribing officials in countries like Nigeria, and assisting Mossad, the Israeli intelligence agency. That pardon was a very controversial decision, one that was done without consulting the U.S. Attorney General or the U.S. Attorney who prosecuted him. However, this is not the only questionable person behind Glencore. The other man, who is a little more current to the times is Tony Hayward, the current Chairman of the Board of Directors at Glencore. He was in charge when the Deepwater Horizon oil rig spilled 4.9 million barrels of oil into the Gulf of Mexico. The fact that other companies are willing to allow him to Chair their Boards is a statement that environmental consequences are beginning to take the backseat to greed.	NS	X
26225	Unique			PER	Kaitlin Seiberlich		1293	10	If you add in the fact that PolyMet is a new company that has never actually opened a mine, is proposing to open a mine both near and in sensitive wetlands, and the techniques it is proposing to mine with have never been tested off paper, it seems to be a recipe for disaster. Historically, sulfide mining has not been a clean process, resulting in massive amounts of environmental pollution, and in many cases, this was when the mines were not located near delicate ecosystems, pristine wilderness, and massive bodies of water. PolyMet insists that it is capable of overcoming that stigma, but I believe we should be doubtful. One of the more recent examples occurred in the US: the Brohm Mine in South Dakota accidentally produced acid mine drainage, one of the side-effects of which was turning a nearby stream more acidic than lemon-juice. The company in charge of the mine ended up going bankrupt. Only 1/8 of the clean-up costs were paid by the company because of the bankruptcy. The rest of the clean-up was paid for by American taxpayers. If the PolyMet mine were to end up polluting the surrounding wetlands and other ecosystems, it would have to be fully responsible for paying for the clean-up, no matter how long or intensive the process. I would also like to point out that just because a company can, does not mean they should. Just because PolyMet has proven they can meet pollution standards on paper, does not mean they will be able to do so in action. Just because PolyMet is capable of creating 620 acres of mining area and removing just over 88 million pounds of copper, nickel, cobalt, and precious metals from those mines, does not mean that it is the best course of action. Instead of focusing on the importance of unspoiled wilderness areas or clean water sources, people are being blinded by greed and desire to become the first to tap untouched natural resources. Human greed is blinding common sense, and I implore you to reconsider allowing this mine to be established.	NS	X
29809	Unique			PER	Karen Williams		2636	1	The track record of sulfide mining puts surface and ground water at risk. Therefore, human health impacts, wildlife, fish and other aquatic life, wild life, and other living things are also at risk.	NS	X
29809	Unique			PER	Karen Williams		2644	9	It is obvious that copper sulfide mining should not be permitted in the Land of 10,000 Lakes without a perfect guarantee that ALL water quality standards can be met during mine operation and in perpetuity after closure. This guarantee is impossible so PolyMet as well as any other sulfide mines cannot be allowed.	NS	X
26393	Unique			PER	Kathleen A. Anton		1305	1	After learning what these mining projects do to our environment and our rivers, I feel it is imperative to reject this mining proposal for the health and safety of the environment and rivers. Especially when a company has a bad environmental record at its past projects.	NS	X
29514	Unique			PER	Kathleen Miller		2541	7	5. DNR variances: If permitted, this company should NOT be allowed any variances of metal or discharge levels to be approved by the DNR - PERIOD!! They say they have the technology - if it doesn't work, they need to shut down until they get it right and can prove it.	NS	X
29399	Unique			PER	Kenneth Westlake	USEPA	3805	7	Recommendation 3: Any contingency mitigation measures implemented in a permit must include measurable and enforceable outcome-based requirements. The permit applicant should also be required to demonstrate that the proposed contingency mitigation measures will be an effective means to return the project to compliance should noncompliance occur.	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29399	Unique			PER	Kenneth Westlake	USEPA	3807	8	The potential for water transfer from the Lake Superior watershed to the Rainy River watershed needs to be further evaluated and addressed. Recommendation 4: Potential inter-basin water transfers should be quantified. Interbasin transfers from the Great Lakes watershed are subject to approval under the Great Lakes-St. Lawrence River Basin Water Resources Compact.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3810	6	Recommendation 2: A robust and sufficient monitoring program should begin as soon as possible to establish adequate baseline data that help to identify pollutant migration pathways in a timely manner and can detect a potential northward flow. Monitoring data should be collected and analyzed before any major grading or excavation of soils or conveyance or pumping of water is carried out at the site for any purpose other than to install monitoring equipment.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3827	2	In our PFEIS comment letter, we recommended that the FEIS analyze and assess the impacts of implementing the proposed contingency mitigation measures. The FEIS includes basic qualitative estimates and presents a general description of the proposed contingency mitigation measures in Section 5.2.2.3.5. This is adequate for purposes of the FEIS. However, further impact assessment is needed during the permitting process, including information on water quality and quantity impacts that may occur as a result of a northward flow path and/or contingency mitigation measures.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3828	3	In addition, limited site-specific data is currently available to assess the potential for a northward flow path, and to design effective contingency mitigation measures should northward flow occur. The permitting agencies have proposed to begin routine groundwater monitoring when active operations begin. EPA continues to recommend that the permitting agencies collect and analyze additional site-specific data during the permitting review process as the project design is being further developed. It appears that technology is currently available to implement contingency mitigation measures. However, the selection of any measures determined to be necessary must be informed by data that sufficiently support refining their design and assessing their impacts in the context of the project as a whole (e.g., by determining the rate of downward water leakage at the One Hundred Mile Swamp).	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3829	4	Recommendation I: Given the possibility of a northward flow path, analyses of environmental impacts associated with this possibility should be conducted and evaluated during the permitting process. These analyses should include anticipated direct and indirect environmental impacts that may occur if one or more of the proposed contingency mitigation measures are implemented.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3830	5	We understand that the monitoring program outlined in the FEIS will be refined and implemented in greater detail during the permitting process. We share the goal of the permitting agencies to ensure that pollutant migration from the site and impacts to surface waters are minimized and meet the requirements of the CWA. We also want to ensure that a robust monitoring program is put in place to identify pollutant migration pathways in a timely manner, so that permitting and contingency mitigation-related decisions can be made as quickly and effectively as possible. To this end, the following points and recommendations related to monitoring and the contingency mitigation measures should be addressed during the permitting process to inform permit decisions: 1. The trigger(s) for implementing contingency mitigation measures should be defined. 2. Because each contingency mitigation measure, if implemented, would result in other impacts to the project and/or to the environment, each measure requires additional study before approval. 3. In the event that the requirement for one or more contingency measures is triggered, time will be required for additional study, permitting, planning, design and construction. This possibility should be considered in further project development to avoid or minimize any period of noncompliance before such measures are in place.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3831	9	A comprehensive surface water/groundwater monitoring and modeling approach would satisfy the requirements of various permit programs by evaluating the hydrology and pollutant migration from the site during all phases of the project (construction, mining and post-mining). This could avoid duplication by enabling use of the same sampling points for various purposes during further project design and permitting. It would also provide PolyMet with a full understanding of the monitoring that will be expected during the project to meet various permit requirements. We strongly encourage the permitting agencies for this project to involve a specialized expert who can inform the permitting agencies' review of this comprehensive monitoring and modeling approach. Any such review should consider the influence of other nearby mining operations (such as NorthShore's PMP). It should also establish a process that provides for refinement of modeling as additional data become available, and adjustments to the monitoring regime when necessary. Recommendation 5: The permitting agencies should involve a specialized expert to inform the permitting agencies' review of a comprehensive monitoring and modeling program at the Mine Site. Infom1ation gathered through such a program should inform permitting conditions and requirements.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3832	10	Recommendation 6: EPA also recommends initiating a community environmental monitoring program as part of further project development. This would provide ongoing information about the project's environmental performance to the community, including assessments of water quality and quantity near the NorthMet site.2	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3833	11	In addition, EPA would like to continue our constructive engagement with the permitting agencies going forward. Recommendation 7: EPA recommends that we continue to engage in a close dialogue with the permitting agencies about the details of modeling, monitoring, and project design (including contingency mitigation measures), as relevant to project construction and permitting decisions. EPA will seek expert input as needed to support this process.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3834	12	The FEIS describes the proposed compensatory mitigation for direct wetland impacts and wetland fragmentation impacts. This mitigation includes wetland restoration, upland buffer, and wetland preservation. Two of the wetland mitigation sites are outside of the St Louis River Watershed and include some out-of-kind wetland replacement. Greater credit ratios are required for out-of-kind and out-of-watershed compensatory mitigation. Based on the credit ratios outlined in the FEIS, if performance standards are met, the three sites would provide sufficient mitigation for direct impacts (Table 5.2.3-17).	S	O
29399	Unique			PER	Kenneth Westlake	USEPA	3835	13	The FEIS identifies uncertainties in estimating the extent of indirect wetland impacts (pp. 5-257 - 5-260). EPA agrees with the FEIS' statement that an indirect impact monitoring plan, adaptive management plan, and a plan to provide compensatory mitigation are needed to assess and mitigate for indirect wetland impacts if the project moves forward. The descriptions of indirect impact monitoring, adaptive management, and compensatory mitigation within the FEIS should be further developed during the permitting process to sufficiently assess, avoid, minimize, and compensate for indirect impacts to wetlands.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3836	14	Recommendation 8: EPA recommends that the Corps require PolyMet to establish additional wetland monitoring sites, develop a detailed impact assessment method, and plan for the contingency of additional indirect wetland loss as part of an adaptive management strategy that identifies sufficient wetland mitigation opportunities and compensates for all indirect impacts. This could be incorporated into the comprehensive plan called for in Recommendation 5. Because of the importance of these indirect impact plans and any permit conditions outlining them, EPA requests an opportunity to review the Corps' final permit evaluation and draft CW A Section 404 permit - including the indirect and direct wetland impact monitoring, adaptive management, and mitigation plans - in order to assess compliance with the CW A Section 404 Guidelines before permit issuance.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3837	15	The FEIS notes the current lack of scientific consensus regarding health risks associated with exposure to non-asbestiform varieties of amphibole minerals; and an "ongoing effort" to develop the "scientific tools and expertise" to establish health-based standards for these mineral fibers (p. 5-515). Part of this ongoing effort is a study currently undergoing peer review, which examines the relative cancer potency of various elongated mineral particles based on dose characterization data collected at EPA's Duluth laboratory between 1978 and 1986. Recommendation 9: To address uncertainties regarding health risks, the permitting agencies should consider this research and any further credible scientific evidence that becomes available during the permitting process. The most current scientific understanding of health risks should continue to be considered as appropriate in project design and implementation, in order to minimize worker and public health risks related to mineral fibers. EPA will provide this study and other relevant research it identifies to all agencies with relevant permitting responsibilities.	S	N
29399	Unique			PER	Kenneth Westlake	USEPA	3838	16	Recommendation I 0: During the permitting process, the permitting agencies should require avoidance or minimization strategies that reduce impacts to moose to the greatest extent possible. Examples may include avoiding wetland impacts, preserving known wildlife corridors, and constructing appropriately-placed wildlife crossings at new and existing roads and railroads. Constructing one or more wildlife crossings along the roads and railroads within the project area should be considered as a strategy to reduce collisions between vehicles and wildlife.	S	N
27616	Unique			PER	Kobilka Bradley		1784	2	They support the Prove it First Law adopted by the state of Wisconsin and would like to see that law put into effect before any land is mined.	NS	X
27721	Unique			PER	Kris Wegerson		2117	9	Water would need to be treated indefinitely from the mine and plant sites. This is in violation of Minnesota mining laws which prohibit mines from being permitted that require perpetual water treatment. Indefinite water treatment is unlawful and inadequate.	NS	X

29850	Form Letter	1	Variant	PER	Kyle Lind		2670	3	All across the nation in environmental studies class rooms, and natural resource agency headquarters Minnesota is looked to as a leader in natural resource science and conservation. As my friend and ecological mentor in Montana always says "Minnesota is ten years ahead on environmental issues". That is because we care about our natural inheritance. In 2008 Minnesotan's voted overwhelmingly for the Clean Water, Land and Legacy Amendment. The Legacy Amendment is the largest state conservation measure taken in US history. It only happened because Minnesotans, even during a recession and economic crisis, voted to raise their own taxes to protect the things that make our state unique and special. Not only do we care enough about our natural inheritance to back it up with increased taxes during hard economic times, we understand that a clean and healthy environment is a fundamental driver of our economy.	NS	X
29850	Form Letter	1	Variant	PER	Kyle Lind		2671	4	Minnesotan's are smart, countless studies name Minnesota as one of the smartest and healthiest states in the entire nation. Hard rock mining for copper nickel in sulfide bearing rocks utilizing techniques that have proven over, and over, and over again to fail to protect the environment as laid out in countless environmental impact statements is a kick in the face to all Minnesotan's. As Minnesotan's we demand responsible use of our natural resources, and projects that protect our cherished and valuable natural heritage.	NS	X
29850	Form Letter	1	Variant	PER	Kyle Lind		2680	11	Approving this FEIS and the general mine plan as currently drafted is the biggest mistake any politician, or public representative could ever make if they want to see a vibrant hard rock copper nickel mining industry in North East Minnesota. Just ask Canyon Resources a Colorado Based Mining Company that wants to open an open pit hard rock (Sulfide) gold mine in Montana's Blackfoot River Watershed. Unlike Minnesota, Montana has a long history of hard rock (sulfide) mining for copper and the environmental legacy has been devastating, thus Montanan's (who are generally pretty pro industry) passed a ballot initiative in 1998 I-137 banning all hard rock mining-in this case cyanide leach mining- which exposes sulfide bearing rocks just like the kind found at Poly Met to air and water, resulting in acid mine runoff, and leaching of things like arsenic.	NS	X
29850	Form Letter	1	Variant	PER	Kyle Lind		2681	12	Minnesotan's like Montanan's will not hesitate to ban copper nickel hard rock mining. All they need is a little push. Many of us are already skeptics -note 98% of the 58,000 comments submitted to the lead agencies for Poly Met's DEIS were opposed to this project as currently drafted, or completely no matter how it is drafted. The Poly Met North Met project as currently proposed and the economic, environmental, and health legacy it leaves will give us that push, I guarantee it! That is not good for anyone, and Iron Rangers for whom this mine is being billed as a sort of salvation will be hit the hardest.	NS	X
29850	Form Letter	1	Variant	PER	Kyle Lind		2683	14	While I am adamantly opposed to the Poly Met North Met Project as proposed, and though am severely disappointed at the inadequacy of the lead agencies FEIS- and their dismissal of so many of the public's, the tribes, and the environmental organizations concerns, I do realize that there is a strong possibility that this Mine Plan and FEIS will be deemed adequate by people whose vision is blinded by the industries false promises, and their own desires to reign in a new era of prosperity to the Range despite all signs pointing to this being a sad new era in Minnesota's environmental legacy. Therefor, I would like to end the personalized segment of this message by discussing Financial Assurances. Based on what has happened, or is happening, at other Sulfide bearing Hard Rock mines throughout the world, such as the Gilt Edge Mine in South Dakota, Mount Polley in Britttish Columbia, the EPA disaster in Colorado, numerous mines in Montana like those at Butte, and at Lac Du Flambeau in Wisconsin among many others, I know that not only do these mines pollute continuously, and indefinitely. I also know that these mines and the systems put in place to protect the environment from them commonly fail catastrophically. Therefore, I feel very strongly that if our elected and appointed officials in Minnesota and at the Federal level do approve this FEIS and the necessary permits for this or any other Hard Rock copper nickel mine Minnesotan's deserve at the very least strong financial assurance from Poly Met and it's backers that Poly Met is going to foot the bill to clean up the mess, not Minnesotan's or federal tax payers via the Super Fund Site option. History tells us that \$500,000,000 five-hundred million dollars is not at all an unreasonable level of financial assurance to demand from Poly Met or any other similar project. The tax payers are sick and tired of the rampant corporate welfare taking place in this state and the country in general. Furthermore, if Poly Met is unwilling to provide adequate financial assurances of at least \$500 million then clearly they are not serious about protecting Minnesota tax payers and our environment.	NS	X
27688	Unique			PER	Laura Gauger		3263	10	Because of the predicted flows of contaminated groundwater from the PolyMet project site toward streams within and beyond the PolyMet property boundary AND because of the potential flow of contaminated surface waters from man-made ponds (non-mechanical water treatment systems) that PolyMet hopes to construct at the project site in the future, mechanisms need to be in place to insure proper enforcement of the federal Clean Water Act. Yet, some of the most basic information needed by state and federal agencies and the public to facilitate the prosecution of potential violations of the Clean Water Act at the PolyMet site is not included in the FEIS. First off, the FEIS fails to designate which waters within or near the PolyMet project site are deemed "navigable" and therefore waters of the United States subject to protections under the federal Clean Water Act. This designation proved crucial in a recent Clean Water Act case waged against the owner of the Flambeau Mine in Wisconsin. I was one of the plaintiffs in that case. If the stream of concern (a tributary of the Flambeau River known as Stream-C on company drawings) had not been designated "navigable" in the Flambeau EIS, the case would have had greater difficulty moving forward in federal court, and it would have been near impossible to try to hold the company accountable for polluting the tributary (which is now on the EPA's impaired waters list due to copper and zinc toxicity linked to the Flambeau Mine operation). It turns out that even with Stream-C having been designated "navigable" in the Flambeau EIS, the courts failed to award the stream the normal protections guaranteed under the Clean Water Act. But at least we had a shot at it. So how does this factor into the PolyMet discussion? As stated above, the PolyMet FEIS does NOT list which of the streams and creeks or other bodies of water at or near the PolyMet project site are "navigable" and therefore waters of the United States guaranteed protection under the Clean Water Act. This is clearly an error of omission and must be corrected if there is any hope of holding PolyMet accountable for the potential impairment of small but nevertheless navigable waters in the vicinity of the project. In addition, once the navigable waters have been identified, the PolyMet FEIS must provide baseline water quality data for each and every one of them in order for the FEIS to be deemed adequate. In the Flambeau case cited above, baseline water quality data for Stream C was missing from the Flambeau EIS, and, even though the headwaters of the stream were within a few feet of where the high-sulfur waste rock was stockpiled during operations and only a thousand feet or so from where the ore was crushed and loaded onto rail cars, the company would not concede in court that the elevated copper levels in the stream were caused by the mine operation. In turn, this made it more difficult to hold the company accountable for violations of the Clean Water Act. The failure of the PolyMet FEIS to identify any and all navigable waters at or near the project site AND to provide baseline water quality data for them is a set-up for similar enforcement problems in Minnesota.	S	N
27688	Unique			PER	Laura Gauger		3265	12	Nor does the FEIS comment on whether or not Second Creek is considered "navigable." The absence of this information in the FEIS will make it more difficult to hold PolyMet accountable, in a court of law, for potential problems that may arise in Second Creek as a result of the mining operation. The same can be said of other navigable waters at or near the PolyMet project site. The State of Minnesota and general public need to know which waters at or near the PolyMet site are "navigable" and what the baseline water quality is for each and every one of them if there is to be any hope of enforcing the Clean Water Act. The failure of the FEIS to provide this crucial information renders the document inadequate.	S	N
27689	Unique			PER	Lea Foushee	North American Water Office	3104	12	Destroying any wild rice waterway is a direct treat to the survival of those who rely on rice. NorthMet opens the doorway to additional mining interests that will put even more wild rice lakes at risk. NAWO requested an illustrative map be created by the Minnesota Pollution Control Agency to provide a visual of the 30 mines waiting and the wild rice lakes surrounding them. We have attached this document. Eliminating the food that sustains the Anishinaabeg must be considered an act of environmental racism. Those that are harmed the most by this proposal are the Anishinaabeg.	NS	X
23643	Unique			PER	LeRoger Lind	Save Lake Superior Association	2932	1	Despite the huge volume of information included in the Final Environmental Impact Statement for the PolyMet NorthMet Mine Project in Northeastern Minnesota the project would continue to violate state and federal environmental and other laws as described herein	NS	X
20	Unique			PER	Linda Simmons		64	2	This seems like the wrong way to take care of our planet and create jobs. Please don't let this happen here. I am 66 years old and have been going to the boundary waters for 30 years. My husband and I enjoy the beauty of our 10,000 lakes and want our grandchildren to have the same opportunity.	NS	X
29740	Unique			PER	Lori Andresen	Save Our Sky Blue Waters et. al.	3908	23	The FEIS leaves a protected pollution zone on mine property, which encompasses surface and ground water that is publically owned. Water monitoring begins on the mining company boundaries. This is inadequate and allows for dilution of pollution as a mitigation plan, yet allows for the degradation of public waters.	NS	X
29370	Unique			PER	Lori Olinger		2517	2	How can the DNR ensure that PolyMet meets the required standards for construction and water seepage? I think an independent group should be involved in monitoring construction and in monitoring for water quality. PolyMet should monitor but should not be the only group involved in monitoring.	NS	X
29370	Unique			PER	Lori Olinger		2519	4	there are legacy water quality issues from taconite basins and the risk for the copper tailings is greater than taconite tailings. If the DNR has not enforced standards for taconite basins, how can the public be assured that they will enforce standards for the much riskier copper tailings basins?	NS	X

¹ Issue - the table for reference is on the tab "Codes, Terms and Definitions"
² Response ID - the table for reference is on the tab "Codes, Terms and Definitions"

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
29370	Unique			PER	Lori Olinger		2520	5	A multi-year study conducted by the Univ of MN was conducted to evaluate the current sulfate standards for wild rice. The results of the study confirmed the current standard. However the MPCA decided to conduct a Peer Review and an additional 3 week lab testing. The proposal to change in the wild rice standards as a result of the lab testing seems too hasty and the timing and results are suspiciously coincidentally to the benefit of the PolyMet proposal.	NS	X
9792	Unique			PER	Lori Rumpf		635	4	In addition, no [Clean Water Act Section 404] permit should be issued for the proposed mine because it would degrade groundwater and surface water. There is no plan to compensate for the thousands of acres of impact to high quality wetlands, and there has been no meaningful consideration of alternatives that would reduce harm to wetlands and water quality.	NS	X
27021	Unique			PER	Lyndon Nurm		1629	2	We would also recommend or hope the state would have a 'BIG STICK' to use in a timely manner if things appear to be going wrong. No monkeying around, just shut it down. Sure hope that is not how it works out.	NS	X
27186	Unique			PER	Lynn Bottge		1691	3	The major financial backer of the project, Glencore, has a history of mining pollution. Our current State Agencies like the MDNR and the MPCA have a poor record of monitoring pollution from existing mining in our area and an even poorer record of enforcing existing regulations such as the wild rice standard for sulfites in our waters and Mercury emissions standards in our air.	NS	X
26648	Unique			PER	Margaret A. Redmond		1392	2	The concept of having to treat water from 200-500 years is, de facto, a commitment to operating a sophisticated mechanical system "in perpetuity." a. Is this not illegal under state law—ie, placing faith and trust in something "in perpetuity"	NS	X
26648	Unique			PER	Margaret A. Redmond		1396	6	Thus, the FEIS acceptance of this reliance on corporate maintenance of complicated technology appears to be pure fantasy in a document which should require the most hard-headed reality-based thinking. This is not a "defer consideration to the permitting phase" issue.	S	O
26648	Unique			PER	Margaret A. Redmond		1403	13	8. The parent company of PolyMet, the foreign-owned Glencore, has had complaints about its mines polluting waters in many countries on different continents. Interestingly, one of its Directors is Tony Hayward, head of BP during the tragic Gulf Oil spill in 2010. Did anyone there look at this company's record via Google? It's not at all good... This does not lead to confidence in the company's trustworthiness nor good will; rather, any Glencore/PolyMet enterprise should be incredibly closely planned for, set up and monitored—rather than having so many blank spots in the FEIS that seem to be dependent on the good will of the applicants.	NS	X
29737	Unique			PER	Mark Kaprelian		2584	2	The NorthMet Mining Project is the only significant project in PolyMet's portfolio and its only significant source of potential future revenue; The success of the Project depends in large part on the price of copper, which has been falling since 2011 and is likely to be exposed to continued downward pressure from seasoned, low cost producers; and PolyMet is thinly capitalized, with significant amounts of assets that could be impaired if the price of copper remains depressed or if the Project is otherwise unsuccessful.	S	O
29737	Unique			PER	Mark Kaprelian		2589	5	There are good reasons to believe that PolyMet in fact will not continue in operation, and may even cease to be a going concern, in the event of a prolonged downturn in copper prices. Not the least of these reasons are PolyMet's own statements to this effect. For example, in its public financial disclosures, PolyMet states: Because the price of metals fluctuate, if the prices of metals in our ore body decrease below a specified level, it may no longer be profitable to develop our NorthMet Project for those metals and we will cease operations...If the prices of copper, nickel, cobalt, platinum, palladium and gold are, for a substantial period, below our foreseeable costs of production, we could cease operations. Project. Ifwe are unable to raise such additional funds, we will have to suspend or cease operations...Ifwe cannot raise the money necessary to continue to explore and develop our property, we will have to suspend or cease operations...We have had no production history and we do not know if we will generate revenues in the future...While we were incorporated in 1981, we have no history of producing minerals. We have not developed or operated any mines and we have no operating history upon which an evaluation of our future success or failure can be made. We currently have no mining operations of any kind We may not successfully establish mining operations or profitably produce metals at any of our properties. As such, we do not know if we will ever generate revenues...We have a history of losses, which we expect will continue for the future. If we do not begin to generate revenues we may either have to suspend or cease operations. We will need to raise sufficient funds to meet our current obligations as well as fund ongoing development, capital expenditures and administration expenses, in accordance with our spending plans for the next year. While in the past the Company has been successful in closing financing greements with Glencore AG, a wholly owned subsidiary of Glencore plc (together "Glencore") and other parties, there can be no assurance it will be able to do so again in the future. PolyMet Mining Corp, January 31,2015 Form 20-F at 7-9.	S	O
12	Unique			PER	Mark Roalson		28	2	That particular set of equipment is NOT running at the present time, although it is supposed to be in operation. There have been several documented aquatic life kills in the Dunka watershed and Birch Lake into which it drains. Contractors "monitor" this drainage but there is no enforcement of the water standards. This tells me that the DNR, EPA, MPCA and any other governmental agency chartered to prevent water pollution is incapable of doing this. Enforcement is non-existent. Cleveland Cliffs is only charged with "monitoring", not treatment. What assurance does the public have that this will not happen again with PolyMet? None.	NS	X
265	Unique			PER	Mark Roalson		163	1	1. The engineering firm that will be the lead for PolyMet Copper Nickel Mine to design and build its tailings dikes was also the designer for the failed Mt. Polley Imperial Metals Copper-Gold Mine of British Columbia, Canada. This mine burst its dikes in August of 2014, releasing tons of sulfates and heavy and other metals into the local watershed. Knight-Piesold Engineering claimed that their firm warned Imperial Metals that they had already put too much sediment and water into the ponds, and their warning was ignored. The mine also had logged 5 major violations from the Province of British Columbia. They. too, had warned the mine to correct its operations, but obviously it did not. What assurance is there that our own regulatory agencies are going to put teeth into its authority?	NS	X
265	Unique			PER	Mark Roalson		164	2	2. There is a tradition of allowing a variance in effluent from taconite mines here already when it comes to the sulfate standard. Taconite dikes here already leak. How is that going to be mitigated by PolyMet, especially if they are going to re-use the abandoned dikes for their new load of waste. Who is going to be responsible for actually enforcing these regulations? The leaking Dunka Pit has no water purification equipment running as per stated in law. No one is enforcing regulations there. The public has no assurance that any of the regulatory agencies "in charge" will do what they are charged to do at PolyMet, if they cannot enforce what is already on the books.	NS	X
29963	Unique			PER	Martin Cooney		4221	2	However, if the DNR decides that PolyMet's application merits a Permit to Mine it must ensure that the precedents it establishes in connection with the conservatism and prudence of the design, oversight, and enforcement of the financial assurance requirement are rock-solid and impervious to political pressure and the instinct to accommodate the Permittee.	NS	X
29963	Unique			PER	Martin Cooney		4223	7	The Financial Assurance Amount Must be Reviewed By Completely Independent Financial and Engineering Experts The Minnesota Administrative Rules 5 provide that the permittee, PolyMet in this case, shall submit an estimate of the components of the financial assurance amount to the DNR commissioner as part of an annual report on the project. Estimating the sufficiency of the financial assurance amount, including funds for unplanned contingencies involves two fundamentally different activities. After the commissioner establishes the objectives required to comply with the Permit to Mine, the first process is to assess the necessary material handling, construction, and mining costs required to achieve these goals. This assessment will ultimately drive the amount and timing of the expenditures. The second process entails determining the timing and amount of the delivery of the financial assurance funds. This must be conducted by finance professionals, expert in the application of financial mathematics to problems of this nature. They should be retained and supervised by the commissioner and selected on the basis of fitness for the task. These experts should be free of any connection with the mining industry, PolyMet, or its affiliates, or any other relationship that could suggest a conflict of interest. The DNR must make every effort to ensure that their choice of experts cannot be criticized for a real or imagined conflict of interest, as occurred with the selection of Crowell and Moring by the Governor's Office to defend the State against potential lawsuits pending the decision on PolyMet's permit application as reported by the Star Tribune in early December, 2015.	S	N

29963	Unique			PER	Martin Cooney		4224	4	1. Formally Incorporate the Financial Assurance Detail into the EIS Process In its online Financial Assurance Fact Sheet1, PolyMet states that “It is not typical for financial assurance to be included in an EIS as it is in the PolyMet environmental review.” If this is the case, this is a deficiency in Minnesota’s EIS process. The DNR should make financial assurance a mandatory component of all future draft and final EISs. Doing so will ensure that the “purpose and requirement of financial assurance, including the rules and criteria that would be used in determining financial assurance and the risk analysis involved, as well as how [an applicant] would calculate financial assurance during the permitting process”2would be clearly specified for the benefit of the applicant and rigorous public review. The number of public comments complaining of the lack of detail in connection with all aspects of the financial assurance requirement, as described in the draft environmental impact statement (“DEIS”) is evidence of the need for this modification in the EIS process. The FEIS refers all comments on the DEIS’s financial assurance section to Section 3.2.2.4 in the FEIS. This section consists of “available detail” related to financial assurance, which does not begin to provide sufficient detail on the specifics of the financial assurance to permit informed comment. As it stands right now, financial assurance remains a “black box” to the Minnesota public. The FEIS states that “additional details on the cost estimates and calculations that would be required for the project would be addressed during permitting”. These additional details are critical. Given the importance of the financial assurance to safeguard the taxpayer, the DNR must assure the public that the permitting process will be transparent enough to allow for thoughtful public comment on PolyMet’s financial assurance requirements prior to the finalization of the permit, if the DNR is disposed to grant the permit. Financial assurance is the taxpayer’s most important insurance policy against natural disaster, incompetence, malfeasance, negligence, and plain bad luck in connection with this mining venture.	S	O
29963	Unique			PER	Martin Cooney		4225	5	2. Make the Financial Assurance Detail for the PolyMet Permit Available for Public Review and Comment Prior to Completion of the Permitting Process PolyMet is the first of many sulfide mining permit applications pending for consideration by the DNR. The DNR should establish a public review of each project’s financial assurance details as standard operating procedure for every permit. The PolyMet application, as first in line, is setting precedent for future non-ferrous mining applications. Both the DNR and PolyMet are assuring the public that the detail will be addressed in the permitting process that follows completion of the FEIS. To satisfy the public interest in this crucial piece of the mining permit application, details of the plans for PolyMet’s and all other non-ferrous mining venture’s financial assurance should be available for public review and comment prior to the finalization of each Permit to Mine. The publicly available detail should include: ? detailed scope of costs covered; ? the methodology and assumptions employed in the financial calculations; ? the minimum standard for publicly available credit ratings of any bank, insurance company, surety, financial instrument, or other component of the financial assurance fund; ? provisions for the termination, (if any) and/or replacement of the component instruments or sureties of the financial assurance; ? detail on the timing and amounts of contributions to and withdrawals from the financial assurance fund; and, ? ongoing participation of qualified financial advisors on matters of increases or reductions of the amount of financial assurance stemming from the annual review. Given the risk of extensive environmental damage to the State and the track record of financial irresponsibility of similar sulfide mining ventures in the past elsewhere, the public is putting more stock in the availability of bulletproof financial assurance to clean up a potential environmental mess than in PolyMet’s ability to police itself, or the DNR’s ability to effectively oversee this project given the project’s scope and the DNR’s lack of institutional experience in regulating and monitoring sulfide mining operations.	S	O
29963	Unique			PER	Martin Cooney		4226	6	3. The Financial Assurance Amount Must Include Provisions for Unanticipated Corrective Actions The purpose of financial assurance is to eliminate the risk that the Minnesota taxpayer will ever be required to pay the bill for environmental damage caused by the PolyMet mining operation, a for-profit venture. The residents of the Iron Range certainly do not want to be held solely responsible for the cost of cleaning up an environmental mess even though they would benefit directly from PolyMet’s activities. Neither should the Minnesota taxpayer at large have to pay for cleaning up a mess stemming from activities that benefitted the Iron Range directly. These financial assurance rules are the only insurance that the Minnesota taxpayer has that these costs will be borne by the mining venture and not the taxpayer. The Minnesota Administrative Rules related to financial assurance3 require the Applicant (PolyMet) to annually adjust its financial assurance amount, reflecting all the risks entailed in the mining operation at that point, and to report these estimates to the DNR in its Annual Report. These reported cost estimates include: ? The Contingency Reclamation Cost Estimate, which is intended to cover the cost of closure and post closure activities associated with an orderly wind-up of the mining operation within one year, including the ongoing expenses of limiting environmental damage from the residue of twenty-years of sulfide mining for an indeterminate period – estimated to be as short as 200 years, or as long as forever; and, ? The Corrective Action Cost Estimates, which include the estimated cost of implementing corrective actions of known deficiencies in compliance with the permit. The Corrective Action Cost Estimates, should include not only the cost of implementing corrective actions of known deficiencies, but also make provisions for the costs of correcting and mitigating the environmental damage associated with the plausible failure scenarios that the DNR must certainly have considered in the formulation and evaluation of the EIS and other facets of the permit application. Diligent monitoring of the mining operation would be expected to include the identification of, and costing out of, potential accidents or material failures of the processes and structures that are put in place to mitigate environmental damage. While it is not possible to know with certainty what the cost of one or more potential serious system failures may be, it should be possible to develop a probabilistic estimate of the correct addition to the financial assurance Corrective Action Cost Estimates that will consider the frequency and magnitude of plausible failure scenarios identified by the DNR. The purpose of securing financial assurance in advance of planned or potential expenditures is to ensure that the projector’s funds4 are available to protect the State’s taxpayers at all times, even in the face of a PolyMet bankruptcy. If the financial assurance amount only includes funds in an amount equal to expected costs, unexpected or unplanned contingencies would likely exhaust the financial assurance fund and expose the taxpayer, thus frustrating the legislature’s intent. To be effective, the financial assurance amount must cover estimated costs of planned corrective activities; an orderly wind-up of the mining operation; and, the cost of correcting and cleaning up the environmental damage caused by one or more plausible, but unanticipated, failures at the mining site. The financial assurance amount must also assume that PolyMet will be unable, and the parent company (Glencore plc) will be unwilling or unable, to make up any deficiencies in the financial assurance fund. Were this to happen, ant shortfalls would have to be covered by the taxpayer, which is precisely what the legislature and the DNR rulemaking process intended to avoid by requiring financial assurance. Anything less than a financial assurance amount included for unanticipated contingencies will be insufficient.	S	N
29963	Unique			PER	Martin Cooney		4230	8	Disclosure of the Details of the Financial Assurance Fund Requirement For Public Comment Must Clearly Explain the Gap Between PolyMet’s Estimated \$200 million Maximum and Estimates Produced by the Public Prior To a Final Decision on the Issuance of the Permit The lack of clarity in connection with the size of the financial assurance fund has generated a wide range of estimates. Not surprisingly, that of PolyMet is lower by half than many of those produced independently by advocates opposed to permitting the project. PolyMet estimates in Table 3.2-15 Preliminary Cost Estimate for Closure of the FEIS that the fund requirement for financial assurance to cover closure and reclamation will peak within a range of somewhere between \$160 and \$200 million in Year 11. This requirement is exclusive of the cost of treating the water for anywhere between 200 years and perpetuity (?!). PolyMet estimates the annual cost of this last requirement to be between \$3.5 and \$6 million per year. If these annual recurring costs are capitalized and added to the PolyMet estimate for closure and reclamation, the total estimated financial assurance amount still falls significantly short of the amount posited in an analysis prepared by Messrs. Sternal, Thometz, and Gappa employing PolyMet’s publicly disclosed information6. In their analysis, these finance professionals conservatively estimated the minimum financial assurance funding requirement at \$350 million. The DNR must find a way to publicly describe the essentials of its estimation methodology and publish a draft computation for a preliminary financial assurance requirement. This would include addressing obvious questions, for example: ? the length of time, post closing the mining facility, that the DNR assumes that polluted water must be filtered and monitored before it can be released; ? the methodology it employs to estimate the amount required for unplanned contingent costs; ? the discount rate and earnings credit applied to securities included in the fund; and, ? the assumptions related to the cost of financial assurance provided by third parties (banks and sureties) as these must come out of the fund earnings. Finally, if the DNR’s estimate of the required fund amount submitted for public comment diverges materially from the many plausible good faith estimates of the required fund amount by various environmental organizations and concerned citizens, it should be prepared to provide a generally accessible reconciliation between its preliminary calculation and these higher independent estimates. The release of this information must be done in such a way as to protect PolyMet’s essential confidential financial and engineering information. However, the principal objective is to allay the public’s suspicions and the criticisms that inevitably arise from a lack of transparency. A project of this import, touching upon jobs and the environment, must be absolutely above-board and free from the taint of double-dealing. Despite opposition on principle to sulfide mining in Minnesota, or specific perceived deficiencies of the project, opponents may feel that their concerns are mitigated if the DNR demonstrates unambiguously that the financial assurance amount is very conservatively estimated and that it is sufficient to meet the costs of any plausible unforeseen environmental catastrophe caused by PolyMet. This is a complex area that lends itself to easy obfuscation. The DNR should be mindful of this risk and exert itself to deliver this information clearly and transparently, including taking comments prior to the finalization of the financial assurance amount. 29963	Unique			PER	Martin Cooney		4231	9	6. The Financial Assurance Fund Must be Structured to Ensure Seamless Protection For Minnesota Taxpayers There are various risks associated with accepting anything but US government securities to fill the financial assurance fund. Alternatives to securities included in the financial assurance administrative rule are: A letter of credit ("LOC"), which is a promise by a commercial bank to pay the beneficiary (the State of Minnesota) if a clearly defined event occurs, such as PolyMet's failure to meet the terms of the permit. Banks, like corporate bonds, also subject the beneficiary to credit risk and, if they become insolvent, cannot meet their obligation to pay the State. A surety bond, which is very similar to a bank LOC, and bears many of the same risks, including the surety's inability to pay due to insolvency. In addition, conditions under which the State may call on a surety often present more execution risk than does drawing on a bank LOC; Basic types of financial risk inherent in a long-term financial assurance requirement: Credit risk: the credit quality of mortgage-backed, corporate, municipal, and state securities may fluctuate. Deteriorating credit quality adversely affects the market value (realizable price of the security if it must be liquidated by the commissioner) of the security because of increased risk of default; Interest Rate Risk: The market value of a fixed rate security, even a "risk-free" security like US Treasury bonds, can drop if market interest rates rise above the level they were at when the security was purchased. While not affecting the ultimate principal amount deliverable at maturity, interest rate risk does affect the value of the security if it must be liquidated prior to maturity. The longer the period to maturity, the greater the volatility in the security's value. Recent statements by the Federal Reserve suggest that interest rates are due for a gradual secular rise, meaning that it more likely than not that the value of fixed rate securities will be adversely affected over the foreseeable future. ? Rollover (replacement) risk: There is no rollover risk in a security as it converts to cash upon maturity. The security matures, but the cash paid at maturity remains in the fund until the moneys are reinvested. Protection continues. However, once a bank LOC or surety agreement expires, there is no funding event. The protection offered by these institutions simply ceases to exist. Without adequate safeguards, the State is vulnerable to PolyMet finding a replacement guarantor or failing to come up with the cash itself. Such replacement is occasionally unavailable, leaving the beneficiary exposed. The purpose of financial assurance is to avoid this risk altogether. Due to regulatory restrictions, bank LOCs and surety bonds are never issued in perpetuity. Bank LOCs are seldom issued for terms in excess of five years. PolyMet will tend to propose these instruments to the State because paying a fee to the bank or surety for a guarantee is significantly less expensive to than locking up funds in a low-risk/low-yield security, such as US Treasury bonds, for twenty years or more. The DNR must be mindful of the credit and rollover risk associated with third party guarantors. There are structuring options that permit a draw on the guarantees/LOCs if a replacement cannot be secured within a given period prior to expiration, or a the credit rating trigger that permits a draw on the guarantee if the guarantor's credit rating declines below a specified level. However, these arrangements must be entered into with the advice of financial professionals, with expertise not only the financial engineering, but drawing up legal documentation to ensure the objectives of the financial assurance are met. Guarantors will want to maximize their flexibility and PolyMet will want to minimize its cost. Both objectives work to the detriment of the taxpayers and their agent, the DNR. Retaining experienced independent advisors will compensate for the DNR's lack of experience in these matters.	S	N

28495	Unique			PER	Mary Heise		2310	5	Also, the timeline for necessary treatment and monitoring is unreasonable and is not in accordance with state law.	NS	X
365	Unique			PER	mary jane manion		180	1	I'm just someone's grandmother but I have enough sense to know that if it is imperative to contain mine waste for 500 years to get rid of the toxicity then it should never be started because we can't control what happens in 50 years, let alone 500 years.	NS	X
28483	Unique			PER	Mary Slattery		2277	2	The post mine closure plan contradicts state law (closure and post closure maintenance "the mining area shall be closed so that it..... is maintenance free"). Even if this law is broken, we have no guarantee that Polymet will be around 500 years to clean up a possible leak.	NS	X
27066	Unique			PER	Matthew Miltich		1643	2	For state institutions with the public trust as their highest priorities, seriously to consider the project at this time is itself something like a betrayal of public trust.	NS	X
26997	Unique			PER	Maureen Johnson		1531	10	The DEIS noted that residue composition of this experimental process at an operational scale might differ from laboratory and small-scale pilot tests. (Id.) Certainly, since the hydrometallurgical processing liquid was not produced and/or analyzed, this will be new information during operations that PolyMet has not made public. PolyMet has avoided like the plague providing the public with any significant information about this waste liquid and its changes over time due to the natrojarosite decomposition that may or may not be inhibited by lime or limestone addition. This uncertainty should require the HRF to be designed as a hazardous waste facility in every aspect of the federal and state rules that apply.	S	O
26997	Unique			PER	Maureen Johnson		1534	13	The PolyMet FEIS does not include a requirement that the HRF obtain a permit as a hazardous waste facility. Neither does the FEIS contain any analysis of whether the HRF should be treated as a facility for storing hazardous wastes. This is because they have not piloted waste production for analysis. This analysis is long overdue. The Minnesota Pollution Control Agency (MPCA) has the delegated authority to enforce Resource Conservation and Recovery Act (RCRA) regulations in Minnesota. No generator can treat, store, or dispose of hazardous wastes in Minnesota without a hazardous wastes facility permit. Minn. R. 7045.0211, subp. 1; Minn. R. 7001.0520, subp. 1.	S	O
26997	Unique			PER	Maureen Johnson		1535	14	FEIS Theme HAZ 02 response states: "Minnesota Rules, part 7045.0120, subpart 1.1 provides exemption to waste from extraction, beneficiation, and processing of ores and minerals in regard to storage, labeling, transportation, treatment, processing and disposal." Theme PD17 and other locations submit that "Mining wastes associated with extraction, beneficiation, and processing of ores and minerals are typically excluded from the RCRA definition of hazardous waste by regulatory definition." These FEIS responses do not clarify, as the referenced hazardous waste exclusion in the Regulation does, that only 20 processes are specifically identified as exempt from hazardous waste rules, and any other processing wastes are subject to Hazardous Waste rules. The precious metals and PGE hydrometallurgical processing wastes are not listed as exempt and are not exempt from hazardous waste rules. processing; I read the rule to say PolyMet's process shown on FEIS Figure 3.2-26 is not exempt from hazardous waste rules.	S	O
26997	Unique			PER	Maureen Johnson		1542	21	If the Coal Ash Landfill is moved into the HRF, the action must comply with new coal ash landfill regulations under Subtitle D, Solid Waste, explained at http://www2.epa.gov/coalash/coal-ash-basics .	S	O
26997	Unique			PER	Maureen Johnson		1553	29	With a facility this large that does not have sufficient toxicity information on all of the wastes it will contain until they are produced -- after the facility is constructed, the FEIS should clarify that the facility be designed and built as a hazardous waste facility and managed accordingly until the wastes analyses are completed. Minnesota rules ensure that a facility issued a hazardous waste permit or a state disposal system permit will be properly inspected and maintained and that long-term closure will reduce the risks that caustic or toxic wastes will be released. There is no such assurance for the HRF.	S	O
26997	Unique			PER	Maureen Johnson		1558	34	The FEIS must be revised to provide a rigorous analysis of whether the HRF wastes or any part of them are hazardous wastes under Minnesota law, requiring issuance of a hazardous waste disposal permit.	S	O
26997	Unique			PER	Maureen Johnson		1559	35	• The FEIS must be revised to reject any location for the HRF on top of wetlands, compressed peat, slimes or unconsolidated materials, and to reject any location on top of faults or fractures, unless detailed hydrologic analysis has demonstrated lack of hydraulic conductivity to shallow groundwater.	S	O
26997	Unique			PER	Maureen Johnson		1560	36	• The FEIS must be revised to conclude that the location for the HRF in the PolyMet proposed action is unacceptable.	S	O
26997	Unique			PER	Maureen Johnson		1567	45	CLASS 4A IRRIGATION standards On the discharger's argument about no irrigation exists -- EX. Response to Theme AQ 14 does not even acknowledge violations of irrigation standards. The current rule, 7050.0140, Subp. 5. Class 4 waters, "...all waters of the state that are or may be used for any agricultural purposes..." [italics are mine],.... These definitions literally (1) provide for future agricultural purpose where capable in the present, (2) indicate present agricultural use is not a requirement as a basis for the implementation of the standard, and (3) prevent uses that would subvert future agricultural purposes.	S	N
26997	Unique			PER	Maureen Johnson		1569	47	Theme Response WR039 does not address my comments #16678 about allowing contamination to progress to property boundaries. The response discusses the presence of wells near to property boundaries. My comments discuss compliance with Minn. R. 7060 which does not allow contamination of ground water at all. So all potential sources (HRF, waste water storage/equalization ponds, waste rock piles, other containment with liners, FTB containment system, any existing ground water contamination, pits) must be monitored to be discovered and mitigated at the source to achieve the most practical capture when and where the pollution is concentrated and not dispersed to the property boundary where capture becomes nearly impossible.	S	O
26997	Unique			PER	Maureen Johnson		1571	49	FEIS p. 5-447. 5.2.5.2.3, Open Water end. states, "Surface water quality standards do not apply to the pit lake or Tailings Basin." The FEIS should explain the how ground water discharging to surface waters of the US when filling the pit becomes a waste water that is no longer governed by surface water regulations unless it overflows.	S	O
26997	Unique			PER	Maureen Johnson		1572	50	40 CFR. § 122.4(i) prohibits the net increase of any pollutant that will cause or contribute to a numeric or narrative water quality standard violation. 40 CFR. § 122.44(d) requires effluent limits in permits to ensure discharges do not cause, have a reasonable potential to cause, or contribute to the violation of a numeric or narrative water quality standard. The Theme PER 09 Response pushes narrative standards compliance off to permitting, but narrative standards should not be ignored in the FEIS.	S	O
26997	Unique			PER	Maureen Johnson		1574	52	This response, FEIS PER 23, ap. 2569, about variances and available state tools being effective for compliance, should be clarified and completed with: State tools include choosing not to enforce, not including effluent limits in the permit so there is nothing to enforce, giving repeated variances allowing discharge of pollution that can cause loss of sensitive aquatic species populations in violation of narrative standards that are also not enforced, allowing partial caps instead of complete caps on wasterock piles resulting in partial pollution reductions, and minimal studies, penalties and action when the public requests enforcement. All these tools result in "compliance" with the permit -- but not with the standards and rules. The effectiveness of all these tools are demonstrated by the Dunka Mine Duluth Complex wasterock NPDES permit history. This utterly failed permit and other lax mining permits are the reasons I encourage MPCA not to use the above tools, rather, MPCA should require everything that the FEIS says in the NPDES/SDS/stormwater permit, more detailed parameters than proposed, and detailed source monitoring to assure compliance with every regulation and rule, more than the FEIS has proposed.	S	O
