26997	Unique			PER	Maureen Johnson		1577	55	No estimate has been made of the damage that would occur if PolyMet reneges and asks for variances (which MPCA has been very liberal about giving out).	S	O
27405	Unique			PER	Melanie Peterson-Nafziger		1710	2	The PolyMet mining company does not have a history of environmental and corporate responsibility with a mine of this size. Its affiliated corporation Glencore has a devastatingly negative record of corporate responsibility, requiring a presidential pardon for the founder to escape responsibility for his past environmental disasters and negligence. This sulfide-mining industry has a track record of escaping long-term corporate accountability through bankruptcy and other manipulative maneuvers. Promises made in the EIS do not assure Minnesotans of any long-term commitment to the disaster this mine would create.	NS	X
27660	Unique			PER	Michael Levings		1806	6	Any inspections to pollution control methods under existing law can only be carried out after the fact "IE. The DNR can not shut them down until pollution is found outside their operational jurisdiction" and (they are acquiring vast land holdings).	NS	X
27671	Unique			PER	Michael Youngquist		1827	2	Actions speak louder than words – PolyMet says they can work this mine and protect the environment, but they have been proven wrong where ever they have operated.	NS	X
27460	Form Letter	1	Variant	PER	Mike Maleska		1752	2	Potential copper-nickel mining ventures seem to get extra attention any time the economy gets rattled or the iron ore industry staggers. It is at exactly these times in our mining history that people become vulnerable to the temptation to tolerate the weakening of environmental regulations. Add that to the economic enticements of mining exploitation and you have created the opportunity for an disaster like nothing Minnesota has ever before experienced.	NS	X
N/A	Form Letter Template	4	Non-Variant	PER	Multiple	Center for Biological Diversity	FL28	6	no Clean Water Act Section 404 permit should be issued for the proposed mine because the mine would degrade groundwater and surface water, there is no plan to adequately compensate for the thousands of acres of direct and indirect impacts to high quality wetlands, and there has been no meaningful consideration of alternatives that would reduce harm to wetlands and water quality.	NS	X
N/A	Form Letter Template	1	Non-Variant	PER	Multiple	Mining Truth/Conservation Minnesota/Water Legacy/MEP	FL4	4	The PolyMet FEIS is inadequate under federal and state laws and regulations because: - It fails to evaluate pollution risks to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure.	NS	X
24759	Unique			PER	Nancy Aronson Norr MP	Jobs For Minnesotans	2954	4	Based on my review and the level of detail included in the FEIS, it is clear the document meets all state and national environmental requirements.	NS	X
8645	Unique			PER	Neil Simonson		595	2	With Minnesota's expertise we can insure that we can monitor the process just fine.	NS	X
29871	Unique			PER	Niki Roussopoulos Geisler		2689	3	we urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 3. Mining companies must leave the site maintenance free (in accordance with existing MN mining rules)	NS	X
27575	Unique			PER	Pamela and Alexandra Thompson		1775	2	Do we kid ourselves into thinking that the directors of Polymet (with Glencore/BP's Tony Hayward at its head) care about our long-term pollution? They will never live here, never invest positive time and energy in our communities except where that investment begets enormous stockholder money. They won't buy a house here, come to school board meetings, help renovate the church parish hall...	NS	X
29263	Unique			PER	Pat Hawkinson		2472	8	Will this mine have a community watchdog group, funded by the company seeking to mine, like the underground Michigan mine visited in your boss's "due diligence"? Seems fair considering how much more massive the scale of this less similar open pit mine, and the water intensive environment, is in this case.	NS	X
27085	Unique			PER	Paula Maccabee	Water Legacy	3092	84	WaterLegacy would also emphasize that monitoring does not prevent pollution of surface or groundwater. Minnesota has a long history of monitoring pollution from mining facilities, including those that have gone into bankruptcy, leaving a legacy of contamination. In order to prevent irreparable harm to wetlands and water quality, environmental risks of a proposed mining project must be rigorously analyzed, publicly disclosed and mitigated before a project is permitted.	NS	X
27085	Unique			PER	Paula Maccabee	Water Legacy	3097	137	WaterLegacy's comments on the SDEIS referenced EPA's research, A Field-Based Aquatic Life Benchmark for Conductivity in Central Appalachian Streams,30 which set a benchmark conductivity level for Appalachian streams at 300 microSiemens per centimeter (µS/cm). Since the SDEIS, chemist Bruce Johnson and biologist Maureen Johnson, both former regulators for Minnesota and federal government agencies, have produced a report, An Evaluation of a Field-Based Aquatic Life Benchmark for Specific Conductance (hereinafter "Conductivity Evaluation"), attached as Exhibit 16. Specific conductivity is regulated in Minnesota's numeric water quality standards to permit use for irrigation with a limit of 1000 micromhos per centimeter ("µmhos/cm" and "µS/cm" are equivalent) applicable to waters and wetlands. Minn. R. 7050.0224, subp. 2, subp. 4. Aquatic life are also protected from pollutants, including specific conductivity, by Minnesota narrative standards that prevent degradation of Class 2 waters and require that "lower aquatic biota" upon which fish depend not be seriously impaired or altered materially. Minn. R. 7050.0150, subp. 3. Minnesota rules apply to aquatic life a test of toxic pollution similar to the XC95% benchmark used in the EPA Benchmark Conductivity Study, which used the 5th centile of a species sensitivity distribution (SSD) as the benchmark value to determine what conductivity level is considered to be "associated with significant biological degradation."31 Minnesota rules protect the aquatic community from toxic effects, defined to mean "the protection of no less than 95% of all the species in any aquatic community." Minn. R. 7050.0217, subp. 1, 2. The Conductivity Evaluation applied the methods used by the EPA to develop a specific conductance aquatic life benchmark for Appalachian ecoregions to recommend specific conductance aquatic life protections for three ecoregions in Northeast Minnesota, including the areas that would be affected by the NorthMet project. The Conductivity Evaluation analyzed baseline water chemistry and benthic invertebrate data from the Minnesota Regional Copper- Nickel Study32 and concluded that regional similarities in streams order, unimpacted water chemistry, and populations of benthic invertebrates allowed application to Northeast Minnesota ecoregions the methods used by the EPA to determine a 300 µS/cm specific conductivity benchmark for Appalachian ecoregions. (Conductivity Evaluation, Exhibit 16, pp. 8-14, Table 1). The Conductivity Evaluation used data from taconite mining facilities, including the Dunka Mine, where Duluth Complex rock was removed in order to mine the underlying deposit, to demonstrate that both mine-related seepage and passive wetland treatment have resulted in elevated levels of specific conductivity, often exceeding even Minnesota's numeric irrigation standard of 1,000 µS/cm. (Id., pp. 14-19). After reviewing testing methods and pollution tolerances of Minnesota benthic invertebrates (Id., pp. 20-24), the Conductivity Evaluation analyzed of the impacts of mining-related specific conductivity on impairments of benthic invertebrates in receiving and downstream waters, include the St. Louis River. (Id., pp. 24-41). Based on the EPA Conductivity Benchmark Study and Minnesota data on baseline and impacted conditions, the Conductivity Evaluation concluded: 1) EPA protocols to set a limit for specific conductivity to protect aquatic life are applicable to Northeast Minnesota surface waters; 2) The median specific conductivity level in all Minnesota Copper-Nickel Study samples (including impacted streams) was 68 µS/cm, so background unimpacted conductivity in this region would be less than 68 µS/cm; 3) Existing data from identified Minnesota ecoregions demonstrate impacts on invertebrate genera from elevated specific conductance in mining impacted waters; and 4) In the Minnesota ecoregions discussed in the Evaluation "discharge of specific conductance above the level of 300 µS/cm, established as guidance for Appalachian streams is highly likely to result in extirpation of 5% or more of invertebrate genera." Thus, "Such discharge should be prohibited under Minnesota narrative standards preventing degradation and toxic pollution." (Id., p. 42). In order to protect aquatic life, the Conductivity Evaluation recommended applying the 300 µS/cm aquatic life benchmark for Minnesota discharges in the ecoregions reviewed, pending further analysis to determine if a more stringent limit is needed. (Id.)	S	N
27085	Unique			PER	Paula Maccabee	Water Legacy	3120	118	We then focus on the inadequacy of the FEIS' assessment of the NorthMet project's indirect effects on wetlands. At the end of Section II, supra, discussing project mine site impacts, WaterLegacy requested independent water modeling. Such independent water modeling could be used to quantify indirect impacts on wetlands. In the alternative, since it is the only quantification of wetlands drawdown impacts in this record, the Co-Lead Agencies should accept GLIFWC's analysis of mine site impacts to wetlands for purposes of alternatives analysis, wetlands mitigation and permitting.	NS	X
27085	Unique			PER	Paula Maccabee	Water Legacy	3126	113	Neither the FEIS nor the Residue Management Plan address the difference between the HRF proposal and modern landfill siting and performance. Modern landfills, on which the optimistic expectations of HRF leakage performance are based, cannot be sited on locations like the one proposed in the PolyMet NorthMet FEIS. As summarized on the EPA's website, municipal solid waste landfills must comply with the federal regulations in 40 C.F.R. § 258 (Subtitle D of RCRA), or equivalent state regulations. Federal standards for solid waste landfills include: "Location restrictions—ensure that landfills are built in suitable geological areas away from faults, wetlands, flood plains, or other restricted areas."27 Minnesota law similarly precludes the siting of either a hazardous or a solid waste facility in a wetland or in a location where the topography, geology, hydrology or soil is unsuitable for the protection of the ground water and the surface water. Minn. R. 7045.0460, Subp. 2, Minn. R. 7035.1600. The FEIS and supporting documents demonstrate that the proposed HRF is an unsuitable location for either a hazardous or an industrial waste landfill. The HRF would be located on approximately 36.1 acres of wetlands, 7.5 acres of which would be newly impacted by fill and are subject to both state and federal regulations. (FEIS, 5-321). In addition to the wetlands, the HRF would be located on top of as much as 50 feet of fine tailings and slimes in the existing LTVSMC Emergency Basin. (FEIS, 5-664, Fig. 5.2.14-9). Although the FEIS proposes that a preload could be placed on these materials to compress them in order to reduce stress deformation and strain on the liner system, it is expected that the material would rebound a small amount after the preload is removed. (FEIS, 5-667). Differential settlement of foundation materials is known to create longitudinal strain for liner materials. (FEIS, 5-661).	S	O

27085	Unique			PER	Paula Maccabee	Water Legacy	3182	179	Earlier sections of these comments have raised concerns about adverse environmental impacts due to hydraulic conductivity of Virginia Formation rock and fractures in the East Pit and under the Category 1 waste rock pile (Section II, supra), the potential for northward flow (Section II, supra), the substantial wetlands drawdown effects modeled by GLIFWC, and the serious consequences of drying and rewetting cycles to mercury methylation in peatlands explained by Dr. Branfireun (Section I, supra). It is irresponsible not to evaluate whether implementing Mine Site Reverse Osmosis in Year 1 and returning clean water to mine site tributaries or wetlands would reduce environmental damage and mitigate these risks.	S	O
27085	Unique			PER	Paula Maccabee	Water Legacy	3191	184	Placing Category 1 waste rock in the West Pit, after grouting any fractures revealed by mining, may reduce adverse effects from uncaptured release of contaminated seepage to surface and groundwater. Maintaining saturated conditions to reduce oxidation may also be more effective within the West Pit than trying to do so with a cover on a tiered pile. These potential benefits from the West Pit Backfill alternative should have been analyzed in the FEIS.	S	N
27085	Unique			PER	Paula Maccabee	Water Legacy	3221	206	EPA comments on the PolyMet NorthMet SDEIS recommended, “The FEIS should include indirect impacts in the analysis of cumulative impacts to wetlands.” (EPA Comment on the SDEIS, Exhibit 1). The FEIS provides an inadequate and misleading response to this.	NS	X
6309	Unique			PER	Peggy Parise		473	1	the state and federal standards proposed are more than adequate to protect the environment.	NS	X
27659	Unique			PER	Peter Bormuth		1795	1	The least restrictive means standard is exceptionally demanding (see City of Boerne, 521 U.S. at 532) and cannot be met by the proposal for the North Met mine.	NS	X
29019	Unique			PER	Rev. Elton W. Brown		2397	15	This huge new kind of mining in Minnesota will require more site inspections and testing, by the DNR and other regulatory agencies. In this time when many politicians want to trim government taxation and spending, what assurances are in place to guarantee that budgets for timely monitoring will not be lowered but rather be raised to cover adequately the increased need of government regulation?	S	O
29019	Unique			PER	Rev. Elton W. Brown		2398	16	What assurances do we citizens have that, should violations occur during the NorthMet project, the regulatory agencies will act quickly to shut down the mine until the problems are fixed (rather than issuing variances to allow the violations to continue)?	S	O
29019	Unique			PER	Rev. Elton W. Brown		2399	17	in the long run the increasing noise, traffic, haze, and escaping toxins will make this area less attractive, leading to a loss of population. Baby Boomers who are thinking of moving and building here will look elsewhere, and even many of those who come here for the mining jobs will move on once the mine closes. Economic and population gains due to copper/nickel mining will be short-lived at best. How is it in our self-interest to put our growing diverse NE Minnesota economy at risk for the sake of the boom-and-bust extraction of non-renewable natural resources?	S	O
29019	Unique			PER	Rev. Elton W. Brown		2400	18	As a very concerned property owner and tax payer of NE Minnesota, I ask you to not risk citizens’ long-term health and investments for the sake of uncertain short-term financial gains. Please reject the PolyMet SDEIS.	S	O
29273	Form Letter	1	Variant	PER	Rhoda Liebo		2484	5	Only bad science has been delineated in the reports, submitted during the EIS stage. They are not impartial and a third party with knowledge, would be to a good counter point to this terrible idea. I did review the EIS and have read much of it and realize it is faulty and lacks credibility. A third party, impartial science team shoud evaluate the plans to see if they agree with the findings.	NS	X
10133	Unique			PER	Richard Crum		659	3	3. We have highly competent regulators in Minnesota. With 25 years of environmental consulting, I have found the Minnesota Pollution Control Agency stands out from regulators in other states and Canada in terms of their understanding of the science and engineering, the statutes, rules and guidance. The argument that our state agencies are not capable of protecting the interests of the state on a project like Northmet is also nonsense.	NS	X
9828	Form Letter	3	Variant	PER	Richard Houck		644	2	with all of the mandates and restrictions that have been imposed on this type of business, and in my opinion are being more than met, this project must receive approval for the benefit of all of Minnesota, and especially those in northern Minnesota who are in need of employment.	NS	X
10359	Unique			PER	Richard Newmark		682	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine - MAINLY because it leaves the US government and the citizens of MN with hundreds of millions of dollars of liability to clean-up after the mine closes and PolyMet declares bankruptcy. Please require at least a \$500 million bond to cover clean up for the next two hundred years which can't be used to cover bankruptcy fees.	S	O
30074	Unique			PER	Rick Billmeier		2802	2	I support the creation of a Minnesota Statute similar to Wisconsin's 1997 "mining moratorium" law. Minnesota should adopt a similar statute that prohibits the granting of a mining permit unless the permittee can show: 1) that an existing mine has operated in a sulfide ore body for 10 years without polluting the ground or surface water; and 2) that a mine that operated in a sulfide ore body and has been closed for 10 years has not completed the ground or surface water. Historically, the environmental review process has been unable to PREDICT the actual impacts of sulfide mining in water rich environments and has underestimated the impacts as well as the cost of clean-up. At the very least, Minnesotans should require proof, in the form of documented actual prior mining experience, that Poly Met has been able to do the proposed sulfide mining somewhere else without creating sulfuric acid or Acid Mine Drainage in toxic levels.	S	O
27114	Unique			PER	Robert Essian		1658	3	I don't believe Polymet is the company to manage this Brownfield site or can manage this over the long haul. God forbid this become one of those environmentally horrific sites.	NS	X
27114	Unique			PER	Robert Essian		1660	5	I DO NOT believe the State of Minnesota has the proven track record as she refuses because of costs to run the Water Treatment Plant at the Dunka Pit, her only sulfide project to date and it's just a little one. how will Minnesota manage a much larger Polymet.	NS	X
29727	Unique			PER	Robert Tammen		2570	1	Polymet's FEIS does not demonstrate compliance with Minnesota Rule 7050.0185, Nondegradation For All Waters. "It is the policy of the state to protect all waters from significant degradation from point and nonpoint sources..." Promises of reliance upon "Adaptive Management" indicate that Polymet's intent is to react after degradation has occurred.	S	O
29246	Unique			PER	Ron Brodigan		2457	6	It should be demonstrated that there are compliance schedules for abating existing and future water and soil pollution.	NS	X
5313	Form Letter	1	Variant	PER	Ryan Bergstrom		424	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. While I support mining and the livelihood it brings to the residents of northern Minnesota, and, while I understand that mining will occur in the Duluth Complex at some point in the future, I oppose issuing state or federal permits allowing Polymet (or any other entity) to destroy this land until better mining technologies have proven themselves. The need for these resources is not so great, nor has it been proven as such, that it warrants issuing permits and risking (even in the slightest) the environmental integrity of our most valued natural resource - the natural splendor that is northern Minnesota.	NS	X
28855	Unique			PER	Ryan John Mallek		2362	2	if more time was spent on a EIS I would still be against the mine because it clearly states that water treatment will take place for a significant period of time. No mine should be granted a permit that would require any type of long term treatment of water.	NS	X

17945	Unique			PER	Stephen P. Arkulary		827	4	Are we going to learn after the fact that the greatest watershed on the planet is beyond repair?	NS	X
24761	Unique			PER	Steve Timmer		1095	1	This is a comment to the Final Environmental Impact Statement on the proposed PolyMet NorthMet copper-nickel sulfide mine. It is offered in opposition to the issuance of a permit to mine. This comment focuses on the very real financial consequences to the state and its citizens of a tailings dam failure at the former LTV processing facility, or the persistent pollution of surface and groundwater either from the processing facility site or the mine pits themselves.	NS	X
29900	Unique			PER	Susan Lynn		2699	1	I'm writing to call attention to your primary responsibility as elected leaders that you hold in trust the common property shared by the people of Minnesota. It is your duty to use scientific information to disallow pollution, resource destruction, chemical introduction and other harm to our resources. You cannot allow risk to be taken unless and until conclusive proof exists that such practices will not pose harm.	NS	X
29356	Unique			PER	Tara Widner		3700	6	The PolyMet proposal also would appear to violate the spirit, if not the letter of, the Clean Water, Land and Legacy Amendment (Legacy Amendment) to the Minnesota Constitution that was approved by the state’s voters in 2008. The Legacy Amendment was designed to: protect drinking water sources; to protect, enhance, and restore wetlands, prairies, forests, and fish, game and wildlife habitat; to preserve arts and cultural heritage; to support parks and trails; and to protect, enhance and restore lakes, rivers, streams, and groundwater."	NS	X
27483	Unique			PER	Thomas J Sundberg		1763	1	Neither of us have any environmental concerns about the mine. It appears to me that all of the questions have been answered, and the permitting process should proceed. The Iron Range has a rich tradition of mining, and has always upgraded the facilities when any environmental concerns arise. The area is in need of mining to create good paying jobs and help alleviate the high unemployment in the area. Don’t play politics with the future of the Iron Range, approve the permits, and allow the area to prosper.	NS	X
29478	Unique			PER	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3851	6	WE urge the governor to require restoration bonding to be guaranteed and escrowed in advance of any approvals, with the parent company, Glencore PLC, named specifically;	S	N
29478	Unique			PER	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3852	7	WE urge the governor not to issue any more permits to mine anywhere in the state until all the currently expired permits are properly re--- permitted and all mining activities brought into compliance;	NS	X
29478	Unique			PER	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3865	19	WHEREAS, permitting a nonferrous mine that admittedly cannot be closed without perpetual treatment is against Minnesota Statute 6132.3200.subpart 1: Goal. The mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free;	NS	X
29046	Unique			PER	Tim Gihring		2407	5	Finally, the FEIS does not consider precedent that would be established by the project, which would be the first of its kind in Minnesota but almost certainly not the last if the project goes forward. This is not PolyMet's responsibility, of course, but it should be the DNR's. There are cumulative impacts, multiplying the volume of run-off and water-treatment needs, that should be considered.	NS	X
26996	Unique			PER	Timothy Weulander		1519	7	the DNR is not what it once used to be. I mean no offense by that, but my father worked over 25 years of his life for the DNR, between Cook, Orr and Tower offices. He cared about the land and wildlife, so did most of his co-workers. They took great pride in their jobs/careers and the land and wildlife were of great concern. It certainly does not appear to be much of the case anymore. Whether it’s the powers that be, prohibitive laws, lack of funding, or what-have-you, I along with anyone I have ever talked to about this Polymet matter, have little to no faith that the right thing will be done.	NS	X
27061	Unique			PER	Tyler Kaspar	1854 Treaty Authority	2975	1	Under the proposed project, it appears that long term (perhaps perpetual) water treatment, site maintenance, and monitoring will be needed after closure to protect the environment and meet water quality standards. We don't believe that this meets the goal of a maintenance free closure, which is required under MN Rule 6132.3200: "To receive a permit to mine, the permittee must be able to close the mine in such a way that it is stable, free of hazards, minimizes hydrologic impact and release of substances, and is maintenance free."	S	O
27061	Unique			PER	Tyler Kaspar	1854 Treaty Authority	2985	9	Wild rice exists upstream in the Embarrass River from the draft MPCA staff recommended definitions of water used for production of wild rice (compliance points). In the Partridge River, the 2009 survey identified rice near SW-004b, also upstream of the proposed compliance point. Barr Engineering conducted the survey and has indicated a possible error in the 2009 survey, bringing into question the accuracy of these upstream wild rice locations in the Partridge River. Currently, the wild rice water quality standard is not being met in portions of the Embarrass and Partridge river systems. The FEIS states that the wild rice sulfate standard would be met for the Embarrass River, assuming the containment and seepage collection system would capture seepage presently going to the Embarrass tributaries. However, the Partridge River will exceed the standard during low-flow conditions. We question how this will be handled in permitting.	S	O
27061	Unique			PER	Tyler Kaspar	1854 Treaty Authority	3006	33	Research has indicated that planned/expected impacts from mining operation are almost always inaccurate. Impacts are typically greater. Mining operations also change over time (e.g. longer mine life), affecting initial plans. Contingency mitigation can probably be expected in some form, and the company must be held responsible for this. The FEIS states that contingency mitigation will not be included initially in the financial assurance package. Financial assurance must be monitored and updated as the project proceeds to properly cover site cleanup and closure.	S	O
26087	Unique			PER	Victoria Thor		1268	3	There is no such thing as environmentally friendly mining. We need to stop looking at our natural world as a “resource.”	NS	X
26485	Unique			PER	William Haapala		1335	4	However, based on my experience in air, water quality, solid waste, chemical, and hazardous waste management, my greatest concern is not with the engineering, science, technology and design of the project, but with the environmental ethics, knowledge and commitment of the people who will take charge in the future. From what I gathered now the current group understands that commitment. What I worry about is the change of future command, operations becoming routine and complacent and loss of institutional memory. That also impacts commitments to future remediation plans. Permits will be issued. People have to comply. Build in some provisions for changes in leadership and economic conditions so that the human factor is taken into account.	NS	X
29367	Unique			PER	William K. Dustin		2513	6	Although I am totally against this project, I do not question your integrity in doing your jobs to get it approved. It is most unfortunate that the state of Minnesota encourages this activity in the first place.	NS	X
29734	Unique			PER	William K. Dustin		2581	6	Although I am totally against this project, I do not question your integrity in doing your jobs to get it approved. It is most unfortunate that the state of Minnesota encourages this activity in the first place.	NS	X
29973	Unique			PER	William Robbins		2747	4	I understand that agencies that write permits and regulations often are expected to resolve many questions relating to operational details, but I suggest that such details are often overlooked by such regulating agencies.	NS	X
26780	Unique			ROD	Alaina Pilate		1465	17	We also object to the land exchange under the Forest Service Rules found at 36 CFR 218. We reject any claim that the objection process can be limited to people who commented prior to the draft land exchange Record of Decision.	NS	X
26479	Unique			ROD	Audrey Kramer		1259	10	The US Forest Service knows strip mining is prohibited on land set aside for watershed and forest protection.	NS	X
27184	Unique			ROD	Carl Sack		1687	15	I request the U.S. Forest Service reject the proposed land exchange. I request U.S. Environmental Protection Agency initiate a 404(c) process to veto any wetlands fill permits to Polymet. I request the U.S. Army Corps of Engineers publicly recognize that compensatory mitigation sites are inadequate to compensate for wetlands of the size and quality that Polymet would destroy, and deny any Section 404 permit related to the project.	NS	X
27308	Unique			ROD	David A. Lien	Minnesota Backcountry Hunters & Anglers	3186	2	the U.S. Forest Service reject the proposed exchange of Superior National Forest lands for the PolyMet project; and the U.S. Environmental Protection Agency veto and the U.S. Army Corps of Engineers deny any Section 404 permit that would allow PolyMet polluted discharge and wetlands destruction.	NS	X
25385	Form Letter	1	Variant	ROD	David Witt		1161	3	I support the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal;	NS	X
25385	Form Letter	1	Variant	ROD	David Witt		1171	13	The PolyMet proposal does adequately considers alternatives to reduce harm to wetlands and water quality and is the Least Environmentally Damaging Practicable Alternative for a huge mineral deposit that happens to be located where it is not where humans wish it was located. In fact it is located in a 100+ year old mining district with essentially all necessary infrastructure in place.	S	O
25385	Form Letter	1	Variant	ROD	David Witt		1174	16	the U.S. Forest Service support the proposed exchange of Superior National Forest lands for the PolyMet project; and the U.S. Environmental Protection Agency and the U.S. Army Corps of Engineers issue all Section 404 permits that will allow PolyMet discharges and wetlands utilization.	NS	X

25385	Form Letter	1	Variant	ROD	David Witt		1175	17	I support the land exchange under the Forest Service Rules found at 36 CFR 218; the responsible official for that decision is Superior National Forest Supervisor Brenda Halter. I submitted comments on the PolyMet SDEIS and I support the claim that the objection process can be limited to people who commented prior to the draft land exchange Record of Decision.	NS	X
27685	Unique			ROD	Dennis Szymialis		1861	16	That commentator, Dennis Szymialis, requests relief in that no permits be granted for the PolyMet mining project and that the no action alternative be adopted.	NS	X
11015	Form Letter	1	Variant	ROD	Donna Cannon		738	5	I strongly object to the proposed NorthMet Mining Project Land Exchange in the Superior National Forest	NS	X
27836	Unique			ROD	Ellen Hawkins		2179	2	The EIS is inadequate; the Forest Service Record of Decision does not provide convincing support for the land exchange;	NS	X
27836	Unique			ROD	Ellen Hawkins		2191	14	The land exchange would be bad public policy. Turning ownership of National Forest Lands over to a private mining company would be contrary to the Forest Service’s mission: it would not serve the people well and it would demonstrate the very opposite of caring for the land. The land exchange would be in direct opposition to long-standing federal policy that protects wetlands: it would result in the direct destruction of 914 acres of wetlands as well as the destruction or impairment of up to 7,694 additional acres of wetlands. More, it would apparently degrade surface waters and groundwater to the extent that they would not meet state, federal and tribal water quality standards. The ROD does not acknowledge, nor does the FEIS weigh heavily enough, the harm that would be done to vulnerable species, including moose, lynx, and northern goshawks. The ROD and the EIS do not indicate serious consideration of the loss of ecological services so that all of those benefits can be weighed against the mining company’s gains. This exchange would mean the destruction of 700 acres of imperiled Black Spruce – Jack Pine Woodland, now protected as part of the Superior National Forest, and among our favorite places for birding, botanizing, and hiking. Many other special plant communities - some micro habitats that are easy to miss for most of us, yet still significant, and including rare species and many sites of High Biological Significance, as identified by Minnesota Biological Survey, would be traded away - in most cases with no equivalent replacement. Lands that the Forest Service would gain ownership of in the exchange are for the most part already used in ways that are consistent with the Forest Plan. There is no great advantage, in terms of land use, in bringing them under Forest Service management. The meager list of benefits to the Superior National Forest derived from the exchange doesn’t begin to offset the loss of habitat, water quality, ecological services, ecological health, and recreational uses. There has been no analysis of the cumulative impact of similar deals involving transfers of public lands and access to minerals to the mining and drilling extraction industry across the nation. In these transactions the value of the lands is transferred from the public to industry investors (who are often not U.S. corporations or citizens) with relatively little or no value flowing back to the public. The interests of future generations, the uncountable numbers of which obviously have an even bigger stake than we present day citizens do, are not represented. And although industry benefits from these deals, taxpayers foot the bill for the years of work that public land managing agencies dedicate to facilitating deals requested by industry. Consideration of this proposal should have included documentation of the time and money the Superior National Forest has invested in this exchange over the past decade and show how that weighs against impacts to ecosystem components and benefits/losses to the public, as well as the big picture view of how this fits into similar actions across the U.S. Public Lands System, or at least in those lands managed by the USFS.	S	N
29745	Unique			ROD	Erin Mittag	Minnesota Center for Environmental Advocacy	3978	34	The FEIS also fails to describe the foreseeable impacts of the no action alternative at the mine site. According to the Draft Record Of Decision (DROD): the reason the Forest Service is conducting this land exchange is that if it does not, PolyMet is likely to litigate its right to build an open pit mine on Forest Service property acquired under the Weeks Act, and the outcome of that suit is uncertain. In other words, the Forest Service believes that there is a significant chance that the no action alternative would result in an open pit mine on Forest Service land. Although we agree that this outcome is not certain, if it is foreseeable enough that the Forest Service is trading away a ten-square-mile contiguous piece of property with irreplaceable resources in order to avoid it, it is surely certain enough to assess in the FEIS. Indeed, the Forest Service’s actions to avoid this scenario prove that it is already effectively foreseen. The Forest Service has the established right to impose conditions on mining operations to protect natural resources in situations like this one, where the Forest Service owns the surface and a private party owns the mineral estate.102 Because the mine as proposed would violate so many of the provisions of the Superior National Forest Land and Resource Management Plan (Forest Plan), the Forest Service would undoubtedly impose many additional requirements if the mine were to be built on Forest Service land. The Forest Service cannot assume for the purposes of NEPA that an open pit mine on Forest Service land would have the same impacts as an open pit mine on non-Forest Service land. We understand that the Forest Service does not want this mine on its property, and we can hardly blame it. We also understand that the Forest Service sees an advantage in obtaining other land in exchange. But neither we nor the Forest Service know that this is the environmentally preferable outcome, and the FEIS does nothing to enlighten us. The whole point to the NEPA process is to look at the actual expected environmental effects of the range of alternatives in a given situation. In this particular situation, it is unclear that there will be any on-the-ground environmental benefit of Forest Service ownership of the nonfederal lands, as opposed to the current owner. Will water quality, vegetation, wildlife, or ecosystem services benefit from the change of ownership? FEIS that goes into this alternative at length. On the other hand, would these natural resources benefit from Forest Service ownership of the mine site, if a mine will be built regardless? The FEIS tells us absolutely nothing about this possibility. The Forest Service is hiding behind its legal position when it says that if there is no land exchange, there will be no mine. But the Forest Service cannot have it both ways. If an open pit mine on the Superior National Forest is foreseeable enough to drive this entire action, it is foreseeable enough to require assessment under NEPA.	S	N
29745	Unique			ROD	Erin Mittag	Minnesota Center for Environmental Advocacy	4098	160	The proposed mine’s direct and long-term destruction of two square miles of designated lynx and wolf critical habitat, along with the mine’s adverse and cumulative impacts to the few remaining travel corridors for lynx and wolves, would result in the “destruction or adverse modification” of critical habitat, which is prohibited by the ESA.389 The conversion of the critical habitat at the Mine Site to an open-pit mine would destroy and adversely modify all of the primary constituent elements for Canada lynx and gray wolves identified by the U.S. Fish and Wildlife Service, including for lynx the destruction of boreal forest landscapes that support a mosaic of forest stages, sites for denning, and matrix habitat allowing for travel and habitat connectivity.	S	N
29745	Unique			ROD	Erin Mittag	Minnesota Center for Environmental Advocacy	4099	161	Additionally, despite the acknowledged significant impacts to lynx and wolves, and their designated critical habitat, including impacts to the few remaining wildlife travel corridors in the region, the FEIS fails to consider or address the impacts of the proposed mine and land exchange on lynx and wolf recovery. By adding to the widespread cumulative impacts of mining projects and other development across this region, including contributing to the continuing decrease in available travel corridors, the proposed mine project is likely to appreciably contribute to the diminishment of the chances for the lynx and wolf populations in this region to recover, and to be eventually taken off the list of threatened species. The FEIS’s failure to consider this fundamentally important factor concerning lynx and wolves violates NEPA and the ESA.	S	N
29745	Unique			ROD	Erin Mittag	Minnesota Center for Environmental Advocacy	4100	162	Section 9 of the ESA prohibits any person from “taking” a threatened or endangered species.391 “Take” is defined broadly to include "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.”392 The proposed mine would likely result in the “take” of Canada lynx and wolves, through the destruction of their critical habitat, vehicle and train collisions, and the continued loss and fragmentation of the few remaining wildlife corridors in the area.	S	N
24372	Form Letter	1	Variant	ROD	gloriana casey		1036	7	Many people have helped to create a wilderness system, but it only takes a few to really muck it up forever. PLEASE don't be a mucker, as we have enough of those already in Washington D. C.!!!!!!!!!!!!!!	NS	X
28494	Unique			ROD	Ivan Weber		2305	13	Please reject, defer or indefinitely delay mining projects of this sort in this region, including land exchanges that are integral to them.	NS	X
7393	Form Letter	4	Variant	ROD	Jane Beattie		543	10	The and exchange is not in the public interest, and will violate the forest plan for the Superior National Forest, harm endangered species, impair downstream tribal resources and conflict with laws and policies to protect wetlands and other resources.	NS	X
295	Form Letter	1	Variant	ROD	Janet Hill		167	1	I'm told that a phone number is required for the U.s. Forest Service to consider my comment. My phone number is 218-259-4090.	NS	X
24333	Unique			ROD	Joanna Schor		1023	4	The agencies should reject PolyMet’s proposal, and keep the proposed mine site under the current protections of the Weeks Act, Endangered Species Act, and the Superior National Forest Plan.	NS	X
27688	Unique			ROD	Laura Gauger		3270	17	Moreover, since the Draft Record of Decision (DROD) issued by the USDA Forest Service regarding the land exchange was “based on the Final Environmental Impact Statement (FEIS) for the NorthMet Mining Project and Land Exchange,”1 a document now shown to be inadequate and flawed with regard to critical information relied upon by the Forest Service in making its decision, I object to the draft decision authorizing the conveyance of 6,650 acres of federal lands in the Superior National Forest to PolyMet. The deciding officer’s stated assumption in the DROD that “the mandatory requirements of relevant policy, regulation and law related to the mining project will be met,”2 has been shown to be flawed. With regard to my objection to the land exchange, I know of no way to resolve the objection except to outright deny the exchange.	NS	X
29740	Unique			ROD	Lori Andresen	Save Our Sky Blue Waters et. al.	3923	38	We have commented on the PolyMet DEIS and SDEIS, and we object to the proposed U.S. Forest Land Exchange with PolyMet, which would allow PolyMet to open pit strip mine on what is now protected Forest Service land.	NS	X
29740	Unique			ROD	Lori Andresen	Save Our Sky Blue Waters et. al.	3924	39	The FEIS has exempted PolyMet from considering an underground mine option based upon the companies own cost estimates, so no further analysis was done. The USFS has the authority to require an underground mine, rather than submit to a land exchange.	S	O
29740	Unique			ROD	Lori Andresen	Save Our Sky Blue Waters et. al.	3934	49	The proposed NorthMet mine and land exchange is not in the public interest and should be rejected.	NS	X

27085	Unique			ROD	Paula Maccabee	Water Legacy	3139	134	Failure to resolve the many deficiencies in these comments on the FEIS precludes the Forest Service from proceeding with the proposed land exchange. WaterLegacy’s separate comments on the Draft Record of Decision for the land exchange will summarize pertinent deficiencies as well as substantive impacts of the NorthMet project that preclude proceeding with the federal land exchange.	NS	X
10466	Unique			ROD	Ryan Talbott		697	2	While the Forest Service claims that an extension of the objection period is not permitted, see Draft ROD Legal Notice (citing 36 C.F.R. § 218.6(d)), it is important to note that the Forest Service’s regulations cannot run afoul of the National Environmental Policy Act (“NEPA”) and the Council on Environmental Quality’s (“CEQ”) regulations. NEPA “is our basic national charter for protection of the environment.” 40 C.F.R. § 1500.1(a). “Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA.” 40 C.F.R. § 1500.1(b) (emphasis added). NEPA’s public participation regulations require the Forest Service to “[m]ake diligent efforts to involve the public in preparing and implementing their NEPA procedures” and to make environmental documents available “so as to inform those persons and agencies who may be interested or affected.” 40 C.F.R. § 1506.6(a)-(b). In some cases, “proposals should be given more time for the thoughtful preparation of an EIS and development of a decision which fulfills NEPA’s substantive goals.” CEQ, Forty Most Asked Questions Concerning CEQ’s National Environmental Policy Act Regulations, Q. 35 (1981). Requiring the public to review over 3,500 pages of documents and file an objection within 45 days is contrary to NEPA’s substantive goals and the Forest Service’s obligation to ensure the public has enough time to fully scrutinize the FEIS and Draft ROD.	S	O
10466	Unique			ROD	Ryan Talbott		702	5	While the Forest Service treats all projects equally for purposes of filing an objection, it does not when it comes to resolving an objection. For example, if “additional time is necessary to provide adequate response to objections,” the reviewing officer “has the discretion to extend the time [for resolving objections] for up to 30 days[.]” 36 C.F.R. § 218.26(b). It is arbitrary and capricious for the Forest Service to have the option to extend its deadline for resolving an objection when no such opportunity exists for filing an objection. Finally, it is important to note the timing of the Forest Service’s Draft ROD. As stated above, the legal notice for the Draft ROD was published on November 17, 2015. The 45-day objection period ends on January 4, 2015. ¹ In other words, the Forest Service knowingly burdened the public with an objection period that coincides with three major holidays – Thanksgiving, Christmas, and New Year’s. SOS and WLP have been waiting for the Forest Service’s Draft ROD for almost a year. Releasing the Draft ROD so that the objection period coincides with three major holidays substantially impairs SOS’s and WLP’s ability to meaningfully review the FEIS and Draft ROD and file a comprehensive objection.	S	O
3509	Form Letter	1	Variant	ROD	Scott Slocum		381	2	The USFS should reject the proposed exchange of Superior National Forest lands for the PolyMet project. The EPA and Army Corps of Engineers should deny any Section 404 permit that would allow PolyMet discharge to pollute wetlands and public waters.	NS	X
29478	Unique			ROD	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3848	3	WE object to the U.S. Forest Service proposal to exchange Superior National Forest land for the PolyMet proposal and urge the U.S. Forest Service to reject the proposed exchange of Superior National Forest lands for the PolyMet project;	NS	X
28477	Unique			ROD	Wendy Robertson		2267	6	I am also asking the USACE not to issue any 404 permits to the Polymet project. The USAD Forest Dept. should not agree to any land exchange.	NS	X
23032	Form Letter	1	Variant	SO	Aaron Pendl		889	1	On one hand this mine will bring jobs to an area that needs them. Adding jobs, and the associated economic impact that comes a long with those jobs, can have a tremendous impact on families. That is a fact, and one that is not to be taken lightly and hard to overlook.	NS	X
23032	Form Letter	1	Variant	SO	Aaron Pendl		892	4	This wilderness is already paying for itself. There's an entire economic model already in place that was built on the boundary waters, and the 250,000+ visitors each year that come to enjoy its pristine wilderness. So approving this mine is risking one for the other, plus the additional risks of major pollution.	NS	X
23032	Form Letter	1	Variant	SO	Aaron Pendl		895	7	the permanent risks, seem to far outweigh the short term rewards.	NS	X
558	Unique			SO	Abbie Debiak		249	12	Deciding whether to allow a mine near a wilderness area is far more complicated than simply choosing between economics and the environment, especially when nature tourism and the tradition of the wilderness experience is such an integral part of Minnesota’s economy.	S	O
8814	Form Letter	1	Variant	SO	Alan Breuer		617	2	It's time to stop environmental terrorist from stopping jobs and businesses from moving forward after following all regulations and showing they'll operate safely!!!	NS	X
29	Unique			SO	Allen Killian-moore		87	2	Our wildlands are far too precious to take such risks. Our wildlands already provide far too many jobs for those working the the outdoors industry, forest industries, land water management industries, tourist industries, children's and adult camps, farming, etc.	NS	X
29	Unique			SO	Allen Killian-moore		88	3	I don't think the benefits of jobs potentially provided by the mine outweigh the risks to the jobs and livelihoods that already exist in this region of our state.	NS	X
26973	Unique			SO	Andrew Comfort		1495	3	There is political pressure to proceed with mining from a pre-existing mining lobby. This faction would like to keep doing more mining to continue a tradition of mining that began with iron mining in Minnesota. By this logic, mining just continues generation after generation, until at some point the mineral resources just run out. Then, a post-mining economy will be the only choice. In northeastern Minnesota, there is currently a large eco-tourism and vacation economy that would be seriously negatively impacted by mining all resources including throughout the BWCA. Since mining is of dubious profitability for the mining companies and even less like to produce any lasting wealth for Minnesota, Minnesota would be better off in the long term to ban all sulfide mining and make the shift to a post-mining economy now. In this way, the amenity of a pristine wilderness environment can continue to support an eco-tourism and vacation economy in perpetuity - and simultaneously act as a draw for families and workers interested in working in the post-mining economy. This post-mining economy could be characterized by (among other opportunities) small business entrepreneurship making use of high speed data connections to the rest of the world.	S	O
6755	Form Letter	1	Variant	SO	Andy Schuster		501	1	I believe that mining can have a good short term effect on the local economy, but that the long term negative effects aren't worth the potential risks.	NS	X

30061	Unique			SO	Anita Tillemans		4318	5	Statistics abound concerning the wealth of wilderness tourism; and it cannot be reconciled with a mining scenario. When the copper mines are gone, what will be left? The choice is truly between wilderness and mining. Transport down scenic highways to and from the NorthMet Project will weave a web far beyond the sites that FEIS reviewed. Tourists will be traveling down the Superior National Forest Scenic Byway, along highways and roads to Hoyt Lakes, Embarrass, Ely, Babbitt and Silver Bay. These potential long-term customers will see the effects of mining and it will affect the tourist industry. The sounds of blasting, trucks and drilling are not conducive to wilderness by any stretch; and neither is the potential of streams and waterways polluted with sulfuric acid and other toxins from mining copper. Atmospheric conditions are unpredictable and Polymet will not be able to control these. The sounds of drilling from exploratory wells for copper and other metals can be heard in the BWCAW at this time. If Polymet gets permission to pollute and take lands in the Laurentian Uplands, there will be little peace for these areas, no chance of true wilderness experience and tourism.	S	O
28888	Unique			SO	Ann Reed		2369	1	People having adequate employment is a real issue but let's be clear: if we destroy the water in Minnesota, poison it, make it uninhabitable to support fish and other wildlife, there will be no need for jobs. No one will want to live there. There will be no tax base. Tourism will be nothing. No one will be fishing, hunting, hiking.	NS	X
22622	Unique			SO	Anne Uehling		877	5	-Negative economic impact has been ignored and only the jobs impact of mining noted for 20 years until closure). In that part of northeastern Minnesota where mining is not taking place, the economies are sustaining and growing: Duluth, Grand Marais, Ely.	NS	X
28533	Unique			SO	Arno S. Kahn		2318	6	The small economic benefit will assist very few people and the total impact on the environment is massive and irreparable.	NS	X
26479	Unique			SO	Audrey Kramer		1333	7	It would also be detrimental to resort owners, local residents at Cloquet, Duluth, MN and Superior, WI.	NS	X
22	Unique			SO	Barbara Richards		68	3	I am hoping that you will gather more facts than a few outsourced jobs and inflated single bottom lines for extractive industries. I hope you will consider whether a quick (in universe/evolutionary clock time) profit is worth the loss forever: think eternity.	NS	X
27377	Unique			SO	Beth Lewis		1704	6	As a Lake County property owner and MN tax payer, the NorthMet project does not make economic nor environmental sense. The cost risk to tax payers to protect water and environmental quality for hundreds of years for a commodity industry with boom/bust cycles and foreign corporate owners with poor track records in both treatment of workers and the environment isn't worth it.	NS	X
6310	Unique			SO	Bill Parise		476	2	We need the added jobs and mineral base in our area	NS	X
9995	Unique			SO	Bob Hedlund		650	2	it will help the economy of the state and the country.	NS	X
27620	Unique			SO	Brad Heltemes		1786	1	Though it is understood that it is the DNR's task to consider also the economic and recreational aspects of our nature resources, the first and foremost role of the MNDNR is, and should be, to protect those resources -- they must be preserved for all to enjoy, including future generations. As a physician and scientist, it has become quite clear to me that the proposed PolyMet mine would seriously threaten just that, with a significant risk of causing irreparable damage to our water supply, fish and wildlife, the health of those living in the area, and ultimately the livelihood and enjoyment of the Minnesota people.	NS	X
26377	Form Letter		Variant	SO	Brandon Long		1304	1	I oppose the proposed PolyMet NorthMet copper-nickel sulfide mine. This type of mining has been done nowhere safely and I urge you to consider the sustainable Eco tourism industries it would destroy for short term gains and the essentially irreversible pollution to our Minnesota waterways.	NS	X
28486	Unique			SO	Brenda Simonson		2280	1	We now have another industry possibility in PolyMet on the Iron Range that would create employment for many people. This allows families to stay in northern Minnesota rather than leave the area for other employment.	NS	X
27672	Unique			SO	Brian Smith		1830	2	I do not believe that the benefit of 30 to 40 years of mining jobs is worth the expense, natural resource destruction, and hazards to humans of +200 years of anticipated clean-up from this mining project.	NS	X
27149	Unique			SO	Brooke Staupe	Minnesota Power	3197	2	The positive economic benefits to the region provided by the PolyMet project are well understood. Once operating, the Poly Met Project will provide hundreds of good paying jobs and provide an economic boost to a region of the state sorely in need of it.	NS	X
30173	Form Letter	1	Variant	SO	Bryan Forbes		2837	1	Silly to risk one of our best natural resources for short term gain. Especially given the track record of mine incidents + cleanups.	NS	X
23994	Unique			SO	Byron Rice		997	1	I do not support the NorthMet Mining Project. We are privileged to have pristine land in Northern Minnesota and the mine project drains into those areas if there is some problem. Even if there are not mistakes or errors, mining leaves all sorts of waste materials that are hazardous for decades, if not longer. I don't think a short-term economic gain should jeopardize our fragile environment for generations to come.	NS	X
27698	Unique			SO	Caree Gordon		2101	3	There are many well-established businesses that stand to loose profits if the wilderness is spoiled. PolyMet/NorthMet will create jobs for people in Northern MN, however, the essence of our beautiful wilderness and clean lakes is at stake - the exact reason why so many people choose to vacation and visit Northern MN. I believe the stakes are too high and definitely not worth the risk. Future generations of family members return year after year to experience the unpolluted lakes, forests and solitude that is exclusively offered in the BWCA Wand surrounding areas. For long-term commerce, we need to keep MN clean and free of unwanted pollution for the sake of our unique wetlands, water, animals and forests. The Wilderness Act of 1964 was put in place as federal law to protect the boundaries ofthe BWCAW. Let us HONOR our land and RESPECT the foresight our leaders had to create these protective boundaries.	NS	X
25466	Unique			SO	Carly Hawkinson		1187	2	As I've listened to individuals speak up on both sides of this issue, I noticed a few things. The large majority of those in favor of this PolyMet project are not giving any substantial proof or evidence to discount items raised by those against it. I have not heard any quality, educated honest truth to prove the opposing side wrong. Those in favor of this project are driven by money. It doesn't matter what kind of mining it would be, they just want more jobs. There are no jobs being taken away from anyone -- no one is being laid off their job here. This project would just be creating brand new jobs -- and as PolyMet has stated it would create ~300 jobs (as a guess). Those guesstimated ~300 jobs would not necessarily be given to people from the Iron Range or Minnesota. PolyMet is an international business, so it is very possible that people they hire will not not be from Minnesota. Another point that many people have already stated is that the project would be for ~20 years (also a guesstimate). Only 20 years. That certainly goes by very fast. Twenty years ago it was 1994 -- that wasn't that long ago. Another hap-hazard statement was made in the late 1800's. A politician was quoted in saying that there was enough old-growth timber across the U.S. that it would take a century just to make a dent in it. In less than 20 years, the old-growth timber was cut down. That was devastating and we are now repairing it by replanting as we have learned about conservation practices. Sulfide mining is not repairable. It is traumatic and its' damages/death last forever. PolyMet says it will take 500 years to clean up. I can't seem to comprehend why "we" are even discussing this project with them, with their incomprehensible and irrational data. Again, PolyMet is making a guesstimate...500 years to clean up. I would think that with that number, PolyMet either... 1)has no idea how long it would take to clean up, but they know this is highly toxic so it certainly will take a long time...2)they really know it would never be able to be cleaned up but instead of saying "Never or Forever", they just threw out a big number instead...3)they don't care what number they say because they aren't going to clean it up and why would they, it's not even their country to care about. And what company would even last 500 years, let alone follow through with their clean-up in a foreign country in which they only got 20 years of product out of? It's very rare that you hear of companies that are 100 years old. Researching this PolyMet company shows that they are not trustworthy, unethical, and have no concern for the land, water, and people (and workers) who live, work, and recreate in the area they are after. Those in favor of this sulfide mine are seeing dollar signs or at least hope to. But, it doesn't matter what kind of mining it is, they just want more work/more money. There is a waxing and waning with many professions and skills, and if the people who are living on the Iron Range are not willing to move to a different location to find it (which is what many people have to do in order to find work), then a new type of profession/skill needs to be created in that area -- however, jobs such as; drug dealers, prostitution, cock-fighting, the mafia, and sulfide mining are not ethical and all of them damage the overall well-being of the greater biotic community, environmentally and socially. The only reasoning behind any support for this mine comes from people wanting jobs in one area of the state that sees waxing and waning from any type of mining operation. The destruction that this type of mining would be irreversible and any local people who might get one of the few jobs created by this mine would likely end up with severe health problems and live in an undesirable environment. The new wave of the future rests on renewable and sustainable. Why not bring in jobs to the Iron Range area that would be on the leading edge of those green industries?	NS	X
25466	Unique			SO	Carly Hawkinson		1191	6	Think of the harm and lasting negative, irreversible impacts that one company could do to so many lives. Many will suffer, many will die, many will lose their jobs across a wide variety of job fields (including state jobs), many will lose their way of life. The high quality of life that Minnesota has with regard to the bountiful and HEALTHY natural environment will be lost if a senseless activity like sulfide mining is allowed. Please, do not permit this type of mining. This type of mining activity does not bode well for the citizens of Minnesota, the visitors to our state, or the flora, fauna, soil, and water resources that we place as highly valuable to our livelihood and well-being. There is real fear sweeping across this state -- please, DO NOT allow sulfide copper mining into this beautiful state we call Minnesota (Mni Sota = clear waters that reflect the clouds).	NS	X
2338	Form Letter	1	Variant	SO	Carol bechtel		322	1	The long-term health of Minnesota's waters & the tourism industry is worth much more than a limited number of jobs for a limited time.	NS	X
27560	Unique			SO	Catherine Brown		1769	1	The state of Minnesota will never recoup the money lost or be able to redeem the state's reputation for clean water and clean politics. Why don't we spend some money creating real sustainable jobs on the Iron Range and training folks to work them? People want jobs -- good jobs, real jobs. Let's make some!	NS	X
2759	Unique			SO	Catherine Johnson		341	5	4) Tourism is a large part of this beautiful area and a toxic spill would result in the loss of many valuable jobs and businesses in the area that rely on tourism. 5) Mining is a very unreliable job venture, as proven by the recent layoffs. A determination to approve just to provide jobs is unrealistic and unsustainable.	NS	X
53	Unique			SO	Cathy A. White		130	4	Money should NEVER a reason to pollute and pillage any untouched land.	NS	X

27414	Unique			SO	Chris Bangs		1732	2	As we've seen from the taconite industry, and I was born and raised in Chisholm in the heart of the Mesabi Iron Range, it is a fickle and short-lived industry. Jobs come and go, the Canoe Country is a truly unique and special place.	NS	X
25945	Unique			SO	Chris Bohler		1249	2	The iron range mining is slowing down and with so many miners unemployed it would certainly help the area.	NS	X
22538	Unique			SO	Chris Heeter		870	1	This risk of contamination and permanent damage to a precious and fragile ecosystem makes the benefits of job creation simply not work. We cannot run the risk of contaminating land and water, particularly when it is impossible to determine how far-reaching that damage and contamination will flow.	NS	X
22538	Unique			SO	Chris Heeter		872	3	And so it falls to you, Governor Dayton, and leaders of agencies tasked with protecting our environment, to make the hard call. To speak and act from our wiser selves, compassionately resisting the pull of a "quick fix" for our employment needs. And standing for wild places that depend on your voice.	NS	X
13	Unique			SO	christie white dauphin		33	4	Is your idea of jobs, jobs, jobs, that this project, if approved will provide the next generations with work cleaning up the inevitable pollution?	NS	X
48	Unique			SO	Christine		117	3	I understand there is employment opportunities within this company however the devastation caused to our beautiful Superior is not in the least bit worth it.	NS	X
8493	Form Letter	3	Variant	SO	Chuck Lyons		580	2	It will also create needed job in north eastern Minnesota.	NS	X
10364	Unique			SO	Claudia Egelhoff		684	2	Financial: the PolyMet financial model does not take into account today's mining costs, metal prices, and realistic financial assurance requirements. Further, it ignores the impact of new technologies that will make use of rare metals obsolete.	S	O
2138	Unique			SO	Coby Maria		307	1	The jobs the mine would provide would be a plus in the short term, but the potential for environmental damage is too great. Northern Minnesota is an outdoor vacation area, tourism also provides a living for many people.	NS	X
310	Form Letter	1	Variant	SO	Colles B. Larkin		170	3	And, at the same time, we must find alternative jobs for our miners; it is the responsibility of our State, our universities and our sustainable industries to do so!	NS	X
13532	Form Letter	1	Variant	SO	Crystal Yakacki		787	3	And nobody is going to make a dime but non-minnesotans and non-working-class people. We cannot afford these kinds of short-sided decisions anymore. Let's put money into building long-lasting jobs, and protect what makes Minnesota special -- our clean water and wilderness.	NS	X
26942	Unique			SO	Crystal Yakacki		1488	2	And nobody is going to make a dime but non-minnesotans and non-working-class people. We cannot afford these kinds of short-sided decisions anymore.	NS	X
27347	Unique			SO	Dan Andree		1696	3	The BWCA and NE. MN. in general has riches far greater than anything that can be taken out of the ground like copper etc. NE. MN. has forests, rivers, lakes, streams, marshes, bogs etc. varied terrain wildlife etc. The BWCA and its interconnecting waterways are so much more valuable than anything a mining company could possibly extract from the land, though Mining Companies may not agree as I feel they are after making money first.	NS	X
23729	Form Letter	1	Variant	SO	Dan Iverson		966	1	Let's suppose Poly-Met and later Twin-Metals and the sulfide mining becomes a reality in Minnesota. Indisputably, jobs will be created and the local economy will receive immediate benefits. Let's suppose also that within a few short months of mining operations the adjacent land and water are necessarily and irreparably transformed. Let's further suppose that after a few short years of operation, the state finds the mining interests EIS data tragically incongruous with the reality of the mining operations that are beginning to compromise with a growing circumference all surrounding lakes and streams like a spreading cancer. But, with legal documents in hand and obligatory inspections and resulting fines paid, the sulfide mining would continue unabated. The locals, already angered that the projected job numbers and rebirth of the Range never materialized, will demand justice and compensation. But, there will be neither. For, no amount of legislation can turn back the clock. Unlike a farming operation in southern Minnesota that is dumping excessive nitrates into the rivers and lakes whereby simply reducing or stopping the practice will immediately start restoring the environment, there would be no such outcome with sulfide mining. Mountains of toxic sulfur laden tailings and lakes of equally poisonous water holding ponds will remain forever a testament to the desperation and short sightedness of a brief and sad time in Minnesota's history.	NS	X
24657	Unique			SO	Daniel Houle		1063	2	by its tail. This is what they are doing to you as a entity... trickery... SAY NO TO THIS MINE AND SAVE OUR BEAUTIFUL LAND THAT HAS SOME SUSTAINABLE JOBS.....JOBS THAT WILL LAST FOR HUNDREDS OF YEARS...HUNDREDS...	NS	X

24062	Unique			SO	Dave Bjerk		1000	1	I am TOTALLY against allowing Polymet or any other mining company mine copper nickel in the Ely area. In my opinion it is not worth the risk of ruining the boundary waters area for 200 jobs for 20 years. If there were to be an environmental disaster, (which I am sure there will be) there would be more than 200 jobs lost in the tourism industry for more than 20 years. I don't believe there can be any assurances that will make Polymet or any other company pay for any cleanup if a disaster happens. History proves this. We the tax payers would once again have to pay for it. My family has a cabin on Eagles Nest #4 by Bear Head State Park, so we do have personal interest in the decision. In conclusion, please error on the side of caution and DON'T allow Polymet to continue with this project.	NS	X
26286	Form Letter	1	Variant	SO	Dave Kisor		1301	1	Look at the recent history of mining in both the US and abroad and you will find disasters where the mining companies poisoned the landscape and got off with chickenfeed fines. The coal mine in West Virginia did an enormous amount of damage and the one that just happened in Brazil was a major disaster. Allowing this to happen is like building dozens more nuclear facilities in Japan after Fukushima, which is still spewing radiation into the Pacific. It's already noted where the pollution will go, so that should be cause enough, but apparently short term corporate profits have taken a front seat to reason, sanity and logic, because that ratsucking so called citizens united gave corporations unlimited political spending, for which some members of Incongruous will be salivating over this potential disaster. This is only my opinion as a retired USFS Physical Science Technician with a BA and an MA in Geography, aside from being a Naval Veteran.	NS	X
27308	Unique			SO	David A. Lien	Minnesota Backcountry Hunters & Anglers	3248	7	We understand that healthy public wildlife habitat, rivers, and streams are the foundation supporting the American pastimes of hunting and fishing, along with a multi-billion dollar outdoor recreation economy.	NS	X
27308	Unique			SO	David A. Lien	Minnesota Backcountry Hunters & Anglers	3253	12	The very lifeblood of northern Minnesota's economy is its healthy watersheds and waterways, but PolyMet's proposed mine waste will be leaching sulfuric acid into those same northern Minnesota waterways "for up to 2,000 years." Is 20 years of a couple hundred sulfide mining jobs worth 2,000 years of poisoned waterways and watersheds that will cost the rest of us millions, and possibly billions, to clean up?	NS	X
27390	Unique			SO	David Brown		1707	2	If MN needs more jobs, then create pollution free jobs, not mining.	NS	X
5495	Form Letter	1	Variant	SO	David Danz		426	2	1. The benefit of the jobs created is far outweighed by the potential risk. The creation of a couple hundred high paying jobs in, and in support of, the mining operation is insignificant compensation in face of the potential risk of exposing our northern Minnesota waters and lands to the poisons leached into them from a copper-nickel mining operation. 2. The lifetime of the economic reward to NE Minnesota is a mere 20 YEARS, while the potential damage to our valuable land and water resources is ETERNAL. This is a lousy trade.	NS	X
25190	Unique			SO	David Myers		1140	1	I fully support the Polymet project. We've spent millions in tax payer money on the EIS. We also pay the DNR and others to do the studies. These people are professionals and if they deem the Polymet project as permit able then there is no reason to say otherwise. Northern MN also needs the jobs and tax base Polymet will bring. I also believe it will be done in an environmentally friendly manner. Please allow the project to move forward.	NS	X
2147	Unique			SO	David Rutford		310	1	I support the permitting of polymet to mine in northern Minnesota. This area of the state is in much need of a diversified employment base and there has not been a company more scrutinized as polymets. Issue the permits and the whole state will benefit!	NS	X

29164	Unique			SO	Deborah Huskins		3614	17	Polymet proponents point to the jobs that will be created by the project. These jobs will not materialize all at one time, nor will they all last for 20 years, the expected years of operation of the mine. Risking the thousands of jobs in parts of the economy that are not subject to a “boom-bust cycle”, including but not limited to those tied to hunting, fishing, wilderness exploration, for a few years of here-and-then-gone jobs is foolhardy. The economic benefits of a Polymet operation should be compared to the economic benefits to the rest of the economy of NOT proceeding with Polymet. This comparison should not only assume a successful operation and favorable market, it should also be done assuming that Polymet is floundering, the market for the copper, nickel, and other minerals is tanking, and the acid mine drainage is damaging the environment—if the environment that the other sectors of the economy depend on is damaged, the economic effects will be stark and long-lasting. Moreover, there is no assurance that the market will sustain operations for 20 years. We should learn from the current crisis in ferrous mining and the layoffs of hundreds of people on the Iron Range. Why should we create yet another industry that is subject to such widely fluctuating market conditions, with the severe economic hardships that result, and that themselves result in further social impacts?	S	O
27675	Unique			SO	Deborah Mielke		1838	6	The 500 jobs created will last for only 20 years, then will be greatly reduced. These kind of jobs do not contribute to a sustainable economy in the area.	NS	X
27675	Unique			SO	Deborah Mielke		1840	8	I also do not think the NorthMet Project benefits the state of MN other than generate tax revenue. That benefit may be lost if the future costs to the state taxpayers outweigh these revenues.	NS	X
23255	Unique			SO	Dennis Szymialis		912	6	Count Six That the SDEIS and land exchange analysis arbitrarily and capriciously includes positive impacts of the project and excludes negative impacts including the transfer of the Minnesota tax burden to businesses and citizens away from mining by reserving mineral interests to the State of Minnesota, a practice followed in no other state, hoarding of land for mining exploration, including 940,000 acres in St. Louis County alone, and not discussing and giving public notice of the Minnesota Power/ PolyMet power rate agreement likely to cost citizens and businesses in North East Minnesota more than one billion dollars overthe life of the mine, higher health care costs, decreased recreational opportunities, decreases in tourism related business and income, a destruction of the St. Louis River basin agricultural economy from contamination of irrigation water, and ultimately an economy inconducive to economic redevelopment and conducive to high rates of poverty as has been shown to be the case in most mining communities.	NS	X
27685	Unique			SO	Dennis Szymialis		1851	6	That the SDEIS and land exchange analysis arbitrarily and capriciously includes positive impacts of the project and excludes negative impacts including the transfer of the Minnesota tax burden to businesses and citizens away from mining by reserving mineral interests to the State of Minnesota, a practice followed in no other state, hoarding of land for mining exploration, including 940,000 acres in St. Louis County alone, and not discussing and giving public notice of the Minnesota Power/ PolyMet power rate agreement likely to cost citizens and businesses in North East Minnesota more than one billion dollars over the life ofthe mine, higher health care costs, decreased recreational opportunities, decreases in tourism related business and income, a destruction of the St. Louis River basin agricultural economy from contamination of irrigation water, and ultimately an economy inconducive to economic redevelopment and conducive to high rates of poverty as has been shown to be the case in most mining communities.	NS	X
27685	Unique			SO	Dennis Szymialis		1884	39	ES-40 The Economic Impacts of mining only include allegedly positive impacts and fail to state the negative cumulative economic and social impacts of mining? ES-41 Since the SDEIS puts in issue the economic impact of the PoltMet project it is necessary that the authors specify the basis for and underlying assumptions made in determining the following at ES-40. "Federal, state, and local taxes would total an estimated \$80 million annually. During operations, there would be approximately \$231 million per year in direct value added through wages and rents and \$332 million per year in direct output related to the value of the extracted minerals. As with employment, these direct economic contributions would create indirect and induced contributions, estimated at \$99 million in value added and \$182 million in output."	S	O
27685	Unique			SO	Dennis Szymialis		1885	40	is the portion of \$231 attributable to wages based on the unlikely prospect of a union mine?	S	O
27685	Unique			SO	Dennis Szymialis		1924	79	p.4-319 "represented by the loss of so many iron industry jobs" -This statement is taken out of context and in fact a complete and accurate reading of Powers is that these jobs were consolidated by the industry due to efficiencies. The whole of the report by powers should be up for consideration in order for it to provide a fair context.	S	O
27685	Unique			SO	Dennis Szymialis		1925	80	p.4-322 The poverty and ignorance of the communities are typical of mining communities in general and should not be encouraged with more mining and empowerment.-Powers-.	NS	X
27685	Unique			SO	Dennis Szymialis		1926	81	p.4-325-26 -factors not included by Powers include tax policy which promotes mining, the MP PolyMet power utility agreement, the IRRRB which administers most of the funds indicated on p.4-332 and funnels public tax money back into mining arbitrarily, increased health care costs mining areas, displacement of agricultural jobs at the expense of mining, etc. -why is no LQ value analyzed for long term job losses in regional agriculture due to pollution from mining and at the expense of mining pollution?	S	O
27685	Unique			SO	Dennis Szymialis		1927	82	p4-326 -mining has displaced the potential for additional tourism. It is misleading to say they exist harmoniously. -the Iron Range is a community that has blessed by rich mineral deposits and a hundred years of prolific mining. In spite of operating in relatively clean iron oxide deposits they have managed to pollute the environment. Now they are crying to engage in mining that has historically had a poor record of toxic waste discharge. Their is no reason to believe they will do any better this time around. No amount of patronization will change anything. It is unconscionable, in the context of an EIS, for an agency to disregard an industry that is an economic predator and facilitates a culture of environmental degradation.	S	O
27685	Unique			SO	Dennis Szymialis		1928	83	p4-340 "Grand Portage's subsistence fish consumption averages 144 grams/day, five times higher than the MPCA assumed fish consumption rate of 30 grams/day. Fond du Lac's subsistence fish consumption is on average 60 grams/day, two times higher than the MPCA assumed fish consumption rate (ERM 2012). The effects of mercury bioaccumulation on subsistence activity are discussed in Section 5.2.10.2.6." -mining has a disproportionate impact on the poor and minorities. Government ownership of large tracts of land for the benefit of mining contributes to an evasion of property tax payments and contributes to homelessness by resticting access to land for residential building.	S	O
27685	Unique			SO	Dennis Szymialis		2016	171	Further degradation of this area by trading it for more mining degradation only serves to further cripple the ability of a once thriving agricultural community to recover from mining. Further, it lessons the value unjustly and to the detriment, of the community, state, of surrounding lands. These ongoing economic policies corruptly and foolishly promote special interests at the expense of individual landowners.	NS	X
27685	Unique			SO	Dennis Szymialis		2018	173	Agricultural production needs to be protected from contamination and a healthy agricultural economy needs to be preserved.	NS	X
27685	Unique			SO	Dennis Szymialis		2036	191	under The no action Alternative Colby Lake augmentation would not occur. Benefits of tourism and cleaner environment would accrue. Race relations with native tribes would be improved.	S	O
27685	Unique			SO	Dennis Szymialis		2068	223	The Northeastern Minnesota area deserves a chance to build an economy not dominated by the effects of mining. Northeastern Minnesota has been subjected to the burden of one-hundred years of mining, it is someone else's turn.	NS	X
25039	Unique			SO	Doug Jones		1128	1	I am opposed to approval of the Poly Met mine. I do not believe that the State and the Northern portion of our State will be well served by this new mining operation. The potential pollution during operation and pollution after the operation ends are not worth the minimal benefits. We can create jobs without compromising the environment.	NS	X
3562	Unique			SO	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2903	7	THE RISK TO OUR REGIONAL ECONOMY OUTWEIGHS THE BENEFIT The value of jobs now is real, in any number. We all rely on mined products. And yes, copper mining has to happen somewhere. However, we believe this type of mine, in one of the world's great freshwater resources, is too great a risk. We know some people will take issue with us getting involved in what is perceived to be a political issue. Indeed, a recent article in the newspaper - without a clear explanation of our position - was enough to cause some of our customers to boycott our products. This is an economic issue resulting from an environmental issue. We believe the risk to the environment poses a long-term threat to the regional economy that far outweighs the short-term benefits.	NS	X
3562	Unique			SO	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2904	8	OUR REQUEST: INVEST THE MONEY THE STATE WOULD SPEND ON POLYMET IN SUSTAINABLE LOCAL BUSINESS DEVELOPMENT INSTEAD There is an alternative to the boom and bust extraction economy that benefits foreign corporations and leaves local communities worse off in the end. Our locally owned small businesses are proof positive that a more sustainable model is possible. We, and other locally owned businesses, will continue to reinvest the wealth we create into new jobs over the next 20 years. And there's another important resource on the table the money the state will spend on environmental review, permitting and regulation of PolyMet. We call on Governor Dayton to reject the PolyMet proposal, and instead invest that state money in sustainable local small business development on the Range. This investment has the potential to make a larger and longer-term impact than the proposed copper-nickel mining project.	NS	X
27730	Unique			SO	Dr. Kyle R. Crocker		2123	2	And in exchange for what? Jobs for a hundred largely out-sourced workers for twenty years and huge profits for an utterly inexperienced foreign owned and financed company.	NS	X
8768	Unique			SO	Dyke VanEtten Williams		605	1	Nowhere do I see an economic or aesthetic analysis - hence your "study" is in no way complete and no permits should be issued until ALL affecting factors are considered.	S	O
27406	Unique			SO	Edward Pendleton		1719	3	As a result this will destroy the recreational industry effecting many more jobs that will be created.	NS	X
5982	Form Letter	1	Variant	SO	Elaine Thrune		443	2	No amount of "new jobs" would be worth any risk of degrading the health of Minnesota citizens, adults and children, and those who visit our state, and the livestock and pets who use the water. No amount of taxes or jobs is worth any risk of degrading our precious Boundary Waters Wilderness Canoe Area or any of the surrounding areas that feed into it or drain from it, nor any risk of degrading any part of the North Shore or Lake Superior drainage. No amount of jobs or taxes or temporary prosperity is worth the risk of degrading surface and groundwater and causing harm to any wildlife, including endangered, threatened and species of concern, including the northern goshawk, great gray owl, lynx and moose. Whatever enters the environment and water affects EVERY size of every species of every plant and animal, including humans. No amount of jobs or taxes is worth impairing tribal resources. No amount of jobs or revenue is worth degrading Minnesota's tourism through poisoning our environment--water, air, land, beauty, and aesthetics of any kind. And no amount of additional extracted metals are worth any of the above!!!!	NS	X
23088	Form Letter	1	Variant	SO	Elinor Ogden		897	2	In addition, I feel that allowing a non-US company, whose net profit will leave the US, to conduct mining without tight environmental controls is a very bad idea.	NS	X
27836	Unique			SO	Ellen Hawkins		2190	13	There is no consideration given to the thousands of good jobs in northeast Minnesota that rely on a healthy environment. Instead, there is a cheering section for the promised mining jobs and spin-offs based on an economic model that pretends to calculate the alleged economic benefits but ignores what jobs would be lost, whether jobs will go to transient workers, what happens when the commodities market shifts, or what happens during the bust part of the boom and bust mining cycle. Both of us recently retired from good jobs here in northeast Minnesota that will not be available to others if this beautiful place turns into a mining district.	NS	X

28547	Unique			SO	Esteban Chiriboga	GLIFWC	3553	56	The discussion of socioeconomic effects of the proposed NorthMet project is inadequate. The IMPLAN model is the primary tool for assessing the economic benefits of the proposed project. However, IMPLAN cannot calculate the negative effects of a mine project on other areas of the economy that depend on unspoiled and healthy natural environments (tourism, hunting, etc.). In addition, IMPLAN cannot assess the economic impact of the proposed project on ecosystem goods and services that nature provides to society. An example of these ecosystem goods and services is free water treatment and flood controls provided by wetlands. If the NorthMet project is permitted, thousands of acres of wetlands will be destroyed and their water treatment functions will have to be replaced by a constructed treatment plant costing millions of dollars a year to operate. Recently, an ecosystem services valuation has been completed for the St. Louis River watershed (Attachment B). This document provides many of the data and tools needed to properly assess the effects of the proposed project on the goods and services that the area provides. Tribal cooperating agencies and intertribal agencies asked the co-lead agencies to include the ecosystem valuation information in the FEIS. This request was declined. GLIFWC staff used the information in the Ecosystem Valuation Report for the St. Louis River watershed to characterize the losses in ecosystem services to the watershed as a result of the land exchange and the NorthMet Mine. The analysis of direct impacts includes wetlands filled at both the mine and plant sites. The analysis of indirect wetland impact focuses on the mine site of the proposed project which is the area of the proposed land exchange and does not include indirect wetland impacts at the plant site (Attachment C). This is one of the possible applications of the ecosystem valuation information that should have been done by the co-lead agencies as part of the NorthMet FEIS.	S	O
27678	Unique			SO	Faye Topliff		1759	3	There is no amount of money worth the possible contamination occurrence if PolyMet is allowed to move forward .	NS	X
23524	Form Letter	1	Variant	SO	Flint Krupinski		958	1	Destruction of these habitats and all the life that depends on them is not worth the environmental backlash for years to come for temporary resource gains now. most of these mining ops are about the profit, and not about what is going to happen to the environment during and after they've reached maximum profit and decided to abandon the mining operation.	NS	X
23524	Form Letter	1	Variant	SO	Flint Krupinski		959	2	i can safely say that Minnesota and the people who live here will not stand for the destruction of our state for big mining corporation's minimal gains while our states beauty is destroyed, polluted and almost inhabitable for the life that once lived there cannot return.	NS	X
55	Unique			SO	Gary Geisler		135	3	Sacrificing this invaluable future resource for a lousy 350 mining jobs is utter madness!	NS	X
29965	Unique			SO	Gary Glass		4283	46	Accumulative Economic and Social Cumulative Effects (Tab. 4.10-14) omits at least three potential probable negative impacts from the potential health and safety hazards associated with the proposed project. Probable human exposures and negative impacts known (4.6-57) to be caused from exposure to mineral fibers in air may led to increases in lung cancer, asbestosis, and mesothelioma over the present baseline numbers, as well as increases in asbestosis over current known numbers of cases. This increased exposure most likely will lead to increased mortality and higher incurred health-care costs in the working population, and may well produce a number negative and cumulative impacts which are presently omitted from this analysis. These omissions must be corrected, and reasonable assumptions for probable and possible exposure-cause-effect impacts presented and evaluated. In addition, giver the predicted direct increases in mercury emissions, and the increased methyl-mercury conversion rates from increased sulfate concentrations from the proposed project in downstream St. Louis river reaches and reservoirs where high concentrations of legacy mercury have been deposited in surface sediments, including the St. Louis river estuary and the Western Arm of Lake Superior, will cause increased in mercury exposures and toxicity due to increased mercury exposures in the general fish-consuming population and populations of Native Americans whose subsistence diets depend on much higher diets of wild animals including freshwater fish, than the general fish-eating populations. These increased exposures may lead to poorer health conditions and higher health-care costs, as well as higher costs from alternative diets should fish-mercury concentrations reach levels judged unsafe for human consumption. The high probability for these negative condition and negative impacts to occur are presently omitted from this DEIS and must be added to the final EIS given the certainty of the predicted increases in both mercury emissions and methyl-mercury rated of conversion and increased toxicity and potential health impacts from the proposed project.	S	O
3854	Form Letter	1	Variant	SO	Gary Gross		385	1	I support the current PolyMet NorthMet copper-nickel sulfide mine proposal. Let's get this thing built ASAP so that the hard-working people on the Range can find meaningful employment.	NS	X
28301	Form Letter	1	Variant	SO	Gary Horning		2245	2	2- I could not find where the Division of Tourism has been involved. I say that because I could not find anywhere what the effect on tourism would be if such things as water, wetlands, vegetation, wildlife, fishing etc.became effected because of pollution from this mine. That needs to be addressed.	S	O
30284	Form Letter	1	Variant	SO	Gregory Klave		2846	1	Studies show this is a bust boom for economy and is not sustainable. Also threat to ground and surface waters and wild rice environment.	NS	X
12609	Form Letter	1	Variant	SO	Henry Hark		763	1	I oppose the Polymet mine project because 25 years of jobs is not worth the destruction of the most visited wilderness area in the country.	NS	X
27669	Unique			SO	Hunter Gilbert		1824	1	I am writing you because I think even if the risks have a chance ofhappening, I still think it is totally worth it. I think it is totally worth because the way the steel economy is going and the :fuct that we already have one mine shut down, I think it is very very important otherwise not only will the iron range suffer, the whole state ofMinnesota will suffer.	NS	X
29845	Unique			SO	Jack Ray		2666	1	I oppose this project. It is unsound economically, environmentally and socially. It stands to be an economic drain on the people of Minnesota for generations.	NS	X
387	Unique			SO	Jacob Davis		191	3	Unemployment is steadily decreasing and our economy strengthening; yet this state is willing to gamble away its precious land and water resources, which generate tax dollars and jobs already, in the name of jobs and economic impact?	S	O
387	Unique			SO	Jacob Davis		192	4	It wont be hard for me and others like me to take our education, professional knowledge, and talents to another state which doesn't abuse its people and resources.	NS	X
24219	Unique			SO	Jacqueline Bartosh		1012	1	I strongly oppose the PolyMet project, or any copper/sulfide mining project in such a wetland region as Northeastern MN. Such a project is risky and highly dangerous to the ecosystem. Plus, PolyMet isn't in our best interests being it's not a local company, doesn't have a backup savings so taxpayers don't have to pay for cleanup after they're gone, and cannot manage the sulfur issue indefinitely or plans to. The few jobs it creates are temporary short term with long term consequences. Please, for the love of all that's good, don't allow this project to go thru. We humans have done enough damage to this planet.	NS	X
26824	Form Letter	3	Variant	SO	James and Marianne Potratz		1471	2	The first phase of the Polymet production initiative will result in 350 permanent well-paying jobs. The economic fallout will be enormous at the local, county, and state levels. This is in addition to hundreds of construction jobs in the rehab of the old steel mill.	NS	X
25033	Unique			SO	James Henderson		1127	1	I am opposed to the NorthMet Mining Project, known as PolyMet. I am so opposed to it I cannot tell you how much in words. I have a visceral disgust at the thought of the project and the destruction and pollution this mine will cause, for so little and for so temporary a gain. There is no logical way to talk against this mine because the very concept of if is so illogical. Why, I ask myself, would anyone even propose such an awful thing? It would be another part of our world sacrificed, our water made undrinkable, and our land destroyed for monetary profit that cannot hope to ever compensate in financial gain for what is lost in our Minnesota way of life.	NS	X
25970	Unique			SO	James Kayfes		1251	1	The Iron Range community deserves this mine and the jobs that go with it. We have been mining for years up there, we know what we are doing and most certainly DO NOT want to harm the environment. I was born and raised on the Iron Range, have you been up there lately, their communities need the work.	NS	X
26995	Unique			SO	James S.		1512	2	The employment opportunities can be significant but only for a limited number of years. I implore the responsible parties to think long term rather than short term.	NS	X
10	Unique			SO	Jana Guseynova		22	7	This mine that promises to provide 350 jobs for twenty years has no place jeopardizing the thriving tourism-based economy that sustains 18,000 jobs annually.	NS	X
29810	Form Letter	1	Variant	SO	Janelle Carlson		2647	3	I feel that's exactly what is happening with copper mining; deception. Deceiving talking points like "We support Mining" are deployed on a region and people that are in need of jobs. I've seen this strategy utilized before by many corporations wanting to bring a dangerous industry to a region by continually downplaying the risks and confusing and distracting the public with their promises of jobs. The bottom line for any corporation is making money and they've proven time and time again that they seem to have little regard for the well being of humans, animals, the environment, or even the planet. They take short cuts and risks if it will save them a nickel. To take such a risk with our precious water and environment is totally insane to me. We need environmentally progressive jobs and we can find much better ways to employ people. I will never be convinced that this is type of mining is safe and can't believe that the state is even considering this. This gives added meaning to the phrase "risky business".	NS	X
28489	Unique			SO	Janet McTavish		2291	1	The nickel resources belong to the public and as a member of the public and a Minnesota resident and tax payer, I Do Not give my permission for a private Company to use this resource of mine to make a profit at the expense of the public.	NS	X
29286	Unique			SO	Janet Nye		2491	1	We all need fresh and unpolluted water to drink, and in view of that we need an economy based on things other than those obtained by invasive, polluting methods.	NS	X
29286	Unique			SO	Janet Nye		2492	2	There are other jobs in areas that would actually benefit the environment. These need to be recognized and made available for the many people who are out of work.	NS	X
29839	Unique			SO	Janice Ann Smith		2657	6	The number of people to be employed by the industry does not outweigh the risk for severe and permanent environmental damage.	NS	X

25399	Unique			SO	Janice Burns		1177	1	I am opposed to copper nickel mining. First it is an environmental disaster waiting to happen and second these are jobs that are simply not good long term steady employment. Money needs to be invested in finding truly sustainable jobs on the range.	NS	X
27411	Unique			SO	Jared Yount		1728	3	We need to look at other ways to get jobs to the iron range. The cost of the material they are going after has been sliding as well.	NS	X
15169	Unique			SO	Jason George	International Union of Operating Engineers Local 49	2923	2	There is heightened interest in this project right now because of the incredibly dire situation facing workers on the Iron Range. While we wait, construction workers are being laid off, and two million construction work hours at Poly met sit idle. 350 family sustaining jobs in operations are unfilled while thousands of skilled people are without jobs.	NS	X
29282	Unique			SO	Jason H. Kuehn		2490	3	The substantial health and environmental risks involved in this venture significantly outweigh any marginal benefit that would be gained	NS	X
76	Unique			SO	Jason Kuehn		147	2	The proven risks and ensured negative outcome resulting from such a mine is not worth the minuscule benefit to our economy.	NS	X
27686	Unique			SO	Jason McCall		2071	3	Many jobs in tourism and related businesses will be lost. Other businesses will not come here and some may leave. Property values will decrease, while property tax will go up to make up the difference for those not coming and those leaving.	NS	X
28734	Unique			SO	jdmalcolm@wildblue.net		2333	2	This is an unacceptable risk to take based on the number of permanent jobs that it may create.	NS	X
28734	Unique			SO	jdmalcolm@wildblue.net		2334	3	In the past we have heard that most of the time these companies bring in their own employees to fill the good paying jobs leaving the bulk of the employees subject to “boom and bust” cycles. Also, it is only a matter of time and the ore is gone and so are the jobs. Witness what is happening in the iron ore mining right now. This is a short term economic boost for a region that needs a long term plan for the future.	NS	X
28734	Unique			SO	jdmalcolm@wildblue.net		2335	4	If/when there is a major leak, their prospects for encouraging other businesses to locate in the area will be greatly diminished. The wealth of this area is in the unspoiled area that is hard to come by in this day and age. We must protect it and work to help the economic prospects for the people of the area to find a long term solution to the problem.	NS	X
27421	Unique			SO	Jeff Bryan		1737	2	These toxic byproducts of the mining will last many times longer than any economic benefit to the iron range.	NS	X
27970	Form Letter	1	Variant	SO	Jeff Conrod		2237	2	The beauty of the BWCA is too great to risk. What if the claims that the mine won't hurt the BWCA or anyone or anything are right but we don't approve the project? What do we loose? We loose some jobs that will go away when the mine closes (in 30 years?) and we lose the use of the minerals that are extracted. But what if the claims are wrong? What do we loose? We loose thousands of jobs, clean water, the BWCA and all the other things you have been told about already. Which way would you rather be wrong? Please please please oppose the proposal! Please protect our water, plants, animals and our health.	NS	X
26627	Unique			SO	Jeff Schroeder		1374	3	As I understand it, the consequences of more sulfate mining is that the states water quality will deteriorate, the question becomes is the long-term environmental degradation worth the temporary increase in the number of good paying jobs and a temporary increase in state revenues?	NS	X
4557	Unique			SO	Jeff Wehr		410	2	It just seems mining co lie a lot and do not bring the jobs that they claim to the area.	NS	X
29254	Form Letter	1	Variant	SO	Jeffrey Morrison		2463	1	While the mine would bring economic activity to northern Minnesota, the environmental impact is too high.	NS	X
27067	Unique			SO	Jennifer Church		1649	3	No one has the right to risk the lives of others’ children for the sake of such short term profits.	NS	X
29358	Form Letter	1	Variant	SO	Jennifer Hengelfelt		2508	2	I ask that there is better disclosure as to how polluted air, water and loss of wilderness qualities will impact the sustainable local economy.	NS	X
748	Form Letter	1	Variant	SO	Jenny Dahl		258	2	Yes, mining generates jobs, but they are ALWAYS temporary. They always put at risk the potentially permanent tourism jobs. Moreover, I personally believe clean water will be the "oil" of the next generation -- worth big \$ and fought over. So please let's not put water -- our invaluable, irreplaceable, and to some degree uniquely Minnesota -- resource at risk for some temporary jobs.	NS	X
27691	Unique			SO	Jessica Diamond		2087	4	This is an unacceptable trade-off for employment in Minnesota. Jobs that lead to devastating destruction of freshwater and resulting health hazards, jobs that destroy one of the nation's most pristine and precious wilderness areas -these types of jobs are terrible for Minnesota.	NS	X
27691	Unique			SO	Jessica Diamond		2088	5	once PolyMet and the other mining companies extract copper, nickel and platinum from the region -these jobs will disappear forever yet from that point on a key source of potable drinking water and wilderness area will forever be tainted. The net environmental impact is terrible, so much worse than today's chronic underemployment because there is no way to clean up dispersed heavy metal pollution.	NS	X
261	Unique			SO	Jim and Diane Malcolm		132	6	Property values would plummet and the tourism which that area of Minnesota greatly depends upon, would decrease significantly.	NS	X
261	Unique			SO	Jim and Diane Malcolm		161	8	I understand their reason for supporting the mine because of the need for jobs in the area. But, there really is no guarantee that the mine will actually provide good paying jobs for those who now live in the area. It often is the practice of these companies to bring in from outstate, people to fill the high paying jobs claiming there weren't any local people trained or educated to fill those jobs. The jobs left for local citizens will be unstable as they will be based on the demand for copper When people are laid off the state will be left to pay unemployment.	NS	X
28475	Unique			SO	Jim and Diane Malcolm		2256	4	Property values would plummet and the tourism which that area of Minnesota greatly depends upon, would decrease significantly. My family are campers, hunters, and fishermen. Our lakes and streams are suffering already. We can't afford to risk damaging them further. That region of Minnesota depends a great deal on tourism. If that source of income and state revenue is taken away, the people in the area will have an even greater difficulty sustaining their way of life.	NS	X
28475	Unique			SO	Jim and Diane Malcolm		2257	5	I understand their reason for supporting the mine because of the need for jobs in the area. But, there really is no guarantee that the mine will actually provide good paying jobs for those who now live in the area. It often is the practice of these companies to bring in from outstate, people to fill the high paying jobs claiming there weren't any local people trained or educated to fill those jobs. The jobs left for local citizens will be unstable as they will be based on the demand for copper When people are laid off the state will be left to pay unemployment.	NS	X
28475	Unique			SO	Jim and Diane Malcolm		2258	6	If would be much more beneficial to the region to look elsewhere for companies willing to relocate in their area of Minnesota. There is some new businesses doing quite well in northern and northwest Minnesota. Look to the real and long lasting future. Many people would love to live there. New startup companies would be a good place to start for recruitment. We need to stop looking at "today" and plan for the future.	NS	X
25972	Unique			SO	Jim Pounds		1254	2	Jobs would be lovely but they can no longer come at the expense of reduced habitat and ground water contamination.	NS	X
23917	Form Letter	1	Variant	SO	Jim Steitz		978	8	Please issue an SDEIS that fully accounts for these ecological and financial costs, and find correctly that no mining permits conforming to the public interest can be issued. Thank you for your attention to this issue.	S	O
27904	Form Letter	1	Variant	SO	Joe Moriarity		2227	2	Yes, the mine will provide jobs, but only in the short run. eventually the mine will play out, or a catastrophe will force the State and PolyMet to shut it down... and the latter is the most likely outcome.	NS	X
29034	Unique			SO	Joel J. Olander		2402	1	It is apparent the environmental risks outweigh any economic benefit to Minnesota.	NS	X
26744	Unique			SO	John Buschette		1445	1	The inevitable spill of sulfuric acid and toxic metals will cost thousands of tourism related jobs for hundreds of years. This is a job killer not a job creator.	NS	X
30335	Form Letter	1	Variant	SO	John Buschette		2853	1	The inevitable spill of sulfuric acid and toxic metals will cost thousands of tourism related jobs for hundreds of years. This is a job killer not a job creator.	NS	X
24347	Unique			SO	John Kruse		1026	2	The argument that it will create jobs is rendered less plausible when we see Essar experiencing difficulties meeting its payroll obligations.	NS	X
29269	Unique			SO	John Wild		2477	3	A few temporary jobs are not enough to offset the risks of this venture which include the damage to the 6650 acres and industrial pollution from ongoing operations.	NS	X
30027	Unique			SO	Jon Auel		2775	3	I believe we should focus our efforts on supporting the growth of an already thriving tourist industry, and related service industry jobs, instead of trading the millions of dollars this clean and sustainable industry currently adds to Minnesota's economy each year instead of trading it for a potentially eternally damaging and short-term mining project. It is a guge mistake to believe the Superior National Forest area can support both.	NS	X
2132	Form Letter	1	Variant	SO	Jonathan Baker		305	5	Certainly there will be short-term benefit to members of the public who will obtain employment at the proposed mine, but those benefits will be short lived.	NS	X
27807	Unique			SO	Joseph Butler		2149	4	My Personal Future. As noted above the economy in northern Minnesota can be very cyclical; it has and will continue to have a financial impact on me personally. I will work on this project, and it will have an immediate boost to financial security, but it will also improve the overall economy of Minnesota, creating long term security.	NS	X
27807	Unique			SO	Joseph Butler		2150	5	Future of Friends and Family. In addition to impacting me personally, this project will provide immediate and long term financial stability for many businesses. Whether they are directly linked to mining or construction or just receive revenue, second, third or fourth hand, this new mine will improve the lives of the people I care about.	NS	X
29083	Unique			SO	Josh Gregorich		2414	2	I would like to ask you, is approximately 25 years of minerals and jobs (for a few hundred people) worth the risk of decades or centuries of water treatment and/or acid mine drainage into our ecosystem? I think not.	NS	X
29984	Unique			SO	Josh Gregorich		2758	4	I would like to ask you, is approximately 25 years of minerals and jobs (for a few hundred people) worth the risk of decades or centuries of water treatment and/or acid mine drainage into our ecosystem? I think not.	NS	X
24078	Unique			SO	Josh Patrick		1001	1	Say no to the polymet mine. Inadequate long term job creation, tremendous environmental risk, and hundreds of years of environmental impact make this a terrible deal for Minnesota. We cannot commit a half-dozen generations to a clean up fund that polymet will surely excuse themselves from funding as soon as the profits are gone. Protect Minnesota and say no!	NS	X

516	Unique			SO	Joshua Bernstein		224	2	the proposed mine would reap devastating consequences on Minnesota’s ecology, and the long-term damage will far outweigh any short-term benefits in job creation or economic growth. Specifically, the contamination from mine tailings and from the elevated levels of mercury and aluminum in the water will prove fatal for the already-threatened ecosystems.	NS	X
516	Unique			SO	Joshua Bernstein		229	6	While some Minnesotans may support this proposed mine on the grounds that it would purportedly create jobs, the truth is that these supporters have been misled or coopted by the mining industry. Any economic gains would be short-term and primarily limited to the financial stakeholders of the mine, while Minnesotans as a whole will invariably have to pay for the enormous and long-term costs of site repair and environmental cleanup. There is simply no sustainable way to run a mine in Minnesota, as any honest scientist or economist will attest. The best solution for job growth in Minnesota is to promote the industries that can work in harmony with the state’s natural resources, such as tourism and camping, rather than those, such as mining, that exploit those resources for the good of the few. The State of Minnesota can also devote funds to worker training and education, two strategies that are far sounder in the long-run and likely to reap greater economic benefits than destroying the state’s precious lands.	NS	X
4549	Unique			SO	Judith Chervený		408	2	Please, please, please do not allow the mining of these heavy metals to take place in Minnesota. Is 20 years of 350 jobs worth the risk? I don’t think so. The mining companies are only interested in profit. They couldn’t care less about the impact their mining practices have on our communities. They will be gone as soon as they have used up our resources and will go on to other places to woo them into sacrificing their natural resources for a few more years of profit. Will they clean up their mess after they are gone? They say they will, but do you really trust them? If you truly have the best interest of the citizens of Minnesota at heart when making your decision, you will make the right one: not the easiest one; not the one that politicians want you to make; not the one mining enthusiasts want you to make; you will do the right thing and say “No. It’s not worth the price we could very well pay.” And there’s no reversing a bad decision this time.	NS	X
26225	Unique			SO	Kaitlin Seiberlich		1294	11	In summary, I would argue that the FEIS proposed is in no way complete. There are many questions and problems that are left to answer, and in many ways the mine does not seem feasible or logical. I have only addressed five issues. I am certain there are many, many more. I would encourage people to think critically, and also not to simply look at the economic effects of the mine, but also at the social destruction that would result from the establishment of the mine. Large sections of Northern Minnesota host recreational activities year-round for people that come from all over the United States. If the mine were to be established, that activity would either be forced to move, or cease entirely. That would result in a massive loss of economy and jobs to those areas. That is something that cannot be allowed to happen. If the PolyMet mine is allowed to establish itself, that is the beginning of the end for pristine wilderness. I urge you to think about the fact that though the mine could be established by 2018, those who will be responsible for the clean-up and restoration of the area are your grandchildren.	NS	X
27736	Form Letter	1	Variant	SO	Karen Eckman		2129	3	Jobs today mean nothing if future generations have to leave the area anyway to find clean water.	NS	X
26679	Form Letter	1	Variant	SO	Karen Kormann		1438	3	Of nearly equal significance is the lack of attention given to the real issue in Northern Minnesota: the economic needs. With or without Polymet, this area needs fresh approaches to creating a healthy and liveable area with opportunities for a different kind of livelihood and reputation.	NS	X
29809	Unique			SO	Karen Williams		2638	3	This "bust and boom" industry puts the economy in danger, especially the billion plus dollar tourism.	NS	X
25356	Unique			SO	Karl Meller		1158	1	As I have said before there is a danger of moving too fast on Poly Met. The state seems to back off a health assessment due to possible liability. Another thing that worries me is that the state seems to take some of Poly Met’s data at face value. Doing that is like letting the company investigate itself. When some one negotiates with themselves they never lose. If the state guesses wrong on the copper mine and the water is ruined, the relatively few jobs for a rather short period of time would not be worth the damage. While it is true that good paying jobs are needed on the Iron Range these jobs should not be at the cost of enviornmental damage. If the water is damaged that could impact in negative way the tourist industry which has provided jobs for many years. The last thing Minnesota needs is a rush to judgment on Poly Met which could cause long term damage to the state and the region	NS	X
22565	Form Letter	1	Variant	SO	Kathleen Hills		726	1	The destruction of a significant portion of our forestland is not worth a few jobs for a few years.	NS	X
1701	Form Letter	1	Variant	SO	kathleen kelnberger		284	2	I see no gains to be made by Minnesota in pursuing this mining proposal. It will mean the destruction of the thousands of permanent jobs supported by those who travel to the BWCA each year. We are giving that up for a limited (I believe I read 30 year) extraction of an ore which is close to 99% waste. Putting that waste in water, in an already failing tailing pond, is insanity of the worst dimension.	NS	X
32	Unique			SO	KatieWilli@aol.com		97	5	I am also a property owner on the end of the Gunflint Trail and I am concerned that development of sulfide mining will negatively impact my property value.	NS	X
25400	Unique			SO	Kay Brandt		1178	1	Temporary jobs do not justify the environmental impact that will eventually happen as we are humans whom make lots of mistakes in monitoring and doing everyday tasks. I put no faith that this will go fourth with complete and perfect monitoring. The ecosystem is more important and will be here long after us. The jobs are temporary. Not worth the small monetary gains compared to our earth.	NS	X
27893	Unique			SO	Keeley Todd		2218	2	The mining industry has served its purpose in Minnesota during the 19th and 20th centuries. To open up the Star of the North state to further destruction of the environment for the benefit of a few years of profit and a few jobs in the future, with the likelihood of destruction of the Lake Superior and Rainy River watersheds is in my opinion irresponsible to future generations. You are well aware of the high risk of pollution from PolyMet so there is no need for me to elaborate here.	NS	X
27893	Unique			SO	Keeley Todd		2219	3	Mining in the past has been very good to northern Minnesota however, now is the time to look for other, more sustainable means of economic stability. All you have to do is drive from the Western Mesabi on Highway 169 on up the range to see the impact an unstable mining industry has had. Houses and businesses sit empty and unkempt because the labor force has had to move on. People who live on the Range need stability, not feast or famine. Industry that is tied to global market fluctuations is not stable.	NS	X
27994	Unique			SO	Kelly G. Ramer		2243	1	The risk of the North Met is not worth the reward. Our watersheds in MN are so precious, we must protect them with all that we can.	NS	X
1084	Form Letter	1	Variant	SO	kelly hemsath		270	2	350 jobs is one of the most laughable parts of this proposal. Where is the breakdown of income and positions for these ridiculously low number of created jobs? There are so many companies looking for workers in a 200 mile radius that to destroy an entire ecosystem for the profit of overseas CEO's is what makes this deplorable.	NS	X
26854	Unique			SO	Kenneth Swanson		1478	6	Yes Hoyt lakes Mn. is struggling all the mining town on the range are but 20 years of jobs does not make up a good reason to pollute for centuries	NS	X
379	Unique			SO	Kevin Kramer		183	2	This project will not create any more jobs than your average grocery store.	NS	X
24060	Unique			SO	Kristin Whatton		999	1	My family is very concerned about the water for years and years to come if the mining project were to pass. Our long term water supply is far more important than the short term benefit the mining would provide. Not only are we compromising the water if it passes, but the beauty of Northern Minnesota including the Boundary Waters and the North Shore. It isn't worth it!! Please do not let PolyMet proceed with their plan to mine in this area.	NS	X
29794	Unique			SO	Kristine Vesley		2617	2	I too would love a nice job up north, but I would not seek it at the expense of our irreplaceable natural resources. What is more important? Painfully extracted copper? Or water? And peace of mind? We have to stop the destruction sometime. Why not here and now? Minnesotans are tough. We will figure out new economic solutions.	NS	X
29850	Form Letter	1	Variant	SO	Kyle Lind		2682	13	Let's not let our enthusiasm over this exciting opportunity to bring good paying jobs to the Range cloud our judgement. The writing is on the wall, all available evidence points to Poly Met and their proposed open pit hard rock copper nickel mine being a huge mistake. That is why Rebecca Otto our state auditor, and our leading health professionals have been so critical of this project. The metals lying below the surface are only valuable to the state of Minnesota and it's citizens if they can be removed responsibly (aka not how Poly Met is proposing) and once they are removed only if the mine operation can be closed down in perpetuity by the mining company with no additional input or perpetual treatment.	NS	X
29898	Unique			SO	Laura Carrero		2695	3	No number of jobs, which are only temporary (perhaps 30 years worth), are worth the possibility of pollution in the Boundary Waters.	NS	X
29898	Unique			SO	Laura Carrero		2696	4	Also, if something happens, like the mining waste that flowed into rivers in New Mexico this year, there will be countless jobs lost when tourism decreases as a result.	NS	X
27121	Unique			SO	Laverne Wagner		1662	1	I worked and retired from the Iron Mining Industry and understand the need for jobs. The cost and risks of environmental catastrophe however greatly outweighs the short term job growth.	NS	X
27121	Unique			SO	Laverne Wagner		1665	4	Lets look at employment. The Mining Industry is a boom and bust industry. How many times on the Range have we seen the Iron Ore/taconite business go from booming to double digit unemployment . This will be the same with copper/nickel prices and supplies also. Could the Iron Range use the jobs of course they can, but not at the costs of environmental disasters that affect our health, our tourist industry and land owners who have cabins and summer homes on lakes nearby.	NS	X
27689	Unique			SO	Lea Foushee	North American Water Office	3272	2	Surface water and surficial groundwater from the NorthMet Project Mine Site flow to the Partridge River and the Plant Site mostly drains to the Embarrass River with the exception of Second Creek (Partridge River Watershed). Both rivers are tributaries to the St. Louis River, which flows to Lake Superior. Tourism is an economic mainstay in the Lake Superior region. Destruction of lands and forests over the acreage of the project and beyond, which is certainly plausible, if not probable in times to come, would detract or eliminate tourism in the area affected by development.	NS	X
2539	Form Letter	1	Variant	SO	Leah Nelson		330	1	While PolyMet claims that sulfide mining will "diversify" the mining economy, I feel that it is not the kind of economic diversification we need in northern Minnesota. We need to protect our sustainable industries that depend on environmental health for the future hundreds of years.	NS	X
2539	Form Letter	1	Variant	SO	Leah Nelson		331	2	I dread to see the day where the PolyMet 'bust' occurs and people are out of jobs along with loss or degradation of our most precious natural resource - water.	NS	X
25506	Form Letter	1	Variant	SO	Lee Kaplan		1192	1	Now, you may think this is a perfectly good plan. Look at all the jobs that will be created. Hundreds of them! What could possibly go wrong? The risks inherent in the PolyMet plan are obvious; the potential benefits do not justify taking these risks. It's not even a close call.	NS	X

26141	Form Letter	1	Variant	SO	Leslie Limberg		1274	2	Our economy can grow in several other ways. Please find alternatives more sensible for people.	NS	X
9166	Unique			SO	Levi Hurley		622	1	My thoughts are that if this mine does not go forward, with all the work that has gone into the Final EIS, I’m not sure how any mining operation can possibly be permitted in Minnesota and actually go into operation. It makes me wonder if the state is interested at all in the good jobs, and the economic advantages that would result from this mine operation. What a shame it would be if it falls by the wayside. This mine has been looked at every which way possible for risk of every possible type one could imagine. It is time to move this project forward!	NS	X
24246	Unique			SO	Linda Tyssen		1019	1	We just need to look at how many miners have been laid off -- and with no word on when they will be called back to work.	NS	X
28556	Unique			SO	Lindsay Sovil		2327	2	Mining is not the key to Ely’s long term economic success, and even if it were, the price to be paid is far far too high. What damage this project will do can never be undone.	NS	X
438	Form Letter	1	Variant	SO	Liz Bercaw		204	2	As citizens, we understand that we seek to approve mining in MN for the sake of jobs, stability for some people. While this is honorable, the number of people who suffer both now and in the future will be much greater if we continue with this short term way of seeing.	NS	X
29080	Form Letter	9	Variant	SO	Liz Dahl		2412	5	Can't we develop clean industry in Minnesota to create lasting jobs while protecting our land and water?	NS	X
29740	Unique			SO	Lori Andresen	Save Our Sky Blue Waters et. al.	3913	28	The PolyMet FEIS is inadequate because it is an appeasement plan for a marginally economic mining operation. The plan will allow a foreign mining company to make a profit at our expense and at the expense of the environment of northeast Minnesota for all generations to come.	NS	X
29370	Unique			SO	Lori Olinger		2524	9	The opportunity to add 450 job for the next 20 years is not worth the environmental and financial risk. There are too many questions that have not been answered and disagreements that have not been resolved. The FEIS is a ‘Happy Path’ assessment that focuses on what is expected to happen if everything goes according to plan. But everything won’t go according to plan. Copper mining has a very bad track record and this FEIS has not addressed all the possible issues and eliminated alternative mining options prematurely. We should wait until there are safer ways to mine this copper without the huge environmental risk. We should not approve a plan with such high probability of severe problems which cannot truly be fixed	NS	X
28476	Unique			SO	Lyndon Nurmi		2260	2	That being said, we also want the jobs so our young people can stay up here, find jobs in ‘GOD’s Country’.	NS	X
26648	Unique			SO	Margaret A. Redmond		1401	11	How is it that Minnesota thinks that it’s OK to run yet another experiment so close to such a fragile area as the BWCAW and its surrounding waters? Tourism, recreation, second homes, and related services bring in a large amount of money, and are utterly dependent on clean water.	NS	X
29397	Unique			SO	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3819	113	Executive Order 12898 specifically identifies Environmental Justice issues to be addressed regarding Native American Populations.311 But in the SDEIS Socioeconomics chapter, none of the issues identified in the Executive Order have been addressed, despite the Band repeatedly asking for further analysis. It is the Band’s position that any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife, and gathering of traditional plants and medicines within the 1854 Ceded Territory. Native Americans should be specifically evaluated as an affected population throughout this section.	S	O
29397	Unique			SO	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3824	114	The analysis of socioeconomic impacts resulting from the Project is woefully inadequate. The IMPLAN (“Impact Model for Planning”) model was the primary tool used to assess the economic benefits of Project. However, IMPLAN is only able to calculate the Project economic benefits, and cannot calculate the “bust” side of mining’s known “boom and bust” economic activity. And IMPLAN has no capability to determine the negative effects of a mine project on areas of the economy that depend on unspoiled and healthy natural environments (e.g., hunting, fishing and gathering, or tourism). Further, IMPLAN cannot assess the economic impact of the Project on ecosystem goods and services that nature provides to society (e.g., no-cost flood control and water treatment).	S	O
29397	Unique			SO	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3825	115	But the value of natural resources maintained in good condition is simply not represented in the FEIS. Nor is the economic value of clean water provided or assessed. EPA’s guidance even provides a monetary value for water resources, but the Co-Leads failed to take this into account. Instead, the socioeconomic evaluation is simply a discussion of the short-term benefits of the Project, without evaluating long-term socioeconomic effects of the loss of healthy watershed ecosystems on communities during and after mining ceases. Fond du Lac provided an ecosystem services valuation completed for the St. Louis River watershed. Every year, the ecosystem services of the watershed provide \$5 billion to \$14 billion in economic benefits. Despite mining activity in the headwaters of the river and the Area of Concern at the River’s mouth, this report demonstrates that the St. Louis River still provides important economic inputs into the regional economy.315 This analysis, like the UMD/NRRI Cumulative Effects Analysis, on the value of ecosystem services was something the Bands have repeatedly requested the Co-Leads provide to assess tribal socioeconomic impacts of the Project. However, the Co-Leads did not honor this request either. The Project proposed action will destroy thousands of acres of wetlands and their water treatment and flood control functions will have to be replaced by perpetual mechanical pumping and wastewater treatment plants costing millions of dollars a year to operate.	S	O
24763	Unique			SO	Mark Colbeth		1101	1	PolyMet is suggesting a couple hundred jobs, for how long? 20 years maybe and at what potential risk to the environment and cost to tax-payers left with the ongoing expense of clean-up and monitoring for 200-500 years? I know PolyMet will be required to fashion a so-called financial assurance package, but how do you put a dollar figure on this is unknown? On the other hand, you have an ever expanding group- The"Downstream Business Coalition". They have an ever expanding membership that currently exceeds 1000 employed by over 50 small businesses. I believe this number will continue to grow if their water does not become poisoned by the likes of PolyMet. What if PolyMet's presence destroys peoples desire to visit the BWCA? How much negative impact will that have on the local economy? What is the downstream risk of re-polluting the St. Louis river? What sense would that make of the multi-million dollar already investment to improve it's quality? Some may think they can't live without this copper-nickel mine, but we ALL know we can't live without clean water.	NS	X
27082	Form Letter	1	Variant	SO	Mark Johnston		1651	1	As a recent MBA graduate from St Thomas, this proposal does not make business sense to Minnesota. I need more details, but initially I understand the cost-benefit analysis as follows: Benefit: the proposal may create 300 jobs for the mining community, and I assume there would be tax revenue generated for MN. I also assume that the profits would go to the mining company. I'm curious what the expected Return on Investment (ROI) will be for PolyMet. Cost: I believe 250,000 visitors come to the BWCAW each year. When they come, they add to local economies by purchasing gas, food, supplies all of which generate revenue and jobs in the region. Once the water is polluted, I expect those visitors to go elsewhere. Water is 10 lbs/gallor so it would not be logical to think campers can carry in their own drinking water. I suspect the fishing appeal would also diminish. Also, the pollution will last for generations-probably much longer than PolyMed will stay in business. After PolyMed is no longer a corporation, MN will be on the hook for any ongoing cleanup. This is a big liability for MN. With these costs and liabilities in mind, I would like to see what the expected ROI is from the MN perspective.	S	O
29737	Unique			SO	Mark Kaprelian		2586	4	The IMPLANmethodology is based on the recognition that "some years will be a little better, others a little worse" (FEIS at 5-577), which is a gross understatement of the "boom and bust" phenomenon described in the FEIS and casts significant doubt on the reliability of the IMPLAN model. If IMPLAN does not model the "boom and bust" phenomenon, then IMPLANmust be supplemented. Simply stating that "[t]he diverse economy of the study area could offset the degree to which the effects of a bust are experienced" does not adequately address the potential effects of a prolonged "bust" cycle on a junior miner in precarious financial condition.	S	O
29737	Unique			SO	Mark Kaprelian		2594	6	According to the FEIS, "PolyMet states that, due to its structure as a 'low-cost producer,' the NorthMet Project Proposed Action would be unlikely to completely cease operations during a recession." (FEIS at 5-583). The factual basis for this statement is not disclosed. It appears to be inconsistent with PolyMet's own public financial disclosures (~ "we have no operating history upon which an evaluation of our future success or failure can be made.") The Co-Lead Agencies appear to regard it skeptically, noting: That statement notwithstanding, complete suspension of mining activity is not an uncommon response to recession or significant drops in commodity prices. This "bust" aspect of the cyclical economy is familiar to mining regions in Minnesota and beyond. (Id.) Yet the risks of "bust" cycles are addressed only incompletely and indirectly in the FEIS through the use of commodity prices that are characterized as generally conservative, compared to price trends. In particular, copper... prices used in the IMPLAN model are significantly below recent average prices. (Id.) The prolonged downward trend in the price of copper exposes the shortcomings of this approach. Although the current economic expansion is entering its 78th month and is among the longest in U.S. history," the current spot price for copper is around \$2.10 per pound, well below the \$2.90 per pound price used in the IMPLAN model.' In fact, copper prices have been falling since 2011 and have been below \$2.90 per pound for most of the current year- despite larger than normal supply disruptions. Many analysts expect copper production to remain high and copper prices to remain low for many years to come thanks to several large, seasoned low-cost producers, including a huge existing mine in Indonesia with 2016 production costs expected to be \$0.61 per pound?	S	O
29737	Unique			SO	Mark Kaprelian		2595	7	In view of these facts, statements in the FEIS that the copper prices used in the IMPLAN model "are generally conservative" and "significantly below recent average prices" appear to be incorrect. The effects of lower copper prices on the FEIS presentation are likely to be material and to require significant revisions to the FEIS, including updating the results of the IMPLAN model based on contemporary copper prices and directly modeling a reasonable worst-case scenario that includes a complete suspension of operations.	S	O
26457	Form Letter	1	Variant	SO	Martha Roberts		1317	3	It's time for Minnesota's Commissioners of key agencies, the Governor and federal agencies to understand and see that WATER and Minnesota's other natural resources are far more important and valuable in this equation, and these resources determine our survival and the long-term health and well-being of both the wildlife and our human families who drink the surface and ground water, who hunt and fish from Minnesota's streams and lakes, who harvest wild rice from the wetlands, who hike and ski in the forests, who live and work and raise our families in this great state. The economic benefit to the state will be tiny in comparison to the permanent and lasting environmental damage that this kind of mining will reek on our forests, wetlands, water quality, wildlife and human health.	NS	X
29963	Unique			SO	Martin Cooney		4220	1	I believe that the tenuous and transient economic relief that the PolyMet project offers to the Iron Range, even under the rosiest projections, does not begin to compensate the State, including the residents of northern Minnesota, for the immeasurable risks to what is clearly emerging as Minnesota’s most valuable resource: abundant, clean waters and the fragile northern Minnesota ecosystems that produce them. For this reason, I urge the State to deny PolyMet’s permit application, as well as all applications to pursue sulfide mining at the expense of degrading Minnesota’s environment and water resources.	NS	X

NorthMet FEIS Comment Matrix											
Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
26628	Unique			SO	Mary Adams		1386	7	This proposal looks "oh, so good" on paper. The iron range has been here before. Good for a few boom years and then, back to square one. Long term, sustainable jobs are needed, that do not cause significant environmental impacts.	NS	X
26285	Form Letter	1	Variant	SO	Mary Ann Cunningham		1299	3	This mining proposal is short sighted in every way: It will provide relatively few jobs, it will support a few years of production and cause centuries of environmental damage. It will destroy American public lands to provide income to a few multinational, Canadian, and Swiss corporations. In short, the PolyMet proposal is an unjustifiable plan.	NS	X
28483	Unique			SO	Mary Slattery		2279	4	The Scandinavian countries can find ways for people to be provided for without jobs that destroy the earth. Can't a country as creative and great as the USA do the same, or are we so dominated by the few, amassing great wealth at the expense of the many and the earth?	NS	X
10633	Form Letter	1	Variant	SO	Mary T'kach		707	2	The jobs that will be created are far fewer and shorter lived than the jobs that a robust tourist economy will bring.	NS	X
24820	Unique			SO	Matt Huang		1120	1	I would like to address my concerns and objection of issuing permit to allow Polymet open mines near the BWCAW. As a resident of the state, a visitor of the area, a conscious citizen. I found the arguments on the benefits of the project are nearsighted and not strategic. It won't benefit the residents near the area, the temporary workers for the project, the tourism industry of the area, the local economy, the environment, and the long term reputation of the state. The BWCAW is not just a treasure for the state. It is a treasure for the region and the entire nation. As shortage of fresh water becoming a global issue, we should protect every resource we have. We can't risk the future of our younger generation and generations to come. Please do not approve the poly project!	NS	X
1831	Form Letter	1	Variant	SO	Matt Straw		287	2	Why would you otherwise want to risk the CERTAIN gainful employment of tens of thousands of Minnesotans that can be maintained FOREVER with a clean environment through tourism, guiding, retails sales of everything from boats to gasoline, lodging, camping fees, park fees, etc.? Employment gained by that mine is a drop in the bucket comparatively, won't last, and will leave whole communities stunned and hurting with unemployment.	NS	X
26101	Form Letter	1	Variant	SO	Maurice Spangler		1269	1	I think it's crazy to risk this unique area that has such clean waters, as well as risk the St. Louis River, for just a few years of mineral mining that carries with it the significant and likely risk of pollution for decades or even centuries. It's just not worth it for a few jobs. Northeastern Minnesota needs to wean itself off mineral extraction and onto other economies that won't damage their beautiful environment. The State needs to encourage and enable new economies there.	NS	X
30003	Form Letter	1	Variant	SO	ME Reierson		2771	1	I love the BWCA. I know it will provide jobs to the area, but at what long-term costs? The history of mining in general and in MN in particular is that mining operations provide jobs WHEN OPERATING, but when shut down leave a legacy of pollution and abatement that we, the taxpayers and state/ federal government have to pay for. Lets not risk one of the most unique natural areas in the world for a short-term gain for a few hundred people!!! PLEASE DO NOT APPROVE this project.	NS	X
27405	Unique			SO	Melanie Peterson-Nafziger		1714	6	The 20-year profits for an inexperienced US company (not even from Minnesota) and multinational mining company are not worth the permanent degradation of Minnesota's natural resources.	NS	X
27660	Unique			SO	Michael Levings		1802	2	Pound for pound – clean water is worth more than metal	NS	X
29922	Form Letter	1	Variant	SO	Michael McCormick		2726	1	I oppose IN THE STRONGEST POSSIBLE WAY the current PolyMet NorthMet sulfide ore copper-nickel mine proposal. The Superior National Forest is the wrong place to permit destructive and dangerous hard rock mining to occur. I moved to Minnesota, and several of my family members followed me, in large part because of the natural environment of our state, especially the North Woods, Lake Superior and Boundary Waters areas. Allowing mining to occur at PolyMet, for the spurious short-term benefit of a few boom-and-bust jobs, while creating permanent devastation to the landscape for generations to come and further tying norther Minnesota to a cycle of destructive short-term natural resource extraction economics, with pollution flows into the St. Louis River, Lake Superior and very likely the Boundary Waters and Voyageurs National Park, would be a legacy that should prevent any responsible official from sleeping at night.	NS	X
26164	Unique			SO	Michael Wahowske		1279	1	I am against the NorthMet Mining Project. The potential and limited economic gains do not outweigh the known and significant environmental losses.	NS	X
27671	Unique			SO	Michael Youngquist		1826	1	I am writing this letter opposing this copper-nickel mine. We cannot sacrifice our state's natural resources and put our citizens health at risk simply for profit motive of a multi-national business. A few short term jobs is not worth the long term damage to this operation has the real potential to cause.	NS	X
27594	Unique			SO	Michelle Egan		1780	1	I just wanted to express my concern about the proposed mine. Since this state has such valuable water assets, I believe that the small amount of temporary jobs that would be created is not worth the risk. Northern Minnesota needs a diverse economy and mining would just be more of the boom and bust job pattern that has always been a problem in that region.	NS	X
27692	Unique			SO	Michelle Lackey Olsen		2090	2	puts the short-term financial interests of a few ahead of the long-lasting potentially adverse environmental effects that will dog many generations after us. It fails the seven generation test that urges us to consider the effects of our actions on those that will follow us for at least 7 generations.	NS	X
8906	Form Letter	1	Variant	SO	Mike & Linda Gallagher		610	5	It is just not worth the gamble to provide a few good paying jobs, and loose a wilderness area forever.	NS	X
27460	Form Letter	1	Variant	SO	Mike Maleska		1751	1	As this process unfolds from conception to the present, an unmentioned, yet ever-increasing truth gains momentum. And that is the anticipated economic draw complicating the reality of the issues. No future (potential) mine employee will want to be the one to step forward and say "this is not the tolerance level for pollution I am comfortable with" and follow up by contacting the authorities. No mayor of a local community will want to step forward and say "this mine has to be shut down due to intolerable levels of pollution, or unfair transgressions of a mining company on the welfare of his/her community. Politically, no incumbent will seek closure of a mine due to pollution. Indeed, it is in the best interest of politicians to maintain the flow of tax revenues and voter pleasure. Spin-off industries and their employees will oppose any slow-downs or closures.	NS	X
27460	Form Letter	1	Variant	SO	Mike Maleska		1753	3	Should the permitting be allowed, and the mine is up and running it is very difficult to see how any entity at all could have the courage and support to seek suspension or stoppage of such an economic dynamo.	NS	X
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3281	2	The responsibilities of the federal government under the trust responsibility and environmental justice doctrine are at their zenith here, as the proposed mine is located within the area where the Band holds its 1854 Treaty protected off-Reservation rights to hunt, fish, and gather – the exercise of which would be adversely affected by the proposed mine and the related proposed land exchange. In addition, the proposed action would also impact on-Reservation waters, which are also held by the Band under the 1854 Treaty.	NS	X
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3379	98	The FEIS here does not contain a proper analysis of the environmental justice impacts of the proposed mine as is required by Executive Order 12898 and the CEQ Environmental Justice Guidance. The Project here is not one intended to serve broad public interests or needs. It is not a reservoir that would provide stable public water supply, nor a public work needed to address flood control. It is a mine which is sought by a privately-owned company and intended, first and foremost, to generate profits for that company. While the Project may create jobs and generate tax revenues, those are the only potential benefits which may inure to the public (and may well be negated by the potential adverse environmental impacts of the Project). The FEIS otherwise gives no meaningful consideration to the disproportionate impact that the Project would have on Indian people as is required by Executive Order 12898. Contrary to the CEQ Guidance, the FEIS, focuses on a simple recitation of census numbers and proportions of Native Americans in the regional and statewide populations. FEIS 5-590. While acknowledging that the Project has the potential to disproportionately affect the Chippewas' right to hunt, fish and gather in the area, the FEIS otherwise ignores those impacts, asserting only that the proposed land exchange would provide the Bands with access to other lands. FEIS 5-778 - 5-779. But for the reasons discussed above, the land to be exchanged does not mitigate the loss of these critical resources or their adverse impact on the exercise of the treaty rights. More fundamentally, the proposed land exchange does nothing whatsoever to mitigate the disproportionate adverse effects on Indians who depend heavily on fish and wild rice from exposure to mercury and arsenic. The FEIS simply dismisses these concerns, commenting that "bioaccumulation of mercury in fish could affect Band members' willingness to rely on subsistence fishing as a contribution to household economies, as well as affect continuation of traditional fishing practices." FEIS 5-573. The FEIS suggests no alternatives that might have a less adverse environmental impact, nor any measure to mitigate the harm. Telling Indian people who hold treaty protected rights that they should stop fishing is not the kind of mitigation measure that environmental justice requires.	S	O
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3380	99	The FEIS's discussion of Socioeconomic impacts of the propose Project, §4.2.10 is deficient as it fails to consider, much less address, the value of ecosystem services as required by the Council on Environmental Quality,186 as well as the Office of Management and Budget, and the Office of Science and Technology Policy.187 Consideration of ecosystem service values has been required for plans and proposals that affect management of federal assets including National Forests, and are to be implemented to address a broader range of federal decision-making in the future. Id. at 1-5.	S	O
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3382	100	As it became apparent to the Band that none of the Co-lead Agencies on the EIS was examining this issue, the Band, as a cooperating agency secured expert services to undertake the necessary study with grant funding from EPA. The study, entitled The Value of Nature's Benefits in the St. Louis River Watershed, was prepared by Earth Economics, a nonprofit organization with expertise in science-based ecological economic analysis. The study was completed in June 2015. The Band submitted this study to the Co-lead Agencies as work proceeded on the EIS, and, in the Band's August 2015 comments on the Preliminary Final EIS, the Band urged its consideration in the EIS. The FEIS, however, makes no mention at all of ecosystem service values. The failure to address ecosystem service values is another substantial deficiency in the FEIS.	S	N

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3383	101	The economists at Earth Economics then quantified the value of the ecosystem services in the watershed, using a conservative approach that underestimates the full value of the ecosystems in the watershed. As a result of their analysis, the economists determined that “[t]he St. Louis River watershed provides an estimated \$5 billion to \$14 billion in ecosystem service benefits per year.”189 They further found that “[t]aking a conservative approach and considering natural capital as a shortlived economic asset, like roads and bridges, the asset value of the watershed is between \$273 billion and \$687 billion over 140 years.” Id. The study concludes that “[t]he landscape of natural capital and associated ecosystem services in the St. Louis River watershed is highly valuable and provides the foundation for the regional economy.” Id.	S	N
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3435	153	Fourth, the FEIS contains no assessment of the value of the ecosystem services – an analysis required by the Council on Environmental Quality,267 the Office of Management and Budget, and the Office Science and Technology Policy268 As discussed in Section 1.N above, the natural resources in St Louis Watershed are an essential component of the economy in this region. They provide protection from flooding, habitat for plants and animals which, in turn, provide food – fish, game and wild rice – as well as recreational opportunities on which the economy in the region depends. In addition, the wetlands that are part of ecosystems in the St Louis Watershed play a critical role in removing pollutants from water and protecting water quality. 269 Their value has been quantified, and they provide an estimated \$5 billion to \$14 billion in ecosystem service benefits per year. The asset value of the watershed is between \$273 billion and \$687 billion over 140 years. Id.	S	O
27901	Unique			SO	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3446	162	Indeed, the public interest determination cannot be made without considering the ecosystem services provided by the lands in both the federal and non-federal estates. As discussed above, although required by the Council on Environmental Quality,276 as well as the Office of Management and Budget, and the Office of Science and Technology Policy, the FEIS provisions on the proposed land exchange wholly fail to consider, much less address, the value of ecosystem services. Consideration of ecosystem service values has been required for plans and proposals that affect management of federal assets including National Forests, and are to be implemented to address a broader range of federal decision-making in the future. Id. at 1-5. The record includes an economic analysis of the ecosystem service value of the St Louis Watershed. Fond du Lac submitted an expert economist report, The Value of Nature's Benefits in the St. Louis River Watershed278 to the Co-lead Agencies with the expectation of its consideration in the environmental review (and its inclusion in Appendix C of the FEIS), and GLIFWC provided additional preliminary analysis of the value of the wetlands/floodplains/forests for properties conveyed. Despite the available expert analysis of ecosystem service values, the Co-lead agencies did not consider it at all in their environmental review process, and chose not to include this additional analysis in Appendix C where it would be readily available to the public. 23515	Form Letter	1	Variant	SO	Nancy Songer		957	2	Do not sacrifice a precious, long-term resource for a mere 20-year or less one and a few jobs.	NS	X
27385	Form Letter	1	Variant	SO	Natalie Hilscher		1705	1	Does the inflow of capital really outweigh the global costs we'll all have to pay down the road?!!?! Really? And I thought Minnesota was progressive. We have such a beautiful state with so many beautiful, clean lakes and risking fucking that up seems pretty ridiculous to me....	NS	X
8645	Unique			SO	Neil Simonson		596	3	We can finally obtain Paladium from an American source to box out the Russians.	NS	X
8645	Unique			SO	Neil Simonson		598	5	Because of all the unemployed Iron Workers on the Range now's the time to mine the NE Mesabi.	NS	X
27408	Unique			SO	Nicholas Eltgroth		1723	3	We do not need or want this kind of toxic pollution, no matter how many jobs it may create.	NS	X
26	Unique			SO	Norman Lee		82	5	I keep hearing about jobs as a critical issue. All the jobs will be temporary except for the pollution clean-up jobs that will go on forever. If jobs are needed in that area, move 1% of the States 40,000 employees to northern Minnesota. That will more than cover the new temporary jobs claimed by the mining interests.	NS	X
27575	Unique			SO	Pamela and Alexandra Thompson		1776	3	PLEASE consider the long-term - our 7th generation - when weighing 20 years (at most) of 400 (at most) mining jobs versus potable water, which is getting more and more scarce on this entire planet.	NS	X
27575	Unique			SO	Pamela and Alexandra Thompson		1777	4	Also please consider the jobs in tourism (diversity of industry in this area) which will disappear with the advent of copper-nickel mining. There are many of us who would like to stay at our jobs we've carved out for ourselves in some facet of the tourism industry, who are NOT pining for jobs in the mining industry.	NS	X
27575	Unique			SO	Pamela and Alexandra Thompson		1778	5	Does anyone think that when iron mining suffers a reversal, copper-nickel mining will come to its aid? It will NOT! Mining for all these minerals will wax and wane together. Every time iron mining suffers a reversal, copper-nickel mining will follow or precede.	NS	X
29263	Unique			SO	Pat Hawkinson		2474	10	Even so, if the region cannot survive without mining, it's inevitably, economically doomed at some point. Minerals do not grow back. The most water rich U.S. state's fresh water comes before the far more risky, unproven, foreign owned, copper\$/nickel\$/.....sulfide* industry.	NS	X
29143	Unique			SO	Patricia Coppo		2429	2	This is our last opportunity to halt an operation that will provide a small number of potentially temporary jobs but risk irremediable damage to a precious resource enjoyed by many.	NS	X
27898	Form Letter	1	Variant	SO	Patricia Isaacs		2223	3	my understanding is that the mine would provide employment opportunities in northeastern Minnesota for about 20 years. Two decades will go by in the blink of an eye, but the natural beauty and precious water resources of the area will be compromised for much longer than that.	NS	X
27898	Form Letter	1	Variant	SO	Patricia Isaacs		2225	5	in the long run pure water is much more valuable than ore. We have it here in Minnesota, and we need to protect it. The PolyMet mine trades long-term sustainability for short-term profit. Don't give in to that flawed reasoning.	NS	X
7290	Form Letter	3	Variant	SO	Patti Rajkovich		535	1	I am 100% for PolyMet. Jobs are badly needed in the area.	NS	X
28879	Unique			SO	Paul W Swanstrom		2368	2	A few hundred jobs over the short time of mine operation can't possibly offset the enormous cost of trying to contain the pollution seeping into the environment for hundreds of years.	NS	X
26151	Unique			SO	Paul Winslow		1276	2	I believe this is a short term gamble with long term risks for enduring pollution and health risks.	NS	X
28540	Unique			SO	Pauline Callahan		2319	1	The beauty of our state would be severely compromised if this project is allowed to go forward. So many people in the Northern part of Minnesota depend on our water resources for recreation. It is the basis for our tourism there. I believe that the defacing of the land by the NorthMet project would impact far more people than we realize.	NS	X
28480	Unique			SO	Peder Otterson		2272	1	I am also concerned that the ore being proposed for mining is quite low grade. This is a problem both for the economics and the environment. It was a proposal by Minnamax back in the 1970's that triggered the Regional Copper Nickel Study, but it was a drop in the price of copper and nickel that scuttled it. Currently, taconite mines on the Range are laying off people because of the competing costs of foreign ore and low demand. Although boom/bust is common to the industry, this project carries the added need to continually safeguard its toxic wastewater long after it is ended.	S	O
28480	Unique			SO	Peder Otterson		2275	4	Perhaps a time will come when both the need for the ore and the technology to process it without consequences have both advanced to a stage when it can be safely done. But not now. A few jobs and temporary economic gain to the Range are simply not worth the risk.	NS	X
6309	Unique			SO	Peggy Parise		474	2	We need the added jobs and mineral base in our area,	NS	X
29999	Unique			SO	Peter Shulman		2770	5	If the BWCA becomes contaminated and polluted, not only will it become a natural disaster, the adjacent communities will suffer economically.	NS	X
351	Unique			SO	rachel susan		178	4	It seems to me that the enormity of negative impact on this project is being minimized in favor of the enormity of short-term economic gain for a few people very far removed from the actual location of this project. The long-term losses to the ecosystems necessary for health should not be sacrificed for short-term economic gains.	NS	X
27521	Unique			SO	Randy Holland		1766	2	The few jobs being created are pathetic compared to the pollution risk that threatens the tourist industry, water supplies, public health, and fisheries. The state's finances are also in good order for the near future so there's no reason to grab the tax revenues now.	NS	X
26137	Unique			SO	rayoungsmn@aol.com		1272	3	I am aware of the need for jobs. A great marketing strategist should be able to find the strengths of the area and help create new jobs that do not pollute the environment for future generations.	NS	X
6263	Form Letter	1	Variant	SO	Rebecca Dudley		459	1	I dont think the long term condition of our Minnesota wilderness is worth risking over the short term gain of jobs and economy.	NS	X
6263	Form Letter	1	Variant	SO	Rebecca Dudley		460	2	Our real economy is the tourism and the beauty of the northern part of the state.	NS	X
6855	Form Letter	1	Variant	SO	Rebecca Dudley		515	1	I dont think the long term condition of our Minnesota wilderness is worth risking over the short term gain of jobs and economy.	NS	X
6855	Form Letter	1	Variant	SO	Rebecca Dudley		516	2	Our real economy is the tourism and the beauty of the northern part of the state.	NS	X
29019	Unique			SO	Rev. Elton W. Brown		2385	3	Where are the company's assurances of wage levels and benefits? Should there not be a realistic analysis of how many jobs will be offered to Iron Rangers (rather than commuters who are apt to spend most of their income elsewhere)? Further, is there any way to hold PolyMet (and its parent corporation) legally obliged to fulfill its promised local hires and wage levels?	S	O
29019	Unique			SO	Rev. Elton W. Brown		2386	4	If we permit this industry for the benefit not of the corporation but of the people of Minnesota, should we not raise the meager percent of taxes they will return to the state? An investigative journalism article in the Ely Timberjay (Jan. 17, 2014) reveals that local tax revenues generated by area taconite mines have been falling behind inflation, even as taconite prices have soared. It makes no sense to sell off these world-class non-renewable resources so cheaply.	S	O

29019	Unique			SO	Rev. Elton W. Brown		2390	8	The PolyMet PDEIS is inadequate in its failure to include an analysis of the costs of this mining proposal to the local economy. Is there a realistic estimate of lost income from tourism, fishing and hunting licenses, etc, should a large hunk of the Superior National Forest be lost to heavy industry?	S	O
29019	Unique			SO	Rev. Elton W. Brown		2391	9	Also, what protections and compensations are in place for the well water and air quality of the rural Babbitt and Embarrass homes which are just a few miles north of the project? Will the mining corporation have the requirement and the assets to purchase private properties whose value and livability are compromised by the PolyMet operations?	S	O
29019	Unique			SO	Rev. Elton W. Brown		2394	12	Given that many children on the North Shore already have higher than average mercury levels, how can we allow the PolyMet plan to be so vague on the amount of mercury they will be adding to the environment?	S	O
29273	Form Letter	1	Variant	SO	Rhoda Liebo		2482	3	It is short term greed that fires up the locals to support the dream of new jobs and industry in Ely. Not gonna happen.	NS	X
10133	Unique			SO	Richard Crum		660	4	4. My last comment is a personal one. NTS is a firm of about 50 scientists, engineers and administrative staff. The vast majority of our practice is for mining or mining related businesses in Northeast Minnesota. The economic impact of both ferrous and non-ferrous mining is VERY REAL to us. Our Staff and the Professionals in the mining companies they work with, take their jobs very seriously to protect the environment, support the economic engine of this region and maintain our social license to mine. The team assembled by Polymet to start up and operate the Northmet project is beyond reproach in terms of the science, engineering and ethical character.	NS	X
24784	Unique			SO	Richard Nolan	US House of Representatives	2957	2	First, as everyone knows, we need the jobs. With hundreds of miners laid off due to the illegal dumping of millions of tons of foreign government subsidized steel into our marketplace, PolyMet will bring hundreds of good paying new jobs to the Range. With more bad trade agreements like the Trans-Pacific Partnership threatening to exacerbate the crisis, we need the project up and running soon.	NS	X
29908	Unique			SO	Rick Fry		2710	2	The prospect of the destruction of the environment for jobs that may last 20 years is ludicrous.	NS	X
27778	Form Letter	1	Variant	SO	Robert Graves		2138	7	A limited number of years of mining operations are not worth the potential environmental catastrophe that threatens fish habitat, beautiful and pristine waters, and a way of life based on the great outdoors.	NS	X
27828	Unique			SO	Robert Hagen		2171	2	Wile it may create over300 jobs it is not worth the lasting risk to the State's natural resources, its reputation as a tourist destination and its reputation as a steward of wild areas.	NS	X
27828	Unique			SO	Robert Hagen		2173	4	Furthermore, the existing price of copper does not bode well for economic returns to the mine. The price of copper is notoriously sensitive to world economic forces. While its price may rebound eventually, how many economic cycles will we see during the mine's operation? Having grown up in a copper mining community, I know the hardships endured by local citizens when a copper mine closes. It would be in the public's long-term interest if the Iron Range's economy were diversified though retraining programs designed to meet known and forecast shortages in selected occupations.	NS	X
29727	Unique			SO	Robert Tammen		2571	2	Polymet's FEIS has not documented that there will be a net economic benefit to the State of Minnesota. The November 2012 report from the Labovitz School of Business & Economics states on p. A-16 "...a cost-benefit analysis would be needed..." There is no rigorous analysis of Polymet's economic impact.	S	O
27690	Unique			SO	Robert Topliff		2083	7	There is not enough value in these minerals to justify the ruination of our state.	NS	X
28807	Unique			SO	Rod Fisher		2356	1	I oppose the approval of the Polymet mine permits. The risk outweighs the benefits.	NS	X
24346	Unique			SO	Ron Tupy		1024	1	Creates hundreds of jobs which will in turn create hundreds of workman's comp claims from the multitude of health problems created. Just say NO.	NS	X
11	Unique			SO	RONALD & JEANETTE		24	2	Jobs are important to Northern Minnesota...they should enhance the beauty of the area	NS	X
25465	Unique			SO	Roth Indihar		1185	1	I support PolyMet, this will be a great business for this area. As person in the mining industry, PolyMet will run in a sound manner. With the passion of the workforce in northern Minnesota the operation will be run to the standards set the State. In terms of being a greenfield operation the EIS has lead to every stone being turned over. Thank you to the DNR for a good road map. The public has had a HUGE voice in the operational process of the operation. AND to the people in the cities, 350 JOBS is huge for this area! The environment will be protected by these 350 people.	NS	X
28855	Unique			SO	Ryan John Mallek		2363	3	Loosing 9000 acres of national forest along with the creation of maybe 200 full time jobs for 20 years and millions in revenue for 500 years of pollution and water treatment. Not a economic win in my opinion.	NS	X
13597	Form Letter	1	Variant	SO	Sally Fresquez		788	1	I realize you have a lot of push back from businesses and residents to allow this risky mining. I grew up in Hibbing, MN and am painfully aware of the need for jobs in the area. Jobs are a concern, but not worth the risk of the destruction and contamination of our land and water for what would inevitably be short-term jobs and negative impacts on the environment.	NS	X
29746	Unique			SO	Sandra Wagner		2596	7	I understand the Iron Range is experiencing economic hardship, but the definition of insanity is to do the same thing expecting a different result. I remain convinced this project would do far more economic and environmental harm than any short term gain. The mineral market is collapsing due to the global gambler's greed, not need.	NS	X
27454	Unique			SO	Sandy Kershaw		1746	2	Copper mining in and around our "Golden Goose" could be a monumental disaster both spiritually and economically.	NS	X
29289	Unique			SO	Sandy Sterle		2502	8	Unfortunately, mining has a long history of boom and bust of the local economy. Glencore, the largest shareholder has recently dropped its dividend, which means to the financial community that the company is in "survival mode". The FEIS needs to include in the analysis of financial viability for PolyMet from the effects of the market for copper having dropped 27% in 2015 to a six-year low.	S	O
29985	Form Letter	1	Variant	SO	Sarah Elizabeth		4316	10	Northmet's economic projections are disturbingly vague. What is the breakdown of the 360 direct operations jobs? How many of those are expected to be skilled, full-time positions that would draw from local applicants? How certain are the predictions for number of jobs?	S	N
24	Unique			SO	Schmidt Michael		73	2	The long-term costs (potential and actual) to the State of MN are far greater than any projected economic gain.	NS	X
26321	Form Letter	1	Variant	SO	Scott Kylander-Johnson		1302	1	This plan is short sighted and highly unethical. We have a new epidemic destroying our children, especially our boys called autism and we aren't sure why. Who knows exactly what the cause(s) is but the pollution from mining cannot be overlooked. Don't think for a second that the jobs are worth the overall cost to the health of people and the planet. There isn't a mine on the planet that has helped make the community around it or improved it. Sadly, only the opposite has happened. Don't make the mistake of approving this plan.	NS	X
26723	Form Letter	1	Variant	SO	Scott Wolff		1441	2	I am opposed to the present proposals because I think an intact, unspoiled environment is more in the interests of northern Minnesota rather than the short term gains that PolyMet would afford. The long term losses exceed that. Despite their assurances, there is no track record that this can be done without environmental harm. The jobs they promise are non-sustainable over the long term, and when the jobs are gone in 10-20 years, we are right back where we started from, with the only legacy of a damaged if not irrevocably harmed environment. The current tourism based economy is sustainable, and PolyMet jeopardizes that.	NS	X
26723	Form Letter	1	Variant	SO	Scott Wolff		1443	4	I object the the antagonism that this project introduces to our region (e.g. labor-union members boycott local businesses who have and the courage to oppose this project, and this does reduce their business short term). This pits neighbor against neighbor. I do have empathy for those who look to gain employment through this. Mining is extractive and short term. In the long run, I hope their children look for other training and education. I did.	NS	X
29404	Unique			SO	Shaun Braun		2529	1	I'd like to take a moment of your time to express my support for Polymet's Northmet project. As a regional business leader, I've witnessed firsthand how the downturn of our regional mining economy has affected our community in northern Minnesota. It is a troubling time for both local businesses that support the mines and more importantly, the families themselves. The Northmet mining project will bring an instant revitalization to the community, and will diversify northern Minnesota with an additional form of mining, reducing the region's dependence of taconite mining.	NS	X
6029	Form Letter	1	Variant	SO	Shirley Anderson		446	3	The few jobs that will be created will not compensate for the loss of this precious area.	NS	X
28488	Unique			SO	Shirley Huskins		2284	3	polluted water will affect directly the production of wild rice. Proposal does not address how wild rice growers/producers will be reimbursed for loss of income.	NS	X
28488	Unique			SO	Shirley Huskins		2289	8	PolyMet does not present facts presenting absolute benefits, without reservation, of their proposal.	NS	X
28488	Unique			SO	Shirley Huskins		2290	9	PolyMet's proposal indicates NO plus benefits, only MINUS benefits.	NS	X
3213	Form Letter	1	Variant	SO	Sieglinde Gassman		363	1	approval of this short-termed venture assumes that there will be long-term negative effects on the environment ifn the state of Minnesota. We should not be undertaking any such thing. There are other initatives to provide jobs without trading and destroying land and pollutting the water.	S	O
26803	Unique			SO	Solfrid Ladstein		1468	2	The new jobs that might result-- a mere 350--are in no way worth the irreversible damage that such a mining project will cause. Surely there are better ways to provide income to the few workers who would benefit. Every place in the world where such mining has taken place gives evidence of permanent ravages of the land for the short term gain of the few.	NS	X
14	Unique			SO	Spencer Shaver		43	7	This mine that promises to provide 350 jobs for twenty years has no place jeopardizing the thriving tourism-based economy that sustains 18,000 jobs annually.	NS	X
25141	Unique			SO	Stan Burns		1133	1	I am against the Polymet mine. Not only is there significant probability of environmental damage but it is bad for the range economy. Look at the boom-bust cycle in taconite; now in a bust phase. The taconite companies don't care a wit about the people and area when there is a market downturn. There has to be diversification in the range economy for the steady state prosperity of the families living in the area.	NS	X
6342	Form Letter	3	Variant	SO	Stephen Quin		478	1	I have had the pleasure of being involved in the early days of this project, initially as a director of Fleck Resources and subsequently as a director of PolyMet for several years. As a result, I am knowledgeable about the project and its potential for significant benefits to the economy and people of Minnesota and the USA. I also recognize the importance of protecting the natural environment and ensuring a sustainable outcome.	NS	X
26659	Unique			SO	Steve Jay		1422	14	a. PolyMet discharge of pollutants will have adverse effects on municipal water supplies, aquatic life, wildlife, human health and welfare, and present significant environmental justice inequities.	NS	X
23004	Form Letter	1	Variant	SO	Steve Voiles		882	3	Yet we hold out for short-term jobs that will sell our treasure to foreign interests and leave Minnesota impoverished. How can we be so foolish?	NS	X
27094	Unique			SO	Steven Lyons		1655	2	Jobs that will only last 20 years and poisoning of the precious environment for the next 1000 years is NOT a good deal for Minnesota!!!!!!!!!!!!!!!!!!!!!!!!!!!!	NS	X

28770	Unique			SO	Susan Beerhalter Soule		2343	1	Here in Minnesota, lakes and water are a huge part of our heritage, our identity and our economy. The tourist and recreational dollars that stem from our beautiful lakes and wilderness are crucial to our governmental budget and the livelihoods of many.	NS	X
28770	Unique			SO	Susan Beerhalter Soule		2347	5	The number and duration of the jobs created do not begin to support the risk to our water supply, our economy and our beautiful natural environment from the Polymet project.	NS	X
8492	Form Letter	1	Variant	SO	Susan Boyle		577	2	Are Minnesota's decision makers determined to empty Northern Minnesota of inhabitants?	NS	X
8492	Form Letter	1	Variant	SO	Susan Boyle		578	3	The poverty that plagues Northern Minnesota since jobs emigrated elsewhere should be obvious to all.	NS	X
30585	Form Letter	1	Variant	SO	Suzanne Damberg		2876	1	Please also consider the negative financial impact. The thousands of dollars & tax revenue that would be lost if seasonal homes, lost their value and if commercials loss if those seasonal homeowners left.	NS	X
25	Unique			SO	T.C. Smith		75	2	mining is a commodity market business-mines only pay a production tax & no proerty tax-so when times are good some tax is paid & when times are bad no tax is paid-infact the companies often fold up their tents & bug out	NS	X
25	Unique			SO	T.C. Smith		76	3	we are being told 1000 "new jobs" how many of these jobs are only for 18 month construction period?	NS	X
25	Unique			SO	T.C. Smith		77	4	i have spent time in SE Alaska (Skagway) & know that often times if commodity prices are spiking over a several year period the mines increase production -everyone is fat & happy-which leads me to forecast that if such a condition occurs toward the beginning of the mines life the estimated 20 year life expectancy could easily be cut in half or more-thats just good business acumen for the stockholders but what about the miners who mbenefitsay well have families & homes ,thinking they have a20 year job with benefits?	NS	X
26759	Unique			SO	Terrance Wilm		1449	3	The political pundits will choose "jobs creation" as their mantra to justify proceeding with the proposed project. As is generally seen in the iron ore industry; as well as other commodities; when the price is low the layoffs begin. We have witnessed this time and again-including the present situation on the "iron range". It will be NO different with ANY mining corporation, when the price point is low there will be NO WORK ! Therefore it is incumbent to change the mindset of the workforce to move AWAY from mining as an occupation/career. It is time to break the cycle of layoffs and the only thought being more mining is the answer. Environmentally and economically mining needs to go away in northern Minnesota.	NS	X
27459	Unique			SO	Terrie Christian		1748	2	Loss of jobs affected my own family including my mom.	NS	X
26499	Form Letter	1	Variant	SO	The Rev Donald Rudrud		1341	2	PolyMet, or whoever they sell the mine to, would do more harm than good.	NS	X
27680	Unique			SO	Thomas Andrick		1843	1	I'm writing too voice my opposition and urge you to reject PolyMet Permit. From everything I've read the environmental consequences are not worth the gain. It would be a terrible legacy to leave future generation	NS	X
29478	Unique			SO	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3869	24	WHEREAS, the limited number of jobs created for the short term economic gain will pale in comparison to the need for water treatment and other environmental protections virtually into perpetuity, estimated at least 500 years;	NS	X
29478	Unique			SO	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3870	25	WHEREAS, the PolyMet mining will do very little to diversify the economy of the region, already heavy with mining projects; WHEREAS, the expected tax and fee contributions to local cities, school districts and the State from the mining activities will not be sustainable to the needs of the region in the long term, and would be at risk if the project fails due to global competition;	NS	X
29478	Unique			SO	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3871	26	WHEREAS, the overall economic analysis has overstated the short term benefits and not fully considered the risk pushed to future generations;	NS	X
26554	Form Letter	1	Variant	SO	Tim Callister		1350	3	the PolyMet mine will employ a few hundred personnel in the beginning to get it operational and then that number will dwindle to a very few. In the meantime the economic loss to the state from fewer visitors to a prime wilderness area will mean that resorts and other attractions (that currently employ an equal number of personnel on a long term basis) will provide less employment and send fewer tax dollars to the state.	NS	X
22249	Unique			SO	Tim Schwarz		859	5	This mine that promises to provide 350 jobs for twenty years has no place jeopardizing the thriving tourism-based economy that sustains 18,000 jobs annually. Please keep these folks, the environment that sustains them, and future generations of Minnesotans in mind as you reject Polymet's permits to mine in and around the Superior National Forest.	NS	X
26996	Unique			SO	Timothy Weulander		1513	1	The majority of our economy up here is mine based and has a great history of going into ruin based on the mines operating or not, this current situation is just another of many times the mines have proved there value (and lack of) to its employees. It's not just northern Mn that is affected either, as we all know, but this is probably not the best place for the political side of ideals. We just need better than mining, mining, and more mining. We need to diversify and this mine prevents that, and continues the cycle of the "Iron Range".	NS	X
26986	Unique			SO	Tom Smith		1509	1	I feel that the company is padding the number of jobs created,that the ratio of construction jobs to fulltime jobs is like 10 to 1-ridiculous	NS	X
27061	Unique			SO	Tyler Kaspar	1854 Treaty Authority	2994	21	The analysis included only looks at the economic benefits of the project, and not the environmental "costs" and impacts. The FEIS states that these impacts could have real and/or perceived economic costs, but that these "non-market values" are not typically expressed in monetary value. Stating the economic benefits of the project, while not stating economic costs to resources and related uses, does not allow for a fair comparison or overall view of the project. Environmental economic tools do exist to value resources and the services they provide, and perhaps some would be applicable and beneficial for the FEIS. The FEIS should address this with further analysis or description in sections 5.2.10 and 6.2.1 0. Please reference "The Value of Nature's Benefits in the St. Louis River Watershed" completed by Earth Economics for the Fond du Lac Band in the FEIS and include results from their analysis of the St. Louis River watershed.	S	O
26087	Unique			SO	Victoria Thor		1266	1	Exchanging our waters, environment and wildlife for temporary jobs is irresponsible. The environmental impact of mining is forever.	NS	X
25187	Unique			SO	Vincent James		1138	1	I want to add my name to the list of real Minnesotans who want to preserve our state's natural resources, heritage and the Boundary Waters area. Minnesota does not need to allow International mining companies to come into our state, bribe our representatives, exploit our natural resources and leave a massive economic burden on the tax payers. There is no reason for these mining projects and they will damage the real economy of Norther Minnesota—Hunting, Fishing, Recreation, Arts, etc.	NS	X
25151	Unique			SO	W.E. Lavin		1134	1	This is NOT the time to take a chance of polluting our fresh water for only 300 jobs.. With the loss of aquifers around the country and world, we must be vigilant and protect our waterways at all costs.	NS	X
28477	Unique			SO	Wendy Robertson		2265	4	The amount of short-term proposed economic gains or benefits from the Polymet project in comparison with the costs of jeopardizing the long-term environmental economic value of the St. Louis River watershed should not be given any more consideration.	NS	X
25209	Unique			SO	William Cunningham		1144	1	I oppose the Polymet mine license. Despite the changes in the draft EIS, I believe that the mine will eventually harm the water quality and environment of northern Minnesota. Perhaps this damage won't occur during the 20-year active life of the mine, but eventually, long after the mining company has left Minnesota, the safeguards will break down and no one will be willing or able to maintain water monitoring and protection. I believe, further, that despite the claims of the company, a significant leakage of contaminated water out of the St. Louis watershed and into the Kawishawi River will occur. This will lead to disastrous pollution of the Boundary Waters Canoe Area. It's bad enough to contaminate Lake Superior and 20 percent of the world's clean, freshwater supply, but it's even worse to pollute the BWCA. I realize that there's vehement support for this project among many residents of northern Minnesota because of the desperate need for local jobs, but I am convinced that only a small number of temporary jobs will be offered to current residents of the Arrowhead. I regard it as folly to sacrifice long-term environmental protection and the potential for sustainable ecotourism-based jobs for short-term gain. In coming decades, clean freshwater will be in far shorter supply and much more essential to our state than copper or nickel, and I urge you to reject this project.	NS	X
26485	Unique			SO	William Haapala		1261	2	The economic benefit to the region and the nation would be significant.	NS	X
27563	Unique			SO	William K.		1773	4	While I think the Polymet plan as presented in the present EIS is about as good as can be hoped for for a new mining project, the decision whether to approve the project is a stark choice: Twenty years of intermittent jobs that depend on the vagaries of the metals markets followed by an endless threat of water pollution, or preserving the healthy natural environment albeit with the less than vibrant local economy that we have in northern Minnesota today.	NS	X
29367	Unique			SO	William K. Dustin		2514	7	Undisturbed natural areas are a resource that can be enjoyed by many generations and they provide ecological services that are grossly underestimated in economic accounting. It is extremely shortsighted that they do not receive the same valuation as other exploitable natural resources.	NS	X

27685	Unique			VEG	Dennis Szymialis		2048	203	It has been proven that air pollutants inhibit the ability of pollinators to find food and pollinate plants http://www.latimes.com/science/sciencenow/la-sci-sn-honeybees-cant-sniff-out-flowers-amid-diesel-exhaust-20131004,0,6485580.story . Pollinators have become increasingly endangered as a result of habitat degradation including in Minnesota http://www.dnr.state.mn.us/volunteer/julaug09/pollinators.html . Humans have a symbiotic relationship with bees and other pollinators. Often times individual flowers have a symbiotic relationship with an individual wild bee species. This will have an impact on the ability of the Floating Marsh Marigold to survive as a species.	S	O
29745	Unique			VEG	Erin Mittag	Minnesota Center for Environmental Advocacy	4114	181	22.1 Cumulative impacts on rare plants. The FEIS contains a similar problem in regard to rare plants. This issue was raised in our comments on the SDEIS at Friends 63-64 and CBD 76, as well as in our letter of October 8, 2015 to Forest Supervisor Brenda Halter. The comments and letter are attached, and the referenced pages incorporated herein. This issue was not addressed in either the Response to Comments or the text of the FEIS, in violation of 40 C.F.R. § 1503.4(a).	S	O
29745	Unique			VEG	Erin Mittag	Minnesota Center for Environmental Advocacy	4122	182	The cumulative effects analysis for rare plants provides the same delineation of the “cumulative effects assessment area” (CEAA) as is discussed above for wildlife, i.e, the portion of the Iron Range within the Nashwauk and Laurentian Uplands.502 It then discusses the number of populations of rare plants for which Takings Permits have been issued within the CEAA.503 But rather than comparing the number of affected populations in the CEAA with the total number of populations in the CEAA, it instead provides a comparison with the number of populations statewide. The FEIS simply assumes that all populations outside the CEAA are secure, an assumption that has no basis in the record. Furthermore, limitation of the analysis to impacts for which Takings Permits have been issued very likely understates the impacts. According to the assessment for three plant species, none are expected to be indirectly affected. We question whether Takings Permits are an appropriate means to assess indirect effects; we doubt that mining companies have applied for Takings Permits for such effects, which are usually somewhat uncertain until after they occur. At any rate, the fact that as much as 8 percent of the statewide population of one species (ternate grapefern) is expected to be directly affected by currently planned “takings” on the Iron Range alone gives one reason for pause. Without some information about threats to this species throughout its range in Minnesota, the conclusion that “the cumulative effects of the NorthMet Project Proposed Action and other reasonably foreseeable activities are not expected to jeopardize the presence of B. rugulosum in Minnesota” is unfounded. The same is true for all of the other species of concern that will be impacted by this project, including the floating marsh marigold.	S	O
27687	Unique			VEG	John Finnegan		2075	4	You also haven’t addressed the wild rice stands downriver of the site. There should not be any sulfide mining in our water rich state.	NS	X
30065	Unique			VEG	Jon Schubbe		2782	5	The EIS does not adequately address impacts to state listed plants, such as Clatha natans. Makes no mention of how state populations in the project area would be affected or avoided, especially in the vicinity of the rail corridor. Will mitigation take place in the event of take?	S	O
30065	Unique			VEG	Jon Schubbe		2783	6	EIS states habitat will be restored, which is misleading. Many ecosystems in the project area cannot be restored after they have been disturbed, such as spruce bogs. How will the project avoid dewatering wetland habitats associated with Hundred Mile Swamp, Mud Lake and Yelp Creek.	S	O
30065	Unique			VEG	Jon Schubbe		2784	7	Do bog specialists such as Malaxis paludosa occur in this area? How will the project avoid impacts to these species.	S	O

30066	Unique			VEG	Kevin Viken		2789	2	Wild rice in the partridge and St. Louis Rivers will not be adequately protected from mine waste.	NS	X
29978	Unique			VEG	London Bresette		4295	7	It is also our belief as a Sovereign Nation, that the PolyMet Mine activities as proposed, significantly disrupts the Cultural Heritage of our tribe and every tribe that is part of the Six Bands of the Anishinaabeg Territory Watersheds and Waters of Lake Superior as well as all the tribes represented by the Cooperating Agencies and the 1837.1842 and 1854 Treaties. The Red Cliff Band has are-cultivation of wild rice, just 70 miles downstream from the mouth of the St. Louis River, yet believes the devastation of wild rice beds just from the former LTV Steel Mining Company tailings basin and Area Pit 5 MW Operations already demonstrates an institutionalized disregard for the sanctity of precious tribal cultural resources. Our cultural beliefs include the sanctity of precious resources. It is our experience that when consideration for their sacredness is ignored, that spiritual consequences manifest in harmful and unforeseen ways. Our migration story and spiritual beliefs are based on our historical ancestry and when better understood, form the basis of practical principles of preservation. Many tribal members suffered the ill effects of being disconnected to our cultural heritage and that disconnect cannot also be separated from the sociological challenges that are often associated with "Reservation Life".	NS	X
27901	Unique			VEG	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3442	160	Inexplicably, the FEIS removes from Chapter 4, Affected Environment, this salient description of existing land use in the federal tract that appeared in the SDEIS: The federal lands proposed for exchange contain portions of the Minnesota County Biological Survey (MCBS) Headwater Site. “The Headwaters Site straddles the continental divide, with water from the Site flowing both east through the Great Lakes to the Atlantic Ocean and north to the Arctic Ocean. Paradoxically, the divide runs through a peatland. Although the peatland appears flat, water flows out of it from all sides, forming the ultimate source of rivers that eventually reach two different oceans. The Site is the headwaters of four rivers: Stony River, Dunka River, South Branch Partridge River, and the St. Louis River, which is the second largest tributary to Lake Superior...[t]hese conservation areas are the best opportunities for conserving the full diversity of terrestrial and aquatic ecosystems and globally rare or declining species.” It is hard to understand why, in the face of explicit SDEIS narrative noting the biodiversity significance of the Mine Site in its current condition and land use, the Co-lead Agencies would expunge this information from the FEIS. It does not serve the public, nor comport with federal trust responsibility, to deliberately diminish the ecological values provided by such a large expanse of intact, functional, diverse forest and wetland habitat.	S	O
28922	Unique			VEG	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3590	15	In our comments on the SDEIS, we raised concern over the permanent loss of 1,719 acres of habitat designated by DNR as having High Biological Diversity. These lands are within the 3,908.3 acres of forest and wetland area directly impacted by this project including some threatened plant communities, and endangered, threatened or, special concern plant and animal species. The FEIS document in addressing this issue only says that the land will be restored to a stable, vegetated condition after mining. This is equivalent to saying that a duck marsh can be restored by building a swimming pool. The two are not the same, and the environment and the future citizens of the state will be the poorer as a result. We think the FEIS has undervalued the long-term benefits these lands provide to the citizens of Minnesota when compared with the short-term benefits of a 20 year copper-nickel mine.	S	O
23032	Form Letter	1	Variant	WAT	Aaron Pendl		890	2	But I hope you also realize that 1 error with this mine will wipe out other northern communities. Towns like Ely would be destitute if any hazardous waste invaded the water system.	NS	X

29913	Unique			WAT	Adam K. Wilke		4217	1	I oppose the FEIS as it is currently written. Specifically, the FEIS fails to assess: Data available for projected precipitation ? Capacity of the facility to handle large (100-year and 500-year statistical probability) storm/precipitation events	S	O
29913	Unique			WAT	Adam K. Wilke		4219	3	“While climate change may occur in the future, it cannot be stated at this time if in the long-term there would be more or less rainfall.” This assumption is false. Data provided by the Minnesota Department of Natural Resources State Climatology Office (Figure 1), National Oceanic and Atmospheric Administration (NOAA) National Climatic Data Center (http://www.ncdc.noaa.gov/cag/) (Figure 2) , United States Geological Survey (http://www.usgs.gov/climate_landuse/clu_rd/nccv/viewer.asp), and National Climate Assessment (Figure 3) indicate otherwise. Why is projected precipitation data not incorporated into the FEIS? Further, I take great concern with this statement: "If over time, climate change causes a gradual increase in annual rainfall, the 100 year storm event would be redefined to a larger value and mine facilities would be upgraded to handle a larger design storm" (page A-670). It is simply not okay to wait for an extreme precipitation event to upgrade facilities to handle such events. This facility should be capable of handling not only 100-year storm events, but 500-year storm events. Why is the facility not designed to handle large (100-year and 500-year statistical probability) storm events?	S	O
26780	Unique			WAT	Alaina Pilate		1453	3	We also recognize and want an evaluation of impacts of the polluted seepage that will be north of the mine site flowing into the Boundary Waters Area basin.	S	O
26780	Unique			WAT	Alaina Pilate		1457	9	Please fix the inaccurate water data and redo the water model in the Polymet's Plan. Please inform Minnesotans how long polluted water will need treatment.	NS	X
24810	Unique			WAT	Alexa Douglas		1117	5	Second....Appoint an independent environmental analysis on water modeling. It seems all information is coming from PolyMet, obviously biased! There is not even a liner under the toxic dump.	NS	X

7012	Unique			WAT	Allen Killian-Moore		530	3	Similar to what I had read in the previously issued Supplemental Draft EIS, the Final EIS statement doesn't make it clear how on earth the potential post-mine water treatment would be handled. I as understand it, two wastewater treatment plants to treat polluted water from the mine site and the tailings basin would operate when the mine is running and would continue operating after the mine closes. But, treatment will be needed at the mine site for a minimum of 200 years and at the plant site for a minimum of 500 years and this seems like an awfully long time, post-mine, in order to guarantee accountability and safety. We're talking somewhere between 2 to 5 centuries in which the water would need to be consistently and effectively managed in order to ensure safety for people and the ecosphere.	NS	X
56	Unique			WAT	Amber Garlan		138	2	When sulfur comes into contact with water or oxygen it becomes sulfuric acid. There is no safe way to do sulfide mining.	NS	X

18376	Form Letter	1	Variant	WAT	Amber Garlan		830	1	PolyMet's pollution would contaminate drinking water with lead and arsenic, increase mercury contamination of fish, and decimate wild rice, damaging the health of communities as far downstream as where the St. Louis River meets Lake Superior.	NS	X
29843	Unique			WAT	Amy Schwarz		2662	5	I encourage you to reject this proposal and protect our state's most valuable and irreplaceable resource--water.	NS	X
27822	Unique			WAT	Anita Tillemans		2152	2	Is it wise to risk the security of the St Louis Watershed, one that feeds the greatest freshwater lake by area in the world, Lake Superior, and lies at the extreme headwaters of the St Lawrence River? All life depends upon reserves of water; and the Arrowhead is at the source of one of the largest supplies on Earth. St Louis River, at the extreme headwaters of the St Lawrence Seaway, supplies freshwater to Lake Superior and the Great Lakes. Products of the Laurentide Ice Sheet melt, Rainy Lake, Lake of the Woods, and Red Lake formed in the basin of Lake Agassiz, which extended over 170,000 square miles, possibly the largest freshwater lake ever (similar in size to the Black Sea). This glacial lake provided water to northern Minnesota, the Red River Valley and may still be discharging its glacial waters from the fractured metamorphic bedrock aquifers of the Arrowhead. The FEIS confirms that bedrock of the region has low conductivity and could take thousands of years to discharge. In addition to the glacial waters of Agassiz, others glacial lakes like Norwood, Upham and Aitkin, products of the LIS, as well, have discharged their waters into the Arrowhead of Minnesota. Diverse moraines such as the Vermilion Moraine, left evidence in patterns of glacial till that can be seen around Babbitt, Ely, the Embarrass River area, and Hoyt Lakes, overlain in many areas by lush vegetation and lakes. Covered by such a luxuriant carpet, the land that Polymet and others want to mine can be as difficult to inspect for existing aquifers, confined or otherwise, as it is to locate existing faults and fractures of bedrock in the area. This does not mean they don't exist. The fact that the NorthMet Project prospect lies within the boundary of the Vermilion Moraine, along with the BWCAW and Ely, makes this even more difficult. The potential of water traversing aquifers through fractured metamorphic bedrock, sight unseen, is heightened. No one spot duplicates another, essentially with variations in depth to bedrock by hundreds of feet, coverage of waterlogged vegetation and lakes, and a diversity that is like no other on earth. Like faults, aquifers can be inferred invariably through their effects. Observe the copious discharge of water from the Big Stoney along the north shore of Minnesota. Observe the waters that so readily flow from the area of the Mesabi Widjiu, in rivers like Prairie River and Swan River from the Hill of Three Waters, the Vermilion River, St Louis River, Rainy River, and the great Mississippi. All one needs to do is observe. As faults and fractures allow water to disperse in bedrock, these aquifers eventually find outlet in rivers, streams, fens, wetlands, falls, ponds and lakes at varying distances and directions from the site of recharge in the Laurentian Uplands. According to the FEIS, surficial aquifers surrounding the mine site have a low conductivity, though not as low as bedrock in the same area, which supposedly decreases with depth. In this environment, then, it took thousands of years for glacial waters to make their way to the basin of Lake Superior. These waters can be seen dispersing in rich wetlands and rivers throughout; and they continue to nourish land in the Arrowhead supporting a vast and intricate ecosystem. Does it make ecological sense to place a copper mine where it can do so much harm to water resources, with the potential of collecting into highly toxic sludge, polluting more and more of the surficial aquifers of the region, as waters are made stagnant and dead over the years? There will be floods. There will be upheavals, as history proves ... waters will disperse, as it is the nature of water to do. What will be left after the mine extracts precious reserves of water from aquifers, seen and unseen, confined or not, to process metals that serve its profit margin? Will there be any wild areas left, named or unnamed, categorized or not when the pollution from concentrates, waste rock and filters have found their way through this valuable ecosystem and the watersheds of the Arrowhead? Our national security depends upon protection of freshwater resources, and the Arrowhead stands as a source of one of the largest fresh water reserves on earth. No copper mine is worth the risk of degrading this precious resource.	NS	X
27822	Unique			WAT	Anita Tillemans		2155	12	If water seepage and inflow has not been predicted realistically for this study, then, the potential for harming watersheds of the St Louis River, Vermilion River and the Rainy River is great. Tribes inform the co-lead agencies that inflows are considerably higher than suggested by the EIS. How has related data from this observation informed the FEIS?	NS	X
27822	Unique			WAT	Anita Tillemans		2161	7	Potential effects that can be caused by drawdown in artesian springs, are given little review and field study, limited by assumptions and documents supporting the FEIS conclusion that bedrock geology plays a small part in hydrology of the area. At the same time, we are assured that if there are, indeed, fractures, faults and confined aquifers found during operation, or that drawdown becomes a problem, these issues will be dealt with at the time. Of course, once an artesian has been drawn down, the chances of drawing it back up are limited. At this point, there does not appear to be any technology that can guarantee the renewal of an aquifer, or restoration of ground waters fouled?	S	O
27822	Unique			WAT	Anita Tillemans		2162	8	Considering the importance of geology in this complex area of Minnesota, the FEIS omits much in detail. Ground water in the Laurentian Divide frequently diverges from surface topography and therefore locations of recharge and discharge can be impossible to predict. Polymet's probabilistic models cannot possibly be informed adequately to address the enormous danger of mining water, drawdowns, depressurization of artesian, and upwelling of brackish water to name only a few dangers posed by this project. In the process of review, some of the most relevant information appears to be missing from the FEIS, or discounted, much of the obvious geological and hydrological evidence that would prove a no action alternative best for the environment and for the habitants upstream and downstream of the proposed mining project. For instance, significant evidence on the fractured metamorphic nature of these lands, inferred and actual fractures and faults that have been named, the prospect of artesian springs, other faults and fractures in bedrock that may conduct water from the site, the potential that water inflows are much greater by many accounts have been given short shrift in deference to a computer model fed with data chosen, in particular, for this study. It all seems quite arbitrary, and these omissions are significant. The area that includes Babbitt, Hoyt Lakes and the transportation corridor are covered with sand and gravel surficial aquifers, which run the possibility of overdevelopment in irrigated areas. This region also includes igneous and fractured metamorphic bedrock aquifers, where water can be found in cracks, joints and fractures within otherwise solid rock formations. Hoyt Lakes is a land of sand and gravel buried aquifers, which can be a major source of water (eg the Biwabik formation). Further down the St Louis River, in addition to sand and gravel surficial, and buried aquifers, igneous and fractured metamorphic bedrock aquifers, there are also sedimentary bedrock aquifers. Even though yields from these sedimentary cretaceous deposits are supposed to be low, the possibility that ground water discharges in lowlands from sand and gravel and fractured aquifers, also in the area, certainly exists. Igneous and fractured metamorphic bedrock aquifers line the North Shore of Minnesota where there are over sixty water features in falls, rivers, and streams. The St Louis Watershed drains a basin of over 3500 square miles at the extreme headwaters of the St Lawrence Seaway. It appears that waters from glacial lakes, formed during the melt of the Laurentide Ice Sheet might still be discharging into Lake Superior as these waters work their way through the fractured bedrock aquifers of St Louis, Lake and Cook Counties. As noted, FEIS confirms that due to low permeability of the bedrock, discharge could take thousands of years... and so it seems that polluted waters could do the same. Polymet would be long gone before the consequences of copper mining could be fully assessed. The FEIS avoids much discussion on differentiating major geologic areas, although Ely, Babbitt, Hoyt Lakes, Embarrass, the BWCAW and the whole of Giants Ridge are encompassed in a single one of these regions. The FEIS avoids in depth review of the existence of confined aquifers (extremely important in the security of the groundwater), avoids discussing in particular dissimilarities in surface composites and bedrock as relates to their conductivity and connectivity, specifics on the variability of depth to bedrock, inevitable flooding scenarios, weather anomalies, likely spills and exposures, drumlin fields, watershed anomalies (for instance, the fact that the tailings pond at the LTV plant has outgrown what was once the boundary of the Vermilion Watershed, redrawn on maps to put it within the St Louis Watershed). Polymet's NorthMet Project will increase the size of this tailings pond and so it is crucial to understand fully the hydrology of both surficial and bedrock aquifers directly underlying this tailings pond in particular. Metamorphic rock is mentioned very little in the FEIS, as it fails to note that most of the Arrowhead is covered by fractured metamorphic rock, and in the area of the project, that sand and gravel surficial aquifers are prevalent as well, major omissions in outlining the geology of the area. Through these errors of omission, the probability of surficial and bedrock transport appears minimal at best. Is it possible to make a valid review of the project's feasibility without details like this?	S	O
27822	Unique			WAT	Anita Tillemans		2163	9	why experiential data from over 100 years of mining was not favored over probabilistic prognostications and limited field study prepared specifically for the NorthMet Project?	S	O

Our national security depends upon protection of freshwater resources, and the Arrowhead stands as a source of one of the largest fresh water reserves on earth. No copper mine is worth the risk of degrading this precious resource.	S	O
30061	Unique			WAT	Anita Tillemans		4322	7	This FEIS does not address known fractures, fault lines within the project site, and those along the Range. What of the Waasa and Camp Rivera Faults? What of the Vermilion Fault? The effects of faults and fractures have been downplayed in models, which were made to inform the FEIS. The connectivity of bedrock with surficial aquifers assumed to be low, and the upper surface of fractured metamorphic bedrock assumed to be fractured more heavily at the top than down under. This conclusion seems convenient and arbitrary, since these structures cannot be truly known, sight unseen. Is there some reason that Polymet did not use the available information on inferred faults for more in depth field study on these particular areas? Details and independent, in depth fieldwork is still needed concerning bedrock aquifers, faults and fractures in the area because of their potential for being conduits of pollution into ground water reserves, sight unseen. Polymet admits seepage will occur, but it continues to minimize the risks through assumptions concerning the conductivity of fractured metamorphic bedrock and sand and gravel aquifers throughout the area. Water will most assuredly traverse aquifers and find the path of least resistance. The FEIS minimizes and leaves these pathways open to conjecture with promises that all will be handled, in time.	S	O
30061	Unique			WAT	Anita Tillemans		4323	8	Potential effects that can be caused by drawdown in artesian springs, are given little review and field study, limited by assumptions and documents supporting the FEIS conclusion that bedrock geology plays a small part in hydrology of the area. At the same time, we are assured that if there are, indeed, fractures, faults and confined aquifers found during operation, or that drawdown becomes a problem, these issues will be dealt with at the time. Of course, once an artesian has been drawn down, the chances of drawing it back up are limited. At this point, there does not appear to be any technology that can guarantee the renewal of an aquifer, or restoration of ground waters fouled?	S	O
30061	Unique			WAT	Anita Tillemans		4324	9	In the process of review, some of the most relevant information appears to be missing from the FEIS, or discounted, much of the obvious geological and hydrological evidence that would prove a no action alternative best for the environment and for the habitants upstream and downstream of the proposed mining project. For instance, significant evidence on the fractured metamorphic nature of these lands, inferred and actual fractures and faults that have been named, the prospect of artesian springs, other faults and fractures in bedrock that may conduct water from the site, the potential that water inflows are much greater by many accounts have been given short shrift in deference to a computer model fed with data chosen, in particular, for this study. It all seems quite arbitrary, and these omissions are significant. The area that includes Babbitt, Hoyt Lakes and the transportation corridor are covered with sand and gravel surficial aquifers, which run the possibility of overdevelopment in irrigated areas. This region also includes igneous and fractured metamorphic bedrock aquifers, where water can be found in cracks, joints and fractures within otherwise solid rock formations. Hoyt Lakes is a land of sand and gravel buried aquifers, which can be a major source of water (eg the Biwabik formation). Further down the St Louis River, in addition to sand and gravel surficial, and buried aquifers, igneous and fractured metamorphic bedrock aquifers, there are also sedimentary bedrock aquifers. Even though yields from these sedimentary cretaceous deposits are supposed to be low, the possibility that ground water discharges in lowlands from sand and gravel and fractured aquifers, also in the area, certainly exists.	S	O
30061	Unique			WAT	Anita Tillemans		4325	11	The FEIS avoids much discussion on differentiating major geologic areas, although Ely, Babbitt, Hoyt Lakes, Embarrass, the BWCAW and the whole of Giants Ridge are encompassed in a single one of these regions. The FEIS avoids in depth review of the existence of confined aquifers (extremely important in the security of the groundwater), avoids discussing in particular dissimilarities in surface composites and bedrock as relates to their conductivity and connectivity, specifics on the variability of depth to bedrock, inevitable flooding scenarios, weather anomalies, likely spills and exposures, drumlin fields, watershed anomalies (for instance, the fact that the tailings pond at the Minntac plant has outgrown what was once the boundary of the Vermilion Watershed, redrawn on maps to put it within the St Louis Watershed). Polymet's NorthMet Project will increase the size of this tailings pond and so it is crucial to understand fully the hydrology of both surficial and bedrock aquifers directly underlying this tailings pond in particular.	S	O
30061	Unique			WAT	Anita Tillemans		4326	12	Metamorphic rock is mentioned very little in the FEIS, as it fails to note that most of the Arrowhead is covered by fractured metamorphic rock, and in the area of the project, that sand and gravel surficial aquifers are prevalent as well, major omissions in outlining the geology of the area. Through these errors of omission, the probability of surficial and bedrock transport appears minimal at best. Is it possible to make a valid review of the project's feasibility without details like this?	S	O
30061	Unique			WAT	Anita Tillemans		4327	13	Of course, a model cannot take into consideration all of the factors in this extremely complex area of the North Met Project prospect, and so, I wonder, why experiential data from over 100 years of mining was not favored over probabilistic prognostications and limited field study prepared specifically for the NorthMet Project? The Mississippi is now polluted; the St Louis River, and waters off the North Shore are imperiled. One hundred years is so little time in the course of a history like the Arrowhead, but much damage has already been done. What would be the result after 500 years of seepage from the degraded rotted and rusted infrastructure of a copper sulfide mine? Studies that fail to use extensive fieldwork and data available from mining experience of the Mesabi Widjiu over the past one hundred years since the late 1890's are likely to misrepresent the risks involved with a copper mine in the Arrowhead.	NS	X
30061	Unique			WAT	Anita Tillemans		4328	14	If water seepage and inflow has not been predicted realistically for this study, then, the potential for harming watersheds of the St Louis River, Vermilion River and the Rainy River is great. Tribes inform the co-lead agencies that inflows are considerably higher than suggested by the EIS. How has related data from this observation informed the FEIS?	NS	X
30061	Unique			WAT	Anita Tillemans		4329	15	Exploratory wells have been made well past the northern boundaries of the St Louis River Watershed, into the Rainy River Watershed, and on the boundary of the BWCAW. As a consequence, if the North Met project for a copper mine is granted, this will create the potential of a succession of mining pits and wells that move from the NE of Giants Ridge into the domain of the BWCA Wilderness. Consequently, the NorthMet Project prospect has the potential of affecting a larger area than the study proposes. Elevated levels of arsenic can be found in the BWCAW along with brackish waters from exploratory wells. These details cannot be overlooked because it foretells the real possibility of pollution from Polymet's mine pits traversing aquifers and connecting the St Louis Watershed to the Rainy River Watershed. The potential of surficial and bedrock connectivity from the mine site to this highly diverse geology of the BWCAW region through fluid and interconnected wilderness waterways, glacial moraine and diverse geology is relevant to the discussion.	NS	X
30061	Unique			WAT	Anita Tillemans		4330	16	Relying on probabilistic outcomes that narrow the view and minimize the prospect of pollution reaching downstream seems unrealistic. The potential of downstream contamination throughout the St Louis River Watershed should be given full consideration in any responsible environmental study concerning the prospect of a copper mine in this ecologically important area at the headwaters of the greatest body of freshwater on earth.	S	O
22622	Unique			WAT	Anne Uehling		873	1	Herein are my comments on the Polymet's Northmet Project FEIS. (also attached) -Longterm plans for sustainable water treatment are inadequate. An inability to predict the future is given as a reason to leave future water treatment open ended. In particular, "Once the West Pit is full (by the end of year 52), discharge of treated water from the WWTF to the West Pit would be terminated. The WWTF would be upgraded to RO or equivalent technology that would meet water quality targets and include evaporator/crystalizers to convert the RO reject concentrate to residual solids...." (FEIS 3.2.2.1.8, p. 3-65)	NS	X
22622	Unique			WAT	Anne Uehling		876	4	This watershed is currently impacted by mining and needs all mitigation possible as it flows to Lake Superior. Polymet will be discharging sulfates into the watershed, sometimes higher than the 10 ppm and thus potentially harmful to wild rice beds. Furthermore, more than 3 ppm have been shown to facilitate the formation of methylmercury, a major problem in the area of Lake Superior fed by the St. Louis River.	NS	X
22622	Unique			WAT	Anne Uehling		878	6	The inadequacy of water models for determining The direction of water flow, bedrock fractures, and rate of flow from The site are documented by Tribal entities and others. While it is asserted that certain concerns WILL be addressed in The permitting process and in on-going monitoring by agencies, this is an undercover process at best and when monitoring shows a problem, The pollution HAS begun.	NS	X
27088	Unique			WAT	Anthony P. Vessicchio		1652	1	This mine would produce acid mine drainage and other pollution that would require water treatment for at least 500 years. This pollution could drain northward and trash the watershed of the Bounty Waters Canoe Area wilderness or damage the St. Louis River as well as Lake Superior to south. Federal and state agencies don't know where this pollution will go.	NS	X

29897	Unique			WAT	Anthony Runkel		4216	1	The content of the FEIS dealing with bedrock hydrogeology is improved over the SDEIS in a number of ways. The inclusion of a higher hydraulic conductivity layer corresponding to shallow bedrock conditions, and adjustments to conductivity parameters in the models, are positive additions. The FEIS also more clearly and consistently acknowledges the potential for enhanced flow along fractures that have yet to be identified at the mine and plant sites. Another improvement is the addition of possible mitigation strategies should such enhanced flow be recognized during mining, or post-mining operations. Other approaches suggested in my (and other) 2014 SDEIS comments to improve the NorthMet site characterization were not employed. These include the use of routine techniques such as depth discrete head measurements, water chemistry (for residence time), borehole geophysical logs, and packer tests; all targeted towards identification of enhanced flow through fractures. The FEIS justifies the exclusion of these and related techniques mostly by suggesting that the current level hydrogeologic characterization for the NorthMet site is adequate, and that it is based on techniques and assumptions that are “standard approaches” or “common practice” in the mining industry. While it is not the role of a non-regulatory agency such as the Minnesota Geological Survey (MGS) to determine what is “adequate” in a permitting process, the MGS does have a responsibility to inform the process as an unbiased source of Earth Science information when we have the expertise to do so. In that spirit, the remainder of this FEIS comment provides what I consider to be a scientifically current perspective on “standard approaches” in the field of hydrogeology that would improve the ability to predict impacts of the proposed mining at the NorthMet site. If the approach used to characterize the hydrogeologic conditions at the NorthMet site is indeed consistent with standard practice, it might be beneficial to reconsider the standard, or if that standard is appropriate for a project of this magnitude. A standard that might be sufficient for basic water budget (quantity) predictions may not be a sufficient standard for an activity such as nonferrous metal mining, where transport of contaminants (water quality) is of equal importance to water quantity. The latter should require a more comprehensive hydrogeologic understanding of a site. The techniques described in the Runkel 2014 SDEIS comment, such as depth discrete head measurements, borehole geophysical logging, packer tests, and discrete interval water sampling for residence time information, have been used to improve our understanding of hydrogeologic conditions in this region for nearly two decades. Government agencies that have used these approaches include the Minnesota Department of Health, Pollution Control Agency, Department of Natural Resources, and the Minnesota and Wisconsin Geological Surveys. Industry groundwater consultants have also used many of these approaches for remediation of contamination sites. As a specific example, the DNR Division of Ecological and Water Resources routinely uses information from these techniques to depict hydrogeologic conditions at county-scale, as part of the County Geologic Atlas program. The widespread and longtime use of these approaches to hydrogeologic characterization could therefore be considered common practice. A more systematic approach to identifying enhanced flow along fractures that included routine techniques such as those described here would have reduced uncertainties inherent in the predictions of water-related impacts at the NorthMet site. For example, identification of enhanced flow along fractures would lead to significantly shorter predicted travel times than currently estimated in the FEIS. The unrecognized presence of especially high conductivity fractures can also lead to miscalculation of flux predictions. Current predictions of flux described in the FEIS are based on a conceptual model in which the bedrock fracture network is deemed to be sufficiently well-connected at site-scale to behave as equivalent porous media, and that a low bulk hydraulic conductivity is representative of the entire site. The bulk hydraulic conductivity, and thus the flux, will be greater than currently estimated if high conductivity fractures are present, but remain unidentified. The limited number of boreholes and manner in which those holes were tested at the site greatly reduced the odds of identifying any such fractures. In summary, the FEIS is improved over the SDEIS, but a considerably more complete understanding of the hydrogeologic conditions could have been achieved by including information derived from a number of well-established, common practice techniques that provide greater insight into transport through fractured bedrock. These improvements would decrease the odds of unanticipated environmental impacts, and, if the proposed project moves forward in the permitting process, lead to more robust water protection and monitoring strategies.	S	O
28533	Unique			WAT	Arno S. Kahn		2313	1	The proposed extraction of copper-nickel, as proposed by Poly-Met, will, without question, add sulfide pollution to our area?s pristine watershed. We owe it to subsequent generations of Minnesotans, as well as to the rest of the planet, to safeguard this rare fresh water treasure.	NS	X
28533	Unique			WAT	Arno S. Kahn		2314	2	The addition of sulfide to this watershed will heavily impact both the plants and the fish population.	NS	X
30079	Form Letter	1	Variant	WAT	Ashlee Kveton		2803	1	However, I must admit I have serious doubts about the copper nickel mine that Poly Met has proposed. Further, I have serious doubts about the integrity of the lead agencies Environmental review process and it’s subsequent EIS’s and their predictions/conclusions. First of all, I lived in Montana for quite some time where the environmental, and public health consequences of mines just like the one proposed by Poly Met induced Montanan’s who are largely Pro Industry- to pass a ballot Initiative I-137 in 1998 banning -cyanide leach mining- which in all reality poses the exact same dangers that the copper nickel mine Poly Met is proposing. See the cyanide goes away but what is left is the same thing we have to worry about with Poly Met’s Proposed project- sulfide bearing waste rock (like what Poly Met is mining) that reacts with air and water to produce acid runoff and also all kinds of nasty toxins like Arsenic that destroy down stream aquatic ecosystems.	NS	X
30079	Form Letter	1	Variant	WAT	Ashlee Kveton		2804	2	I fear that like the mines in Montana, the Gilt Edge mine in Lead South Dakota, Poly Met cannot stop the toxic runoff from their waste rock piles from seeping into groundwater, being flushed downstream, or even entering the BWCA watershed via groundwater flow and movement in the 100 mile swamp-which looks to flow into the St. Louis river/Lake Superior Watershed, as well as, the Rainy River/Hudson’s Bay Watershed. As I understand it the stream flow data that Poly Met gathered is a very inaccurate representation of what is actually happening at the Poly Met site. This of course is the same data that The lead agencies used to predict the flow of water, and toxins into the environment. This is unacceptable. Also, the Environmental Review process should be taking into account changes in ground water flow and tables, relating to other mining related disturbances/influences on the flow of water during and after the life of the Poly Met Mine. Such as a draw down of 200-300 feet in a mine pit lake north of the Poly Met site-which arguably will cause the groundwater from Poly Met to flow North into the Rainy River watershed instead of south into the St. Louis River system.	NS	X
30079	Form Letter	1	Variant	WAT	Ashlee Kveton		2808	6	Is 20 years of mine life and the associated jobs really worth 500 years at least of water treatment from this site, Is it worth the massive plumes of untreated water from this site contaminating ground water, and eventually surface water resources, when the plumes reach the lakes and rivers we swim in and eat from? By approving this FEIS and the associated known- and possible effects of this mine Tom Landwehr and the rest of the lead agency staff is sending the message to Minnesotans that anyone with a lot of money can come into Minnesota and take whatever they want from us at the expense of our communities, our environment, and those Minnesotan’s who will come after us.	NS	X
26479	Unique			WAT	Audrey Kramer		1327	1	It would contaminate the St. Louis River in northern Minnesota, and ultimately Lake Superior because the St. Louis River empties into Lake Superior at its estuary near Duluth, MN and Superior, WI	NS	X
26479	Unique			WAT	Audrey Kramer		1328	2	Because the copper-nickel mineral is a low grade, less than 1 percent of the mineral could be utilized. Therefore 99 per cent of waste rock and fine ground tailings would end up leaching toxic, heavy metals and acid mine drainage into both the surface water and the ground waters which later feed aquifers.	NS	X
26479	Unique			WAT	Audrey Kramer		1329	3	ground water seepage at the mine closure would flow in a northerly direction into the Rainy River which is the Boundary Waters Canoe Area, Minnesota’s pristine wilderness area.	NS	X
27377	Unique			WAT	Beth Lewis		1699	1	Inadequate hydrologic models of volume and direction of water flow.	NS	X
27377	Unique			WAT	Beth Lewis		1701	3	Possible damage to the Rainy Lake watershed and BWCAW from north flowing acid drainage.	NS	X
26555	Unique			WAT	Bethel Anderson		1353	2	I am concerned about ground water contamination of adjacent private water wells. Questions about the validity of the ground water models have been raised. The FEIS must re-evaluate ground water contamination.	S	O
24701	Unique			WAT	Bill Polesnak		1087	1	Please protect our land and water.	NS	X
29731	Unique			WAT	Bill Waddington		2573	1	The environmental studies done up to this point are woefully inadequate: particularly the question of whether pollution will flow into the Boundary Waters. The federal government has said this is a very possible result and recommended further study. This issue has not been studied, in fact folks seem to be avoiding it.	NS	X
23226	Unique			WAT	Bob McFarlin		904	2	Twin Metals agrees with the findings of the FEIS that groundwater flows from the NorthMet Project will not directly, indirectly, or cumulatively affect the Boundary Waters Canoe Area Wilderness or Voyageurs National Park.	NS	X
23225	Unique			WAT	Bob Shannon		902	2	My original comment was parsed into comments 7870 and 7872 which were not adequately addressed by the thematic response. Thematic response (WR189) concludes by saying that “...modeling results for hundreds of years in the future should be viewed with appropriate caution.” The co-leads are using hyperbole to gloss over, accept, and validate scientifically indefensible representations about the long term conditions at the site. While models can provide powerful information within the bounds of uncertainty, any conclusions made based on the output will be bounded but its uncertainty. Modeling conditions far into the future, however, is not scientifically defensible unless there is adequate control of the uncertainty of model input parameters, and this uncertainty is rigorously propagated into the output of the model and accounted for in the subsequent assessment process. Lacking any other empirical evidence that supports long-term conclusions based on these models and their “probabilistic estimates”, a reasonable assessment of these claims must conclude that using these models to any longer-term representations is scientifically indefensible. The question is highly pertinent since the output of these models is being used by PolyMet to support claims made that PolyMet will be able to comply with environmental regulations “in perpetuity”. Since there is no basis for bounding the limits of predictions made by the models beyond the first few years, these claims are not scientifically defensible and they should be excluded. Until the state can project the longer term reliability of representations made by PolyMet – who are making claims about conditions “in perpetuity”, they cannot: 1) assess whether the project will maintain compliance with water and air quality regulations well past the point in time one can reasonably assume that the corporation will continue to exist; or 2) provide realistic estimates of the financial assurance needed to protect the State of Minnesota from long-term responsibility for the site should NorthMet or their successors cease to exist.	S	O
28898	Unique			WAT	Brad Carlson		2370	1	the feis was incomplete in its look at hydrological impacts. There are many variables it did not even consider regarding the geological conditions present that will affect where the toxic waste will flow.	NS	X
28898	Unique			WAT	Brad Carlson		2371	2	the very fact that toxic waste runoff has to be considered in detail should alone be reason enough to cancel this project in our opinion. the facts all support a disaster in the making.	NS	X
27620	Unique			WAT	Brad Heltemes		1787	2	The water modeling for this extremely inefficient proposed mining project is inadequate and ground water testing has not taken into account the amount of bedrock waste that would be generated.	NS	X

30073	Unique			WAT	Brad Sagen		4343	1	Great Lakes Indian Fish and Wildlife Commission (GLIFWC) has notified the lead agencies that groundwater from the NorthMet east pit is predicted to flow northward into the Rainy River Basin upon closure of the Northshore Peter Mitchell Mine. The agencies acknowledge this possibility but have refused to conduct necessary additional analysis. According to an interagency memo of 10/12/15, “the well data and the NorthMet Mine Site MODFLOW model do not exclude the possibility of a future northward bedrock flowpath from the proposed NorthMet pits to the Northshore pits.” The point central to an evaluation of the adequacy of the FEIS is that because of the level of risk involved, the possibility of northward east pit groundwater flow must be addressed in the FEIS.	S	N
30098	Form Letter	9	Variant	WAT	Brian Harrington		2821	5	We are exchanging our health, our safety, our precious water, our forests and marshes for 20 years of mining operation.	NS	X
30098	Form Letter	9	Variant	WAT	Brian Harrington		2823	7	Maintaining fresh water should have higher importance to our state than other considerations on the agenda. Our abundance of water has led to gross neglect of maintaining this essential resource. Frequent headlines in the news lead with issues of water poisoned due to runoff from mining, farming, development, yard maintenance. Not to mention the mercury contamination due to drift from burning coal for power.	NS	X
27003	Unique			WAT	Bruce Johnson		1587	5	The FEIS assumes that leachate from the explosives will rinse off the waste rock and tailing in one year. The open scientific literature from Canada has documented that the Nitrogen has been documented to take 5 years to reduce concentrations (Morin & Hutt 2009, p1550).	S	O
27003	Unique			WAT	Bruce Johnson		1590	1	My comment 15326 regarding the toxicity and degradation products and toxicity as it relates to environmental impacts was responded to with Theme Code HAZ 04. The Theme code answered my comment stating that the MSDS answers my question. Before I wrote the first comment I reviewed all MSDS’s. They did not answer my comment thus I commented on the lack of analysis in the SDEIS. MSDS’s are written for the health and safety of workers that handle a product. The MSDS are not required to provide any environmental health or chemical degradation or mixture information. For example, Flotec Pax (Potassium Amyl Xanthate, Potassium Isoamyl Xanthate) is proposed by PolyMet to be used extensively in the beneficiation process. The MDDS has a small section that describes some ecological information: it is acutely toxic to rainbow trout at >10 -100 mg/l. an acutely toxic to water flea >1-10 mg/l. It states that it is “toxic to aquatic organisms, may cause long term effects in the aquatic environment”, it further states: “this matter is not biodegradable”. The MSDS contains no mixture toxicity information when it is mixed other reagents in the beneficiation process. Clearly the use of this chemical with others in large amounts for 20 years and then discharging them into the tailing basin adds toxics to the basin. Assuming the FEIS prediction of 90% collection of seepages from the basin actually works as hoped. It would return the seepage into the basin. Once returned to the basin an unknown amount and concentration will accumulate and at an unidentified point the remainder will be pumped the wastewater treatment plant. This plant does not have removal rates for any of the flotation chemicals. One would expect an undetermined amount to be sent to both the hydrometallurgical facility as sludge where it will concentrate. The remainder will be returned to the tailing basin where it will further concentrate to a yet undetermined concentration. Another unspecified amount (at least 10%) and concentration will be lost to seepage and enter receiving waters through the shallow groundwater and ultimately the surface water. The DEIS impacts from this have been ignored in the FEIS. This is a critical omission that will have substantial surface and ground water impacts.	S	O
27003	Unique			WAT	Bruce Johnson		1592	3	The FEIS assumptions regarding Ammonium Nitrate Fuel Oil (ANFO) blasting agents described in the NorthMet Project Waste Characterization Package version 12, February 13, 2015 Section 8.4.2 amounts to nothing more than assumptions and speculation with no scientific validation. The open scientific literature and the Minnesota and Federal rules are in disagreement with these assumptions.	S	O
27003	Unique			WAT	Bruce Johnson		1594	6	The FEIS oversimplifies the impacts of ANFO. In Canada ANFO release has been studied and it has been necessary to regulate a Canadian report states ANFO is regulated in surface water using the following statement: Because of the potential adverse environmental effects of ANFO, its use in Canada is regulated by Section 36(3) of the Fisheries Act (1985), which prohibits the deposit of deleterious substances into waters frequented by fish, unless otherwise permitted by regulation. There is no regulation pursuant to the Fisheries Act that permits the deposit of by-products resulting from the use of ammonium nitrate-fuel oil mixtures. Also, the use of ANFO near bodies of water is not recommended by the Institute of Makers of Explosives, which stipulates that No use of ammonium nitrate-fuel oil mixtures occurs in or near water due to the production of toxic by- products (ammonia). The report concludes: “The literature review indicates that the most common environmental issues associated with the use of ANFO are related to dissolution of AN and to oil wicking. Nitrates and ammonium are readily soluble in water, and thus can very easily reach groundwater. Nitrates exceeding the CCME guidelines (2003) of 13 mg NO3-/L for freshwater (or 16 mg NO3-/L for the protection of marine life) are at risk of causing methaemoglobin, especially in babies. In addition, the presence of nitrate in marine water will cause algal blobs and eutrophication. The toxicity of the ammonium ion is low, but the ammonium in water is in equilibrium with ammonia, which is characterized by a much higher toxicity. Aquatic life is affected when concentrations of ammonia exceed 0.019 mg/L (CCME, 2000). In addition, ammonia in concentrations above 25 mg/m3 for a 15-minute period or the IDHL of 210 mg/m3 (NIOSH, 2007) poses a health hazard to humans. However, this situation is not likely to happen to CF members, given the fact that ANFO is usually handled outside.” (Defence R& D Canada, Jan 2010). - The FEIS failed to evaluate impacts from oil wicking of ANFO (Defence R& D Canada, Jan 2010).	S	N
27003	Unique			WAT	Bruce Johnson		1595	7	- Another report states the field literature documents that between 5-15% of ANFO leaches into drainages. In one site an ammonia mass balance showed between 9-27% of ammonia was found in the mine water, and 26-47 % was found in the mill circuit (Morn and	NS	X
27003	Unique			WAT	Bruce Johnson		1596	8	The FEIS assumption that the ANFO release is a one-time load dependent and is not a ongoing load is simply incredible (FEIS p96). The Mine operation is estimated 20 years. ANFO blasts will occur at least weekly. Liter states the leaching of blasts have been documented to leach for 5 years. Thus, assuming the ballast size and frequency remain constant over 20 years, leaching concentrations will increase for the first five years and remain stable for the next 20 years and decrease for the remaining five assuming closure after 20 years. This discharge is therefore not a one tome load dependent discharge as the FEIS states but and ongoing discharge that will last until 5 years past mine closure.	S	N
27003	Unique			WAT	Bruce Johnson		1597	9	My Comment 15312 was “answered” using thematic response WR 32. The response fails to answer the impacts from nitrates. It assumes only the rock in the pit contains residual nitrates. It fails to discuss the treatment levels if the water is internally recycled in the system and not discharged. The literature has documented the tailings also contain residual elevated nitrates. The FEIS proposes the tailing water will be recycled and at an undetermined concentration in the basin and will be sent to the mine site treatment plant. It will be treated to an undetermined extent by the treatment system since it is not being discharged. The undetermined concentration of nitrates in the sludge will be sent to the hydrometallurgical process and concentrate to undetermined higher levels. The “treated” water (treated to a undetermined level) will be sent to the tailing basin where it will accumulate to an undetermined concentration since it will not be controlled under NPDES Permit. That which is not captured at the basin for reuse, will discharge and undetermined concentration of nitrates into the shallow groundwater and discharge to area streams. This entire sequence is undefined and must be addressed to protect both surface water and drinking water.	S	O

27003	Unique			WAT	Bruce Johnson		1598	10	My comment 15313 regarding discrepancies in the amount of ANFO used in a blast was answered with theme code GT01. The Theme code GT01 response has nothing to do with my question. Thus my question remains unanswered.	S	O
27003	Unique			WAT	Bruce Johnson		1599	11	Comments Regarding 90% recycling of Tailing Basin Water. The proposal in the FEIS is to concentrate the water accumulated in the pits, and waste rock and other ancillary areas discharge will be “treated” at the WWTF and discharged to the Tailing basin. The WWTF treatment sludges will be discharged to the hydrometallurgical facility. “At least” 90% of seepage from the tailing basin will be captured and treated for reuse in the beneficiation process. This “recycling” process ignores a number of critical issues:	NS	X
27003	Unique			WAT	Bruce Johnson		1600	12	Since no direct discharge is planned to surface water surface NPDES water standards will not apply to internal “treatment” concentrations, as long as a discharge does not occur to surface water. This means the treatment process is internal and will not have to meet any surface water regulatory standards, or predictions in the FEIS. Thus if the treatment facility could meet surface water standards, which has not been demonstrated using seepage wastewater from field sites such from the Dunka Mine, will not be required. Thus the plant will not be required to meet a set of standards under a NPDES permit. As a result the plant will be operated in such a manner as to not allow the production process to be fouled. This level of “treatment” has not been describe or evaluated.	NS	X
27003	Unique			WAT	Bruce Johnson		1601	13	2. The pumping seepage water from the tailing basin back to the basin will allow the chemicals and minerals are found in beneficiation process that have dissolved as it travels trough the copper nickel and taconite tailings to be added to the existing beneficiation water to concentrate to a undefined saturation point until such a time that the process is hampered by a chemical or element or series of elements. At such a time the concentrate will be processed in the WWTF to an unknown level.	NS	X
27003	Unique			WAT	Bruce Johnson		1602	14	3. Loss of these concentrated seepages that escape containment will have a definite impact on surface waters. It is likely that they will contain numerous beneficiation reagents, elevated specific conductance, calcium, magnesium, potassium, chloride, sulfate, nickel, cobalt, and potentially zinc, as demonstrated from the Amax tailings study (Minnesota Department of Natural Resources, 2004).	NS	X
27003	Unique			WAT	Bruce Johnson		1603	15	The FEIS page 5-131 & 5-132 and Themes WR 002, WR007, and GLIFIC 147 discuss saline groundwater. I find the FEIS responses dated, overly simplified and scientifically inadequate. The FEIS responses comments follow a pattern of citing outdated or inappropriate science and answering with a final statement that if we are wrong we will treat the waste to standards for as long as necessary (FEIS page A539 paragraph 4). I find the discussion of saline groundwater inadequate for the following reasons:	NS	X
27003	Unique			WAT	Bruce Johnson		1604	16	1. The FEIS assumption that saline water is found in only in ground water pools in fracture areas (FEIS p 5-132) ignores current science on the subject. Two published geological research reports have conclusively identified the source of brackish water (salt) within the Duluth Complex. The salt is contained within dry micro-fractures within troctolite rock (Dalberg, Sanini-Eidukat, 1991; Pasteris, Harris, Sassani, 1995). When this rock is exposed to water, in fracture zones or by crushing, the salt dissolved into the water. The absence of water in 12 drill core wells is not an indication of absence of salt but an absence of water in the core.	S	N
27003	Unique			WAT	Bruce Johnson		1605	17	2. The proposed PolyMet pit is troctolite (Patelke, 2010). The same rock that contains the micro fractures.	NS	X
27003	Unique			WAT	Bruce Johnson		1606	18	3. The FEIS (p. 5-131) unproven allegation suggests that PolyMet pit depth is shallow compared to the Amax and is not in the same rock units. This is inaccurate since the rock units dip downward to the southeast from PolyMet. Thus Unit 1 at Amax is at the bottom of the mine and Unit 1, and the other units at PolyMet are on the surface (Patelke, 2010). Additionally Dahlberg stated the inclusions were found “Within drill cores at distances ranging from 11.3 to 917.5 m (37 to 3009 ft) from the foot wall (footwall is defined as the mass of rock beneath a fault, ore body, or mine-working) of the Duluth Complex,...”. Thus, it is highly probable chloride inclusions will be encountered by PolyMet.	S	N
27003	Unique			WAT	Bruce Johnson		1607	19	4. The chloride concentrations would be expected to be the highest in the tailing since the surface area would be the largest, exposing the micro fractures. This would be consistent with the results observed at the Amax tailing test plot (MNDNR, 2004). As a result chloride concentrations are drastically underestimated in the tailing basin table (Large table 10 thru 14, Annual Summary of Concentrations Statistics north, northwest, west, south, and east toe of the tailing basin).	NS	X
27003	Unique			WAT	Bruce Johnson		1608	20	The Theme Response WR173 makes unsubstantiated assumptions that it is “assumed that the oxidation in submerged wall rock and waste rock was negligible.” Major ion dissolution from underwater disposal of waste rock and pit sidewall leaching has not been addressed.	S	N
27003	Unique			WAT	Bruce Johnson		1609	21	The MNDNR Division of Fish and Wildlife reported taconite abandoned mine-pits have elevated concentrations of Ca, Mg, Na, Mn, S04 at neutral to basic pH. Elevated ion concentrations are represented by both individual chemical composition and specific conductance as well as ionic imbalances when compared with unimpacted natural waters. These elevations are further reflected in aquatic benthic invertebrate impacts in the area.	NS	X
27003	Unique			WAT	Bruce Johnson		1611	23	Beyond failing to evaluate major ions underwater concentrations, the FEIS ignores addressing impacts of noncompliance with narrative standards from such releases to surface waters directly or through shallow groundwater upwelling.	S	N
27003	Unique			WAT	Bruce Johnson		1612	24	Subaqueous disposal is used in the US for superfund remediation where mitigation of contamination is the goal, rather than prevention.	NS	X
27003	Unique			WAT	Bruce Johnson		1615	27	The FEIS response to narrative standards concerns is that they are relegated to permitting (Theme Per 09, p A-458). In delaying this critical evaluation, it cannot be concluded by the FEIS that substantial impacts will not occur, Or can be controlled to existing standards for 200 years.	S	N
27003	Unique			WAT	Bruce Johnson		1616	28	- Theme AQ 09 makes the inaccurate assumption that once Duluth Complex waste rock is placed under water in anoxic conditions the only release that would be biologically harmful underwater would be sulfate. Additionally, Theme WR 173 states: “Goldsim model	S	N
27003	Unique			WAT	Bruce Johnson		1617	29	A report by the DNR studied subaqueous leaching with flask laboratory experiments using the Virginia Formation and Partridge River Formation rock Units 1, 2, 3, 4 5, 6, 7, 8. The report disregarded initial leachate flushes that were apparently quite elevated. These type flushes will occur under operation conditions and should not be ignored. The remaining leachate collected demonstrated that concentrations in anoxic conditions are reduced from oxygenated. (Lappako et. Al. June 2013). The resultant copper, nickel, cobalt, zinc, sulfate will all exceed chronic surface water standards for receiving waters with hardness of 50 mg/l which comprise most of the unimpacted wasters in the area.	S	O
27003	Unique			WAT	Bruce Johnson		1618	30	In 1980 the Regional Copper Nickel Study tested Duluth Complex Rock under various oxygen levels and found that anoxic conditions demonstrated that nickel was released slowly to 1 mg/l after 800 hours (33.3 days) a order of magnitude above the 2B standard for these unimpacted waters (Eger P. Lapakko K.). The MinnAmax (Amax) the closed test underground mine is 3.2 miles from the proposed PolyMet pit that is 2.7 miles long. The shaft is 14 ft. in diameter and approximately 1750 ft. in depth. It was constructed through low-level Duluth Complex rock and is constructed in the Partridge River Deposit. The mine has been abandoned and shaft was sealed and filled with water for many years. The surface area is exposed to anoxic leaching. The sidewall surface area exposed is small compared to both the PolyMet pit sidewalls and the disposed waste rock surface area. On October 10-11, 1985 DNR minerals sampled the water in the shaft to a depth of 300 ft. Results from the sampling on October 3rd demonstrate nickel, cobalt, chloride, specific conductance all exceeding 2B surface water numerical standards averaging Yet pH has a mean average of 7.5. (DNR AMAX Shaft Test Data). The shaft contains low concentrations of sulfide bearing rock and has a small surface area exposed to leaching compared to PolyMet’s high sulfur waste rock and high sulfur Virginia Formation and waste rock sidewall in the proposed east pit. The chronic standards for waters in the area is nickel is 0.088 mg/l (hardness 50mg/l), cobalt 0.005 mg/l (not hardness related), chloride 230mg/l. The average values observed were nickel 0.0908mg/l, cobalt 0.0383mg/l. Chloride 647mg/l.	NS	X
27003	Unique			WAT	Bruce Johnson		1619	31	Although the nickel is slightly over standard It must be considered that the PolyMet Virginia formation and the category of waste rock proposed to be disposed of underwater is high sulfur and other heavy metals and will release much higher concentrations of metals, in anoxic circumneutral pH conditions.	S	N
27003	Unique			WAT	Bruce Johnson		1620	32	Another FEIS omission is that major ion balances and specific conductance are ignored. Both of which are well identified to have toxic effects. At the Amax shaft the specific conductance averaged 2,414 uS/cm. This is far above the values that EPA found impacting benthic invertebrates in West Virginia and Kentucky, and in Minnesota (Johnson and Johnson).	S	N
27003	Unique			WAT	Bruce Johnson		1621	33	The FEIS has not addressed impacts of bicarbonates, a major ion that has a numerical standard of 5 meq/l. and major ions and ion imbalances in subaqueous disposal of waste rock or pit sidewalls from runoff and inundation. It further employs limestone as a “treatment” for metals release on the east pit sidewall. This will further elevate major ions concentrations and specific conductance impacting benthic invertebrates in any discharges or seepages.	S	N
27003	Unique			WAT	Bruce Johnson		1623	35	Specific conductance is reported to impact the areas inundated iron ore, and iron ore mine glory holes. Three pits in the area are chemically stratified with elevated specific conductance and temperature with depth (Miners Pennington and Sagamore). All pits are characterized by high sulfate, alkalinity, hardness, and organic nitrogen. Both density and diversity of invertebrates colonizing artificial substrates are low when compared to oligotrophic natural lakes. (Pierce Rodney B., Tomcko Cynthia M., November 1989). Since iron ore is low in sulfate compared with Duluth Complex it further demonstrates that what the FEIS describes as “assumed as negligible” is in gross error.	S	N

27003	Unique			WAT	Bruce Johnson		1624	36	Area field data demonstrates that subaqueous disposal of elevated sulfide waste rock coupled with mine pit sidewall will further drastically increase using subaqueous disposal. This demonstrates that underwater disposal of waste rock and sidewall leaching of Virginia formation will not meet surface water standards for hardness, specific conductance, nickel cobalt and zinc. Once waste is in place underwater it will never meet surface water standard for these parameters and will be impossible to remediate to standards.	NS	X
27003	Unique			WAT	Bruce Johnson		1625	37	The literature also demonstrates similar concerns over subaqueous disposal. As a result of laboratory testing Y.T. Kwong makes the following conclusions: 1. Sub aqueous disposal reduces the rate of sulfide oxidation but does not eliminate it. 2. With the progress of sulfide oxidation underwater the alkalinity will determines the net acidification 3. Potentially deleterious trace elements like arsenic and antimony with multiple oxidation states are susceptible to remobilization under water with changing redox conditions. In summary he states: “it should be apparent that subaqueous disposal as a panacea for managing all types of reactive mine wastes is a myth.(Kwong Y.T. 2004).	NS	X
41	Unique			WAT	Bryan Emmel		108	2	The water filled NE Minnesota is a sitting duck for contamination.	NS	X
29361	Unique			WAT	C.A.Arneson		3692	5	Minnesota has experience with impacts from Duluth Complex material; the lack of ability to successfully deal with the Dunka problem needs to be a part of PolyMet’s SDEIS.	NS	X
29361	Unique			WAT	C.A.Arneson		3703	1	Ironically, since sulfate had nothing to do with current shutdowns, the Natural Resources Research Institute (NRRI) 2014 Semi-Annual Report stated, “A new, low-cost sulfate remediation technology is needed immediately to avoid the potential shut-down of taconite operations in the State of Minnesota. The Minnesota Iron Range Resources and Rehabilitation Board (IRRRB) is offering \$125,000 in matching funds to NRRI to create this project, along with in-kind support from both Cliffs Natural Resources (NR) and PolyMet Mining.” Excuse me? PolyMet already claims reverse osmosis works like a charm. The taconite industry ought to be well on its way to cleaning up its mess by now. But then, Minntac claims there is “no way to treat” its toxic waste from reverse osmosis. https://www.minnpost.com/environment/2015/05/despite-pressurelower-Minntac-sulfate-emissions-status-quo-could-last-awhile	NS	X
29361	Unique			WAT	C.A.Arneson		3705	3	Scientists still do not completely understand how bacteria, sulfate, iron, and mercury operate in our waters, particularly in the mining impacted St. Louis River. How bacteria may work in collaboration with one another, how numerous (sometimes uncontrollable) factors – known and unknown – influence bacterial activity. Such comprehensive research does not exist. Until it does, there is no justification not to enforce the wild rice sulfate standard – in order to protect our children. http://www.ornl.gov/ornl/news/news-releases/2013/ornl-researchreveals-new-challenges-for-mercury-cleanup	NS	X
27698	Unique			WAT	Caree Gordon		2099	1	The aftermath ofthe Mount Polly Mine tailings pond breakage in B.C. is an example of the worst-case scenario of what could happen with the PolyMet/NorthMet project in the Hoyt Lakes area. The Kawishiwi River & surrounding watershed will be affected by the pollution, even if things go well and there is no disaster. The BWCAW is protected, but not protected from the drainage traveling north and east.	NS	X
27184	Unique			WAT	Carl Sack		1669	1	Given the dire threat to the St. Louis River watershed and Lake Superior posed by sulfate and heavy metal runoff from the proposed sulfide mine, I had hoped this day would never come; that Polymet would have closed up shop when the Supplemental Draft Environmental Impact Statement was declared environmentally concerning and insufficient by the EPA and the people downstream of the project would not have to face the prospect of further mercury poisoning.	NS	X
27184	Unique			WAT	Carl Sack		1673	5	Even in the short term, the models used to predict waste runoff likely overestimate the effectiveness of the wastewater containment systems. The FEIS statement that “engineering controls at the Mine Site and Plant Site would capture the majority [of] affected water for treatment” (page ES-35) is given without any citation of research into the efficacy of similar existing containment systems in climates similar to that of northern Minnesota. What research has been done along these lines contradicts this statement. A 2001 study by researchers in the University of Wisconsin-Madison Department of Civil and Environmental Engineering (Edil et al., 2001, “Compatibility of Containment Systems with Mine Waste Liquids”) included an extensive literature review that found “no case studies regarding the environmental performance of engineered containment facilities for tailings.” The FEIS provides no way to test the hypothesis that wastewater containment and treatment will be effective in the short term, let alone in perpetuity.	S	O
27184	Unique			WAT	Carl Sack		1674	6	The water quality baseline data reported in the FEIS is wholly inadequate. Baseline water quality data is not reported downstream of the Partridge River and Embarrass River watersheds. Although it may be diluted, mine runoff does not stop at the river mouth. Baseline water quality testing should be done for the entire St. Louis River below the mouths of the Partridge and Embarrass Rivers, especially within the boundaries of the Fond du Lac Indian Reservation, in the St. Louis River Estuary, and at any municipal water intake sites.	S	O
27184	Unique			WAT	Carl Sack		1676	8	Further, the FEIS leaves the public in the dark in regards to where the mine runoff will ultimately end up. There is no map that shows the entire St. Louis River watershed, including the St. Louis River through the Fond du Lac Reservation, St. Louis River Estuary, and the river mouth in Lake Superior. The regional maps included in the FEIS do not show waterways, and thus lead to a false impression of what areas could be impacted by the mine. Waterways should be shown on figures 1.1-1 and 1.1-2 in particular.	S	O
25466	Unique			WAT	Carly Hawkinson		1189	4	Whether it’s been said by others or not, I’d also like to add that the St. Louis River Watershed is one of the largest watersheds in Minnesota. The St. Louis River is the largest U.S. river flowing into Lake Superior (the largest freshwater lake in the world). Another large watershed that would be affected by this harmful activity flows water into the Boundary Waters Canoe Area Wilderness and into Canada and Hudson Bay. The health of our entire ¼ of the state, as well as our neighboring country and global waters, is in the hands of some politicians and greedy companies. The sulfide mining process would bring about demise to the health of our own bodies and those not yet born. The PolyMet workers and their families, others living in the area of the mine, those people living along the major rivers and streams in the watershed, the plants, wildlife, fish, birds, soil, air, water, etc. – the health and life of all these living organisms would be affected. But remember, life is circular. What is affected in one area eventually affects all others. Groundwater moves, food is transported, migration occurs, travelers travel, the wind is blown.	NS	X
29988	Form Letter	1	Variant	WAT	Carol Iwata		2761	1	PolyMet argues that the environmental disasters are unlikely to happen. We only need for one accident to occur to ruin our water resources.	NS	X
29988	Form Letter	1	Variant	WAT	Carol Iwata		2763	3	Minnesota is blessed with access to a good safe supply of water, and the PolyMet NorthMet project would put our water resources at great risk. 18% of the world’s population lack access to safe drinking water, and 42% lack access to basic sanitation. More than 2.2 million people die each year from diseases associated with these conditions. As water scarcity grows, so will these numbers. By 2025, it is estimated that two thirds of the world’s population will live in areas facing moderate to severe water stress..	NS	X
24659	Unique			WAT	cass kane		1064	1	What are Polymet's to prevent ground water pollution in the water table? If it occurs how will they ever be able to remediate such an accident?	NS	X
30183	Form Letter	1	Variant	WAT	Celia Hemmerich		2838	1	Please avoid polluting our pristine BWCA and Lake Superior!	NS	X
29885	Form Letter	1	Variant	WAT	Charles And Nancy Bagley		2691	1	The PolyMet FEIS is inadequate under federal and state laws and regulations because it does not evaluate the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin. WE CANOE CAMP EVERY SUMMER IN THE BOUNDARY WATERS. WE DRINK THE LAKE WATER. WE OBJECT TO ANY DEVELOPMENT THAT MIGHT POLLUTE THOSE LAKES!	S	O
22971	Unique			WAT	Charles Marsden		887	1	The FEIS represents a massive effort, and I commend the agencies involved in its preparation for all their hard work, but the FEIS does not give adequate assurances that water quality will be protected, and clean water is unquestionably the most valuable natural resource we have in this state and in the United States. Communities and nations that fail to protect this most valuable resource in the pursuit of minerals and industrial production are risking destruction of their citizens' health and their economies. There are more and more examples of the reality of this every year.	NS	X
26823	Unique			WAT	Cheryl Kallio	Multiple Groups	2960	1	We are deeply concerned about the reliance on “adaptive management” in lieu of complete scientific analysis of the existing hydrologic regime and likely hydrologic impacts of the PolyMet mine prior to mining commencing. The hydrologic impacts are critically important because they will determine whether Lake Superior, Hudson Bay, or both, ultimately receive mine waste water, how much water is discharged and the characteristics of the waste water. Surface water quality impacts will be different and will require different management depending on how the mine’s waste water moves through the landscape and where it expresses to surface water. Of particular concern is the movement of water through the Peter Mitchell taconite pit about a mile north of the proposed mine. Rock in that pit is known to be acid-forming and yet the EIS does not take that into account in any way, even though it acknowledges that water is likely to move through that pit and discharge eventually into the Rainy River watershed. Adaptive management is entirely inadequate and inappropriate for addressing the formation of acid mine drainage, heavy metal, sulfate and other mine pollutants and their movement through watersheds.	S	O
26823	Unique			WAT	Cheryl Kallio	Multiple Groups	2961	2	There is significant disagreement among the coordinating agencies regarding whether the mine’s waste water will flow south to Lake Superior or north to Hudson Bay. The modeling performed by consultant ERM makes a blatant error in the elevation of the land surface. That error forms the basis for their conclusion that water will flow south and remain in the Lake Superior basin. If the water flows north, it will violate the Great Lakes and St. Lawrence River Basin Water Resources Compact, a binding agreement in which Minnesota committed to not divert water out of the Great Lakes Basin. Without further investigating the question of where waste water will end up, any attempt to respond to this issue is nothing more than a guess. This use of adaptive management to address this concern is inadequate and inappropriate.	S	O
26823	Unique			WAT	Cheryl Kallio	Multiple Groups	2962	3	In other parts of the country, EPA has expressly rejected the idea that adaptive management can replace due diligence during the planning phase. Instead, adaptive management is appropriate as a tool to monitor and adjust management actions during the life of the mine based upon information that becomes available over time. There is simply no reason that groundwater flow and quality cannot be better understood prior to mining. Importantly, it is required. We encourage you to reject the adaptive management approach as a means to avoid answering the essential question of where the mine water will end up and what its characteristics will be. The country’s largest fresh water lake is at stake.	NS	X

30197	Form Letter	1	Variant	WAT	Colles B Larkin		2841	1	Bravo Water Legacy & Paul Maccabee for taking on Giants - We need all we can to preserve the quality and quantity of our Water Resources - which are not guaranteed forever -	NS	X
310	Form Letter	1	Variant	WAT	Colles B. Larkin		169	2	We need to protect our land and, especially, our waters. Not one of these copper-sulfide mining companies has ever avoided compromising the land it mined; the cost of clean-up are prohibitive where clean-up is even possible. The startling hazard with these mines is the certain contamination of our water. Water is increasingly precious and restricted. For the present generation and future generations, we need to deny this mining.	NS	X
26942	Unique			WAT	Crystal Yakacki		1487	1	Polymet is not trustworthy, the venture is inherently flawed, it has only lead to bad things wherever it has been attempted, and it should not be attempted so close to our precious resources, the Boundary Waters and Lake Superior.	NS	X
26942	Unique			WAT	Crystal Yakacki		1489	3	Let's put money into building long-lasting jobs, and protect what makes Minnesota special -- our clean water and wilderness.	NS	X
29735	Unique			WAT	Dana Bloom		3887	1	1) The state needs direct access to core samples. During my work with the Minnesota Department of Natural Resources (DNR), in the Hibbing Lands and Minerals office, where the mining companies store their core samples, my supervisor told me that core samples drilled by mining companies are considered confidential/propriety information; DNR staff are not allowed to view the core. Mining companies drill and examine thousands upon thousands of feet of core, much more than the state could possibly drill and examine independently. Since the state is unable to replicate the magnitude and detail of a mining company's drilling and rock core study, and since DNR staff is not allowed to view the mining companies' core, the state is unable to independently verify, with any certainty, the accuracy of the mining companies', and third party contractors', claims. The existing EIS relies too heavily on other party's interpretation of data, and too little on direct observation of raw data specific to this mine plan. The state should be allowed to view rock core samples and verify mining company claims. Not viewing the actual core samples, obtained by mining companies, for this specific mining project, is the equivalent of deciding to purchase a house after only being allowed to tour a couple of neighbors' attics and read the realtor's description. The state cannot determine the EIS is adequate, or accurate, without being allowed to view the core samples from which the conclusions in the EIS are drawn.	S	N
24657	Unique			WAT	Daniel Houle		1062	1	You already have most of the state with water pollution problems,, why in the good lords name would you ever want to be the ones that contribute more pollution?	NS	X
24660	Unique			WAT	Daniel Houle		1065	1	Are you kidding me? You're going to permit a mine that no doubt is going to pollute.... Right on top of our continents two great watersheds. A recipe for disaster.	NS	X
29801	Unique			WAT	Daniel Pauly		819	37	Due to the critical nature of the NorthMet FEIS, and the centuries-long impacts of the NorthMet Project, an audit is necessary. A thorough review of the datasets and collection details should be undertaken to confirm integrity and accuracy. A third party competent to perform such a review should be retained, because an independent review is more likely to find serious errors than having the existing team of consultants review their own work. I would be willing, at the request of the MDNR or other NorthMet project participants, to undertake a further initial review of other FEIS datasets to assist a third party audit.	S	O
29801	Unique			WAT	Daniel Pauly		4101	31	The Water Treatment Pilot Test data shows profound sampling irregularities that raise serious concerns about the adequacy of the protocols implemented and the accuracy of the test results obtained.	NS	X
29801	Unique			WAT	Daniel Pauly		4102	36	The Waste Water Treatment Plant influent water has a serious error in either sample collection or data analysis. The FEIS relies upon a WWTP Pilot Test that shows serious errors in testing of the influent water. At a minimum these errors prevent analysis and operation of the Pilot Test system because the influent was not properly characterized. In a worst case scenario, other samples were also erroneously collected or analyzed, but those errors have not (and possibly cannot) be identified.	S	N
29801	Unique			WAT	Daniel Pauly		4171	5	The Tailings Basin has four active NPDES monitoring locations that are positioned to intercept Tailings Basin seepage. NorthMet documents state that these monitoring locations provide the best data for determining Tailings Basin discharges. Inexplicably, the FEIS relies almost exclusively only on data from one of these discharge locations – the one that appears to show seepage below 1.3 ng/L. All three of the other discharge locations, including one that is better positioned relative to the likely flow of NorthMet discharges, were essentially ignored. The result is an improperly skewed assessment that mercury levels will be lower than 1.3 ng/L. Correction of this error shows mercury discharges above 1.3 ng/L. 2. Looking beyond NPDES monitoring sites, a comprehensive review of mercury seepage data collected over time at the Tailings Basin also shows that Tailings Basin seepage will exceed Great Lakes Initiative mercury levels of 1.3 ng/L. Despite the availability of this information, it is essentially ignored in the FEIS.	S	O
29801	Unique			WAT	Daniel Pauly		4173	7	The FEIS includes an “Assessment of Existing Pond Water and Groundwater Quality at the Tailings Basin” that shows mercury seepage at nearly six times the Great Lakes standard for mercury discharges. This result is inexplicably not discussed further in the FEIS.	NS	X
29801	Unique			WAT	Daniel Pauly		4177	11	The FEIS seeks to address these concerns with a proposed “adaptive engineering” approach for the WWTP design and operation. An “adaptive engineering” approach is inconsistent with best practices in the literature for removal of contaminants using reverse osmosis, because each location and system has unique problems and challenges. Due to the relatively complex design of the NorthMet project water flows, including significant seasonal variations of likely methylmercury flows, the WWTP will need to remove disparate contaminants from quite variable influent streams. By approaching critical issues and long term challenges with an adaptive engineering approach, the NorthMet project risks decades of uncertainty, contaminant release violations, and unforeseen costs because the analysis will be undertaken long after the mine is in operation, and some of analysis won't be undertaken until after the mine is closed. This approach fails to provide decision makers with adequate information to assess what the treatment costs will be. For example, it is possible that mercury removal alone could add significant costs to WWTP as currently envisioned, because the various species of mercury are removed by different types of technology. Inexplicably, the WWTP and Pilot Test never even consider mercury removal as an issue, and so no site-specific costs for mercury removal can be calculated.	S	O

29801	Unique			WAT	Daniel Pauly		4183	18	The NorthMet Tailings Basin assessment improperly underestimates mercury discharges by disregarding data from three out of four of the NPDES monitored surface discharge locations at the Tailings Basin. In addition to the erroneous calculation with regard to water quality at numerous Tailings Basin locations, the FEIS has improperly selected a subset of NPDES water sampling locations that has also resulted in a meaningfully inaccurate assessment of current conditions at the Tailings Basin. The Tailings Basin has four active seeps that have been monitored since the closing of the LTV plant site. In the PolyMet water quality analysis, which is an appendix to the FEIS, PolyMet’s water quality scientists state that “NPDES surface discharges from the Tailings Basin serve as the best proxy for concentrations of mercury seepage from the existing Tailings Basin”. PolyMet 2013j at page 271. SD006 is in the southeast corner of the Tailings Basin, SD001, SD004, and SD005 are in the northwest corner of the Tailings Basin; and SD002 is in the north central portion of the Tailings Basin. There was apparently never an SD003, so there is no data. Also, SD005 has essentially been dry and not sampled for most of the last 13 years. That leaves four NPDES sample locations to review: SD001, SD002, SD004, and SD006 consistent with the opinion of PolyMet’s water model that these discharges are the best proxy for concentrations of mercury seepage from the existing Tailings Basin”. Despite the fact that this seepage data is so critical to assessing mercury contamination, only Tailing Basin data from SD004 is used to support the determination that mercury levels will be below Great Lakes levels. This was a clear error in the SDEIS, and the error has been carried forward in the FEIS. SD0026, which is at the plant site and not the Tailings Basin, is also used, but it gives no indication of likely Tailings Basin discharges. In fact, it is not located in the Embarrass River watershed like the Tailings Basin. In order to evaluate whether this single sampling point should be the primary empirical assessment of groundwater conditions, I obtained NPDES sampling data from the Minnesota Pollution Control Agency for all four of the Tailings Basin NPDES surface discharges. I then evaluated total mercury in the Tailings Basin for each of these sample locations, but with more up to date information through 2006 to be consistent with most FEIS data sets. Based upon this MPCA data, I calculated total mercury levels for each of the four NPDES locations, plus average of all samples regardless of which location was sampled (basically a weighted average), and further an average of the four sites (basically a weighted average). My spreadsheets with calculations are available upon request, but should be easily reproducible without them because the data is readily available from the MPCA. My results are provided graphically below, and are also summarized in the accompanying table. The graph indicates that rather than SD004 being a representative sample of conditions at the NorthMet Tailings basin, SD004 is an outlier – the one location that isn’t above the Great Lakes standard of 1.3 ng/L. All three of the other locations were above Great Lakes standards, as were averages weighted by sample number and location.	S	O
29801	Unique			WAT	Daniel Pauly		4195	32	However, I would be remiss in not pointing out that there appears to have been a very serious, repeated error in the collection and analysis of sulfate data from the WWTP Pilot Test. The evidence is quite strong that a serious sampling or analytical breakdown occurred during the Pilot Test as it relates to sulfate levels in the test influent, and perhaps other contaminants of concern. Figures 5 and 6 from the Pilot Test Report are reproduced below, and reveal the reasons for serious concern: First, in looking at Figure 5, notice that surface discharge SD004 has relatively constant levels for the three measured parameters: Sulfate, Total Hardness, and TDS. In contrast, a new well installed in 2011 for the pilot test showed remarkable variation in sulfate levels, fluctuating almost exactly by 400 percent – either at about 100 mg/l, or 400 mg/l. There is essentially nothing in between. TDS and Total Hardness fluctuate on the same days, but at different ratios that are closer to 200 percent. Such readings are inexplicable from a groundwater well. Second, looking at Figure 6, the issue becomes even more concerning, because on the same exact dates that sulfate, total hardness and TDS were changing, the iron and manganese concentrations remained all but constant from the same sources.	S	N
29801	Unique			WAT	Daniel Pauly		4196	33	As stated elsewhere in these comments, I strongly recommend that an independent third party be retained by PolyMet Mining, Inc., or the lead agencies, to audit the data. This will be a significant undertaking, but would allow regulatory bodies the ability to make decisions with confidence that at least the information used for the decision making was sound. I would be willing, at the request of the MDNR or other NorthMet project participants, to undertake a further initial review of other FEIS datasets to assist a third party audit.	S	O
29801	Unique			WAT	Daniel Pauly		4197	34	In view of the identified serious errors in NorthMet data sets as they relate to the Tailings Basin site, a comprehensive audit of NorthMet data should be undertaken.	S	O
29801	Unique			WAT	Daniel Pauly		4198	35	The Tailings Basin mercury contamination calculations confused nanograms and micrograms. As noted above, the Tailings Basin mercury contamination calculations confused nanograms and micrograms. The result is a profound misstatement of mercury seepage levels at nearly half of the Tailings Basin sample locations. The error was of serious significance because it calls for a revision of Tailings Basin discharges from being below Great Lakes Initiative levels to above Great Lakes Initiative levels.	S	O
29801	Unique			WAT	Daniel Pauly		4203	43	The WWTP Pilot Test report also indicates serious flaws in the sulfate pilot testing. In an earlier comment I expressed serious concern over the integrity of the data set from the WWTP Pilot Test. The reported influent levels for sulfate concentrations show that error was introduced into sample collection and/or analysis process. The error seems to be on the order of 400 percent, but isn’t clear if influent levels have been overstated by 400 percent or understated by 400 percent. In other words, no one really knows what the influent sulfate levels were. In addition, just as alarming, is the potential that the effluent results may have the same errors, or even other unidentified errors. This is not a trivial question, in particular because the final step of water treatment, VSEP process, had permeate level reported to be above 10 mg/l, and about 6 to 60 mg/l. See Figure 12 of the WWTP Pilot Test report. So, should those levels be 24 to 240 mg/L? Or maybe they should be about 1.5 to 15 mg/l. Preparers of the FEIS should review sample records, analytical data, and related material to ascertain the accuracy and integrity of the data set.	S	N
29801	Unique			WAT	Daniel Pauly		4204	44	A Comprehensive WWTP Pilot Test should be conducted in a manner that provides meaningful information as to likely costs. As noted above, the WWTP Pilot test failed to even look at mercury as a substance to be removed from the NorthMet site, and also failed to even properly monitor sulfate levels in the influent. Other contaminants, such as aluminum, were also not properly analyzed during the Pilot Test. The need for a supplemental WWTP pilot test is clear from a technical viability standpoint, but is also necessary from a financial viability standpoint. The RO literature is clear that each site is different, and the costs of systems really can’t be estimated with insufficient information about feed water and likely membrane performance. A good example of that information is a 2013 Report from the U.S. Department Of Energy entitled Reverse Osmosis Optimization (available from comment author upon request), which states as follows: The cost of optimizing an RO system is influenced by many parameters that are specific to the application and operation of the system, such as feed water quality, membrane type, system configuration, and purity requirements. Therefore, to determine the costs and financial benefits of optimization options, the financial analysis must take into account the site-specific nature of the technology. Reverse Osmosis Optimization, by Pacific Northwest National Laboratory, page 19 (emphasis added). These are non-trivial issues for which the FEIS contains inadequate information, which is quite problematic for a WWTP that is expected to process 630,000 gallons per day of water for hundreds of years. 29801	Unique			WAT	Daniel Pauly		4206	46	The FEIS proposes a perimeter wetland that will receive sulfate and mercury, and has the potential to lead to significant methylmercury production and transport into the Embarrass River watershed. One of the most significant changes in the Tailings Basin since the DEIS was prepared is a proposal to construct a perimeter cutoff wall and drainage system around the north and west sides of the Tailings Basin. The objective of capturing discharges from the Tailings Basin has merit, but the proposed plan is seriously flawed because the cutoff wall and drain pipe are set back over 250 feet from the edge of the Tailings Basin, so as to form a large perimeter wetland of up to 160 acres in size. As discussed below, due to the nature of the soil in this wetland, the majority of mercury and sulfate laden seepage will be delivered into the wetland, as opposed to going directly to the drain pipe system. The potential extent of this perimeter wetland is shown in the figure below, which is from Barr 2013F, but has been highlighted in yellow to show the perimeter area between the Tailings Basin and drainage pipe.	S	N

10777	Unique			WAT	Darrell Godbout	Ironworkers Local 512	2919	2	In regards to water quality, the Minnesota Pollution Control Agency has concluded that the project would have no significant effect on water quality due to the preventative measures taken (as clarified in the FEIS). Additionally, PolyMet would continuously monitor water quality along with the water treatment facility. Funding will be set aside to ensure treatment is available for as long as necessary.	NS	X
23406	Unique			WAT	Darwin Dyce		952	2	The data mentioned in the Duluth Reader (11/18/15) indicated tailings seepage into the Embarrass River at a rate of 20 gallons per minute. Put a pencil to that and we see a yearly rate of 525,600 gallons of waste. As the water makes its way to the St. Louis River that pollution would be added to pollution from Taconite mining. The contamination keeps going with the flow and eventually ends up in beautiful Lake Superior. (So much for protecting the largest freshwater lake in the world.)	NS	X
23406	Unique			WAT	Darwin Dyce		953	3	As the FEIS relies on Gold-Sims to anticipate weather events, it conveniently ignores the growing unpredictability and intensity of weather that is visiting us with climate change. The climate is changing and old models do not hold up. What if we had a huge and sudden rainfall in a short period of time? One hundred and five hundred year rainfalls are now happening much more frequently. It is doubtful that the runoff of heavy metal toxins would be contained. Groundwater moves. Toxins in groundwater at the site will not simply remain on site.	S	O
29749	Unique			WAT	Dave Chambers	Center for Science in Public Participation	4145	3	Category 1 Stockpile Water Containment System and Cover The engineered cutoff wall or “hydraulic barrier” is critical to meeting water quality requirements for the proposed project. Key factors for the cutoff wall will be: (1) How well the cutoff wall can be grouted into the fractured bedrock to avoid contaminants moving under the wall in more permeable sediments; (2) How effective the collection system on the upstream side of the cutoff wall is at removing pressure on this barrier; and, (3) The permeability contrast between the cutoff wall and the adjacent sediments. Cutoff Wall Contact with Bedrock The cutoff wall is to be installed by: • Cutoff Wall – the cutoff wall will be constructed using trenchless in-situ construction techniques whereby a mechanical mixer is inserted into the ground along the cutoff wall alignment. As the mixer ‘walks’ down the cutoff wall alignment, it mixes the soil along the cutoff wall location with bentonite. The soil-bentonite mixing occurs in-situ and an open trench is not utilized. DeWind One-Pass Trenching and Hayward Baker are examples of companies that provide such services. At locations where boulders are encountered that interfere with trenchless construction, the boulders will be removed using conventional excavation methods. Small diameter cobbles and boulders are expelled from the excavation as part of the trenchless construction process. (PolyMet 2015I, Attachment G, FTB Containment System Slope Stability Impacts p. 5) It might be difficult for an in-situ mechanical mixer to determine when it is really at the bedrock interface since no geologic logging or permeability measurements are being made. If the mechanical mixer does not reach fractured bedrock, for any reason, an zone of relatively higher permeability for contaminants to escape could be created. Collection System Cartoon diagrams of the seepage collections systems at the Category 1 Waste Rock Facility (Figure 3.2-11) and the Tailings Impoundment (Figure 3.2-28) are presented on the following pages. If the seepage collection trenches are not extended to bedrock, as is depicted in Figure 3.2-28, or if the “drain pipes” are not placed at or near the bottom of the trenches, there will be more pressure attempting to push fluid through the cutoff wall. In the Geotechnical Data Package, Volume 1 – Flotation Tailings Basin (PolyMet 2015I), the seepage collection trenches for the tailings basin it is noted that: The seepage collection trench and drain pipe depth has not yet been finalized, but we assume an average depth of 8 feet to prevent system freezing and maintain operations through-out winter (exact depth will be determined during final design and construction). (PolyMet 2015I, p. 4) Even though the cutoff wall is designed to be low-permeability, more hydraulic pressure on this barrier will mean more seepage through or under the barrier. Permeability Contrast The cutoff wall would have a hydraulic conductivity specification of no more than 1x10-5 centimeters per second (cm/sec). (FEIS, p. 3-47) CSP2’s comments on DSEIS recommended 1x10-6 cm/sec. It's not clear why 10-5 is adequate, in that it only provides approximately one order of magnitude difference with some groundwater-carrying sediment units. For example, at the Tailings Basin (PolyMet 2015I, p. 13): ? Depth to bedrock ranges from 2 to 47 feet with an average depth of approximately 20 feet. Bedrock was competent, with a near surface fracture zone. ? Groundwater levels were at or just below the ground surface. ? Hydraulic conductivity of the glacial till ranged from 1.5x10-3 ft/s (4.6x10-2 cm/s) to 1.7x10-6 ft/s (5.2x10-5 cm/s) with a geometric mean of 5.1x10-5 ft/s (1.5x10-3 cm/s). ? Hydraulic conductivity of the upper portion of the bedrock ranged from effectively zero (the borehole produced no water) to 2.4x10-5 ft/s (7.3x10-4 cm/s), with a geometric mean (excluding the zero inflow locations) of 1.9 x 10-6 ft/s (5.8 x 10-5 cm/s) Also see Table 4.2.2-5 Bedrock and Surficial Aquifer Hydraulic Conductivity Estimates at the Mine Site.	S	O
29749	Unique			WAT	Dave Chambers	Center for Science in Public Participation	4149	7	Capture Efficiencies Described for the Tailings Basin It is noted in the FEIS: These new models consider the presence of an upper more-permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed capture system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall groundwater capture efficiencies of the proposed Tailings Basin surface and groundwater seepage containment system would be substantially greater than 90 percent. This analysis supports the conclusion that the assumption of 90 percent or greater groundwater capture efficiency is justified. (FEIS, p. A-546) And from Theme PD 08: The north, west, and east seepage containment systems would capture 100 percent of surface seepage under expected conditions, and 90 percent, 90 percent, and 100 percent, respectively, of groundwater seepage. The Tailings Basin South Seepage Management System would capture 100 percent of surface water (Barr 2015e, as cited in the FEIS). (FEIS, p. 439) Given the proposed method of installing the slurry wall at the tailings impoundment, there is a significant possibility that keying the slurry wall into bedrock, even fractured bedrock, will not be 100% attainable. The modeling described in the statements above assume this is possible. It is not apparent that the modeling took this possibility into account. If the slurry wall is not keyed 100% into bedrock significant leakage could result, especially with the way the seepage collection trenches are designed. We are concerned that the assumed capture efficiencies are too high.	S	O
29749	Unique			WAT	Dave Chambers	Center for Science in Public Participation	4151	9	5.2.4.2.2 Transportation and Utility Corridor Indirect Effects The FEIS analyzes the effect of spillage & blowoff as dust effects to vegetation (Section 5.2.4.2.1) and potential air quality impacts (minimal – Section 5.2.74.2). However, the primary concern for ore scattered along the transportation corridor is on water quality. At the Flambeau mine a small stream located next to the now-closed ore loading terminal is still contaminated with copper from non-point sources. This contamination is most probably related to dust blowoff from the ore trains, since copper is elevated in the entire sub-drainage (Chambers and Zamzow 2009). According to the FEIS, the ore trains would travel on a: ... railroad, which would generally be used to transport ore from the Mine Site to the Plant Site using three to four trains, each consisting of sixteen to twenty 100-ton, side-dumping ore cars ... (Section 3.2.2.2.4 Use During Operations, p. 3-85, emphasis added) The amount of ore spillage was originally estimated to be 6.14 tons per year for unrefurbished cars (PolyMet 2015q). However, after reworking the door hinges, PolyMet estimates the amount of spillage can be reduced 95% (PolyMet 2014a). The quantity of ore that could potentially spill through the door and hinge gaps of a single refurbished ore car is estimated to be 0.20 tons per year. (FEIS, p. 5-164) The maximum number of cars (see the emphasis added above) is: Four trains x 20 cars per train = 80 cars then: 0.2 tons/yr/car x 80 cars= 400 pounds/yr/car 400 pounds/yr/car x 80 cars (FEIS p. 3-85) = 32,000 pounds/yr 32,000 pounds/yr of ore falling from the modified rail ore cars onto the railroad corridor is still a potentially significant amount. It was also noted in Section 8 – Major Differences of Opinion: GLIFWC does not believe that monitoring of the creeks along the rail line will be effective in preventing or minimizing impacts because once detected in monitoring, the impact will have already occurred. GLIFWC states that cleanup of ore dust in an aquatic environment is a long and difficult process. (FEIS, p. 8-24) and; The rail line between the mine and the processing plant is approximately 8 miles long, 1 mile of which is over wetlands, and crosses over at least 3 creeks. ... Because transport will deposit some level of ore and ore dust along the rail line, methods for control of contaminated runoff from along the rail line must be developed and implemented in the mine plan. (FEIS, Appendix C Tribal Agency Position Supporting Materials) Especially given that it is estimated that as much as 32,000 pounds/yr of ore can fall on railroad corridor, we must agree. Baseline soil sampling along the rail route should be established, and regular soil sampling should be conducted to detect soil contamination before it leads to non-point source pollution of streams. 37	Unique			WAT	David		103	1	The risks (in a worse case scenario) to our water shed resources, including the north shore and Lake Superior are incalculable. No amount of profit could justify the risk.	NS	X
27308	Unique			WAT	David A. Lien	Minnesota Backcountry Hunters & Anglers	3187	3	The best case scenario for the mine anticipates an estimated 500 years of polluted water that will have to be actively treated. And, not all of the polluted water will be captured and sent for treatment. Every year, 11 million gallons of polluted seepage from the tailings basin will enter groundwater without being treated. Every year, over 5 million gallons of polluted seepage from the mine site will enter groundwater without being treated.	NS	X
27308	Unique			WAT	David A. Lien	Minnesota Backcountry Hunters & Anglers	3245	4	The plan for an estimated 500 years of active water treatment violates Minnesota Rules (6132.3200) that call for the mine to be left maintenance free at closure. Over 167 million tons of reactive waste rock would be left on the surface after closure. Surrounding this would be a system to collect contaminated seepage that must be monitored and maintained for hundreds of years or longer. A synthetic and soil cover placed over the waste rock pile would require annual maintenance, repairing of erosion, and removal of plants that might perforate the synthetic material. A pit “lake” would be left whose water levels would need to be maintained through pumping to prevent contaminated overflows into the nearby Partridge River. A tailings basin pond would need to have its water levels maintained through pumping to prevent contaminated water from over-topping the dams and entering the nearby Embarrass River. A lengthy network of pipelines conveying polluted and treated water would need to be monitored and maintained for hundreds of years.	S	O
27308	Unique			WAT	David A. Lien	Minnesota Backcountry Hunters & Anglers	3247	6	PolyMet makes a lot of rosy predictions, but the FEIS shows that pollution from the mine tailings and waste heaps will last for hundreds of years and pollution seeping from mine pits into the watershed would continue in perpetuity. This short-sighted sulfide mining proposal amounts to gambling with the future of our Great Outdoors, and Minnesota’s nearly 2 million hunters and anglers—and the bait shops, sporting goods stores, resorts, fishing guides, outfitters, gas stations and hotels that depend on their business—won’t stand for it.	NS	X
10202	Unique			WAT	David Baldus		2905	1	Although I am just finishing my undergraduate degree in geology at a liberal arts college I find it easy to conclude and defend the stance that there is not adequate knowledge of how groundwater will interact with the fractured bedrock at and around the mine to claim that contamination of the surrounding watershed is not likely.	S	O
10202	Unique			WAT	David Baldus		2906	2	It has been widely suggested that the upper layer of crystalline bedrock aquifers tends to exhibit more fractures and a higher propensity for groundwater movement. In the case of the proposed NorthMet sulfide mine in Northern Minnesota this fractured layer is of vital importance in modeling potential groundwater contamination. The groundwater flow properties of this upper-fissured layer of the Duluth Complex are poorly understood and characterized. This study models the flow of contaminated groundwater through this layer from the West Mine Pit to the Partridge River. Based on the wide range of results and their indication of likely contamination in the Partridge River; I suggest that acid mine drainage from the NorthMet cite to the Partridge River is a pressing concern and the hydraulic properties (Hydraulic conductivity, porosity, and thickness) of fissured layer of the Duluth Complex are key factors in modeling this situation, which deserve refined characterization and investigation	S	O
10202	Unique			WAT	David Baldus		2907	3	This contamination would take the form of acid mine drainage. As the sulfide mining occurs large piles of waste rock would be generated. This waste rock will contain elevated levels of sulfide minerals. If left at the surface in contact with water and oxygen these sulfide minerals will oxidize to sulfates and produce highly acidic solutions referred to as acid drainage (Lefticariu 2009).	S	O
10202	Unique			WAT	David Baldus		2908	4	The idea behind filling the pits with water is that the pits will then become anoxic preventing the oxidation of the sulfide minerals and creation of acid mine drainage. While in principle this is true, if the pits overflow or more relevantly leak into the substrate oxidation could occur and produce acid mine drainage.	S	O
10202	Unique			WAT	David Baldus		2909	5	Crystalline bedrock has a very low primary permeability and porosity almost all groundwater movement through them occurs through fractures, faults and joints (secondary permeability and porosity). Due to this property; PolyMet argues that the likelihood of groundwater leakage from their pit is low (Cite). However the literature suggests the upper portion of Hard Rock Aquifers tend to be highly fractured and viable for ground water movement (Lachassagne 2011). I will suggest that groundwater leakage through the upper fractured portion of the Duluth Complex and the overlying unconsolidated deposits from the West Pit to the Partridge River in indeed a reason for concern.	S	O

10202	Unique			WAT	David Baldus		2910	6	PolyMet claims at the fracture flow is largely irrelevant in the Duluth complex due to the fact that fracture causing tectonic event predate the intrusion of the Duluth complex (POLYMET 2013 pg3 ->Farvolden et al. 1988; Douglas et al. 2000; Rouleau et al. 2003). However the literature suggests that fracture permeability of Hard Rock Aquifers is not due solely to unloading and tectonics but the weathering of the surficial layers of near surface crystalline bedrock (Lachassagne 2011). Lachassagne et al. (2011) describe a “fissured layer” residing at the bottom of the unconsolidated weathering profile directly above the un-weathered fresh bedrock that has that has relatively high permeability. According to Figure 1 from Arcworth, 1987 this zone may be anywhere from one to twenty meters thick (3.28-65.67 feet). Citing data from Maréchal et al., and Dewandel et al., 2006 they report hydraulic conductivity values of up to 2.83 feet per day. In the model, groundwater leakage from the NorthMet Mine Site flow through the upper fractured portion of crystalline bedrock is highly relevant. The Duluth Complex is close to the surface and exposed in many locations thus susceptible to weathering and the creation of the discussed “fissured layer”(cite). Groundwater flow will likely be concentrated in this fissured layer because of the relative lack of permeability elsewhere in the bedrock substrate.	S	O
10202	Unique			WAT	David Baldus		2911	7	I will use two values for hydraulic conductivity of the “fissured layer” in this model: the highest reported value (28.3 feet per day), the lowest value (2.83x10-2 feet per day). These values will represent best, worst-case scenarios.	S	O
10202	Unique			WAT	David Baldus		2912	8	Wood et al. (1993) found porosities of 1.5% in the fractured bedrock at the Mirror Lake site, also used by Day-Lewis et al. (2000). Caine and Tomusiak. (2003) report values as high as 2.78% in a fractured crystalline bedrock aquifer system in the Front Range of the Rockies. The Front Range site is likely also heavily altered by faulting and mountain building but having the highest porosity value found in the literature for fractured crystalline bedrock aquifers it will be used to calculate a best-case scenario. The Wood et al., 1993 porosity value will be used to simulate a worst-case scenario model as it setting is the most similar to the NorthMet site.	S	O
10202	Unique			WAT	David Baldus		2913	9	Based on the model discussed in the methods section I estimate travel times from the West Pit to the Partridge River ranging from ~5 months to ~800 years. The range of estimated travel times varies hugely from a matter of months to hundreds of years. This alone suggests that these estimates are poorly constrained and call for more concrete data; specifically hydraulic conductivity and porosity values for the “fissured layer” of the Duluth Complex.	S	O
10202	Unique			WAT	David Baldus		2914	10	there is a high likelihood of acid drainage based on report model results.	S	O
10202	Unique			WAT	David Baldus		2915	11	Despite the lack of a concrete travel time this rough model clearly indicates that there should be serious concern about the possibility of acid drainage contamination in the Partridge River.	S	O
10202	Unique			WAT	David Baldus		2916	12	“fissured layer” in the Duluth Complex, were missing from any reports issued by PolyMet.	S	O
10202	Unique			WAT	David Baldus		2917	13	these data point directly to the need for further investigation of the upper “fissured layer” of the Duluth Complex; and improved characterization of this layer both in terms of hydraulic conductivity and porosity	S	O
27390	Unique			WAT	David Brown		1708	3	Most of the Southern half of the state has water too polluted to swim or fish in. PLEASE don't destroy the water in the Northern half of the state too.	NS	X
24599	Unique			WAT	David Hajicek		1050	2	Also, tailings dumps have spilled over into formerly clean waters, destroying them for generations.	NS	X
27053	Unique			WAT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2967	2	The justification for this delay in treatment is based on several optimistic assumptions, including the most-suspect assumption that acid mining drainage will not occur at any of the several long-term tailings storage dumps planned due to buffering capacity of the rock. This high risk decision is based on only the mining companies own short-term jar testing and “computer modeling”. These optimistic projections all involve circumstances and projected outcomes that do not align with the overwhelming historical record of pollution control failure in similar mines.	S	O
27053	Unique			WAT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2970	5	The current plan for control of water pollution is complicated by multi-step ore and tailings placement and movement, repeated and changing over time, and based on risky extrapolations. The resulting complicated plans and optimistic assumptions for impounding and postponing treatment rely on modelling, instead of the real world experience which is available. This increases inherent risk. Acid mine drainage (AMD) from hard rock, sulfide-bearing rock is the norm at such mine sites, based on a hundred if not several hundreds of examples worldwide. This AMD formation has occurred at other so-called lower sulfide content rock mines including recently at the Brohm / Gilt mine in South Dakota. This mine's highly significant AMD pollution demonstrates the inherent risk in planning on low sulfide rock and delayed actions as an acceptable approach.	S	O
27053	Unique			WAT	David Paulson	Water Think Tank. LLC; Prime Membrane Partners, LLC	2971	6	Also not addressed in the RFEIS is the fact that successful examples of using membrane technology to prevent pollution by, instead of impounding and storing wastewater, treating and returning water to mining operations or the aquifer or surface water discharge has been shown to be successful method. In a rigorous cost-benefit analysis, such proactive wastewater treatment plans are far superior to postponing the gain of knowledge of the necessary treatment, and delaying action as an economic decision.	S	O
29177	Unique			WAT	David Reisenweber		2435	1	I've lived through one 200-year and two five-hundred year precipitation events within a twenty-year period. The results of these events are impossible to prepare for or to remedy. I see no mention of such things in the FEIS, nor do I see any attempt to deal with them. The results of these numerous failures have been catastrophic. When they occur, they will be “permitted” disasters, not natural disasters. They will do immeasurable harm to the water resources and to the economic wealth of northeastern Minnesota. Do not approve sulfide mining, which would destroy the vital resources that make this area unique and poised for sustainable growth.	S	O
29177	Unique			WAT	David Reisenweber		2436	2	Sulfide mines in Minnesota would be used as a supply of last resort, because lower cost areas will always be mined first. Technological advances and ever-larger machinery will continue to eliminate job opportunities in mining. Sulfide mining in our high-cost, water-rich area will only bring more promised booms and certain busts in our unique region, where we should be capitalizing on our natural resources, not destroying them. Reject the PolyMet NorthMet Project.	S	O
29899	Unique			WAT	David Reisenweber		2697	1	it is impossible to know where it might go given our fractured bedrock	NS	X
25385	Form Letter	1	Variant	WAT	David Witt		1163	5	The PolyMet FEIS is adequate under federal and state laws and regulations because: - It evaluates pollution risks to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure.	S	O
25385	Form Letter	1	Variant	WAT	David Witt		1165	7	The PolyMet FEIS is adequate under federal and state laws and regulations because: - It evaluated the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin.	S	O
25385	Form Letter	1	Variant	WAT	David Witt		1166	8	The PolyMet FEIS is adequate under federal and state laws and regulations because: It also recognizes that the ground and surface water divide located just north of North Shore's Peter Mitchell mine prevents northerly water flow. In addition, there is no regional groundwater under the proposed PolyMet mine site.	S	O
30071	Unique			WAT	Deborah DeLuca	Duluth Seaway Port Authority	4334	4	While submitted negative comments speak to a perceived failure to evaluate the potential for groundwater flow to the 100 mile swamp and the Rainy River Basin, this issue has been addressed through the cumulative EIS process, with special attention during the FEIS.	NS	X
29164	Unique			WAT	Deborah Huskins		3598	4	The FEIS is inadequate because it fails to fully acknowledge the risks of pollution to both surface water and ground water of acid mine drainage from Polymet. The impacts of methylmercury and asbestos-like particles, as well as heavy metals on humans, on wild rice, and on the fish and other flora and fauna in the watershed are minimized by the FEIS. Particularly, the likelihood of increased mercury contamination and its effects on human health is not adequately addressed.	NS	X
29164	Unique			WAT	Deborah Huskins		3602	8	There are a number of ways in which contaminated water can seep--or flow, if retainment measures fail--into the surrounding surface and/or ground water. Polymet asserts that the dirt and clay trench around portions of the tailings pile(s) will be adequate to capture virtually all of the contaminated water seepage produced over the period of operations. This strains credulity as well as the experience in other mines, as commenters have pointed out. There are fractures underneath areas in which tailings will be stored. Linings of basins will not last for as long as the potential for contaminated water seepage—500 years or longer. Many commenters raised concerns about these conditions and Polymet’s overly optimistic predictions; the FEIS does not adequately address these concerns.	S	O

29164	Unique			WAT	Deborah Huskins		3610	13	The mine site groundwater models need to be reconfigured to contain realistic water levels in the P-M taconite pits, both for a "current conditions" model and a "closure conditions" model, not the 1996 water levels that were unusually high. The predictive MODFLOW modeling for the closure period must use the correct closure water elevations for the P-M pits which are 300 feet lower than the unusually high 1996 levels that are used for FEIS predictions. Sensitivity analysis and adaptive management cannot be substitutes for consistent and rational characterization of site hydrology	S	N
29164	Unique			WAT	Deborah Huskins		3611	14	The analysis uses our existing climate to estimate the impacts of precipitation. This is inadequate. The effects of climate change 50 years, and 100 years, etc., from now could change precipitation patterns dramatically or cause calamitous weather events. Polymet’s proposed measures to prevent discharge of, and to treat, contaminated water could be compromised. The question “what if” should be asked and various potential scenarios developed, then measures adequate to address the possibilities of environmental damage in those circumstances should be developed.	S	O
29164	Unique			WAT	Deborah Huskins		3612	15	The FEIS analysis relies too much on Polymet and its paid consultants. Independent verification of the modeling, analysis, and verifications should be undertaken.	NS	X
27675	Unique			WAT	Deborah Mielke		1833	1	The report discusses long term monitoring and periodic maintenance for as long as treatment is required. Modeling can't determine the number of years this will take. The decision to go ahead with this project will impact future generations and the safety of water quality for many years after the mining has been completed. The uncertainty of this after mining maintenance concerns me a great deal.	NS	X
27675	Unique			WAT	Deborah Mielke		1835	3	The report mentions the stockpile cover system underperforming and how this will be mitigated. It mentions managing acidity of the effluent with lime and making sure that it is not too basic before being released. Leakage of the stockpiles will also require monitoring and mitigation. The statement that the mining operation can be managed safely does not mean that it will be managed safely. Modeling does not address worst case scenarios or human error in these mitigation actions. The report down plays the chance of "Probable Maximum Rainfall Event" for its overflow system, but this is the very kind of event that causes system failures. The creation of effluent and hazardous stockpiles of this magnitude may seriously damage the local environment, down-stream water, and ground water despite the best of intensions on the part of Poly Met.	NS	X
23302	Unique			WAT	Debra Erickson		926	1	I fish the BWCA area and I have to say I am completely opposed to this. If there were a breach it would contaminate too many lakes and waterways. I do not believe the benefits out weigh the contamination it would cause. Please do not allow them to mine in this area.	NS	X
27833	Unique			WAT	Dennis and Audrey Peterson		2174	1	The FEIS does not ask or answer all the important questions regarding ground water flow. The models must be run to predict groundwater flow from the North Met east pit at the time of closure. The east pit appears to be hydraulically connected to the Peter Mitchell pit; therefore, it is logical that flow would run downward from the east pit into the Peter Mitchell pit and finally into the BWCAW. This is one of the most important issues to be analyzed concerning the environmental effect of the proposed mining operation after its closure. Until this is modeled the EIS is not complete and therefore unsatisfactorily done.	S	O
27833	Unique			WAT	Dennis and Audrey Peterson		2175	2	If modifying or redoing the model to get the correct results requires a lot more work than it still has to be done. The modeling must be redone anyway as it was done by a consultant of PolyMet and not by an independent party. The modeling should be started over by an independent party to determine; what are all the possible ground water pollution scenarios, and determine the effect of each. To ignore what are potentially the worst scenarios is unsatisfactory.	S	N
27833	Unique			WAT	Dennis and Audrey Peterson		2176	3	Until the correct model with the correct water levels and permeability are run the model results will be worthless and do not predict anything. The purpose of an EIS is to predict the environmental impact. The FEIS does not do this.	S	O
27192	Form Letter		Variant	WAT	Dennis FitzPatrick		1694	1	Let's think seven generations out. Don't allow any mercury contamination in our water.	NS	X
29181	Unique			WAT	dennis hatleli		2437	1	the greatest threat posed by sulfide mining is AMD (Acid Mine Drainage) which can persist in the environment for hundreds if not thousands of years during which it will continue to poison water resources. AMD occurs as mountains of sulfide-bearing waste rock created in the mining process are accidentally exposed to air and water. The EIS describes no foolproof technique for preventing this exposure nor does it name any technology that has ever been developed to stop this process once it has begun. Furthermore no example is given of any sulfide mine that has ever succeeded in preventing this from occurring.	NS	X
24484	Unique			WAT	Dennis Helander		1042	2	The existing tailing basin is an ideal place for the new tailings basin. Furthermore, there is no chance that water could ever flow up over the Laurentian Divide and get to the BWCA as is frequently suggested.	NS	X

27685	Unique			WAT	Dennis Szymialis		1903	58	p.4-44 "The specific capacity tests conducted in two wells indicated that the upper portion of the Virginia Formation is more permeable than the lower portion (Barr 2007b). This is attributed to the increased amount of fractures and joints in the bedrock closer to the surface. Overall, groundwater flow within the bedrock units is thought to be primarily through fractures and other secondary porosity features because the rocks have low primary hydraulic conductivity. Near the ground surface, groundwater in the bedrock is thought to be hydraulically connected with the overlying surficial aquifers, resulting in similar flow directions (Barr 2007d). " -The rock that we are concerned about running from the fractures forming and radiating out from the Partridge River are not in the Duluth Complex, See figure p.3-35. -The SDEIS is using the Duluth Complex as the basis for non-permeability in the bedrock.	S	O
27685	Unique			WAT	Dennis Szymialis		1904	59	p.4-45 "One exploration borehole at the Minnamax prospect encountered groundwater at a depth of 1,390 ft in the Duluth Complex that flowed for a period of 6 days, indicating the potential presence of over-pressured groundwater in the bedrock (Barr 1976)." -It won't take very many pressurized flows to drain that Partridge River, divert it's flow, and fill the mine that will need to be pumped. The Minnamax mine was so wet at all times that visitors while hearing the noise of constant pumping had to where hip boots!	S	O
27685	Unique			WAT	Dennis Szymialis		1905	60	p.4-45 "Tests using wells that penetrate through the surficial zone, however, found much higher average hydraulic conductivity, with values similar to the Biwabik Formation aquifer (see Table 4.2.2-5)." -The zone where the surficial deposit meets bedrock is a primary zone of water conductivity generally in hydrology. -this higher conductivity found conflicts with the general SDEIS claim of lack of conductivity upon which MODFLOW and GoldSimm projections were based. -This study also reported that the upper 200 to 300ft ofthe Duluth Complex formation appeared to be fractured and jointed more extensively than at greater depths, so that the upper portion ofthe bedrock should have greater hydraulic conductivity and thus better hydraulic connectivity than deeper bedrock. p.4-46 to 4-47. -Blasting will exacerbate and open fractures.	S	O
27685	Unique			WAT	Dennis Szymialis		1906	61	p.4-53 "The metals exceeding groundwater evaluation criteria in the surficial aquifer probably reflect natural conditions because there is no record of any historic activities at the Mine Site that could have contributed these constituents. -how about the effect of the drill exploration?	S	O
27685	Unique			WAT	Dennis Szymialis		1907	62	p.4-60 "exceedances of arsenic and nickel water quality standards were detected.(in background water sampling)." -this is an indication that drill exploration has an environmental impacts contrary to representations made by one or more co-lead agencies or it should be a warning sign of the high levels of arsenic in the mineral deposit.	S	O
27685	Unique			WAT	Dennis Szymialis		1908	63	p.4-60 "Groundwater Use -There are no existing domestic wells between the Mine Site and the Partridge River. However, there are several MDNR water appropriation permits in effect for mine pit dewatering that affect the Mine Site, including the Northshore Mine permit (Permit 1982-2097). The permit authorizes Northshore Mining Company to withdraw up to 36,000 gpm (80 cubic ft per second [cfs]), of which a maximum of 13,000 gpm (29 cfs) can be discharged to the Partridge River, a maximum of 12,000 gpm (27 cfs) can be discharged to Langley Creek, and a maximum of 11,000 gpm (25 cfs) can be discharged to Unnamed Creek." -Is this permit being transferred? Does it have to go to the tailings basin? Are these permits an indication of what is to be expected in terms of discharges from the PolyMet pit?	S	O
27685	Unique			WAT	Dennis Szymialis		1909	64	p.4-74 "The only consistent exceedance of water quality standards was dissolved oxygen near the headwaters of the Partridge River (SW-002," -this fact will have serious ramifications for the mine plan when this water flows into the pit that the SDEIS plans to flood on the assumption that the flooding will suppress the re-activity through the denial of oxygen of the pit face rock and catagory 2,3, and 4 waste rock.	S	O
27685	Unique			WAT	Dennis Szymialis		1910	65	p.4-86 "Colby Lake is on the Minnesota 303(d) TMDL list because of mercury concentrations in fish tissue, but is not included in Minnesota's regional mercury TMDL because the mercury concentrations in the fish are considered too high to be returned to Minnesota's mercury water quality standard. P.4-86" -but this water will be used to augment stream flows around the tailings basin and increase mercury levels in the Embarrass River and concentrations of mercury downstream to Lake Superior in violation of the Great Lakes Initiative.	S	O
27685	Unique			WAT	Dennis Szymialis		1911	66	p.4-95 "soil borings into the surficial till identified the composition as layers of clay and sand, plus cobbles and boulders that prevented recovery of an intact sample (Pint and Dehler 2009). Near the toe of the Tailings Basin, average depth to bedrock is approximately 25ft, as reported in site boring logs (Barr)" -this is the environment in which the co-lead agencies think that a below ground containment wall can capture 90% of tailings basin water-fat chance.	S	O
27685	Unique			WAT	Dennis Szymialis		1912	67	P.4-94 to 4-115 (my comments-not quotation) Constituent readings for the Partridge River, Embarrass River, and especially for the tailings basin down gradient are of limited value outside of the context of contemporaneous rainfall effecting dilution. Readings for surficial Rivers and Lakes-Concentrations at low water levels are the real indicator of the health of a well, river, or reservoir lake when concentrations are highest and plant and aquatic life mortality are greatest and sometimes absolute resulting in dead rivers because once everything is killed there is no life to regenerate.	S	O
27685	Unique			WAT	Dennis Szymialis		1913	68	Ground water and surficial water aquifer flows are interconnected and reporting readings for residential well water when contaminants are diluted is immoral and should be considered illegal as it is misleading and prevents users from protecting themselves.	S	O
27685	Unique			WAT	Dennis Szymialis		1914	69	The hydrology on pages 4-149 to 4-151 overstate the homogeneity of the mine site surficial aquifer and are irrelevant to what is going to happen when the homogeneous portion removed from the underlying fractured bedrock along the stream bed is removed. These fractures are the vehicle for surface drainage to the larger river fracture when the mine side fractures are breached by the mine excavation the water table will follow these fractures into the mine and because of the lower hydrolic resistance will drain more area more readily including the surficial water on the opposite side ofthe river. River flow will follow the path of least resistance and associated erosion and be redirected naturally through the pit area.	S	O
27685	Unique			WAT	Dennis Szymialis		1915	70	Other wise, The swamp at The actual footprint of The Mine sequesters water for flood control, filters water, and conducts other desired wetland functions.	NS	X
27685	Unique			WAT	Dennis Szymialis		1916	71	P4-220 "although a few individual samples within the Partridge River Watershed exceeded surface water quality evaluation criteria, overall in-stream water quality meets state water quality standards" -readings for surficial Rivers and Lakes-Concentrations at low water levels are the real indicator ofthe health of a well, river, or reservoir lake when concentrations are highest and plant and aquatic life mortality are greatest and sometimes absolute resulting in dead rivers because once everything is killed there is no life to regenerate. -this phenomena also ivites manipulation of sampling data. For example, a high baseline could be established for a stream by sampling in low water levels and after impacted by a new project sampling would be conducted at high levels to indicate compliance when results show baseline levels.	S	O

27685	Unique			WAT	Dennis Szymialis		1917	72	P4-221 "Upper Partridge River sampling sites were indicative of a warmwater stream populated by typical warmwater species, including gamefish such as northern pike and yellow perch (see Table 4.2.6-4)." -the presence of warmwater species where trout would be expected is an indication of the warming impact that mining has on stream ecosystems and the PolyMet will exacerbate this situation as indicated for Wyman Creek: "The MPCA collected fish community data during a 2009 sampling event for Wyman Creek, a State of Minnesota-listed trout stream (see Figure 4.2.6-1). MDNR surveys were conducted on Wyman Creek in 1968, 1981, and 2003 (MDNR 1981; MDNR 2003). Based on the latest 2009 survey, a variety of taxa were collected; however, no trout species were collected, which likely contributed to an IBI score of only 33, four points below the minimum threshold for this stream classification (see Table 4.2.6-4)."	S	O
27685	Unique			WAT	Dennis Szymialis		1921	76	The area in which effects on resources are evaluated is the Area of Potential Effect (APE). The APE is defined as, ... the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist." -the destruction of a once thriving agri-culture in the St. Louis River Valley caused by illegal iron mining pollution. Should we trust a culture of corruption and violation of the law? Minnesota agencies have failed enforce the environmental laws.	NS	X
27685	Unique			WAT	Dennis Szymialis		1936	91	p.5-7 "In this SDEIS, non-mechanical treatment systems are not described in detail because the NorthMet Project Proposed Action is based on mechanical treatment only." -Why isn't the mechanical treatment described then? -Why aren't modeling parameters and protocol described?	S	O
27685	Unique			WAT	Dennis Szymialis		1937	92	p. 5-8 ", but mass balance modeling and analog data from other natural lakes and mine pit lakes in northeastern Minnesota suggest" -not a relevant premise from which to draw a conclusion indicating the lack of foundational reliability in the modeling.	S	O
27685	Unique			WAT	Dennis Szymialis		1938	93	that the mercury concentration in the West Pit Lake, the source of the only surface water discharge at the Mine Site, would stabilize at approximately 0.9 ng/L. There would also be mercury in the tailings, although about 92 percent of the mercury in the ore is predicted to remain in the ore concentrate and the mercury concentration in seepage from the Tailings Basin is expected to be less than the standard. The WWTF and the WWTP would be designed to meet the 1.3 ng/L mercury standard for its effluent. -you mean the WWTF and WWTP haven't been designed yet?	S	O
27685	Unique			WAT	Dennis Szymialis		1939	94	Overall, the NorthMet Project Proposed Action is predicted to increase mercury loadings in the Embarrass River, but decrease mercury loadings in the Partridge River. The net effect of these changes would be an overall reduction in mercury loadings to the downstream St. Louis River. -you mean mercury would be reduced in the Partridge River merely because it has a mercury and sulfate emitting mine next to it?	S	O
27685	Unique			WAT	Dennis Szymialis		1943	98	These elevated concentrations are consistent with concentrations seen elsewhere in the Iron Range and northeast Minnesota.	NS	X
27685	Unique			WAT	Dennis Szymialis		1944	99	Minnesota Rules, part 7060.0600, subpart 8, states that "where the background level of natural origin is reasonably definable and is higher than the accepted standard for potable water and the hydrology and extent of the aquifer are known, the natural level may be used as the standard." -Natural/unaffected at the plant site indicate post mining impacts whereas "bedrock unit only" at the mine site indicates a sample taken somewhere in drilled/disturbed rock. This is an attorney's analysis for purpose of deception and not anyone's reasonable interpretation of natural or unaffected. Neither does the fact that these readings were found at other mine sites on the iron range make them background levels. Just because it is found in isolated disturbed areas doesn't mean that it is a natural origin. -thallium is a serious poison and indications of it should be of serious concern for proceeding with mining its use has been banned by presidential order 11643 in 1972. -manganese is associated with intellectual impairment in children (maybe this is why people on the range are less educated)	S	O
27685	Unique			WAT	Dennis Szymialis		1945	100	p.5-11 -recent studies on the health effects of arsenic would dictate a stricter than 10 parts per billion standard	S	O
27685	Unique			WAT	Dennis Szymialis		1947	102	p.5-14 -minimum flows are probably a state and federal legal requirement and not just a MDNR recommendation (see Flynn Article above)	NS	X
27685	Unique			WAT	Dennis Szymialis		1948	103	p.5-19 "calcium and magnesium ions that contribute to water hardness generally lower metals toxicity" -sounds like another mining proponent fairy tale.	NS	X
27685	Unique			WAT	Dennis Szymialis		1950	105	Why haven't modern techniques been utilized in determining the actual and not simply self-serving theory which given the state of the art in geophysical mapping would dictate to determine ground water flows and subsurface conditions including bedrock fracture? You would think that these would be part of the \$65 million dollars that PolyMet claims to have spent. Or is that money being spent to keep us from knowing the truth? Why hasn't the PolyMet mineral exploration and mining company done testing commonly used in the industry to make good sound interpretations beneath the surface such as ground penetrating radar, seismic reflection, hyperspectral imaging, and magnetotellurics.	NS	X
27685	Unique			WAT	Dennis Szymialis		1952	107	p.5-38-42 -there is no MODFLOW recognition of the pipes that are draining the area around the Plant site. Is the water in these pipes considered ground water or surficial water? There is just no recognition or mention of these drainage pipes.	S	O
27685	Unique			WAT	Dennis Szymialis		1953	108	p.5-51 "chemical reactions, including mineral precipitation and surface adsorption, would limit the concentration of many contaminants in non-acidic waste-rock effluent and thus would reduce the rate at which contaminants were released; and" -precipitation would not "limit the concentration of soluble contaminants like arsenic, nickel compounds, and concurrently methylated mercury, the mercury and arsenic generally bound with the sulfide in the pyrite which allow them to become reactive quicker. Pyrite was observed to be a prominent feature at the Minnamax mine within a few miles of the NorthMet mine site.	S	O
27685	Unique			WAT	Dennis Szymialis		1955	110	p.5-55 Table 5.2.2-14 is just an attempt to confuse by using some kind of alternative terms for solubility and ground filtration. They are trying to say that the water and solutes will enter the ground only in quantities which will produce what they want people to believe is the optimum ground filtration scenario.	S	O
27685	Unique			WAT	Dennis Szymialis		1956	111	p.5-55 "four solutes are assumed to be attenuated by adsorption in the aquifer: arsenic, antimony, copper, and nickel." -for arsenic this statement fails to differentiate between Arsenic V isotope which is arsenic at a lower PH state and Arsenic III Isotope which is the same arsenic at a more neutral state. This EIS projects inconsistent scenarios in assuming a lower PH but not the type of arsenic which is exhibited at that PH level. -the modeling also fails in that it is unable to explain already existing exceedances previously noted as being observed for arsenic at the mine site.	S	O
27685	Unique			WAT	Dennis Szymialis		1957	112	GoldSim as manipulated explains nothing relevant, reliable or valid.	S	O
27685	Unique			WAT	Dennis Szymialis		1958	113	Table 3.2.-13 Sulfuric Acid 1,500 tons per year Hydrochloric Acid 3,590 tons per year Liquid Sulfur Dioxide 1,433 tons per year (according to Wikipedia-"Sulfur dioxide is primarily produced for sulfuric acid manufacture")."-regarding tailings geochemistry we need to start with the fact that the SDEIS is telling us that the tailings basin is going to have some potential for acid mine drainage.	NS	X
27685	Unique			WAT	Dennis Szymialis		1959	115	p 5-62 The fact that the modeling failed to measure predicted, "concentrations of several solutes, including many metals." doesn't necessarily mean that the non-empirical measurements were understated by the model or that there were "additional attenuation effects." It probably is more likely that the data fed into the model was invalid or that it is just a bad model. Why should we give credibility to a modeling that has no proven track record of reliability?	S	O

27685	Unique			WAT	Dennis Szymialis		1960	114	p 5-61 "The NorthMet Project Proposed Action tailings are predicted to have less than 0.12 percent sulfur, which kinetic tests demonstrate is low enough that it would never produce acidic leachate" "Tailings samples subjected to humidity cell tests included a range of sulfideS concentrations (0.06 to 0.14 percentS)" -The range between .12 and .14 percent sulfur according to the EIS indicates that there is some probability that the tailings themselves will produce acid mine drainage. This disregards the effect of the process water which will be added. The SDEIS can hide the treatment process from us but it appears that it is heavily reliant on some sort of ion exchange as there is an indication that large amounts of limestone will be used. -but lets go pack to the water hydrology for a start. The SDEIS starts by disregarding the hydrostatic effects of the head created by digging the pit. When the pit is dug, the large amount of water surrounding the pit will want to drain into the pit, even with the soil conditions the SDEIS claims exists above bedrock. The SDEIS rely's on a few holes drilled. The entire wall of the pit is the area in issue and not just the surface area of a few holes. When water under surface pressure starts to drain into the bit erosion will further open these holes and create ever increasing drainage into the pit. The holes in surficial and bedrock area around the pit caused by drying and erosion under pressure will form the conduit for migration of contaminants out of the pit post-closure. The pit wall will be close enough to the Partridge River to intersect fractures radiating out from the main fracture creating the Partridge River. The SDEIS tells us that the surficial water flow follows the fractures and that these fractures have associated fractures radiating out from them. This will create drainage into the pit. This drainage into the pit will be more pronounced on the north wall where this water will divert the Partridge River through these fissures and keep the north Virginia formation wall flowing with contaminants that will have to be pumped out to accommodate mining operations. -this leach-aid water will be pumped to the WWTF and run through lime to neutralize it but no system exists where the lime will not get coated will the sulfide metals that are precipitated out and fail to continue to neutralize the acidic water it is intended to neutralize. This process will lead to higher than the .06 to .14 percent Sulfur that the SDEIS indicates will be a base level for the tailings and increase the chances that at least at times the tailings basin will become acidified at a level above the .12 level indicated for acidic conditions. Furthermore, the tailings basin itself contains waste which has become inert. The addition of sulfide and sulfate to the top of the tailings basin will run through the basin and methylize the elemental mercury which is in higher than environmental concentration along with the mercury methylized from the process water, "sulfate release rates increasing roughly in proportion to total sulfur (p.5-61)."The reverse osmosis, even if the filters stay unplugged and a suitable disposal is found for the filtrate, is not designed or expected to filter out ions that are smaller than water molecules and highly soluble in water. Toxic heavy metals like arsenic, nickel, and methyl mercury will flow unimpeded to lake Superior and beyond in the solution created.	S	O
27685	Unique			WAT	Dennis Szymialis		1961	116	p.5-63 "NorthMet Project Proposed Action contaminant release parameters are based on a combination of laboratory tests and water quality observations at similar tailings facilities in northern Minnesota." -again, this is not a valid comparison. The SDEIS claims that based "design and performance modeling" that	S	O
27685	Unique			WAT	Dennis Szymialis		1963	118	p.5-77 "This P90 threshold generally equates to a reasonable worst-case scenario and has been adopted for other mining NEPA documents where probabilistic modeling was used (e.g., Idaho Cobalt Project [USFS 2009b] -use for one solute hardly give the modeling any basis for reliability or validity, this is flimsy.	S	O
27685	Unique			WAT	Dennis Szymialis		1966	121	p.5-80 "The WWTP would be constructed south of the Tailings Basin near the coarse crusher and would include an RO unit designed to achieve less than 9 mg/L sulfate in effluent, as well as all other applicable water quality standards." -the RO needs to be designed before permitting and if what is the sulfate level in the 10%+ that escapes the tailings basin containment. Won't it exceed the 10 parts per million sulfate standard?	S	O
27685	Unique			WAT	Dennis Szymialis		1970	125	p.5-83 "The typical discharge rate from the WWTF is predicted to be 285 gpm."-this amount underestimates the amount of flow as it disregards the unintended redirected flow of the Partridge River through the pits. This redirected flow would be exacerbated if the north pit wall were to collapse during mining. The rock composing the pit walls is wet rock which is more brittle than dry rock(as I explained in my DE IS comments) added to this will be a shearing effect between the Virginia, Duluth, and underlying rock formations. Pit wall collapse has been noted recently at the Kennicott mine in Utah.	S	O
27685	Unique			WAT	Dennis Szymialis		1972	127	p.5-92 "A comparison of the hydrogeologic conditions at the Canisteo Mine Pit, the Kinney area wells, and the Mine Site concluded that the geologic and hydrogeologic settings of the Mine Site are relatively similar to the Canisteo and Minntac sites (Barr 2011h)." -this just isn't true as there is a 45 foot drop to the lake on the other side of coleraine within 1/2 mile from the canisteo pit providing drainage for the surficial till surrounding the canisteo pit. No such geological feature exists at the PolyMet mine site. Furthermore, you cannot just "Despite the difference in pit depths," as indicated in the SDEIS. The difference between the height of the water which is at the surface above the PolyMet mine and the bottom of the mine is the "head." The higher the head the more the pressure pushing it down. The depth of the mine relative to the water is everything. Anyone who has been in a waterfall knows that a higher waterfall hits them harder. This is a function of the water pressure.	S	O
27685	Unique			WAT	Dennis Szymialis		1973	128	p.5-93 -discussion disregards environmental effects of surficial compaction from draw down of aquifer. "The proposed Category 1 Stockpile groundwater containment system, which is tied into bedrock, would minimize effects of pit drawdown on these waterbodies." -the addition of the stockpile material after the construction of the containment system is likely to be like putting a rock on a sponge and the containment system will burst like a water balloon, bam!	S	O
27685	Unique			WAT	Dennis Szymialis		1975	130	p.5-102 "The GoldSim modeling assumes, however, that a small volume of leachate would seep through tears/flaws in the geomembrane liner, reaches the groundwater table, and follows what is referred to as the Ore Surge Pile Flow path, ultimately discharging to the Partridge River." -GoldSim modeling is only as good as the data fed into it if it works at all. Goldsim modeling is of questionable reliability as indicated in this SDEIS. -However, it is agreed that tears will form in the liner and reactive water will run off and not be caught. SDEIS projections have failed to recognize pit water which will lead to more saturated ore in this and stockpile 2/3 which will cause more extensive tearing due to the additional weight and lead to more highly reactive waste water flowing untreated into the Partridge River. The solution to this problem is for PolyMet to use a more durable liner. Money saving measures as these that compromise the environment in violation of the FLMPA. -it is unlikely that the waste rock indicated would have limited oxygen transport. Breach of the Partridge River aquifer on the north side of the pit will lead to the inflow of highly oxygenated water from the river that will flow through the reactive waste rock and flow through it leaching contaminants. -the two underestimated above phenomena themselves will lead to exceedences. p.21(polyMet 2013gAWMP) "Effluent concentrations used as inputs to the GoldSim water model are based on the PWQTs and the overall Project water management strategy." -PWQT stands for preliminary water quality targets -some of the assessments will be made based on "information from process equipment vendors related to hydraulic and chemical treatment performance." It is unlikely that accurate information will come from a sales pitch by a vendor which is how this SDEIS seems to be weighted. -It is impossible from the SDEIS to make the modeling predictions given in pages 5-94 to 5-150 plus as the Goldsim results are only based on PolyMet targets which may or may not be achievable. Whether or not these targets are achievable needs to be part of the foundation for this SDEIS. This foundation is failing like that of the DE IS. -The GoldSim model results are simply a product of PolyMets goals and not any objective end result. Arsenic mobility was studied in tailings from Zimapan, a mining zone of Mexico. Primary mineral phases are quartz, calcite, pyrite, pyrrhotite, sphalerite and arsenopyrite. Secondary minerals in oxidised tailings include gypsum, K-jarosite, lepidocrocite, goethite, beudantite and kaolinite. The highest levels of As (up to 3.95 ± 2.29 weight%), Zn (up to 3.26 ± 2.21 weight%) and Pb (up to 0.93 ± 0.83 weight%) were measured in unoxidised tailings located at the edge of the town. Concentrations in water leachates from oxidised tailings were: As (0.41-48.68 mg/L), Zn (1.5-400 mg/L), Pb (<1.0-1.8 mg/L) and Fe (1.9-897.5 mg/L). Mineralogy, pH, and heterogeneity of tailings, explain these concentration ranges. Arsenopyrite oxidation releases arsenic that is then partly incorporated in secondary minerals like beudantite and K-jarosite. Arsenic is also immobilised by sorption onto positively charged surfaces of hydrous ferric oxides. Keywords: arsenic mobility, mining, mineralogy, metals, oxidised tailings, Mexico, water leachates, secondary minerals, arsenopyrite oxidation, arsenic concentrations, sorption, chemistry, environmental pollution -http://www.environmental-expert.com/articles/mineralogical-constraints-on-the-mobility-of-arsenic-in-tailings-from-zimapan-hidalgo-mexico-23730 -sorption occurs in very limited conditions and sorption minerals are likely going to have to accommodate overwhelming amounts of arsenic and other metals subject to sorption. I believe the leachates from the above ranged 41 to 4,868 times the ten parts per billion standard. Even a small percentage of leachate escaping the PolyMet site will cause exceedences. and death http://www. bm j.com/content/342/bmj. d2431 Bangladesh Cardiovascular disease/arsenic exposure study. -given already existing background exceedences this is what should be expected. -Furthermore, if the precedent is set for this level in this branch of the St. Louis River the potential exists for totals from each branch to accumulate to exceed exceedence levels in the main river. Inadequate dilution will occur even if branch river exceedences are met due to evaporation and other losses.	S	O
27685	Unique			WAT	Dennis Szymialis		1978	133	p.5-158 -Again, are the pipes draining from the direction of the tailings basin being considered as ground water or surface water. These pipes would be assumed to drain at a different rate. What is the drainage rate attributable to these buried pipes?	S	O
27685	Unique			WAT	Dennis Szymialis		1979	134	p.5-159 -the ground water containment system that it is claimed will collect 100 percent of ground water needs to be further explained. Under the conditions previously described in this SDEIS that is just not remotely physically possible.	S	O
27685	Unique			WAT	Dennis Szymialis		1980	135	p.5-160 already oxidized and precipitated nickel and arsenic would erode and flow out with water regardless of PH because of it's ionized solubility.	S	O
27685	Unique			WAT	Dennis Szymialis		1981	136	p.5-161 -humidity cell testing result are not reflective of actual conditions.	S	O
27685	Unique			WAT	Dennis Szymialis		1982	137	If at closure there is going to be a liner/bentonite layer installed under the pond, the area under the liner will dry out under some conditions unless the pond liner is leaking. Either the pond is saturated or it is leaking oxygenated water. This is a prime condition according to DNR Savin and Berndt studies for methylization of mercury.	S	O
27685	Unique			WAT	Dennis Szymialis		1983	138	The thickness and effective hydraulic conductivity of the bentonite layer would be designed to achieve a pond seepage flux of 6.5 in/yr or less. -sounds precarious given different weather conditions and specificity for performance.	S	O
27685	Unique			WAT	Dennis Szymialis		1984	139	p.5-165 -because of the limited conditions in which sorption occurs the slowing of these solutes is exaggerated. -travel times lack foundation, e.g.Jree flowing water does not take hundreds of years to flow.	S	O
27685	Unique			WAT	Dennis Szymialis		1985	140	It is impossible from the SDEIS to make the modeling predictions given in pages 5-167 to 5-.... plus, as the Goldsim results are only based on PolyMet targets which may or may not be achievable. Whether or not these targets are achievable needs to be part of the foundation for this SDEIS. This foundation is failing like that of the DEIS. The GoldSim model results are simply a product of PolyMets goals and not any objective end result.	S	O
27685	Unique			WAT	Dennis Szymialis		1986	141	p.5-178 -Colby lake water is higher in sulfates than existing flows from the existing tributary stream water and will result in damage to downstream wild rice beds.	S	O

27685	Unique			WAT	Dennis Szymialis		1988	143	raising the level of arsenic to 10 parts per billion from the tailings basin is unacceptable. This combined with cumulative impacts downstream, existing levels of arsenic in the St. Louis River, and the combined health effects of arsenic with other increases in other solutes is a deadly cocktail for people drinking water out of Lake Superior. Furthermore, the 10 ppb is only a PolyMet target which we cannot expect to be enforced by the agencies under the weight of special interest pressure.	S	O
27685	Unique			WAT	Dennis Szymialis		1992	144	Table 5.2.2-47 is misleading because it uses sulfate levels based on Barr and not DNR readings for Colby Lake water which were higher and because it includes Spring Mine Creek water [p.4-122 Spring Mine Creek, which receives drainage from Pit SNW (see Figure 4.2.2-1). Pit SNW is completely flooded and has been overflowing since before 2001 with an annual average flow of about 2 cfs to the Embarrass River via Spring Mine Creek. This discharge has sulfate concentrations that average 1,042 mg/L (PolyMet 2013j).]which won't be augmented. The net effect of the Colby Lake augmentation is a net increase that will be detrimental to downstream rice beds which are already fragile from existing sulfate exposure. The Colby Lake discharges will be less subject to the attenuation of current flows because they will be released on the surface and not subjected to ground effect filtering. Total stream water concentrations of sulfate are more relevant here than concentrations close to the tailings basin. Two thirds of the augmentation water will go to Trimble creek which has according to this SDEIS average sulfate levels of 12.4 at TC1 and 26.8 at PM19 and Mud Lake Creek which will receive about 1/6 th of augmentation has readings at MLC 1 of 9.8 and MLC 2 of 3.2 mg/L, inadequate data is provided for unnamed creak which will receive less than 1/4th augmentation from Colby Lake from years 21-40 (Table 4.2.2-35). Difference between actual from those given in the SDEIS and differences between Barr and MDNR readings are the product of manipulation. For example, a higher reading will result when taken during lower water levels when concentrations are higher and for Colby Lake water different concentrations of sulfates will occur at different depths. Modeling charts 5.2.2-50 and 5.2.2-51 contradict SDEIS actual readings(In Trimble and Mud Creeks) and known sulfates(according to SDEIS figures) in Colby Lake augmentation water.	S	O
27685	Unique			WAT	Dennis Szymialis		1994	146	p.S-202 "The West Pit, like seepage/head water lakes (e.g., lakes with no significant inflowing streams)," -not true/disputed. There will be Partridge River high oxygen inflow through rock fractures and subsurficial erosion. -furthermore, it is not relevant to compare a sulfide ore body to head water lakes or a select number of pit lakes. p.S-204 "runoff from the Overburden Storage and Laydown Area would be considered process water and would be collected and routed to the Tailings Basin for years 1 to 11, where much oft he mercury would be sequestered in the tailings." -this is not true. Not only will mercury not be sequestered in the tailings, mercury that has been sequestered by lack of contact with sulfates will be reactivated with the addition of sulfate laced tailings during the operation of the mine.	S	O
27685	Unique			WAT	Dennis Szymialis		1995	147	PolyMet given its methodology in disregarding the methylation of mercury and overestimation of sorption makes it's fabricated model appear to be unreliable. Given the mines footprint relative to the size of the Partridge River watershed, at best assuming the validity of the PolyMet Modeling, any benefit to filtering the small amount of background existing run-off from the footprint of the mine and surfaces to be treated would be negligible and beyond detection. The fact of the "natural runoff (with a total mercury concentration of 3.6 ng/L)" is so high merely reflects the environmental impact that exploration drilling has had on the site, contradicts PolyMet's sequestration theory	S	O
27685	Unique			WAT	Dennis Szymialis		1996	151	SDEIS neglects a discussion of the augmentation water from Colby Lake which MPCA testing from 1976-2007 showed mercury of 190 ng/L (p.4-88) while the Embarrass river only has 4 ng/L (p.4-123). All the tailings basin surficial seeps show less than 4 ng/L (p.4-129). This is an increase of more than 45 times the amount of mercury being put into the Embarrass River tributaries. Even ifthe more limited and paid for Barr testing results are used mercury doubles during the period of augmentation.	S	O
27685	Unique			WAT	Dennis Szymialis		1997	152	This 20 year Colby Lake stream augmentation would seriously contaminate fish in the Embarrass River watershed for a generation in the downstream Embarrass River and increase mercury in the Lake 29 Superior Watershed. PolyMet will be taking current cleaner runofffrom the LTV tailings basin and replacing it with much higher mercury contaminated water. Even though this water would also flow in the St. Louis River a net increase will occur because the dillution effect of the alleged cleaner tailings basin water will be removed. This is a clear violation if the Great Lakes Initiative Law.	S	O
27685	Unique			WAT	Dennis Szymialis		1998	153	The Colby Lake water is warmed by the nearby Minnesota Power Laskin plant (p4-85). The warmer water will increase the solubility of the metals in the river system and form an environment that will serve as a catalyst more conducive to oxidizing metals and methylating mercury.	S	O
27685	Unique			WAT	Dennis Szymialis		2010	165	water losses in the watersheds of the tributary creeks are underestimated because they do not account for water flowing through drainage pipes running from tailings basin drainage area to Embarrass River(draw down and intensification of contaminants). If containment system catches 90% of water there will be a shortage of more than 20%. This 20% augmentation from Colby Lake will lead to heightened levels of mercury in the first 20 years and after 40 years in addition to the more extensive augmentation occurring in years 20-40 as indicated previously in these comments in violation of the Great Lakes Initiative Law.	S	O

12961	Unique			WAT	Dorie Reisenweber		783	3	Can Polymet, which from my reading has never mined, be expected to be able to accurately determine that? What if numbers were crunched to fit the desired outcome, or worse yet, what if the public is expected to take that prediction on faith, and it were not true? Wouldn't that negatively impact the waters? the health of the people? What about protection under the law?	NS	X
12961	Unique			WAT	Dorie Reisenweber		785	5	Potable water is the "highest and best use" for all groundwaters according to Minnesota regulations. (Minn R 7060.0400) No economic or social development may override the beneficial current and future uses of the waters. I urge you, do NOT accept Polymet's NorthMet Project & Land Exchange FEIS. It is not in the people's best in	NS	X
17819	Unique			WAT	Dorie Reisenweber		817	5	The FEIS relies on Gold-Sims to anticipate weather events. It ignores the huge swings in weather worldwide due to climate change. Floods and droughts occur at rates far more devastating and frequent than the Gold-Sims recognizes. A thorough FEIS would possibly consult Minnesota's state extension climatologist, Mark Seeley. A thorough FEIS would check several other sources on climate. 90+ percent of the world's scientists are not likely to be wrong about climate change. Realistically, the NorthMet Project and the other even larger companies one can anticipate mining in northeastern Minnesota will not operate under previously existing weather conditions, but a remarkably different climate.	S	O
25059	Unique			WAT	Doris Lavender		1129	1	No we don't want this polymet plant open until you'll company install an cement wall ,reverse spill in own property.In, case of flooding it,want spill into drinking waters.plus company need sceintist studies what happens in water, insure of safety of our waters. No dont open polymet company until Scientists reseach testing and build an cement wall that reverse poison unto own property safty hazardous waste bin.	NS	X
6154	Form Letter	1	Variant	WAT	Douglas Wallace		454	1	As reported in the Timberjay Newspaper (8/19/15) "According to a June 18, 2015, letter from the Great Lakes Indian Fish and Wildlife Commission (GLIFWC), one of the cooperating agencies on the decades-long study, Barr Engineering, the PolyMet contractor that actually ran the water flow model used in the study, made fundamental miscalculations, rendering the results of this key element of the environmental study invalid. Barr works as a consultant for PolyMet, yet the lead agencies have relied heavily on its technical work throughout the environmental review process." "GLIFWC, which represents 11 Indian bands in Minnesota, Michigan, and Wisconsin, maintains its own scientific research staff. The agency, based in Odanah, Wis., is the only entity, other than Barr Engineering, which has actually run the MODFLOW model, a highly complex computer program for determining water flow through the environment." "Yet, according to GLIFWC, Barr got it wrong when it set the assumptions while calibrating the MODFLOW model, using water levels within the Peter Mitchell pits that were ten meters too high for the time period in question. With the higher water levels used by Barr, the model predicted that--since water flows downhill-- the higher the elevation of the water in the pits, the greater outward pressure and flow of that water towards lower terrain, such as the Partridge River, located just south of the Peter Mitchell pit and adjacent to the proposed PolyMet mine. But if the water level is assumed to be 33 feet lower, as GLIFWC officials maintain was the proper assumption, then the headwaters of the Partridge River would be higher in elevation than the water in the Peter Mitchell pits, and that would reverse the flow of water, and potential contaminants, according to Coleman." "Because of this error, the calibration model has the local direction of groundwater flow 180 degrees reversed from the actual conditions during the calibration period," states Coleman. Rather than pushing ground and surface water from the Laurentian Divide to the south, lower water levels in the Peter Mitchell pits would essentially move the continental divide to the south and incorporate much of the area surrounding the proposed PolyMet Mine into the Rainy River watershed."	S	O
6154	Form Letter	1	Variant	WAT	Douglas Wallace		455	2	I along with many seasonal residents spend months at a time within the Rainy River watershed. We believe that Polymet's flow studies are biased, do not rest on solid independent science, and will put a pristine northern watershed at substantial risk in future years. Polymet's proposed mining operation should not be allowed to move forward. The EIS is not complete and it represents flaws putting a whole pristine watershed at great peril.	NS	X
3562	Unique			WAT	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2898	2	Flow path maps in the EIS show that the plume of contamination will reach the Partridge and Embarrass Rivers, which flow to the St. Louis River and ultimately Lake Superior.3 This mine does not just threaten a water source; it threatens one of the world's greatest freshwater resources. Lake Superior contains 10% of the world's freshwater.	NS	X
3562	Unique			WAT	Downstream Business Coalition c/o Loll Designs	Downstream Business Coalition	2902	6	The St. Louis River, after decades and more than \$100 million dollars spent on cleanup from the unsustainable practices of the past, is finally becoming a safe place to live, work and play again. Up to an estimated \$240 million will likely be spent over the next 5 years to continue the cleanup and restoration. We owe it to future generations to finish the cleanup, not to put our water at risk again.	S	N
8768	Unique			WAT	Dyke VanEtten Williams		606	2	I see no reference to any response to the Ojibwe study saying water actually will flow INTO the BWCA. The FEIS states it won't. That's no where near enough assurance given that there has been a legitimate challenge to your assertion. And it doesn't deal with the possibility that polluted water would reach Canada - either via the Rainy Lake watershed or directly on Lake Superior. The fact that the IC and/or Canadian Parliament could stop this cold needs to be addressed.	S	N

50	Unique			WAT	Elizabeth Anzalc		121	2	Should city water be supplied to this development, wyne ridge, by Giants ridge resort? The city of Biwabik , town of white and Aurora are planning a new city water system. Should this city water supply include Wynne Ridge where I live because of possible water well contamination by underground water movement from poly met?	NS	X
25350	Form Letter	1	Variant	WAT	Elizabeth Heck		1153	1	I am strongly opposed to the PolyMet NorthMet copper-nickel sulfide mine project for the following reasons. 1) The PolyMet FEIS has not adequately assessed the potential for water pollution caused by the project which poses serious risks to drinking water, aquatic life and human health.	NS	X
29803	Form Letter	1	Variant	WAT	Elizabeth K Larsen		2625	3	From the headwaters to the estuary, we can see historical and modern evidence of strong desire to protect our valuable river. A century ago, the United States purchased the forested lands in the headwaters region of the St. Louis River to protect the watershed. The deed to the land, purchased under the Weeks Act, prohibits open-pit mining and demonstrates the value of the headwaters of this river. In recent decades, hundreds of millions of dollars have been spent to clean up industrial pollution created in the estuary over the last century. Yet right now, the St. Louis River headwaters are threatened by sulfide-ore copper mining that will pollute this special place which we have sought to protect and heal.	NS	X
29803	Form Letter	1	Variant	WAT	Elizabeth K Larsen		2626	4	Development of the proposed PolyMet mine is contingent upon eliminating the protections of the Weeks Act. As a result, a ?land swap? or exchange has been devised that circumvents laws protecting the headwaters of the St. Louis River from the enormous proposed strip mine. The exchange will sacrifice nearly 1000 acres of wetland directly, with indirect impacts extending much farther. It is as if the value of the headwaters, along with the effort and money spent to restore the health of the river, has been forgotten in the rush to extract minerals from the earth in this watery place, for the benefit of a few.	NS	X
29803	Form Letter	1	Variant	WAT	Elizabeth K Larsen		2627	5	A recent study by Earth Economics details the economic benefits of ecosystem goods and services provided by the St. Louis River watershed. In the study, only those factors with rigorous scientific valuation were included in the tally; those lacking careful study were omitted. Therefore, the present valuation must be considered a very conservative estimate of the economic value of the benefits provided by the St. Louis River and its watershed. In total, the river?s ecosystem goods and services are valued at \$5 to \$14 billion annually. One of many factors considered in this evaluation, carbon sequestration, is of enormous concern to human kind, and much of the St. Louis headwaters area is a large and complex peatland. The study values the carbon sequestration capacity of this area between \$57 billion and \$95 billion over the course of the next seven generations. Recreation and tourism alone generate \$12,843 per acre per year in this watershed. According to a recent directive from the White House Office of Management and Budget, the hundreds of values that have been identified in Earth Economics? Report must be included in any analysis of benefit and cost related to the proposed PolyMet project. I ask that the plan itemize the values of the lands that will be taken and calculate them for the entire duration of the period that this mine proposes to ooze pollution into our ecosystem. We have the right to expect our government to consider the costs of their decisions, not just the benefits that are touted by corporations.	NS	X
27836	Unique			WAT	Ellen Hawkins		2182	5	Most sections I commented on in the DEIS seem not to have changed much in the FEIS. Predictions about where PolyMet's polluted water would spread are not backed up by independent science.	NS	X
27836	Unique			WAT	Ellen Hawkins		2184	7	The FEIS does not consider the impacts of likely toxic seepage of groundwater to the north, even though this failing was pointed out by Great Lakes Indian Fish and Wildlife Commission (GLIFWC) months ago and there has been ample time to consider it; even though the volume of seepage could be huge – perhaps hundreds of gallons per minute or up to a million gallons per day as opposed to the 10 gallons per minute indicated by Barr Engineering modeling; even though this groundwater is not treated, as a percentage of the surface water is supposed to be; and even though the resources at risk include the BWCAW – America's great canoe country wilderness and the basis of the economic health of the region. Because if the untreated toxic seepage flows north, as GLIFWC predicts and DNR apparently concedes is likely, it will flow into the South Kawishiwi River, which flows into the heart of the Boundary Waters Canoe Area Wilderness.	S	O
27836	Unique			WAT	Ellen Hawkins		2185	8	DNR's public discussion of GLIFWC's findings, invoking what sounds like a fantasy groundwater mound and insisting on sticking with a theoretical, rather than a common sense version of whether water flows uphill or down, call into question the EIS's findings on everything to do with waterflow, which is crucial to the impacts of the operation and post operation stages of this project.	NS	X
27836	Unique			WAT	Ellen Hawkins		2186	9	The FEIS fails to analyze the risks of pollution to wild rice, wildlife, and human health using realistic estimates as to how successful treatment can be for the total volume of contaminated water across all stages of the operation.	NS	X
27836	Unique			WAT	Ellen Hawkins		2193	17	The complex hydrologic system underlying and surrounding the operations sites is not adequately described in the document or its technical reports, and it appears that it is not understood by the authors - even though it is the key to a safe mining operation.	NS	X

27836	Unique			WAT	Ellen Hawkins		2196	20	The FEIS admits that water treatment would be required for “...a minimum of 200 years at the Mine Site” and “a minimum of 500 years at the Plant Site”. There is obviously no precedent to indicate that such a feat might be possible; it’s impossible to imagine this could happen. The conclusion must be that the polluted water cannot and will not be treated for as long as it poses a risk to the downstream environment and for this reason alone it’s clear that a permit under the Clean Water Act Section 404 should not be granted.	S	O
27836	Unique			WAT	Ellen Hawkins		2199	23	The 21,600 acres that would be make up the PolyMet site wouldn’t be subject to any water quality standards. Even if waters somehow come clean as they leave the site, an area the size of all the North Shore state parks combined would be severely, and essentially permanently, polluted. This is a huge loss of high quality and mostly unspoiled wildlands. The PolyMet operation would contaminate the highest quality water resources with arsenic, aluminum, beryllium, copper, zinc, nickel and sulfate, among others. It would likely lead to violations of state, federal and tribal water quality standards. Claims to the contrary are unsubstantiated.	NS	X
27836	Unique			WAT	Ellen Hawkins		2201	25	Even at the very optimistic 90% of groundwater seepage the EIS claims would be contained and treated, the volume of untreated “seepage” – at nearly 30,000 gallons per day surely more of a healthy flow than a seep – is an unacceptable volume of polluted water to send out into the environment. This volume would be significantly greater if water flows as GLIFWC suggests; and if all tailings storage piles, pits, and dumps are considered.	NS	X
27836	Unique			WAT	Ellen Hawkins		2204	28	Left unanswered are questions about impacts to the Rainy River Basin that arose when new information about likely flow of contaminated seepage northward was revealed by Great Lakes Indian Fish and Wildlife Commission.	S	O
28378	Unique			WAT	Em Westerlund		2249	2	The EIS does not include a strong analysis of the consequences of chemical-laden seepage from the mine site infiltrating our drinking water and watershed. Chemicals like methylmercury and sulfur which may escape the containment site can degrade our drinking water, as well as negatively impact wild rice and fish.	NS	X
6861	Unique			WAT	Emily Steil		518	1	This EIS is faulty in its assessment of resulting water quality. In chapter three it accepts that the water will need to be treated for an unidentifiable length of time. Next it seems to accept that the water can be treated but says nothing about how long this water will need to be treated. In the press we read it could be a very long time. It then forwards the issue over to the permitting phase to ensure that the water will be treated as long as needed. It assumes that is where the necessary resources will be allocated to treat this water "forever" if required. Since the EIS is not able to say at what point the water will be safe it is in fact saying there is a long term unacceptable environmental consequence from this mine. Hiding behind a "sleight of hand" statement that passes this issue on to the permitting process reveals a huge inadequacy in the EIS. The EIS is about environmental consequence not about whether there will be the will or resources to permanently and forever sufficiently address water quality. Given all the unknowns that our future holds there is a big chance government will eventually be required to address part or all of the water quality issues from this mine. Or, worse, the resulting water will eventually be not treated at all. It also assumes what we know about water quality today is all we will ever need to consider.	S	O
11017	Form Letter	1	Variant	WAT	Eric Krenz		746	4	I feel that the questions regarding the current water model are being inadequately addressed. I have observed no small amount of online propaganda attempting to discredit people questioning that water model.	NS	X
29647	Unique			WAT	Eric Morrison		2557	1	The NorthMet FEIS does not properly consider impacts of the NorthMet mine on the Boundary Waters Canoe Area Wilderness and Voyageurs National Park. The hydraulic connection between the NorthMet proposed mine site and the Rainy Lake Watershed via the One Hundred Mile Swamp is obfuscated by incorrect mapping and incorrect statements in the FEIS.	NS	X
29647	Unique			WAT	Eric Morrison		2558	2	The NorthMet mine site is uphill from the body of water known as the One Hundred Mile Swamp. The One Hundred Mile Swamp is a contiguous wetland that inarguably spans the Laurentian Divide and drains to both the Laurentian Watershed and the Rainy Lake watershed. Drainage to the Rainy Lake Watershed will impact the Boundary Waters Canoe Area Wilderness and Voyageurs National Park. In SDEIS maps and now in FEIS maps, the perimeter of the One Hundred Mile Swamp is drawn incorrectly so as to omit the portion of the wetland on the Rainy Lake side of the Laurentian Divide.	S	O
29647	Unique			WAT	Eric Morrison		2559	3	LINES ON MAPS THAT DEMARCAT E WHERE WATERSHED DIVIDES CROSS OVER BODIES OF WATER ARE NOMINAL AND DO NOTHING TO PREVENT THE MOVEMENT OF WATER WITHIN THE BODY OF WATER, including from one side of the divide to the other. To suggest otherwise is preposterous. The statement that the nominal watershed divide across a body of water prevents water from passing between two watersheds also appears on pages A-273 to A-274, A-453, A-519, and A-602. The nominal demarcation of the crossing of the Laurentian Divide over the One Hundred Mile Swamp is a straight line running east-west from 47.6441, -91.9476 to 47.6441, -91.9341 over a flat body of water as can be seen in the Hydro-NHD USGS TMN 2.0 Viewer map available at http://viewer.nationalmap.gov/viewer/ . The Hydro-NHD USGS TMN 2.0 Viewer map is copied below.	S	O
29647	Unique			WAT	Eric Morrison		2560	4	On page 5 – 5 of the FEIS, the following incorrect statement appears “Yelp Creek and the Partridge River encircle the northern, eastern, and southern sides of the Mine Site. These streams act as hydrologic sinks for surficial groundwater and surface water originating at the Mine Site. Surface runoff or surficial groundwater seepage leaving the Mine Site would flow into Yelp Creek or the Partridge River, and eventually into the St. Louis River.” This statement is incorrect because THE PARTRIDGE RIVER IS NOT A SINK FOR SURFICIAL GROUNDWATER AND SURFACE WATER ORIGINATING AT THE MINE SITE. Water exchanges between the Partridge River and the One Hundred Mile Swamp and groundwater contours in the One Hundred Mile Swamp descend in a northeasterly direction, moving exchanged water across the nominal demarcation of the Laurentian Divide and into the Rainy Lake watershed. Satellite imagery of the Partridge River shows that it disappears completely into the One Hundred Mile Swamp and that at some point all of the water in the Partridge River is groundwater in the One Hundred Mile Swamp. A satellite image of the Partridge River where it disappears into the One Hundred Mile Swamp at latitude 47.63918 and longitude -91.94589 is available at the USGS Earth Explorer web site and is copied below. Groundwater contours for the One Hundred Mile Swamp are shown in EIS Figure 4.2.2-7.	S	O
29647	Unique			WAT	Eric Morrison		2561	5	The FEIS asserts that surface water flow and surficial groundwater flow from the NorthMet Project will not directly, indirectly, or cumulatively affect the water in the BWCAW and Voyageurs National Park but includes no provisions to guarantee the validity of this statement. The validity of the FEIS assertion can be tested by simply monitoring water quality in Langley Creek but none is planned. This is unreasonable and unconscionable.	S	O
29647	Unique			WAT	Eric Morrison		2562	6	To prove that the BWCAW is isolated from the NorthMet Project, hydraulic conductivity testing in the One Hundred Mile Swamp should be required data for the NorthMet FEIS. AT A MINIMUM AND IN ANY CASE WATER IN LANGLEY CREEK SHOULD BE TESTED FOR SULFATE ION AND RESPONSIVE ACTION SHOULD BE REQUIRED IN THE EVENT THAT WATER TESTS POSITIVE FOR SULFATE (levels are currently below detection limits as measured by the EPA 300.0 ion chromatography test method). To not test water in Langley Creek and to have no plan in place for corrective action should sulfate appear is a serious breach of public trust.	S	N
26608	Form Letter	1	Variant	WAT	Eric Snyder		1359	2	1. It's unacceptable for the state of MN to knowingly allow any deterioration of water quality, whether groundwater, or that of waterways. Even a slight risk to health of ecosystems, wildlife, or humans, should be strictly unacceptable.	NS	X
29452	Unique			WAT	Erik Hatlestad	Minnesota Public Interest Research Group	3845	3	The EPA identifies sulfide mining as the largest toxic waste producing industry in the U.S. and is associated with long lasting water pollution across the country and the world. No sulfide mine has ever operating without polluting surrounding waters. It is naive to think that the same will not happen in Minnesota as well, which will result in hundreds of years of clean up.	NS	X

29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3981	67	The plant site model assumed that bedrock had such low conductivity that it was modeled as a no flow boundary but the cross-section model of seepage containment set the bedrock conductivity high so that groundwater flow through bedrock would curve upward and be captured by the drain.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3982	68	Storage parameters based on textbook values are too high. Specific yield for unconsolidated and bedrock units was set to 0.25 and 0.05, respectively. The specific storage is 3x10-6 ft-1 for each formation which means that a very small amount of water removed from a confined aquifer will cause a foot of drawdown. This causes an underestimate of dewatering by an order of magnitude, meaning that a predicted dewatering rate of 500 gpm could actually be 5000 gpm.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3984	42	As noted in the Friends of the Boundary Waters comments on the SDEIS and still relevant here, the FEIS does not describe the pipeline system that will be used to transport untreated and treated water and tailings.148 A description of the length of pipeline that will be used, the various purposes, the pipeline construction and the pumping system is a necessary first step in assessing the risk of pipeline spills. In a review of fourteen copper mines (representing 89 percent of copper mined in the United States), the conservation organization Earthworks found that every mine experienced pipeline spills. The number of spills per mine over a 26 year period ranged from 2 to 54. The EPA’s assessment of potential mining in Bristol Bay includes a good example of a risk assessment for pipeline spills.151 The assessment used statistics from the oil and gas industry. The assessment found: Although the range of published annual failure rates for U.S. oil and gas pipelines spans more than one order of magnitude (0.000046 to 0.0011 per km-yr) (URS 2000), the range for pipelines most similar to the assessment pipelines along the transportation corridor is much narrower. For example, the failure rate is 0.0010 failure/km-yr for pipelines less than 20 cm in diameter (OGP 2010), 0.0015 failure/km-yr for pipelines in a climate similar to Alaska (Alberta, Canada) (ERCB 2013), and 0.00062 failure/km-yr for pipelines run by small operators (those operating total pipeline lengths less than 670 km) (URS 2000). The geometric mean of these three values yields a failure probability of 0.0010 failure/km-yr. This overall estimate of annual failure probability, coupled with the 113-km length of each pipeline as it runs along the transportation corridor within the Kvichak River watershed, results in an 11% probability of a failure in each of the four pipelines each year. Thus, the probability of a pipeline failure occurring over the duration of the Pebble 2.0 scenario (i.e., approximately 25 years) would be 95% for each pipeline. The expected number of failures in each pipeline would be about 2.2, 2.8, and 8.6 over the life of the mine in the Pebble 0.25, 2.0, and 6.5 scenarios, respectively. The chance of a large rupture in each of the three pipelines over the life of the mine would exceed 25%, 30%, and 67% in the Pebble 0.25, 2.0, and 6.5 scenarios, respectively. In each of the three scenarios, there would be a greater than 99.9% chance that at least one of the three pipelines carrying liquid would fail during the project lifetime. The Co-lead Agencies apparently take the position that because engineered systems have progressed, the history of accidents and failures in the past has little bearing on the probability of accidents and failures in the futures. But as the Bristol Bay assessment points out: It may be argued that engineering can reduce pipeline failures rates below historical levels, but improved engineering has little effect on the rate of human errors. Many pipeline failures, such as the cyanide water spill at the Fort Knox mine (Fairbanks, Alaska) that resulted from a bulldozer ripper blade hitting the pipeline (ADEC 2012), are due to human errors. Perhaps more important, human error can negate safety systems. For example, on July 25 and 26, 2010, crude oil spilled into the Kalamazoo River, Michigan, from a pipeline operated by Enbridge Energy. A series of in-line inspections had showed multiple corrosion and crack-like anomalies at the river crossing, but no field inspection was performed (Barrett 2012). When the pipeline failed, more than 3 million L (20,000 barrels) of oil spilled over 2 days as operators repeatedly overrode the shut-down system and restarted the line (Barrett 2012). The spill was finally reported by a local gas company employee who happened to witness the leak. The spill may have been prevented if repairs had been made when defects were detected, and the release could have been minimized if operators had promptly shut down the line.153 The assessment goes on to identify resources that could be affected by pipeline spills, and the range of potential consequences. The risk probabilities calculated for Bristol Bay may not apply to the proposed NorthMet Mine. The lack of information about pipelines in the NorthMet FEIS makes it impossible to draw comparisons or to estimate what the degree of risk might be. However, the Earthworks Report and the Bristol Bay assessment do indicate that the risk of pipeline leaks and ruptures at any mine is not “remote or highly speculative.” The FEIS thus must present information about the degree of risk and the potential consequences. 29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3985	87	PolyMet assumes in its analysis that the stratigraphic units within the deposit are very similar, but does not have adequate support for this assumption.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3986	88	The modeling used a high adsorption factor that prevents contaminants from moving along flowpaths. Seasonal variability, including spring snowmelt, and other conditions may result in higher-than-predicted concentrations.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3987	89	There is potential for acidic conditions in the Category 2/3 and 4 wasterock stockpiles to develop more quickly than predicted.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3988	90	The FEIS must assess water quality impacts in the Partridge River at the closest point between the river and mine features.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3991	114	Our SDEIS comments also objected to the selective use of data on mercury in seepage from the tailings basin to support estimates of mercury in leachate. Although the FEIS figures have changed based on additional data points, they still ignore data indicating that the mercury level is higher in groundwater seeps than it is in surface seeps or pond water. Again, this point is ignored in the Response to Comments and in the FEIS. And although the Response to Comments states that data was reviewed for inconsistencies,267 it is unclear whether the problems identified by Daniel Pauly have been corrected.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3993	46	The Hydrometallurgical Residue Facility’s liner and cover systems’ documentation: lacks data on the values of compression and swell index values used in modeling and/or gives values too low for fine tailings and slimes; incorrectly modeled LTVSMC tailings as homogeneous without consolidation test results for verification; lacks discussion of the potential for spreading and separation of GCL panel overlaps; fails to provide citations for slope stability assumptions and fails to provide for site-specific tests of the final design proposed; similarly assumes a slope for the cover that will be insufficient to avoid ponding and erosion; and significantly underestimates the actual leakage of liners in the field based on best-case assumptions and does not provide for proper testing of actual leakage potential.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3994	47	The Category 2/3 and Category 4 Stockpiles’ liner systems’ documentation: lacks any liner design feature that could effectively prevent or deal with punctures; fails to justify the fact that these liners are projected to allow a higher hydraulic conductivity than is generally recommended for leach pad liners; and does not commit to rigorous geomembrane best practices for installation, observation, and testing that are required to prove efficacy at the high level projected by Polymet.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3996	49	As discussed above, much of the FEIS is premised on assumptions that whatever the issue or problem, it will be fixed. This assumption is apparent in the responses to comments on liners and covers. For example, rather than correcting the identified slope gradient issue and properly addressing the missing information on how the Category 1 Stockpile cover would be designed to avoid root and freeze damage, the response merely says that maintenance would continue long-term to deal with erosion and tree removal.164 Similar responses to comments regarding the stockpiles’ covers need for ongoing maintenance are also made without addressing Dr. Malusis’s expressed concerns.165 This assurance does not engage the issue raised by Dr. Malusis, that the cover should be designed with known properties that prevent erosional damage before it occurs. Vague references to maintenance are not sufficient analysis of potential impacts under NEPA. The response goes on to make conclusory statements about how liners will perform as predicted in the overly optimistic SDEIS.166 Dr. Malusis has given an important critique on how the liners likely will not perform to expectations that goes well beyond this cursory mention, and has asked for more information on permeability issues that has not been provided. The Co-lead Agency response is insufficient under applicable law.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	3997	50	Similar to the failure to address Dr. Malusis’s concerns for the Category 1 Stockpile, the response regarding the Hydrometallurgical Residue Facility also avoids addressing important concerns. Rather than providing the information requested, the response merely repeated lab research information.167 This response does not address the need for site-specific testing and fails to provide additional information that is necessary to evaluate potential environmental impacts at this facility.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4000	53	The response to the comment that liner leakage is often the product of mistakes in installation is similarly limited to a reiteration that PolyMet plans to use liners, completely failing to respond to the comment.171 Liner installations involve covering uneven ground for distances as long as a mile or more with virtually no breaks or gaps. While theoretically of course this could be done perfectly, it rarely is. This is a good example of a situation where the human factor often intervenes; perfect installation requires commitment, ability, and patience that are sometimes lacking. Across all of these responses is a marked unwillingness to address the need for consideration of both site-specific factors and the performance of the chosen technologies in the field, rather than in a best-case laboratory setting. Because this fails to recognize foreseeable risks that the liners will not perform to theoretical predictions, it does not meet NEPA requirements.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4001	54	The FEIS shows a similar disregard for potential problems with the use of bentonite as a pond and bench liner at the Tailings Basin. As for other systems, the FEIS and Response to Comments simply assume that any problem can be fixed, without assessing or discussing the uncertainty of measures that might be used. Regarding concerns expressed about the untested application of bentonite plan, the Response to Comments states: “Potential measures that could bring the capture efficiency of the system to 100 percent include improvements to the existing dam such as lining the upstream dam face with bentonite and injecting grout into the dam.”172 There is no support given for this statement; it also does not acknowledge the fact that the proffered fix (another bentonite liner) is the same technology that commenters questioned in the first place. Bentonite amendment is not a universal panacea, especially when it is being used in unproven and uncertain ways that could be negated by the chemistry of the tailings at this site.	S	O

29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4002	55	Concerning comments like Dr. Malusis’s regarding the implausible uses of bentonite proposed in the preferred alternative, the response states: [P]ublications indicate that uniform blending is important, so that amendments would probably be applied in multiple layers, and that site-specific field tests would be required prior to full-scale application to tailings surfaces or the tailings pond bottom. . . . The [bentonite amendment] plan would be updated as necessary as part of facility permitting, with future in-laboratory material testing performed to confirm percentage of bentonite addition requirements, and with in-field test plots constructed preceding initial cover construction activities to confirm material placement procedures. The specific methods for bentonite amendment at the Tailings Basin, including a material testing program and construction quality control plan would require approval by the facility engineer of record and PolyMet prior transitioning to full-scale implementation. ¹⁷³ This is a misunderstanding of how a NEPA document is meant to function. To the extent that the agencies agree that the effectiveness of bentonite amendments and application to the pond bottom are still untested and unproven—and therefore in need of field and laboratory tests—the environmental review cannot simply assume that the strategy will be successful. The Co-Lead Agencies cannot rely on unproven mitigation measures. As water pollution due to seepage is one of the large risks of this project, it is wholly inappropriate to put off necessary tests until after the FEIS is finalized, and even more inappropriate to assume that the results of those tests will be favorable.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4003	56	In his report prepared in response to the FEIS, Dr. Malusis shows that the analysis remains flawed on key issues. He points out that mixing bentonite into tailings will be less effective than assumed. Tailings “metals will inhibit bentonite swelling as the bentonite hydrates within the mixture, possibly to the extent that the bentonite will not adequately plug the voids in the mixture. If this is the case, then the bentonite-amended tailings layer will be a poor water/oxygen barrier.” ¹⁷⁴ The current proposals for bentonite additions to dams will not effectively block water or oxygen, and therefore all of the predictions of water quality impacts that are dependent on this mitigation measure are incorrect. Dr. Malusis also indicates that important information is still missing from the FEIS. The inconsistencies regarding, and uncertainty of effectiveness for, bentonite-amended dam raises must be disclosed in the FEIS, along with disclosure of the potential environmental impacts should the plan prove less effective than assumed.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4004	76	Modeling must be re-done to reflect the actual hydrology of the mine site to provide an honest assessment of impacts.	NS	X
				WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4006-1	58	The FEIS and supporting documents do not address the uncertainties of the proposed leachate barrier and collection systems at the Category 1 Stockpile and the Tailings Basin. These systems are assumed to collect more than 90 percent of the leachate from these mine features, and this collection rate is critical to all of the predictions of water quality impacts from this project. If these systems do not operate as assumed, the increases in pollutants in surface and groundwater at both the mine and plant site will be significantly higher than predicted in the FEIS, to the point of violating or increasing violations of water quality standards for some constituents. For systems modeled at 99 or 100 percent capture efficiency, a change of even one percent could double the amount of pollutants predicted to enter ground and surface water. In response to questions about the adequacy of the capture systems, the FEIS contains new information showing modeling of the operation of the capture systems. ¹⁷⁷ Dr. Tom Myers has provided a comprehensive review of this modeling. ¹⁷⁸ As Dr. Myers concluded regarding the Tailings Basin system, The FEIS’ statement “[m]odel results indicate that all seepage from the Tailings Basin would be captured along the north and northwest flowpaths under all assumptions of the bedrock fracture zone thickness” is true only because the model was set up in a highly biased fashion. The model was set up to confirm: “These results indicate that the Plan site Goldsim model assumption (that groundwater seepage equal to 10 percent of the aquifer’s transmissive capacity bypasses the Tailings Basin containment system) is conservative” The model was hardwired to show what the modelers were told by Polymet to make it show. The evidence for this is that the model parameters do not resemble the parameters used for other modeling and the boundaries were set to create hydraulic barriers and sinks that will not be present in the field. ¹⁷⁹ In his review of the SDEIS, Dr. Michael Malusis also identified numerous questions and concerns regarding the barriers.		
				WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4006-2	58	For the Category I Waste Rock Stockpile, EIS documentation: lacks information on soil content and a potential additional barrier in the wall; indicates an incorrect liner will be used for a vertical wall; is based in part on missing information (i.e. broken links in reference materials and missing documents referenced) and insufficient explanation; presumes an unrealistic permeable conductivity rate for the vertical barriers; lacks information on keying walls to bedrock; is not clear about wall thickness; and indicates an insufficient surface slope which will lead to ponding and infiltration. The Tailing Basin’s groundwater seepage containment system’s documentation similarly lacks information on wall keying and inward gradient, and indicates a wall thickness that will be too difficult to construct and backfill properly and is not consistent with conventional practice. It appears from the response to comments that no significant additions were made to the FEIS to correct these many omissions and mistakes. As discussed above, reliance on a mitigation measure to avoid disclosing possible impacts of a project requires sufficient evidence for the assumption that the mitigation measure will work as planned, and/or a disclosure of the degree of risk that it will not work as planned along with information about the potential impacts if it does not. Instead of providing this assessment, the FEIS and Response to Comments tell us that the barrier and capture system is both a well-established technology, and a new technology for which historic information about the efficacy of such systems is irrelevant. In hailing the groundbreaking uniqueness of the capture systems, the Response to Comments states: The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be directly compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and reinjection on the downgradient side to reverse hydraulic gradients across the slurry wall and in underlying bedrock.		
				WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4006-3	58	Relatively few containment systems have been built with this degree of pumping and reinjection to ensure effective capture. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture. ¹⁸⁰ In other words, the Co-lead Agencies are not relying on evidence that this technology has worked at this level of capture before. The only evidence it has for its assumption of greater than 90 percent capture (and in some places, 100 percent capture) is “conceptual hydraulics.” However, the FEIS states in another place that The proposed containment system technology is not new nor unique; the slurry cutoff wall and collection trench approach has been used for many decades, beginning initially as a means to facilitate construction of deep foundations in locations of shallow groundwater and difficult soil conditions, and subsequently expanding to other uses such as the containment of contaminated groundwater emanating from unlined waste disposal facilities (e.g., landfills, stockpiles, etc.). There are many papers written about the use of groundwater containment systems and a number of contractors well-experienced and proficient in containment system construction. ¹⁸¹ The comment that this text responds to specifically challenges the assumption that the capture efficiency will be greater than 90 percent. ¹⁸² Thus the response that the proposed technology “is not new or unique” and “there are many papers written” about it refers to a “unique” technology for which the agencies have no evidence other than conceptual hydraulics.		
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4006-4	58	Notably, no citations are provided for the papers. Similarly, in response to comments that the chosen control technologies have never been proven in this type of mining, the agencies cite to a 1986 USACE manual in support of the statement: “Design criteria for the Tailings Basin are based on well-established geotechnical design standards with significant precedent in Minnesota, in the greater United States, and worldwide.” ¹⁸³ In short, the agencies tout “significant precedent” for use of slurry wall technology when commenters point out the complete lack of information on the practical, as-built efficacy of the reverse hydraulic gradient system. And when commenters point out the ineffectiveness of slurry wall technology as shown by “significant precedent,” the agencies tout the uniqueness of the hydraulic system. In neither situation is the comment actually responded to. Despite this attempt to confuse the issue, it is clear that the Co-lead Agencies have no documented examples of situations in which this type of system has worked at the level of accuracy that the FEIS assumes. Given that these walls will be miles long and that the systems will need to continue operating for hundreds of years, assumptions that they will operate perfectly defy belief. Our expert reports provide many reasons to doubt these assumptions. In light of the lack of precedent and the resulting uncertainty in the capture rate of these systems, one would think that the amount of leachate escaping from the Category I Stockpile and the Tailings Basin would be set as variable factors in the GoldSim modeling, allowing a picture of what might happen if the systems are less effective than assumed. Given the relative ease and simplicity of this means of assessing the outcome of a less-than-perfect performance of the containment system, there is simply is no excuse to ignore significant risks of water contamination, as the FEIS currently does.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4007	59	The Hydrometallurgical Residue Facility (HRF) is the only disposal area proposed on the site with double liner. The materials contained within the HRF may be among the most dangerous on the site. The SDEIS was dismissive of the possibility that the HRF would leak; ¹⁸⁴ the FEIS doesn’t mention it at all. Yet the underlying documents demonstrate that the materials in the HRF will undergo “an initial rapid flush of acidity and metals,” and will remain acidic over time. ¹⁸⁵ As noted by Dr. Chambers and Dr. Malusis in both comments submitted herewith and previous comments, substantial concerns remain regarding stability and potential impacts of the HRF. Even a small leak would have a significant impact that must be assessed.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4008	93	For reasons stated in our comments on the SDEIS, we believe that water from the Category 2/3 Stockpile and the East Pit will enter the Partridge River to the west of the mine as well as to the south.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4009	94	Supplemental modeling from Dr. Myers and scientists at GLIFWC indicates that water will likely move north as well.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4010	95	The mine site is located in a bend in the river, and the closest distances to the river for both the Category 2/3 stockpile and the East Pit are in locations that the FEIS omits from the evaluation. A new modeling effort is needed for this project for other reasons; in the course of that modeling, the effort should be made to identify what stretches of the actual river (as opposed to the modeled river) will receive polluted groundwater. The GoldSim model should then be adjusted to account for the reduced distance from mining features to the river.	S	O

29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4011	96	The EIS must disclose the predicted quality of publicly-owned water within the property boundary, including groundwater.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4012	60	As with other systems, the FEIS fails to discuss any potential difficulties and breakdowns that the Waste Water Treatment Plant and Facility might face, despite the assumption that they will have to operate for centuries. Rather than discussing the uncertainties of scaling up to large facilities from the pilot scale testing and the inherent uncertainties of adjustments needed to meet discharge limits for all constituents, the FEIS simply assumes that an answer will be found for any unexpected results. Rather than responding to questions about the uncertain efficacy of meeting the applicable standards at the necessary scale, the Response to Comments focuses on the ability to increase capacity, and to continue treating and/or storing water during any breakdowns. But these responses do not address uncertainty relating to the systems’ ability to meet the discharge limits in the first place. Although reverse osmosis (RO) may be “standard technology that has been operated around the world for decades,”186 the FEIS and supporting documents provide no examples of it meeting the discharge limits that will apply here, at the scale it will need to operate. And please note that we are not saying that it cannot be done; we are saying that there is uncertainty involved and no resolution of the issue. The FEIS must reveal that uncertainty along with the range of impacts on water quality that might result if it does not work as well in reality as it did in a small pilot test.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4013	61	Regardless of the technology involved or the size of the plant, wastewater treatment facilities are not immune from accidents and failures, and most modes of failure involve human error.188 For example, it may be the case that in RO systems “membrane failure tends to be gradual and provide advanced warning,”189 but acting on that warning requires human reliability. The best way to estimate the potential for accidents, failures, and releases due to human error is not to examine the technology but to refer to history. The greatest failure of the FEIS in regard to risk assessment of the water treatment systems is its failure to disclose what it will mean for water quality (and the humans and wildlife that depend on it) if waste water treatment ends prematurely due to a disruption in regulatory or financial institutions. As discussed above, given the timeframes involved this is not a “remote or highly speculative” possibility, and thus must be discussed in the FEIS.190 The public deserves to know the quality of water that will be released if treatment ends prematurely, and decision makers need this information in order to take a “hard look” at what they are approving. The EPA assessment of potential mining in Bristol Bay provides an example of disclosure of the impacts of a treatment plant failure.191 The assessment provides the following description of difficulties with RO systems: Studies of wastewater treatment plant (WWTP) efficiency and design considerations show that reverse osmosis water treatment systems can be compromised by fouling and scaling from calcium, iron, barium, strontium, silica, microbial growth, and silt (Mortazavi 2008). The Bingham Canyon WWTP in Utah treats groundwater contaminated with sulfate and total dissolved solids from copper mining by reverse osmosis. Pilot tests and optimization studies have shown that the structural integrity of its reverse osmosis membranes can be damaged by abrasive materials (e.g., silt) or chlorine (ITRC 2010). Changes in water composition could increase the concentration of chlorine if the mine pit encounters a large flow of brine transmitted to the pit through deep fracture systems, or from localized areas of mineralized rock with anomalous water quality. An example of WWTP failure due to highly variable chemical composition of inflow wastewater has been documented at a copper mine in Chile: when silica concentrations exceeded the design range, the whole reverse osmosis system could not be operated and was therefore shut down until feed water quality improved (Shao et al. 2009).192 Once again, although it may be true that these difficulties can be dealt with if maintenance, replacement, and repairs are performed as needed, it is exactly the failure of maintenance, replacement, and repairs that leads to accidents and unintended releases. The EPA assessment concludes: Although it is highly likely that mine operations would adversely affect water quality at the mine site, several factors make it difficult to predict the level of effects and consequent risks to fish. One component of this uncertainty is associated with the likelihood of water collection and treatment failure. Water collection and treatment failures have been documented at 13 of 14 porphyry copper mines in the United States (Earthworks 2012). These 13 cases represent instances in which engineering uncertainties led to prediction failures, despite the fact that mine permits included mitigation measures intended to prevent such occurrences. These results indicate that failures are not uncommon at modern U.S. copper mines; however, they cannot be used to quantitatively predict the likelihood of water collection and treatment failures in this or future assessments. Even in the absence of failures, predicting the effects of mining on water quality is difficult and results are uncertain. Further, the effects of water quality changes on aquatic communities are uncertain. The following factors contribute to these uncertainties. ? The range of potential failures is wide and the probability of occurrence for any of them cannot be estimated from available data. Therefore, we can only state that, based on the record of the mining industry, treatment failures of some sort are likely to occur.193 As stated by Dr. Miller, RO systems are notoriously difficult. This is an extremely complex system, and the likelihood that it will encounter problems is at least as likely at the 13 other locations studied in the Earthworks report.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4014	69	The mine site model simulates the Peter Mitchell Pit (PMP) as a constant head tens of feet higher than water levels at PolyMet when PMP water levels actually vary and in future will be as much as 300 feet below PolyMet and will be at least 75 feet lower in perpetuity. Adding the PMP to the Myers modeling shows that its long-term dewatering and pit lake development will substantially affect groundwater flow patterns at the proposed Polymet project. It will create pathways at depth from the Central and East Pits north to the PMP and contaminants could reach the PMP in less than 100 years.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4015	70	PolyMet’s MODFLOW modeling ignored the backfill added to the pits and the pit lake in the West Pit in their simulation. The backfill properties would control the amount of water required to fill the pit, but the model did not adjust the properties from those of bedrock to emulate backfill during the pit refilling. As the water levels recover into a backfilled pit, the uppermost part of the backfill would be an unconfined aquifer and the backfill will would require five times as much water to saturate as would bedrock. The West Pit would be a large open volume but the modeling did not change properties to reflect that fact. A lake would require twenty times the amount of water as compared to bedrock with specific yield equal to 0.05.	S	N

29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4016	62	The plan to pump and treat water from the East Pit as it is filling is a mitigation measure designed to help meet groundwater standards. This strategy is unproven and receives only limited attention in the FEIS and its reference documents. The FEIS fails to respond substantively to SDEIS comments asking for further explanation and details. It also fails to provide any discussion of the uncertainty involved or the risk of unplanned difficulties. The strategy is to “rinse” the rock in the backfilled East Pit, with the goal of flushing out constituents to improve water quality in the pit. The plan calls for pumping water out of the backfilled East Pit at a rate of 1750 gallons per minute (gpm), treating the water and returning it to the pit. However, the record does not appear to include any evaluation of the uncertainties of pumping water at this high rate from the backfilled pit, or whether the rock in the pit is certain to remain saturated while pumping at that rate. ¹⁹⁴ The FEIS fails to assess the risk that pumping at the rates described could desaturate the contents of the East Pit, thereby exposing the most reactive rock (Category 2, 3 and 4) to oxygen that may result in the generation of pollution that subaqueous disposal is intended to limit. It appears that PolyMet proposes to add water back in at the same rate that it pumps water out, and therefore operates on the assumption that the rock will remain saturated. But water that is added back into a backfilled pit will follow preferential flowpaths, which may leave some areas unsaturated. ¹⁹⁵ The NorthMet Project Water Modeling Data Package notes that: “After Mine Year 31 the WWTF can accept more water from the East Pit due to decreasing flows from other sources, and the quantity extracted from the East Pit is allowed in the model to increase.” ¹⁹⁶ But the FEIS does not evaluate the uncertainty and the potential risks of increasing pumping beyond the already high 1,750 gpm rate.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4017	63	Nor does the FEIS provide examples of mines where the rinsing of a pit was successfully achieved in the manner in which PolyMet proposes. The FEIS lacks the description and analysis of this proposed method necessary to assess its mitigation potential or to ensure the method itself does not cause significant environmental harm. The Response to Comments on this issue provides only unsubstantiated assurance: FEIS Section 5.2.2.3.1 accurately describes how East Pit backfill would be flooded as it is emplaced during operations to maintain water within 5ft of the backfill surface using effluent from the WWTF and storm water runoff. The Co-lead Agencies’ review of the model found that the footprints and depths of East/Central Pit are correctly incorporated into the three-dimensional model mesh, and that appropriate boundary conditions are used to simulate pit inflows. During reclamation (year 21 – 40), “water from the East Pit would also be pumped to the WWTF and treated...”, after which treatment of water in the East Pit may continue into closure and long-term maintenance ¹⁹⁷ However, Section 5.2.2.3.1 provides only general statements of what is proposed and does not describe the “three-dimensional model mesh” or other details of the method, much less a response to concerns that discharge back into the pit would follow preferential flowpaths and leave areas of reactive rock unsaturated. Rather than providing data, analysis, or examples to support the certainty that the plan will operate as intended, the FEIS Response to Comments simply restates the belief that all areas of the pit will remain saturated: “The Co-lead Agencies believe that the existing plans, as described in the FEIS, are sufficient to ensure that the East Pit backfill would remain saturated perpetually beyond closure.” ¹⁹⁸ This reliance on a mitigation measure, whose efficacy is not supported by the record, and the failure to discuss the risks and uncertainties of the method, violate NEPA requirements	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4018	64	The FEIS is based on a flawed water model that does not consider all potential impacts of the project. The FEIS’s MODFLOW and GoldSim models contain a series of flaws and unrealistically optimistic assumptions that ultimately result in a model that is not useful to predict conditions at the site, particularly the mine site. Indeed, in many cases, the model has inputs that have biased it towards a particular outcome.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4019	65	The simulation estimated recharge that is far too low for the area because it improperly used the 30-day low flow as baseflow, thereby ignoring that baseflow occurs at higher rates even during storm events. Calibration with a very low recharge caused a very low conductivity estimate.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4020	66	The modeling set a vertical conductivity several orders of magnitude less than the horizontal. This limits the flow from the surface layer into the bedrock layer.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4021	74	The Conservation Organizations recognized the fundamental flaws with PolyMet’s water modeling early in the process. Viewing it as insufficient merely to suggest changes to PolyMet’s model, we commissioned Dr. Myers to generate his own water model to demonstrate what a more accurate model without PolyMet’s flawed assumptions would look like. That model is described in Dr. Myers’s comments on the SDEIS in 2014. But the purpose of this modeling was not merely to generate a different, competing water model; it was to give the Co-Lead Agencies additional expertise on which to base their own model. As described in Myers 2015 at 5 - 6, hydrology models can benefit greatly from multiple conceptual models. It is not that one model is better than another, but that multiple models are optimal. But they are only optimal if the modelers choose to take advantage of them. In this case, the Co-Lead Agencies were dismissive rather than accepting of Dr. Myers’s expertise.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4026	85	An inadequate number of samples were used to characterize the chemical composition of waste rock, and almost no acid base accounting (ABA) analyses were done on the samples that were examined. As a result, the FEIS provides insufficient support for its conclusions regarding the potential for acid mine drainage and for virtually all of its water quality predictions.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4027	86	The use of concentration caps and averages, the disregard of actual results of HCT and field tests, and the failure to account for heterogeneity of the rock and seasonal variability result in a FEIS that almost certainly underestimates water quality problems.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4028	78	PolyMet and the agencies’ response to this issue is to promise to find some form of mitigation that will prevent water from flowing to the north. At this point, the promises of mitigation have reached the point of absurdity. According to the FEIS, no matter what goes wrong at this mine, some ideal means will be found to address it. But it is abundantly clear from all evidence and all sources that this is not the way things work at similar mines. If it was, we would not have billions of dollars of contaminated mine sites spread across the country that are not being remediated because the ideal means and money to do so is not available. The FEIS provides four pages of mitigation ideas without one word about cost. GLIFWC reviewed an early version of proposed mitigation measures and responded: Given the uncertainty that the co-leads feel there is in characterization of contaminant flowpath direction, the draft co-lead memo of June 22 proposes several mitigations that attempt to prevent northward flow of contaminants. The feasibility of any of those measures has not been evaluated. Even with the minimal information presented in the memo, several obstacles to successful mitigation of a northward flowpath are evident: 1) The thickness of the low conductivity surficial deposits between the PolyMet site and the P-M pits, approximately 50 feet thick according to Minnesota Geological Survey 2005 publication M158, makes the practicality of an infiltration trench questionable; 2) Lowering of water levels in the the PolyMet pits would expose reactive Virginia Formation rock to air and water, creating acid generation and dewatering surrounding wetlands; 3) Groundwater injection or extraction wells may be a feasible, but costly, mechanism to block northward flow but, as noted in the memo, would require perpetual operation, care and replacement. In addition to the proposed adaptive management appearing to be impractical, substituting “adaptive management” for understanding of the hydrologic system is contrary to the NEPA concept of site characterization and impact prediction. NEPA is a forward-looking process with the goal of anticipating and describing impacts so that measures can be taken to avoid or minimize those impacts. A northward flowpath for contaminants is indicated by both MODFLOW and MathCad. The character of the hydrology between the PolyMet and P-M projects needs to be described correctly so that impacts of that northward flowpath can be evaluated and the feasibility of mitigation measures can be determined. In an Expert Report submitted with these comments, Dr. Tom Myers reviews the suggested mitigation possibilities, and points out: All of these measures would have to be maintained indefinitely because the northward flow gradient would last forever (Myers 2015). The FEIS has failed to prove that any of them could effectively work or that Polymet could afford to implement them. The FEIS should not rely on these mitigation strategies but rather should complete analysis to lower the uncertainty as to whether they will be needed by completing better upfront analyses of the potential for northward flow. The FEIS discussion states that proposed mitigation measures “if needed, would be maintained indefinitely or until acceptable bedrock groundwater flow conditions are obtained without those measures.” ²¹⁰ Acceptable bedrock groundwater flow conditions could not be guaranteed without a change in the law, which is what PolyMet seems to be banking on.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4031	83	The Geochemistry work relied upon by the FEIS uses unsupportable assumptions and inadequate data. Similarly, the geochemistry work is insufficient to support realistic, defensible predictions of water quality impacts. The water quality predictions in the FEIS are based on insufficient data and unsupported assumptions. The combination of the uncertainty in regard to hydrology and geochemistry inputs to the model results in an overly-optimistic assessment of water quality impacts. As with hydrological impacts, the FEIS must include the full range of reasonably possible acid production and metals leaching potential of rock at the site, and the resulting range of reasonably possible impacts on water quality.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4032	84	Nitrogen and ammonia are ignored in the proposed water treatment schemes. Both constituents are likely to be present at high volumes because of blasting agents; yet PolyMet has failed to address them in their water quality predictions and treatment strategy.	S	O

29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4034	92	The flowpaths shown in Figure 5.2.2-7 and used in the GoldSim model do not accurately reflect the geography and hydrology at the site. As the Response to Comments admits, the flowpaths “do not exactly line up with the flow trajectories predicted by MODFLOW.” And even if they did, the MODFLOW modeling itself was not designed to accurately identify flow paths. The FEIS makes several vague statements such as, “A secondary purpose of the MODFLOW model [including “groundwater flow directions” and “the distribution of groundwater baseflows along the Partridge River.”] An evaluation of these parameters showed that the GoldSim setup/inputs were generally consistent with the MODFLOW results.” The FEIS needs to provide sufficient information about both the MODFLOW assumptions and the consistency between the two models to allow for some judgment as to the accuracy of the flowpaths. The Co-Lead Agencies seem to begin with the assumption that there will be no significant impacts along this stretch of the river, thus making the accuracy of groundwater discharge points unimportant. As Mr. Gadway states: Impacts to the river would presumably be greatest along the primary groundwater recharge zone closest to mine operations. Based on predicted pathways for discharges to the river from mine features, monitoring and evaluation points are more than three miles downstream from this point and are just below the discharge from a creek. Selection of these monitoring and evaluation points ensures that the discharges likely to be highest in pollutant concentrations are not caught by monitoring until well downstream, having been diluted by presumably clean groundwater and by surface water from an area less likely to be affected by mine operations. The failure to monitor surface water at the actual point of contact with groundwater and surface water closest to the mine is directly contrary to Great Lakes Initiative (GLI) requirements and standards that ensure that water quality will not be lowered for impaired waters. The FEIS methodology fails to evaluate the receiving water nearest the actual discharge to the Partridge River, and therefore is inadequate to address potential impairment.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4037	99	The FEIS must contain a more complete disclosure of what is known about the length of time for which water treatment will be necessary. The EIS states only that the need for water treatment is assumed to be “long-term.” However, the water quality modeling results clearly indicate that treatment is likely to be needed for more than 500 years, which is as long as the model was run. An accurate statement would be “The length of time for which water treatment will be needed is unknown, but is predicted to be more than 500 years.”	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4039	101	PolyMet has used these statements to sow confusion in the public about the length of time for which water treatment would be required at the site. • “But because the study focused on the water that could escape rather than water contained at the site, other factors would have to be considered to give a true estimate of how long treatment would be needed, said Brad Moore, PolyMet’s executive vice president of environmental and governmental affairs. He said company officials expect mechanical treatment, such as the reverse osmosis systems PolyMet is proposing for the mine and plant sites, would only be needed for decades. The effectiveness of passive treatment techniques such as wetlands is still being studied.” • “Moore, a former commissioner of the Minnesota Pollution Control Agency, also disputed the need for long-term treatment at the mine site. The company estimates mechanical water treatment will only be needed for about 40 years after the mine is closed. When the mine opens, Moore said, PolyMet would begin testing passive wetland filtering systems designed specifically for the site’s water chemistry. He said state and federal regulators chose the word ‘indefinitely’ in the document to be conservative, since the reverse osmosis technology is treatment that’s already proven.” • “One point of debate is the length of time water from the site would need to be treated after the mine closes. The environmental review includes the scenario in which water treatment could be needed for up to 200 years at the mine site and 500 years at the processing plant. But Moore said treatment won’t be needed for that long. He said the conservative modeling used assumes that all elements of the rock will enter the ground water through the weathering process, although that doesn’t happen.” PolyMet also released its own “factsheet” about long-term water treatment in which it said that “PolyMet believes that within 30 years after closure, all water will be treated by passive treatment technologies.”	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4040	104	In summary, the many statements about transition to non-mechanical treatment mislead the public and agency decision-makers into believing that non-mechanical treatments exist that will work at this site, and that they will eliminate concerns over the length of time that treatment will be needed. Neither of these things are true. These statements should be removed.	NS	X
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4041	113	PolyMet and the Co-lead Agencies take the position that mercury will not discharge to surface water through groundwater or enter the treatment plant or facility at above 1.3 ng/L at any point in either watershed. This position is based on shake-flask tests that do not stand up to scientific scrutiny. These tests are wholly insufficient for the purpose they are used for, as explained in our SDEIS comments. The Response to Comments does not address any of our objections to the use of these tests as the basis for assumptions about mercury groundwater transport through tailings or from mine pits and waste rock.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4044	105	The FEIS does not address the need for pumping and treating water from areas adjacent to the pits during mining, or the potential for elevated concentrations of nitrate and ammonia from blasting agents. The FEIS failed to take a “hard look” at the possibility that runoff from the area around the pits could have elevated concentrations of nitrate and ammonia from blasting agents, and that the area around the pits will need to be dewatered by pumping. The FEIS thus failed to consider the need for this additional pumping, which would add water to the total to be treated, including the need to treat process water for ammonium and nitrate. Mine water that has been in contact with blasting agents, including leachate from stockpile materials stored at the mine site and the pit walls, will have elevated concentrations of ammonia and nitrate from the use of high volumes of blasting agents such as emulsifiers, boosters, and ammonium nitrate – fuel oil (ANFO). The treatment pilot tests, however, assumed that mine water would have near-background levels of nitrate and ammonia, and so the effectiveness of the selected methods for removal of these constituents under mining conditions has not been properly tested or considered. The FEIS discloses that large amounts of explosives will be needed to create the open pits: 18,650 lb/yr for the booster, 4.65 million lb/yr for the emulsion, and 10.6 million lb/yr for ANFO. As result, nitrate, ammonia, and oil & grease concentrations could be high in primary contaminant sources at mine sites and downstream. For instance, the significant exceedence of permit limits for nitrate in downgradient groundwater and surface water has been seen at the Buckhorn Mine. However, while the FEIS lists that the “environmental concern” from these hazardous materials includes harm to water and aquatic life, the FEIS fails to actually consider and address the effects of blasting on water quality. Indeed the objectives for wastewater treatment at the Mine Site do not even include mention of nitrate or ammonia removal. The agencies’ response to comments on this issue is inadequate. First, no response was provided for concerns about ammonia removal. And for treatment of nitrates, the response states that the WWTF will also be of modular construction, such that additional modules can be added for increased capacity if necessary. However, because nitrate, ammonia, and oil & grease concentrations will increase as soon as blasting begins (during mine development), treatment approaches cannot be addressed using adaptive management but must rather be in place before mining begins. ²⁵² The response also states that nitrate will be addressed at the Plant Site if nitrate is included in the discharge permit. ²⁵³ However, much of the water at the Plant Site comes from the Mine Site, and the response ignores the potential for transport of mine water to downgradient groundwater and surface water at the Mine Site. The FEIS also fails to address that neither chemical precipitation nor filtration, which are the planned treatment schemes at the mine site, will remove nitrate or ammonia. The FEIS further fails to properly address nitrate and ammonia in environmental modeling. And, the FEIS fails to include mitigation measures or pollution prevention plans for minimizing the use of blasting chemicals.	S	O
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4057	119	Finally, we note that while discharge of Colby Lake water without treatment for flow augmentation is no longer proposed, it is unclear whether Colby Lake water might at times be routed directly to the WWTP, for discharge to the environment below the tailings basin. ²⁷² Colby Lake water averages approximately 6 ng/L mercury, and the FEIS provides no evidence that the WWTP will be able to treat it to the 1.3 ng/L standard. The responses to comments addressing this issue repeatedly refer the reader to the FEIS section on monitoring for more information. Promises of monitoring cannot take the place of providing adequate evidence that discharge will meet the 1.3 ng/L standard—not just on average, but on a regular basis.	S	N
29745	Unique			WAT	Erin Mittag	Minnesota Center for Environmental Advocacy	4116	175	Additional major flaws with the FEIS’ cumulative effects analysis are set forth in the November 13, 2015 request by the Fond du Lac Band of Lake Superior Chippewa for predecisional referral of the North Met proposal to CEQ. ⁴⁶² As explained by Fond du Lac, bedrock and surficial groundwater pollution is already documented at the same site PolyMet intends to use for the NorthMet project (the LTV site), and the Dunka Pit. As the Band has requested, the agencies must consider and disclose the cumulative impacts of the NorthMet proposal, LTV site, Dunka Pit, as well as the groundwater pollution from nearby iron ore mines, including the Peter Mitchell Pit, Laskin Energy, Arcelor-Mittal, United Taconite, and US Steel Minntac. Moreover, the Band reiterated the need for a geographically broader and watershed-based cumulative impacts analysis that takes into account other major proposals such as United Taconite’s proposal for 1,200 acres of wetland destruction to build a new tailings basin, and the existing pollution that is already causing water quality standard violations in the St. Louis River watershed.	S	O
10132	Unique			WAT	Ernest Peaslee		654	2	I do not think the plan is designed in a way that would reasonably protect the St Louis River or BWCAW watersheds. Leakage of toxic mine wastes would be disastrous. Leakage is inevitable. A recent "News in Brief" article in Science (20 Nov 2015 Vol 350 issue 6263 p892) regarding the recent Brazilian mining disaster (collapse of two dams, see photo below) solidified my opinion.	NS	X
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3503	15	The Area of Potential Effect (APE) for groundwater resources presented in the FEIS is inadequate. The groundwater flowpaths at the mine site do not include the bedrock flow to the north, therefore the APE is incomplete. At the plant site, the APE ends at the property boundary north of the tailings basin. While that is the point of compliance for groundwater quality standards, it is not logical to assume impacts would stop at the property boundary.	NS	X

28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3504	6	Mine Site Groundwater Movement. According to the co-lead agency memo of June 22, 2015, it is not possible to rule out a northward bedrock flowpath from the proposed NorthMet pits to the Northshore pits during the closure period and beyond (MODFLOW Teleconference of July 2015 and Draft Interagency Memorandum: Co-Lead Agencies' Consideration of Possible Mine Site Bedrock Flowpath, June 22, 2015). The results of both complex (MODFLOW) and simplistic (ERM's MathCad) modeling of flow direction indicate that there will in fact be a northward flowpath. The existence of a bedrock groundwater mound that would prevent a northward flowpath, is not plausible given the hydrogeology of the site. Adaptive management cannot be a substitute for understanding the hydrology of a northward flowpath through the development of an analytical model based on site data and a consistent conceptual model. Such an understanding would provide critical information on contaminant flow paths and travel times of contaminants to the north as well as to the Partridge River. The current proposal to have a system of monitoring wells that could detect contaminants moving out of the mine pits is appropriate, but is not a substitute for understanding and predicting the scope of potential impacts. Only with an understanding of the site hydrology and the potential impacts can the feasibility of mitigation measures be evaluated. GLIFWC disagree with this adaptive management approach and maintain that the FEIS is inadequate. A defensible, site specific groundwater model, based on a consistent conceptualization of the site hydrology should be used to characterize site hydrology, understand the effects of the PolyMet project and its interactions with adjacent projects and define contaminant flows.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3507	13	The lack of field data means that the NEPA process must rely on models and data interpolations that are not adequate substitutes for site specific data collection. In comments on the DEIS, SDEIS, and PFEIS, GLIFWC staff have repeatedly identified fatal flaws in the XP_SWMM, and MODFLOW models. The co-lead agencies have not been receptive to these comments and have instead relied extensively on materials prepared by Barr Engineering to develop the NEPA document.	S	O
				WAT	Esteban Chiriboga	GLIFWC	3508-1	14	The lack of data and lack of understanding of mine site groundwater hydrology is evident in the fatally flawed MODFLOW modeling presented in the FEIS. An adequate characterization of the groundwater system at a proposed mine site is essential to understanding most of the potential impacts from the project. As stated in the GLIFWC letter to the co-lead agencies of August 11, 2015: "The amount of water entering the groundwater system, be it precipitation or discharge from the bed of lakes, rivers or mine pits, determines the direction of flow and dilution of contaminants, and dictates points of compliance for both ground and surface waters. The horizontal and vertical conductivity of the soil and bedrock materials determines how the groundwater system responds to stresses and the rate at which the groundwater flows horizontally and vertically. The character of interaction between surface water features and the groundwater system, whether it is loss of water from rivers or wetlands to the groundwater system, or discharge from the groundwater system to the surface water features, determines predicted impacts to surface water features by stresses such as mine dewatering. Estimating water budgets and quantities of water that must be treated requires an adequate understanding of the groundwater system. None of the above effects of a mine project can be predicted accurately if there is not an adequate characterization of the groundwater system. Without an integrated model of the groundwater system, one would be left with only professional judgment to determine the value of the many interrelated parameters that are used for impact prediction. Professional judgment is useful in checking the reasonableness of the predictions from a groundwater model but, by itself, cannot adequately integrate the complex site specific information, all pieces of which must fit together like a complex puzzle." MODFLOW is the primary source of information for defining flowpaths of contaminants from the NorthMet Mine pits at closure. The flowpaths are used to define the area of potential effect for cultural resource impact analysis. The flowpaths and the speed of groundwater flow from the MODFLOW model are critical inputs into the GoldSim water quality model. In fact, without MODFLOW results, the GoldSim model could not be run. Thus the outputs generated by GoldSim that predict ultimate water quality parameters in the Partridge River and property boundary points of compliance are not accurate.		
				WAT	Esteban Chiriboga	GLIFWC	3508-2	14	MODFLOW is fatally flawed for one simple reason. It was calibrated to conditions that did not exist at the same point in time. Water levels in the Northshore taconite pits from 1996 were used along with Partridge River baseflows from 1979-1988. In addition, the modeling does not incorporate the predicted Northshore pit elevations at closure which would be significantly lower in elevation than the bottom of the NorthMet pits. This approach is contrary to accepted modeling methodology and constitutes an unacceptable calibration error. These concerns were described in detail in comments on the CPDEIS of 2008 emailed to the lead agencies on February 6th, 2009. It is unclear why the lead agencies have failed to correct an error of this magnitude. GLIFWC staff have corrected the calibration error in the applicant's model. When corrected, the model indicates that the majority of bedrock groundwater flow from the NorthMet pits and Category 1 stockpile will be to the north toward the Northshore Mine pits and not to the south as described in the FEIS. See GLIFWC letters to the co-lead agencies dated August 11 and December 14th for more information. This 180 degree change in flow direction is significant because it invalidates all mine site water resources conclusions in the FEIS regarding water quality at closure. Furthermore, the water quality effects to Birch Lake and the Boundary Waters of Northshore Mine pit water mixing with NorthMet pit effluent have not been evaluated. The co-lead agencies now agree that GLIFWC's assessment of the MODFLOW model is correct and that the northward flowpath results when the correct water elevations in the Northshore pits are used. However, the co-lead agencies have adopted an idea developed by the applicant to claim that the north flowpath is unlikely. The idea is that a groundwater mound has/would form in bedrock north of the NorthMet Mine pits and would prevent northward flow of pit water through bedrock at closure.		
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3508-3	14	This mound cannot form given the hydrogeologic setting of the area. In fact it is physically impossible for a mound to form. See GLIFWC letter of December 14th for additional detail. A webinar and teleconference was scheduled by the co-lead agencies on November 17th, 2015 to discuss the inadequacies of the MODFLOW model and the flawed understanding of mine site hydrology presented in the PFEIS. Since that time, the co-lead agencies have refused to discuss this issue with tribal cooperating agencies and intertribal agencies. In an email dated November 30th, 2015 the co-lead agencies communicated that there would be no additional technical engagement with tribal staff on the topic. GLIFWC staff have attempted to engage in this discussion and continue to provide information to the lead agencies. GLIFWC staff have developed the following technical comments letters: • Dec. 13, 2015. Titled: "Comments on NorthMet FEIS and Section 404 permitting Re: Hypothetical groundwater mound between PolyMet and Peter-Mitchell pits" • Dec. 14, 2015. Titled: "Comments on NorthMet FEIS and Section 404 permitting Re: Mine site groundwater model calibration." • Dec. 15, 2015. Titled: "Comments on NorthMet FEIS and Section 404 permitting Re: Likely northward groundwater flowpath of contaminants." The assessment of hydrologic impacts of the proposed NorthMet mine does not meet the minimum standards of scientific integrity. The co-lead agencies assumed early in the process that bedrock groundwater flow would be to the south at closure. They have since attempted to support their pre-conceived notions about hydrology with information that runs contrary to physical reality. The NEPA process is not well served by this approach.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3511	11	GLIFWC staff began reviewing the potential environmental impacts of the NorthMet Mine in early 2008. Since the beginning of our review, staff have expressed concerns regarding the hydrologic characterization of groundwater and surface water at the mine site. These concerns have never been fully addressed, which had led to an EIS that inadequately and incorrectly characterizes hydrology at the mine site.	NS	X
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3512	12	Early in the environmental review, the lead agencies and their contractor (ERM) assumed that the mine site was a "greenfield." This meant that the agencies did not intend to collect baseline water quality data from the Partridge River and Yelp Creek nor did they intend to collect groundwater quality data and groundwater flow information prior to mining. It is now recognized that the mine site has been impacted by the Northshore Mine and is not a greenfield site. But, the co-lead agencies never implemented a robust baseline data collection program to support impact prediction and, compared to other recently proposed mines, NorthMet remains data poor.	S	O

28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3515	18	GLIFWC staff have noted that elevated specific conductance is a water chemistry ‘signature’ for mining discharges. The analyses included in Appendix C demonstrates that existing mining discharges result in elevated concentrations of pollutants that persist far downstream in the St. Louis River, which is consistent with the findings of the USEPA in their assessment report on the effects of mountaintop removal and valley fill mining. Given that water quality modeling conducted by the applicant is not scientifically defensible, the co-lead agency contention that water quality impacts from the NorthMet project would not extend to the St. Louis River are not supported.	NS	X
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3517	20	The wild rice sulfate water quality standard is exceeded at almost every point where data is available in the Embarrass River watershed and the drinking water standard is exceeded at half of the monitoring locations. In the Partridge River watershed, the wild rice sulfate WQS is exceeded at fourteen of seventeen locations. The NorthMet Project Proposed Action will contribute additional sulfate to the groundwater from tailings basin water that is not captured and treated, with that seeps through fractures in the mine pit walls once the pit has filled with water, and stockpile infiltration and run-off.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3518	21	All of the PolyMet predictions regarding discharge from the mine pits and waste rock piles, including the more reactive waste rock piles and the ore surge pile as well as the unlined permanent Category 1 waste rock pile, are made without considering the effects of fractures on discharge to groundwater and surface water.	S	O
				WAT	Esteban Chiriboga	GLIFWC	3523-1	26	The information in the FEIS on Wild Rice is inadequate. GLIFWC staff have submitted comments on the deficiencies in wild rice analysis in every previous version of the FEIS yet the issues remain. We are aware of the MPCA determination on waters that are defined as supporting the production of wild rice. We believe that the process used to inform this determination must incorporate historic information of wild rice presence, abundance and habitat. The following section provides historic information on wild rice that, when viewed in combination with other more recent information, suggests that the Embarrass River produces or has produced wild rice in several areas upstream of the current point of compliance. Therefore, we suggest that the compliance point for the wild rice sulfate standard should be upstream of the current location at all areas where rice is growing. Manoomin or Wild Rice can be found throughout the Great Lakes but the areas of greatest concentration are in Minnesota and Wisconsin (Peter David, GLIFWC wild rice biologist, personal communication, Jenks 1901, Moyle 1944, MRC 1969). The areas of greatest concentration, which are defined as wild rice districts by Jenks, encompass lakes and streams within the region covered by glacial outwash. Jenks’ description of the wild rice district is often cited in other publications that describe the range of wild rice (GLIFWC, 1999). Jenks provides additional information on wild rice distribution by stating that within the wild rice district, rice is found wherever there is suitable habitat. Specifically: “Farther south the St. Louis River system tells the same tale – the streams all bear abundant stores of wild rice” (Jenks, 1901, page 1035) This publication supports the accounts of tribal members from the tribes acting as cooperating agencies for this project. The draft Cultural Landscape Report prepared as part of the Polymet SDEIS dated September 15, 2011 states, “With the potential for wild rice in the shallow margins of lakes and streams, and abundant wild plant, fishing and hunting habitats, portions of the Preliminary Project APE may have been very attractive to the Ojibwe” (pg. 48). That report also includes an account from a Bois Forte tribal member indicating that harvest occurred on the Embarrass River. Another tribal member stated that she knows of a family that harvested wild rice in the vicinity of the LTV tailings dam on the Embarrass River. These specific descriptions would indicate harvest occurring upstream of Embarrass Lake and upstream of Wynne and Sabin Lakes.		
				WAT	Esteban Chiriboga	GLIFWC	3523-2	26	This supports the notion of abundant wild rice stands in areas where only smaller stands now remain. Another corroborating piece of information is the presence of a wild rice farm straddling the Embarrass River. This wild rice farm operated from 1957 until 1993 when the operation went bankrupt (Barr, 1995). Aerial Photos taken in the spring of 1991 and 1992 show the flooded rice paddies and some ditches connecting the farm to the Embarrass River. The use of water from the river in the farm operation clearly defines the Embarrass River as used for the production of wild rice. In addition Unnamed Creek was likely a source of water for the farm. This creek currently originates at the northwest corner of the LTV tailings basin. According to the Clean Water Act (CWA) this use of water for production of wild rice is a designated use. As such, the sulfate standard applies for the Embarrass River. Field data collected by Barr Engineering (Barr, 2011) indicates that mine related sulfate effluent has already impacted the river to the point of exceeding the wild rice standard. The Draft Staff Recommendation does not provide information on how the MPCA considered the existing water quality in its recommendation and to what extent the high sulfate values have already impacted wild rice on the Embarrass River. This basic analysis should be part of describing existing conditions in the FEIS. A description of how the issues of wild rice habitat protection and existing elevated sulfate levels in the Embarrass River water were treated in the development of the recommendation is needed. Wild rice in this area is a degraded resource. As such, all remnant populations are in need of protection. This need is further emphasized by the designation of the Embarrass River as impaired in the 2012 draft 303d list. The current wild rice standard language clearly states that wildlife use of wild rice is an important factor in protecting the plant. It is not clear how MPCA staff determined that the number of wild rice plants upstream of the current point of compliance is not enough to be used as a food source by wildlife. GLIFWC staff is not aware of research that defines the number of plants or the density of a rice bed that would make it usable to blackbirds, muskrat, geese, or other wildlife. A single plant can provide nutrition to wildlife. Furthermore, browsing by wildlife is one of the reasons that wild rice fluctuates in abundance and density from year to year (Peter David, GLIFWC wild rice biologist, personal communication).		
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3523-3	26	The variability that is observed in the wild rice survey data on the Embarrass River may well be the result of wildlife use. Finally, Barr Engineering field notes indicate wildlife is using the wild rice stands in the area. These observations of browsing include small stands that are classified in the lowest density and lowest abundance categories (Barr, 2013). This supports the tribal position that all locations where rice is growing should be points of compliance for the 10 mg/l sulfate standard. Based on available information the GLIFWC staff believes that productive wild rice waters on the Embarrass River are where wild rice is currently growing and is confirmed to have been present in the past. The basis for this view is: • Wild Rice has been present at these locations during at least one of the five survey years (2009 – 2013). • The wild rice sulfate standard is 10 mg/l. • Wild Rice is food for wildlife regardless of its density and the observed inter annual fluctuation in abundance of wild rice in the Embarrass River is consistent with the ecology of wild rice. Barr field notes support this position. • Historic information from tribal sources indicates past harvest in this area and non-tribal sources support the assertion that this is an area where wild rice was found. • The existence of a rice farm in this area is consistent with the assertion that the Embarrass River water quality was supportive to wild rice prior to mining impacts. • Wild rice in the Embarrass River endures despite degraded water quality. It is likely that the degraded water quality has decreased the abundance of wild rice in this river.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3525	28	Lack of a Calibrated Groundwater Model. GLIFWC staff have advocated for the development of a calibrated groundwater model so that the Crandon method could be properly implemented. The co-lead agencies have repeatedly refused to require the applicant to develop a model saying that such a model is too complicated to construct and would not yield useful information. This conclusion is not supportable. Groundwater models are standard requirements of NEPA processes and are routinely developed to provide information on the effects of groundwater drawdown at mines. During the IAP process, tribes, the US Fish and Wildlife Service and technical staff from the MNDNR and MPCA supported the development of a calibrated model. Management from the MNDNR and MPCA later declined to develop the model. The lack of a calibrated groundwater model was a management decision based on convenience rather than a technical decision based on science.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3526	38	The mass balance at the plant site is dependent upon the assumption that the existing LTVSMC tailings will continue to adsorb mercury in perpetuity. But, adsorption sites can saturate after sufficient exposure to mercury containing waters, allowing the mercury to flow through the system unimpeded. In addition, the adsorption sites can be unstable as a result of environmental conditions such as changes in pH, resulting in the release of previously adsorbed mercury. In fact, there is already existing seepage from the LTVSMC tailings exceeding the 1.3ng/L GLI standard, as shown in Table 4.2.2-35 of the FEIS.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3527	39	The mine site mass balance does not account for seepage from the saturated overburden at the OSLA. This material contains sequestered mercury from past deposition. This is a particular concern for the peat overburden, as peat is known to be particularly efficient at sequestering mercury. There is no estimate of the amount of mercury in these materials or their propensity to release mercury when water moves through them.	S	O
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3540	37	A superior test of the ability of NorthMet tailings to adsorb mercury was also performed by NTS, but was not discussed in the FEIS. Details can be found in the FEIS reference “SRK 2007b” (see discussion of mercury on page 82 of the reference). In contrast to the 8 hour bench top study, the results indicated that precipitation coming into contact with Duluth Complex rock decreased from 12 to 1.9-3.6 ng/L over 32 days, suggesting while the tailing may have some capacity to adsorb mercury, the tailings basin water is still unlikely to meet the 1.3ng/L GLI standard.	S	O

28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3541	40	The mine site mass balance and estimates of mercury concentrations in the West Pit are supported by data presented in the FEIS for analog lakes. The data (FEIS Table 5.2.2-48) shows average mercury concentrations of 0.66 and 0.97 ng/L for analog natural seepage lakes and pit lakes, respectively. The more detailed source data for this summary table can be seen in Section 6.6 of the FEIS reference “PolyMet 2015m.” At least 6 of the 26 analog lakes had individual samples over the GLI standard of 1.3ng/L, and two lakes had average concentrations above 1.3ng/L. Further, data collected by the Fond du Lac Band [available upon request] on total mercury in concentrations in seepage lakes on or near the Fond du Lac reservation between 2011 and 2014 suggest that levels may be much higher in analog natural seepage lakes closer to the proposed Project, than those presented in the FEIS which were further away in Voyagers National Park and sampled over a decade ago. For the 27 lakes sampled by the Fond du Lac Band, 22 had individual samples over the 1.3ng/L GLI standard, and 20 had mean concentrations exceeding 1.3ng/L. Of the 59 samples collected and analyzed from these lakes, 36 (61%) exceeded 1.3ng/L. This suggests that the analog lakes chosen for analysis in the FEIS are not representative of area lakes and underestimate the predicted West Pit mercury concentration. It is likely that the mercury concentration in the West Pit will exceed the GLI standard.	S	N
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3548	48	Wetlands provide a prime mercury methylating environment. In addition, the groundwater at the toe of the tailings basin is predicted to be very high in sulfate, which will further accelerate mercury methylation. The result will be a much greater proportion of the mercury entering the WWTP being in the form of methylmercury than is found in the current environment. Since there is no technology in place to remove this methylmercury, it will be discharged to the Embarrass River increasing fish tissue mercury in downstream waters, including the St. Louis River.	S	N
28547	Unique			WAT	Esteban Chiriboga	GLIFWC	3551	52	The FEIS states that dust deposition would occur within the first 1000 meters of the rail corridor. There is no scientific basis for this conclusion. This number is taken directly from a document prepared by the applicant and does not have support in literature. The FEIS does reference a preliminary geochemical model that is detailed in the Waste Characterization Data Package. This analysis assumes that ore dust is deposited evenly along the rail corridor, reports that water quality standards would be exceeded for Copper, Nickel, Aluminum and Cobalt. There are no mitigation strategies offered for this impact other than dilution from rainwater.	S	O
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3555	1	The mine site MODFLOW model was incorrectly bounded and calibrated and does not provide the hydrologic characterization of the site that is needed in order to perform adequate project impact evaluation	S	O
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3558	2	Unfortunately, the existing project MODFLOW model for the PolyMet mine site was calibrated using P-M taconite pit water levels that were 13 or more meters too high. The project model incorporates the P-M pits as constant-head-cell boundary conditions (FEIS Figure 5.2.2-2 or attached as Figure 1). The project model sets the P-M pit lakes as constant-head-cells approximately 5 meters above the level of the upper Partridge River, yet pit lakes during the period when flow data was collected (1979-88) were actually well below the elevation of the upper Partridge. Because of this error, the calibration model has the local direction of groundwater flow from the pits 180 degrees reversed from the actual conditions during the calibration period. The model predicts that during the calibration period water was flowing from the hydrologic high at the P-M pits to the hydrologic low at the upper Partridge River, when in fact, because the pits were partly to completely empty, water would have been flowing from the upper Partridge River to the P-M pits.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3559	3	The significance of this is that using the high 1996 Peter-Mitchel pit water levels during calibration is likely to have resulted in restrictive (i.e. low) formation conductivities and recharge in order to force the model to match calibration targets. In order to conservatively estimate maximum PolyMet project pit inflows, the models should have been calibrated with realistic P-M water levels and only during pit inflow predictive runs should the P-M pit water levels been raised to their likely maximum level such as that found in 1996. Such procedures for worst-case scenario analysis (Anderson et al. 2015, Section 10.4.1 Scenario Modeling) is basic to hydrologic modeling.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3560	4	Contrary to Barr’s statements in the Model Technical Review Checklist (MTRC) section (PolyMet 2015m.pdf document page 2971), the MODFLOW model was not evaluated to sensitivity of some of the most significant boundary conditions, the constant-head boundary conditions representing the P-M taconite pits. That quality control document has errors and misstatements, raising questions about adequate quality control. For example the local scale models were 8 layers, not the 7 stated in the MTRC, and the software used for the base case was outdated MODFLOW96 not the current industry standard MODFLOW-NWT. These errors cast doubt on the adequacy of the review to which the groundwater models were subjected.	S	O
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3562	5	The closure period model, on which the sensitivity analysis was conducted, was configured with boundary condition in the form of P-M pit water levels at their 1996 levels, over 300 feet higher than the water levels actually expected at closure. Those P-M pits are close to the center of the model used for sensitivity analysis and, therefore, erroneous boundary conditions of this magnitude invalidate the results of the sensitivity analysis. Not only was the calibration model incorrectly bounded but the closure predictive runs use the same abnormally high P-M pit water levels. In particular the predictive runs for long-term closure (MODFLOW run “SS_west_fill_Sept2014_1585ec1595” resulting in Large Figures 29 and 30 of PolyMet 2015m) use the 1996 taconite pit water levels that are over 300 feet higher than the expected closure water levels.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3563	6	Project documents include very clear statements about the importance of MODFLOW in formulating impacts, for example PolyMet 2015m Section 5.1.2.6 states: "Groundwater contours for the unconsolidated deposits and bedrock are the primary source of information used to delineate the flow path areas. The groundwater contours are from the Mine Site MODFLOW model" The GoldSim contaminant transport modeling in particular uses many outputs from the MODFLOW groundwater modeling (attached as Tables 2 and 3). These extend far beyond the stated purpose of the groundwater model; which in one of several statements was to "estimate the amount of pit inflow and evaluate groundwater flow conditions following pit closure (SDEIS reference Polymet 2013i; available at: http://www.lic.wisc.edu/glifwc/polymet/sdeis/references/), thus making it very clear that a valid model that characterizes site groundwater hydrology is foundational for impact prediction. The project MODFLOW model was used to characterize post closure contaminant flow paths (Large Figures 28 & 29 of PolyMet 2015m , attached as Figures 3 & 4, and FEIS Figure 5.2.2-7) and the general nature of the groundwater system such as mine site groundwater levels at closure (e.g. Large Figure 30 of Attachment B of PolyMet 2015m, attached as Figure 6). In addition, the MODFLOW model was used to supply the numeric input parameters to the GoldSim model that is used for prediction of contaminant flow and contaminant concentrations (PolyMet 2015m , Table 1-1). That table, attached as Table 3, identifies critical GoldSim input parameters that are outputs from the mine site MODFLOW groundwater model.	S	O
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3566	7	Despite the widespread use of MODFLOW outputs in the evaluation of the project site and developing the basis for the FEIS, there have been repeated attempts by PolyMet and the co-leads to claim that the MODFLOW model was intended only to look at pit inflow. That is simply not true. In a 2012 technical memo of the Water Modeling Data package of the SDEIS (SDEIS reference PolyMet 2013i), Barr Engineering stated: "The primary objectives of the models were to: ? Estimate the amount of groundwater inflow that can be expected to flow into the mine pits during operations and pit filling, and ? Evaluate groundwater flow conditions following pit closure." In Attachment B of the FEIS reference PolyMet 2015m, Barr stated that: "The primary objective of this study was to estimate the amount of groundwater expected to flow into the mine pits during operations and pit flooding, and to evaluate the groundwater flow conditions following pit closure." and presented model results on mine pit outflow: "Simulated groundwater flow rates for the long-term closure simulations are shown in Table 4- 4." and "Table 4-4 Estimated Groundwater Inflow and Outflow Rates – Long-term Closure Conditions" In their October 12 memo (attached) the co-leads make yet another characterization of modeling purpose: "The stated purpose of the MODFLOW model is to predict pit inflows and characterize hydrogeologic conditions between the NorthMet mine pits and the Partridge River." While we don't disagree that these as some of the purposes to which MODFLOW was put, we believe that the many written statements by PolyMet and the co-leads and the many uses that the MODFLOW results were put to in writing the FEIS (documented in the previous paragraphs) most completely illustrate the true uses of the MODFLOW modeling in this project.	S	N

28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3567	8	Because of the dependence of the GoldSim modeling of contaminant transport on MODFLOW model outputs, it is essential that the MODFLOW outputs be valid. Because the MODFLOW closure models were incorrectly bounded with taconite pit water levels that were 300 feet in vertical error and the base models calibrated to atypically high taconite pit water levels, it is very unlikely that the MODFLOW model outputs are correct.	S	O
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3568	9	The boundary conditions in the MODFLOW current conditions model and in the predictive closure model were far from correct. In particular, the predictive closure models, which were used to identify flow direction and quantity from the PolyMet pits, used boundary conditions that were over 300 feet in error. Sensitivity analysis of both the current conditions calibration model and the predictive closure model to taconite mine pit water levels should have been conducted.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3569	10	The project mine site groundwater flow model (MODFLOW) was calibrated with multiple conditions that did not exist simultaneously, i.e. boundary conditions in the form of taconite pit water levels from 1996 and river baseflows from 1979-88. This means that the mine site model is not correctly configured and, therefore, unlikely to generate accurate predictions.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3570	11	There is no consistent conceptual model of site hydrology. The conceptual model used for the basis of many of the conclusions in project reports and in the FEIS text is that the nearby taconite pits have little influence on the surrounding aquifer, regardless of whether they are full of water or pumped dry. This is a notion that was proposed early in the project and drove many of the data collection and EIS decisions. On the other hand, the mine site MODFLOW model, which incorporates historical and site-specific conductivity data on the bedrock formations and is used by the applicant to predict closure conditions, indicates that the nearby taconite pits have a profound impact on the surrounding aquifer.	S	N
28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3571	12	the project MODFLOW model was configured and used by the applicant as a basis for contaminant transport predictions at closure. Given that it is mis-configured with grossly incorrect closure pit water levels, it cannot give reliable predictions of contaminant flowdirection or quantity.	S	O

28548	Unique			WAT	Esteban Chiriboga	GLIFWC	3572	13	The mine site groundwater models need to be reconfigured to contain realistic water levels in the P-M taconite pits, both for a "current conditions" model and a "closure conditions" model, not the 1996 water levels that were unusually high. The predictive MODFLOW modeling for the closure period must use the correct closure water elevations for the P-M pits which are 300 feet lower than the unusually high 1996 levels that are used for FEIS predictions. Sensitivity analysis and adaptive management cannot be substitutes for consistent and rational characterization of site hydrology.	S	N
12727	Unique			WAT	F Jeff Verito		768	4	An example of the deception is the document’s mention that the nearby riparian corridors do not empty into the BWCA. Well, the corridors must lead somewhere! They flow either into Lake Superior or inland lakes, which many of us don’t want impacted by sedimentation, pollutants, nearby logging, non-invasive species and likely cumulative effects when accounting for the current condition of the area. The site is too near riparian corridors and wetlands.	NS	X
24750	Unique			WAT	Forrest Johnson		1094	1	Please note that I do not support copper-nickel mining in Minnesota. The PolyMet project and any other copper-nickel effort at this time is a threat to water sources in the Lake Superior and Hudson Bay drainages and will prove to be a financial/environmental disaster at some point within the next 200-500 years. There are few, if any, copper-nickel mines that haven't proven to be detrimental to local waters and end up costly to taxpayers in the form of cleanup and impacts to the environment. To imagine a company agreeing to provide adequate wastewater treatment for centuries is ludicrous. There are no financial guarantees that a company can be held responsible for such lengths of time when the company simply will not last as long as is necessary to ensure clean water. Also, exchanging thousands of acres of public land in order to allow access to the ore body in exchange for 20 years of potential jobs is also a ludicrous and losing proposition in terms of the ecosystem and water sources. Reverse osmosis treatment will not work on the scale needed to effectively treat all wastewater and to bank on management of the cleanup effort for 200-500 years long after profits (I don't believe it's profitable at this point anyway with low metals prices) are gone. The ore body may be immense in the eyes of geologists and but the overburden and waste will dwarf the actual product. This project isn't tapping into a clean vein of copper-nickel. It is trapped in sulfide bearing rock and will take mountains of energy to extract, further adding to the chain of climate change. These are but a few of my concerns as we look at the viability of the project.	NS	X
25404	Unique			WAT	franww@andrews.edu		1180	1	Please do everything possible to protect the Great Lakes from mining contamination.	NS	X
29229	Unique			WAT	Gail C. Roberts		3625	15	WR059 – The thematic response to my comment (18523) refers to details about the GoldSim model. Output from the MODFLOW modeling is used as input for the GoldSim model. Since the MODFLOW modeling is based on a number of unverified assumptions about the theoretical, but untested, design of the tailings basic seepage capture system, the results of GoldSim model are suspect and unverifiable.	S	O
29229	Unique			WAT	Gail C. Roberts		3626	16	WR107, WR108, WR 111, WR141 – The acknowledgement in the FEIS that the bedrock under the mine pit and tailings basin is cracked and somewhat porous leads to further concern about the potential leakage and contamination of the groundwater (and possibly drinking water) in areas to the north of the mine site. Stating that “If it is predicted that water via bedrock would flow north from the Mine Site, mitigation would be implemented to prevent this from occurring” (page A-623) is not an adequate response. The mitigation measures must be specified in advance for this scenario, which has such serious consequences for water quality and human health.	S	O
55	Unique			WAT	Gary Geisler		134	2	Conserving fresh water wherever it exist should be a top priority to give future generations a fighting chance at survival	NS	X
29965	Unique			WAT	Gary Glass		4234	2	Rather than doing the additional relevant work to generate critically needed data (see my comments on the NorthMet SDEIS & DEIS, enclosed), the authors of PolyMet 2015 references, along with agency staff who participated in creating the data gaps by reviewing and approving flawed, incomplete work plans, have chosen to leave important data gaps in the FEIS document. These data gaps were produced by 1) not setting the detection limits for analysis of samples sensitive enough to measure the analytes of interest for hazard and environmental impact assessments; 2) not requiring representative numbers of solid samples to be analyzed to adequately characterize the solids proposed to be mined, or including NBS certified solid samples to document the accuracy of analyte measurements; 3) selecting methodology and procedures for laboratory studies that produced results not consistent with the true characteristics and nature of actual conditions (omitting freeze-thaw and temperature cycles/ variations, and bacterial actions) that will occur when mining is conducted and bedrock exposed to the Northern Minnesota environment; and 4) not presenting the knowledge base of relevant information where acid mine drainage has sterilized thousands of miles of streams in Pennsylvania, for which no remedy for successful remediation and recovery has yet been found.	S	O
29965	Unique			WAT	Gary Glass		4246	11	The West Pit lake most certainly will become stratified with a chemocline and/or themocline.. When that happens, oxygen will be depleted from the bottom waters and toxic metal concentrations and toxic gasses including hydrogen sulfide will be generated and will seep into adjacent water aquifers, and, over time, move off site into tributaries of the Saint Louis River. The East Pit burial site could also become major source of toxic metals, acid reactants, and toxic gas including hydrogen sulfide, through both chemical and biotic mechanisms, and similarly pollute surface and ground waters. All bore holes, wall and bottom fissures, cracks and crevasses must be sealed against water escape through pit walls and bottom surfaces as a precaution to limit seepage out of the pits.	S	O
29965	Unique			WAT	Gary Glass		4256	19	Post-test sample analysis were not conducted to determine the "depletion" of constituents or the degree of reactive sulfide consumed during the leach testing, as provided for in the test protocol. The need for this is especially true for the reactive components of the solids to validate the extent of the reaction process that occurred during the time period of the tests, and to confirm possible mechanisms of dissolution. Measurements of chemical oxygen demand on the solids before and after the leach testing should be done to determine the degree of reactive sulfide "depletion." Without actual measurements of post-test solids indicating the degree of element "depletion," no time predictions can be made. (SRK 2007b, pg 97).	S	O
29965	Unique			WAT	Gary Glass		4257	20	The "humidity test" leaching chamber conditions simulate rock pile air-rain exposures, and do not simulate in-lake or in-ground saturated conditions. Because of this the results are "procedure specific" and not meaningful other than qualitative predictions, given the limits of dry-air, and wet-air cycling in laboratory plastic ware under conditions imposed by the ASTM procedure. None of the leach-testing solid sample conditions impose anoxic conditions or biotic exposure expected to be present in the East-pit disposal volume, or in the West-pit lake under probable stratified conditions (Aquatic Chemistry W. Stumm & J. Morgan, 3rd Ed., Wiley-Interscience 1996, 1022 pp.)	S	O
29965	Unique			WAT	Gary Glass		4259	22	Comment #14: Sulfide Sulfur in the ore and waste rock is reactive and makes this proposed mining project different from previously approved mining projects. Measurements of sulfide reactivity including chemical oxygen demand are mostly missing from the characterization studies and leachate studies used for impact analyses. Sulfide sulfur is the single most abundant reactive constituent, millions of tons, and should be evaluated from this perspective. Sulfide sulfur reactivity influences most all of the dissolution processes that can cause environmental concern and harm. Yet no measures of reactivity have been elevated to a "constituent of interest." Sulfide sulfur reacts with oxygen in air producing sulfuric acid which mobilizes metals to toxic concentrations and can adversely affect fish and aquatic life.	S	O

29965	Unique			WAT	Gary Glass		4261	24	Because millions of tons of sulfur compounds are being proposed to be processed, a common, neutral, and gaseous form of sulfur, hydrogen sulfide, should be identified as a constituent of interest because of its roll in the processing of the ore, and its toxicity and probable contributions the aquifers of the proposed project site. Modeling work should have included anoxic conditions and the parameters controlling sulfide sulfur reactivity, especially where hydrogen sulfide is stable and will be present. In general, anoxic conditions are where hydrogen sulfide is found in the environment, in pore and ground waters, and in the proposed West-pit lake, the East-pit waste rock disposal dump where conditions are expected for the formation of hydrogen sulfide, as well as in Hydromet ore processes, and the subsequent waste disposal areas(Aquatic Chemistry W. Stumm & J. Morgan, 3rd Ed., Wiley-Interscience 1996, 1022 pp.). Toxic lethal responses to hatching fish by hydrogen sulfide have been documented in Minnesota waters (USEPA Gold Book 1986). Water quality criteria and standards are available for the protection of aquatic life from hydrogen sulfide toxicity (2.0 micrograms per liter hydrogen sulfide in fresh water protects from chronic effects in fish) and should be applied and evaluated by the Fisheries Division of the Mn DNR for the protection of the fisheries resource in the tributaries possibility affected by this proposed project.	S	O
29965	Unique			WAT	Gary Glass		4262	25	Metals/Metaloids also omitted Selenium, Manganese, and Iron, all of which play important rolls in assessing toxic exposure and responses of the proposed project, and should also be included in the significant "Constituents of Interest."	S	O
29965	Unique			WAT	Gary Glass		4268	31	The draft EIS document fails to mention the wealth of information in the US and Canada on the observed negative impacts to aquatic resources from mining activities where sulfide containing minerals were mined and the disturbance of the soil and aquifers resulted in 2,500 miles of permanently acid-polluted streams draining sulfide-containing coal mines in Pennsylvania, and 10,000 acid-contaminated sulfide-mineral mine sites in Canada. In Minnesota, where acid-forming sulfide minerals were encountered and buried at the Dunka Mine area in the 1970s, acidified runoff is still being observed to this day from the reactive sulfide-containing rock, and the treatment plant that once was operated to mitigate the problem is no longer running, resulting in continuously contaminated surface water runoff from that source of acid-forming sulfide-containing rocks. The Dunka Mine pit case of omitted information and data should be added to the final EIS, along with an assessment of past and present resultant impacts, and the necessary requirements for permanent mitigation.	S	O
29965	Unique			WAT	Gary Glass		4269	32	The magnitude of the current problem in Pennsylvania is exactly what will happen in Minnesota unless totally protective measures are implemented. Sulfide mineral mining without regard to sulfide-air reactivity and resultant acid-drainage has resulted in continuous on-going environmental problems dating from the early 1900s, and before. Federally funded research (overseen by the Duluth EPA lab) from 1970 focused on identifying the origin of the problem: sulfide-containing mineral-air oxidation to sulfuric acid, and the resultant mobilization of soil/rock components, (primarily iron, manganese, and aluminum) which caused the acute and chronic toxicity to aquatic life in streams receiving acidifiedgroundwater and acidified-surface water containing toxic levels of mobilized metals. Pennsylvania's acid-drainage mitigation program, The Science of Acid Mine Drainage and Passive Treatment, Pennsylvania Bureau of Abandoned Mine Reclamation, is on-going and information may be found on the web address: http://www.depweb.state.pa.us/abandonedminerec/cwp/ or by contacting: Bureau of Abandoned Mine Reclamation Director: Roderick A. Fletcher, P. E. Rachel Carson State Office Building P.O. Box 8476 Harrisburg, PA 17105-8476 Phone: 717-783-2267 FAX: 717-783-7442. See WEB reference below. Relevant information from this state's extensive experience has been omitted from the DEIS, and the relevant information and data should be added to the final EIS, along with assessments of resultant impacts, requirements for permanent mitigation, and the methodology presently being tested and implemented.	S	O
29965	Unique			WAT	Gary Glass		4270	35	All sulfide-containing mined rock, ore, and sulfide-containing material is capable of reacting (Piles 1 - 4) with atmospheric oxygen and results in generating toxic sulfuric acid which then absorbs water from the air, mobilizes and transport toxic metal concentrations, and causes groundwater and surface water pollution. Data are absent for measured reactivity and predicted acid formation as functions of times of extraction, particle size, and exposure to various concentrations of oxygen in air vs. depth of cover and precipitation. The entire mining site can become a toxic acid-toxic metal solution generator where ever sulfide containing materials are deposited when mined, transported, handled, crushed, stored, processed, shipped, and their resulting wastes are finally disposed of. Long times of reaction will result in toxic acid and toxic metal solutions being generated over decades of time from when these reactive sulfide-containing minerals, ores, and wastes are exposed to atmospheric oxygen, extracted by precipitation, resultant runoff and groundwater displacement. Mine disposed of mineral extraction wastes in semi-pervious cells, build upon and within leaky iron-ore tailings basins are unacceptable and do not meet the specific requirements described in Minn. Rule 6132.2200 for REACTIVE MINE WASTES. Contaminated water collection systems must be put in place and all runoff water collected and treated at the WWTF for completion of mine waste reaction times to consume all reactive sulfide present, probably several decades into the future, post-closure. This information needs to be generated and added to the final EIS.	S	O
29965	Unique			WAT	Gary Glass		4271	33	The DEIS omits the information and data from Canada relevant to describing and assessing the proposed mining project. The magnitude of the current problem in Canada originating from sulfide-minerals that have been mined in more than 10,000 sites were described in a Geology Dept. seminar at UMD on Nov. 8, 2007, A Canadian professor from the University of Waterloo, Dr. David Blowes, summarized over 20 years of research on more than 10,000 mines in Canada. All Canadian mine operations Dr. Blowes studied and summarized have exhibited contaminated the groundwater at each of the sites, to greater or lesser extents, from the oxidation of sulfide-containing minerals, rock-wastes, and mine tailings, and the subsequent leaching of metals and sulfuric acids into groundwater. If any sulfide minerals are present, they are oxidized and leach toxic acid and metals in toxic concentrations. Prof. Blowes presented detailed data and information, and his conclusions were: 1) Immediate oxidation of sulfides by gaseous air is the major mechanism causing toxic components to be leachable. The first five-to-ten years or mineral exposure to air are the most important to control and prevent oxidation and leaching; 2) Groundwater is the major recipient and conduit for toxic leachate from waste sulfide-containing piles to surface waters down stream. Water travel-times of 2-200 meters per day are typical for contaminated groundwater streams containing toxic acids and metals; 3) Permanent maintenance funds should be required for all sulfide mineral mine, rock pile, and tailings deposits before mining is allowed to begin. Funds must be permanent and by "bankrupt proof" to assure they will be available in future time when groundwater pollution becomes evident and mitigation is required, and: 4) Permanent methods for the collection and treatment of all runoff, run-through, and leachate are required if downstream water quality is to be protected. Different types of prevention and remediation mechanisms are being studied, but no "best methods" are available at this time. Further study and research are underway. The DEIS omitted relevant information from the University of Waterloo Department's efforts that should be summarized and included in the final EIS for use in evaluation, assessment, and mitigation of the known negative impacts from mining sulfide containing, acid-forming, toxic-metal mobilizing minerals.	S	O
29965	Unique			WAT	Gary Glass		4278	41	The reaction times for the reactivity of atmospheric oxygen and sulfide-containing mineral and other substances to form sulfuric acid, and the subsequent reactions caused by newly formed sulfuric acid, itself, acting as a reagent, reacting to cause toxic metals to be mobilized and leached from mineral and soil particles must be determined. This information is presently missing from the DEIS, and is absolutely necessary to evaluate the time frames for observing environmental impacts and devising methods for their possible mitigation. It is a requirement of M.R. 6132.2200, Subp 2, B. (1) to determine when the reactive mine waste "is no longer reactive." The time frames for the various types of solid and liquid wastes to become non-reactive for both sulfuric acid formation and sulfuric acid reactivity in mobilizing metals must be measured and known, and added to the final EIS and used to determine the total scope and magnitude of the treatment and potential mitigation necessary for the proposed project. The time frames for surface and groundwater movements must also be known, and in combination with the inputs due to the reactivity of the mine and mine wastes, and added to the final EIS.	S	O
29965	Unique			WAT	Gary Glass		4280	43	The same is true for liners (described about in 10) used in mine waste storage cells constructed on the iron-ore tailings basin which was not constructed to retain all water and a significant quantity leaks out of the basin into the ground water and subsequently contaminates the surrounding surface waters. This condition of leakage must not be allowed for any water present in the mine-waste storage cells. These cells must be sealed for all time upon closure, and no precipitation or water through-put may be allow to occur, otherwise severe contamination of the ground water aquifer will occur and down-flow surface waters will be polluted, requiring very high cost mitigation and cleanup. These additions are needed in the final EIS.	S	O
29965	Unique			WAT	Gary Glass		4281	44	The mine itself will leave exposed surfaces of reactive, acid-forming, sulfide-containing copper and nickel minerals which, like described above, will continuously form sulfuric acid and toxic concentrations of copper, nickel, aluminum, iron, and manganese, and mimic the acid-mine drainage problems observed in Pennsylvania for over 100 years. The final size and condition of the porosity of the mine wall surfaces will control to some extent the surface and groundwater flows into and out of the final mine pit. There is little question that the water contacting the solid surfaces of the sulfide-containing minerals making up the mine walls will change composition by leaching sulfuric acid and toxic metal concentrations into the otherwise potable water observed in iron-ore mines, absent exposed sulfide-baring minerals. Contaminated polluting acid mine drainage will have to be collected and treated through the WWTP requiring the probable permanent post-closure operation of such a mitigation process. These post-closure operations and costs need to be added to the final EIS.	S	O
29836	Unique			WAT	Gary Swanson		2651	2	Specifically I'm concerned that the PolyMet- NorthMet project and it's all too real pollution effects that threatens not just the entire BWCA but would also flow north into the Rainy River watershed too because of hydraulic connection or conductivity between the proposed mine site and the Dunka River. I'm not an engineer or a hydrologist but anyone with a map of the area and a basic knowledge of which direction the rivers flow up there would be able to figure this out.	S	O
29805	Unique			WAT	Gedicks Al		2629	2	The FEIS asserts that containment and mechanical treatment of all but 10 gallons per minute of the mine's runoff is possible. Furthermore, such containment and treatment can and will be maintained "in perpetuity" for at least the next 200 years at the Mine Site and 500 years at the Plant Site. Such assertions have no basis in fact or in the history of modern mining,	S	O
29743	Unique			WAT	Gerri Williams		2590	1	Duration of water treatment at the plant. Earliest drafts of the EIS said treatment would have to be in place "in perpetuity"; then in subsequent drafts, "500 years" and now in the final EIS: " The Final Environmental Impact Statement (Final EIS) assumes mechanical [water] treatment would be required indefinitely at both the Mine Site and Plant Site." The FEIS does not account for the change in these time ranges. "Indefinitely" is not a scientifically accurate or satisfying answer on which to base a project of this scale and damage potential.	NS	X

29743	Unique			WAT	Gerri Williams		2591	2	The reverse osmosis pilot test that was prepared for PolyMet by Barr Engineering does not reflect the quantity or quality of water that would need to be treated upon mine closure. RO is not proven effective on a large mining scale. The concentration trapped in the RO filters is highly toxic and needs special containment. PolymTet has only indicated its plans to address leaching, overspill, etc AFTER such has occurred. These are only a few examples of why the Polymet plan continues to be deficient. That is because, even after many generous opportunities update, amend, and edit their various statements, Polymet remains unable to surmount the many technical, financial, ecological unknowable factors that this mining project would face. That being the case, it is rash and contrary to the public interest for the project to go forward.	NS	X
24372	Form Letter	1	Variant	WAT	gloriana casey		1030	1	MINING always seems to make a lot of \$ for a few, but so many people ,and the environment end up suffering! OMG, there is still uranium leaking from an old site in the Grand Canyon and polluting the wter system! . Since mines seem to be a terrorist to water-----maybe you should nix the mine idea!	NS	X

29240	Unique			WAT	Henry V. Mott		3630	3	Category 1 waste rock is segregated from category 2-4 waste rock based on perceived reactivity, with category 1 being the lowest reactivity category. Key to this discussion is that category 1 waste rock could be and likely is reactive (Johnson, 2014). Certainly, the process of segregating the various categories of waste rock is not perfect. Segregation is based on a few tests and extrapolation of the results of those tests to define general locations within the geologic formations in which rock would be predicted to exhibit the various reactivities. Truly accurate categorization requires extensive testing, hardly feasible, of excavated samples at the time excavation and stockpiling occurs. Then, certainly, the category 1 waste rock pile could contain pockets of waste rock that are moderately to even highly reactive. Once acid production would begin in these “hot spots”, additional acid production would be kick started in waste rock that is of lower sulfide content. Translation: there could (and undoubtedly would) be significant quantities of exposed sulfide bearing rock in the category 1 waste rock stockpile that would catalyze acid production throughout the entire pile over the course of the storage period planned to last forever.	S	O
29240	Unique			WAT	Henry V. Mott		3631	4	Although PolyMet's plans have been upgraded to improve the isolation of the waste rock pile from infiltrating water and to collect leachate produced by water entering the pile, the solution is still based on a “business as usual” approach of leaving the mining mess strewn over the surface of the Earth. The geomembrane cap is intended to isolate the waste rock from the environment in perpetuity. This geomembrane liner is similar in materials and configuration to a roofing membrane that is used to isolate the contents of a building from rain and snow.	S	N
29240	Unique			WAT	Henry V. Mott		3632	5	While the environment beneath the soil cover would be more protective of the geomembrane than the mineral cover over a typical membrane roof system, root penetrations, the actions of burrowing animals and insects, freeze-thaw cycles, differential consolidation of the waste rock itself, microbial attacks on the organic materials of the membrane and numerous other processes un-thought of at this writing would over time compromise the geomembrane. PolyMet's plan calls for twice yearly monitoring of vegetative cover protecting the cap to ensure woody growth does not occur – will PolyMet be around to do this in perpetuity? I think not. The isolation system will eventually fail and precipitation and oxygen will enter the waste rock pile. Sulfide will be converted to sulfate and toxic, acidic leachate will be produced. The net effect of isolation of this waste rock pile with a geomembrane will simply be to delay the inevitable production of acidity within the pile for decades, perhaps even a century or more. Then when the geomembrane does fail, long after PolyMet is no more, Minnesota's water resources will be adversely impacted by the acid oozing from this waste rock pile.	S	O
29240	Unique			WAT	Henry V. Mott		3634	7	PolyMet proposes to use the existing tailings impoundment created from the mining and processing of iron ores for the final disposal of its sulfide-bearing ore tailings. The reasoning set forth is that the Earth is already spoiled by this impoundment and further use, as a repository for the far-more-reactive sulfidebearing tailings simply makes sense. Here the distinction must be made that taconite tailings are virtually non-reactive, containing little if any sulfide ARD-producing or other toxics-producing mineral. The existing tailings impoundment is largely only an eyesore. Conversely, the tailings from the processing of PolyMet's sulfide ores will potentially (and very likely) be far more reactive, containing large quantities of metals. The differences between the existing taconite tailings and the proposed sulfide ore tailings are like night and day, perhaps on the order of the chemical difference between sodium bicarbonate and sulfuric acid.	NS	X
29240	Unique			WAT	Henry V. Mott		3635	8	PolyMet's plans include attempts to isolate the tailings from atmospheric oxygen by amending the cover with bentonite. Perhaps PolyMet's engineers are not completely familiar with the specific properties of bentonite. Saturated bentonite (the mineral montmorillonite, most often in the sodium form) gels hold intercalated water within a layered-silicate structure. Hydrated cations and (their associated water of hydration) are held near the silicon-oxygen layers by negative charges arising from isomorphous substitution of iron (II) and magnesium for aluminum (III) in the octahedrally-coordinated inner (sandwiched between two silicon-oxygen layers) layer of the mineral. Water also bonds with the negatively charged layered structure. The immobilization of water by this bentonite gel is largely responsible for the ability of bentonite-amended soils to retard through-migration of water. The actual overall porosity of such mixtures is near that of the native soil. However, when unsaturated, the bentonite no longer retains its continuous gel properties. Then, the ability of the bentonite-amended soil to retard through-migration of gases is no better than that of the native soil. Thus, unless bentonite-modified soils are maintained in a fully-saturated state, there is no real advantage to bentonite amendment for improving transport resistance to gases. Thus, PolyMet's proposed use of bentonite as a means to isolate the contents of the tailings impoundment from oxygen will be ineffectual. Consequently, oxygen, as a terminal electron acceptor for the sulfide to sulfate conversion process, will be present in the tailings impoundment. Infiltrating precipitation will contact the contents of the tailings impoundment and produce toxic ARD leachate.	S	N
29240	Unique			WAT	Henry V. Mott		3636	9	PolyMet's examinations of the leaching character of tailings relies upon average values of final sulfide content of tailings to make predictions of acid leaching character (RS54/RS46, 2007). Neither the ore processed for metals recovery nor the processing itself will be totally consistent so there will be perhaps large variations in the sulfide content of the tailings. PolyMet's plan is for the taconite tailings to be a sink for acidity that might form during the mining and post-closure period. Modeling reported in RS54/RS46 is at best a scientific best guess for the behavior of the overall system.	S	N
29240	Unique			WAT	Henry V. Mott		3641	14	Leaving hydrometallurgical wastes in the system proposed by PolyMet would all but ensure a future environmental problem.	NS	X
52	Unique			WAT	Holly Wells		125	3	Also critical to document that this project's ongoing activities will not, by deisgn or by accident, negatively impact local water sources.	NS	X

28494	Unique			WAT	Ivan Weber		2294	2	Sulfide ores are highly variable, but they will inevitable produce acidic waters and a suite of contaminants, including (most significantly) selenium, arsenic, mercury, cadmium, cobalt and aluminum. All come to bear on natural systems, many through multiple pathways, affecting multiple life-forms. • “Wet” disposal of acid-producing waste rock and tailings, as proposed here, is a sure way to maximize their long-term acidification, mobilizing the full spectrum of toxic metals and associated compounds.	S	O
28494	Unique			WAT	Ivan Weber		2295	3	“Treatment” is not discussed in a forthright manner, but the cast of characters involved would seem to lead inevitably to the choice of reverse osmosis (RO), with disastrous consequences in the offing. Disposal of RO ‘concentrates’ on-site or in the vicinity appears impossible, and the prospect of shipping 1/4 to 1/3 of the total treatment volume would be infeasible and environmentally damaging.	S	O
28494	Unique			WAT	Ivan Weber		2297	5	It is striking that the NorthMet Mine investigative documents appear not even to consider several of these analytes, particularly selenium, cobalt, cadmium and chromium, as well as aluminum; and the way mercury is addressed is not at all adequate. Several of these analytes and their molecular variants and compounds are toxic, depending on levels and on receptors. Selenium, particularly, is tremendously dangerous to reproductive mechanisms of amphibians, fish, and water-birds, often at levels found to be beneficial to humans. Animals can’t live with what humans prefer. On the other hand, I observed and, in effect, discovered that a selenium-rich spring, fed from the upgradient Kennecott Refinery, was devoid of nearly all life except hardstem bulrush and Baltic rush. The water was completely clear, showing no invertebrate life, and smelling strongly of selenium compounds. (That spring was diverted to the preferred disposal point nearby on the south shore of the Great Salt Lake, and is now concealed.) Bottom line: selenium is deadly to aquatic ecosystems.	S	O
28494	Unique			WAT	Ivan Weber		2298	6	Under the direction of Mr. Cherry and other Kennecott leadership inclined toward simple solutions, however, the subtlety and thoroughness of the sequential ‘separation’ approach to water remediation was discarded in favor of reverse osmosis (RO), an extreme high-pressure filtration technology that produces ‘permeate’ in the form of clean water, and ‘concentrate’ as a dense sludge of contaminant minerals. Pressure is usually required to be around 650-700 pounds per square inch; permeate is typically 65%-75% of the original feed, and concentrate amounts to 25% to 35%. In most general terms, you can predict that concentrate will amount to from 1/4 to 1/3 of the treatment infeed. Although RO appears not to be discussed in the NorthMet submittals, thusfar, that I have seen, this technology must be addressed head-on, because of the sheer volume of ‘concentrate,’ the highly concentrated contaminant load that must be accommodated in the waste disposal strategies of the facility. How concentrated the concentrate actually is, and how much there will be, will obviously be determined by the molecular mass of contaminant chemicals and the rate of flow.	S	O
28494	Unique			WAT	Ivan Weber		2299	7	Fish, amphibians, birds and natural wild rice production systems all stand to be impacted catastrophically by the discharge of RO, or of any other, ‘water treatment’ technologies. RO is by far the most likely, partly due to the alignment of key personnel (i.e., PolyMet’s Mr. Cherry) with not only the Kennecott/Rio Tinto experience, but also with other RO applications at other Rio Tinto mines. But you should not take my word for it: Study these cases deeply and honestly, on your own, and draw your own conclusions. You in northern Minnesota have a future likely to produce far more RO concentrates than you ever thought possible, and you have no place to put this daunting quantity of toxic materials.	S	O
28494	Unique			WAT	Ivan Weber		2300	8	Where could this magnitude of water contamination originate? Pit, industrial process management, and water used in the process would be one ‘zone’ of contamination source. But the more likely sources are in the waste rock and tailings, which are described as being disposed on-site or at site boundaries. The idea that mine management can know when the sulfides are becoming acidic, and respond to modify by adding neutralization compounds, hasn’t worked elsewhere. Why should it work here?	S	O
28494	Unique			WAT	Ivan Weber		2301	9	1. Oxidation of sulfides takes place not just through direct uptake of oxygen, but rather, through the oxidizing effects of bacteria and bacterial films that prefer sulfide minerals. Everyone seems to be aware of iron-oxidizing bacteria, Thiobacillus ferrooxidans, which is an aerobic iron oxidizer. 2. Bacterial species in the genus Desulfovibrio, in the genus Desulfotomaculum are anaerobic sulfate-reducers can actually render selenium to be more toxic to wildlife when deprived of oxygen. The proposed inundation of acid-prone tailings and waste rock can fail, and probably will fail, due to the development of these anaerobic sulfate-reducing communities, such as Desulfovibrio, Desulfotomaculum, or others of the type. “Sub-aqueous disposal” is a bad idea, put bluntly. This is the subject of vigorous debate and investigation, with some very convincing critiques of mines’ discharge into nearby oceans (see Roger Moody’s Into the Unknown Regions: The Hazards of STD” [STD refers to submarine tailings disposal], for example. Nevertheless, like RO ‘treatment,’ it is a fad in the mining industry.	S	N
672	Form Letter	1	Variant	WAT	Jan Kilian		207	2	We cannot afford even a small amount of more water pollution in our state. A large percentage of our lakes are already beyond recovery and PolyMet would threaten those still viable.	NS	X
10	Unique			WAT	Jana Guseynova		18	3	Part of my coursework concerns water sustainability, and the construction of this mine would jeopardize some of the most important water systems in North America, mainly Lake Superior	NS	X
10	Unique			WAT	Jana Guseynova		20	5	Despite the precautions outlined in the FEIS, I'm concerned that the system Polymet has proposed to treat sulfate-latent wastewater is inadequate. Similar wastewater treatment systems were used by every open pit copper-nickel mine ever operated in North America, and each one has polluted.	NS	X
7393	Form Letter	4	Variant	WAT	Jane Beattie		488	3	Which direction will pollution flow?	NS	X
7393	Form Letter	4	Variant	WAT	Jane Beattie		538	5	There is no evaluation of pollution risks using realistic and scientifically supported assumptions concerning how much polluted seepage is likely to be captured and treated both during and after mining operations.	NS	X
7393	Form Letter	4	Variant	WAT	Jane Beattie		539	6	No Clean Water Act Section 404 permit can be issued for the proposed mine because the mine will degrade ground and surface water.	NS	X
6294	Form Letter	1	Variant	WAT	Jane Koschak		463	2	This flawed sulfide-ore copper mine plan, to be located between the Boundary Waters and the Lake Superior watersheds, the first of its kind in Minnesota, risks polluting the headwaters of both iconic places with toxic metals and acid mine drainage for hundreds of years. We all know, that if permitted, this type of mining activity will not stop because based on the geology, mining of the Duluth Complex could extend eventually all the way to the Gunflint Trail.	NS	X
6294	Form Letter	1	Variant	WAT	Jane Koschak		468	7	PolyMet would require treatment of polluted water “indefinitely”. In other words, forever. This is surely a bad plan for Minnesota and one that I adamantly oppose. It is up to you, the decision makers to safeguard human and environmental health.	NS	X
23365	Unique			WAT	Janet Keough		939	2	First and foremost, the Polymet FEIS fails to accurately model water discharge from the tailings basin, some of which will flow north towards the BWCA watershed. Alterations of the Laurentian Divide from nearby taconite mines has changed the flow patterns. Given the forecasts for climate change, with high risk of 100 or more year flooding (aw we saw in 2012), the model needs to include the change in watershed features and more accurately include risk to the Boundary Waters Wilderness for centuries to come. The planned clay-lined trench cannot possibly contain 100% of groundwater seepage (Figure 3.2-28) and cannot be adequately monitored for groundwater flows leading north to the BWCA (p 3-150, Section 3.2.3.3.4). This section of the FEIS is wholly insufficient and incomplete. I recommend that independent modelers be brought in to conduct any new model efforts, and that a panel of experts review any new modeling exercise.	NS	X
27411	Unique			WAT	Jared Yount		1729	4	We need to protect our real resource, the BWCA and surround bodies of water.	NS	X
28471	Form Letter	1	Variant	WAT	Jason Peterson		2251	1	The most common sense argument in my mind is that containment in these types of mines hasn't proven effective. In the time horizon's we're talking about, the risk of failure is very, very high. This is not the place to take these kinds of risks. The known and unknown surface and ground water flows make this too risky in this part of the country.	NS	X

NS	X
29957	Unique			WAT	Jim Pounds		2728	2	Long term survival depends upon having a clear water supply. Do not threaten our existence in order to make a few SOBs even richer than they are now.	NS	X
23917	Form Letter	1	Variant	WAT	Jim Steitz		972	4	The watershed value of the impacted area is far greater than that of the copper or nickel that could be removed. I understand that this mine would be located in the watershed of the St. Louis River, and is hyrdologically connected to the designated Important Bird Areas. The SDEIS does not appear to appreciate the scope or timescale of water quality threats posed by this mine, including the extremely long period after active mining when heavy metal and acid pollution continues to leach during rains. This time could be centuries during which the watersheds of the far north country will likely be of increasing value, long after our descendants have forgotten about the past value of the Polymet mine except for unsightly scars in the landscape.	NS	X
4464	Form Letter	1	Variant	WAT	Jim Togeas		405	1	I oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. I am an emeritus professor of chemistry. The proposed mine will lead to the formation of sulfites and sulfates, which, when mixed with water, produce a mixture of sulfurous and sulfuric acids. If these escape into the environment JUST ONCE, the damage is done. I am supposed to believe that over the course of decades or even centuries there will NEVER be a single event that allows them to escape into the environment. NEVER over such a long period has a probability approaching zero, meaning that the probability of one escape approaches unity. Sound reasoning must be based on probabilities. I conclude that sound reasoning means that you must reject this proposal.	NS	X
24218	Unique			WAT	Jo Ann Morse		1011	1	I'm very concerned about the impact that PolyMet's proposed sulfide mine would have on Minnesota's water. The Final Environmental Impact Statement assumes mechanical water treatment would be required indefinitely at both the Mine Site and Plant Site. I don't think that PolyMet, or any company, can provide sufficient financial and resource assurances for water cleanup that stretches out indefinitely.	NS	X
24333	Unique			WAT	Joanna Schor		1021	2	Furthermore, the Impact Statement is plainly inadequate, as it has not answered basic fundamental questions such as which direction the toxic runoff will flow and the FEIS fails to evaluate pollution risks and impacts using realistic and scientifically supported estimates for toxic seepage and treatment both during and after proposed mining operations.	NS	X
26979	Unique			WAT	Joel Roberts		1505	1	The project design has evolved to a point where it now relies totally on computer modeling. It is now completely differentiated from the design of seepage barriers at existing mines and processing facilities; hence the responses and the FEIS do not include citations of meaningful real-world precedents. Nothing specific is said about how things will be handled if system performance is not up to the stated criteria.	S	O
26979	Unique			WAT	Joel Roberts		1506	4	2. The response to Comment ID 19577 (submitted by the Fond du Lac band) probably is the most relevant to the overall quality of the comment responses. Here is a quote from that response. The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and discharge on the opposite side to reverse hydraulic gradients across the slurry wall and in underlying bedrock. Relatively few containment systems have been built with this degree of pumping and discharge to ensure effective containment. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture. Here are some observations • The source of the discharge on the opposite (presumably, downstream) side of the seepage barrier is not specified. Is it coming from the Waste Water Treatment Facility, or from somewhere else? What is the magnitude of the discharge? It probably would be some hundreds of gallons per minute. • The fact that the proposed system is different from the water containment systems at other mine sites is presented as a basis for claiming (or at least hoping) that the performance will be better. Many of those other systems operate at less than 60% capture efficiency, but it is claimed that the proposed system will operate at better than 90% capture efficiency. While there may be reason to expect some improvement, no tangible reason is presented that would give an impartial observer confidence that such a dramatic improvement actually will happen. Unfortunately, almost everything is based on computer simulations, and very little is cited in the way of actual experience or testing. • The collection pipe is roughly four miles long (two miles along the north side and two miles along the west side), and it is perforated so that water can be collected. Very little is presented about specifications for the pumping system, such as: o How many pumps are used, what is the spacing between them, and what is the power rating? o What (negative) pressure has to be generated in order to achieve the desired hydraulic gradients?	S	O
26979	Unique			WAT	Joel Roberts		1507	5	• Although the Co-Lead Agencies claim improvement in the project design compared with what was reported in the SDEIS, it comes at the price of relying even more heavily on unproven technologies for the control of seepage from the Tailings Basin.	S	O
27798	Form Letter	1	Variant	WAT	John Case		2143	1	I have been following the arguments pro and con re: PolyMet's proposed sulfide mine. The water pollution issues are too great to allow this mine to be permitted. The risks of water contamination are too great in the BWCAW area and the St Louis River watershed.	NS	X
30068	Unique			WAT	John Herbst		2795	4	On p. ES-36 it states: "At the Mine Site, about 10 gallons per minute of untreated water would be released during closure...At the Tailings Basin, about 20 gallons per minute of untreated water would be released during closure." My comment is: This comes out to >70,000 tons of untreated water per year entering the water table/aquifer, due to groundwater seepage and seepage bypassing the groundwater containment system. This still seems quite enormous an amount of leakage of potent mining process contaminants, and I can't see that there's no build-up of certain compounds/elements in the soil which will linger there and not move on for the long-term (500+ years), causing problems down through the years.	NS	X
24347	Unique			WAT	John Kruse		1025	1	The PolyMet or NorthMet mine is not in the best interests of Minnesotans. It is likely to contaminate groundwater in the region, and despoil a precious, irreplaceable resource. Heavy metals and sulfates are likely to be polluting all downstream areas for many many years after the mining is done. There may be ways to lower the likelihood of such pollution, but not to lower it enough. Further, mining operators have time and again cut corners to make a profit. Everybody else suffers the consequences.	NS	X
29844	Unique			WAT	John Lapham		2663	1	According to the EIS Polluted water produced by the mine will need to be actively treated indefinitely - like 500 years.	NS	X
29844	Unique			WAT	John Lapham		2664	2	The tailings basin that PolyMet proposes to use is already leaking into the groundwater.	NS	X

28344	Unique			WAT	john.coleman	GLIFWC	3456	2	the colead agencies appear to claim that the modeling was only for pit inflow and also only for looking at outflow to the south. A model that is only appropriate to predict one preconceived result (flow to the South) is not a predictive model at all but simply a tool to support preconceived notions.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3457	3	The applicant and co-leads have contended since at least 2008 that the extensive wetland soils in the 100 Mile Swamp would render recharge close to zero. In fact, contrary to the statement above, the applicant's hydrologic characterization of the site, which is used in the FEIS, assumes that recharge in the wetland soils is only 0.36 in/year while upland deposits have 1.8 in/yr of recharge (PolyMet 2015m, Attachment B). Given that the 100 Mile Swamp is the most extensive wetland feature in the area, it seems unlikely that the co-leads contention, above, would be correct.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3458	4	The co-leads seem to overlook the fact that the PolyMet east pit inflow is coming from the north side of the project. If the project data was adequate for looking at water movement toward the east pit from the north, it should be adequate to look at flow from the east pit going to the north.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3459	5	As the applicant and the co-lead agencies have contended since before 2008 the vertical conductivities under the 100 Mile swamp are likely to be low because of thick wetland soils. As we demonstrate in our comment letter of December 13th, even with higher conductivities than those previously supported by the co-leads, it is impossible for enough leakage to enter the bedrock in this area to support a bedrock groundwater mound adequate to prevent northward flow.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3460	6	The elevation of the land surface is, among other reasons identified in our December 13th letter, why the hypothetical mound cannot exist. Both Figures 5 and 6 of the co-lead agencies' memo erroneously place the surficial deposits 25-50 feet in the air above the 100 Mile Swamp. Correct elevations for the land surface and bedrock top are shown in attached Figure 2. Analysis based on the bedrock formations, their conductivities, and the elevation of the land surface and bedrock top, does not support the maintenance of an adequate bedrock groundwater mound between the mine projects.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3461	7	The amount of precipitation is largely irrelevant. The amount of the precipitation that can pass through the surficial deposits to the bedrock is relevant. Unfortunately, neither the co-lead agencies nor their consultant looked at how much water could pass through the surficial deposits. Our analysis, documented in our December 13th letter, demonstrates that there would not be enough leakage to create an adequate mound.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3462	8	In fact, MODFLOW modeling by GLIFWC indicates that the full Area003 West pit would mostly negate the effect of the dewatered Area003 East pit. Groundwater level trends in the region are also relevant to interpretation of the 5 bedrock wells. Five relatively stable wells in the context of regionally increasing water levels would require a different interpretation than that presented in the colead agencies' memo. Wells, relatively far from the Area003-East pit, without greater clarity as to the hydrologic effect of one full and one empty taconite pit, and without the context of regional water levels do not tell us very much about the relationship of the Peter-Mitchell taconite pits and the PolyMet site hydrology. Data from these 5 bedrock wells in conjunction with data from other site wells and trends in taconite pit water levels could be formally analyzed to better understand the site hydrology. Unfortunately such analysis was not conducted by the applicant or the co-lead agencies.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3463	9	However, the map (co-lead agency memo Figure 8) of proposed monitoring well locations shows sparsely placed wells all within or very close to the PolyMet project boundary. To be effective, bedrock monitoring wells should be at greater distances from the PolyMet project boundary. In particular, monitoring wells should be placed farther north from the edge of the Type I stockpile. Surficial aquifer containment efforts at the Type 1 stockpile may interfere with interpretation of bedrock well readings at the immediate edge of the Type 1 stockpile.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3464	10	Our modeling suggests that northward flow may be at depth. This is not surprising given that at depth, the PolyMet east pit either comes very close to or intersects the more conductive Biwabik Iron Formation. Monitoring wells that are not placed at the proper depth or do not intersect the formations or features (fractures/faults) that transmit water in the bedrock aquifer will not provide useful information on northward flow. The feasibility of any particular monitoring plan must be evaluated against what is known about the bedrock aquifer and the bedrock formations. Such evaluation has not been done. Without such an evaluation it is doubtful that the proposed monitoring plan would detect relevant hydraulic head in the bedrock.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3465	11	it is very unclear what useful information would be collected by the monitoring plan as proposed by the co-lead agencies or how that information can be translated into knowledge on the existence of a hypothetical mound at closure. There needs to be much greater detail on how the information collected by the monitoring plan would inform decisions on prevention of northward flow.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3466	12	Several adaptive management approaches are proposed to prevent northward flow of contaminants from the Polymet project. Because the approaches are not evaluated in the context of the site hydrology or the site physical character it is impossible to determine if any are feasible.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3467	13	Grouting.- Grouting has potential for reducing flow to the north but does nothing to eliminate the gradient that would move contaminants to the north. The success of grouting depends on the location and extent of the transmissive features on the north side of the PolyMet pits some of which may occur at great depth. Multiple, diffuse features that transmit water to the north from the pit would require a grout curtain to reduce flow. If northward flow is in both the shallow and deep bedrock, as suggested by our water budget analysis, the grout curtain may have to be vertically continuous to the depth of the east pit. A grout curtain of that extent appears impractical. If northward flow is in discrete fractures or faults, locating those features could be problematic, particularly at depth.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3468	14	Pit lake depression.- East pit lake depression to prevent flow to the north creates a plethora of undesirable side effects. Most of those are mentioned in the co-lead agencies' memo. They include: ? Exposure of reactive pit wall rock that would generate acid mine drainage. ? Elimination of, or at least great reduction in, the Type 2 and Type 3 and Type 4 waste rock disposal area. Those types of waste generate contaminated leachate. ? Decrease in west pit lake water quality. ? A need for additional water treatment and disposal, indefinitely.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3469	15	Given that disposal of reactive waste rock in the east pit is integral to the current mine plan, eliminating that possibility by implementing east pit lake depression is tantamount to proposing another mine plan entirely. Such a plan must be evaluated under NEPA.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3470	16	Groundwater extraction or injection wells - As noted in the co-lead agencies' memo, the number, geographic extent and configuration of the wells is unknown. In addition the cost, feasibility and environmental impacts of installation and operation of an unspecified number of wells in the 100 Mile swamp is unknown. If northward flow is diffuse and occurring at depth, the wells would need to be at multiple depths and across the full extent of the north side of the east pit. If the northward flow is primarily fracture driven the injection or extraction wells would need to target the fracture zones, a difficult proposition. Without further analysis, the feasibility of this mitigation is unknowable.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3471	17	Infiltration trench.- The physical constraints of the site make it unlikely that an infiltration trench could create a bedrock mound adequate to prevent northward flow. As with natural recharge in the 100 Mile Swamp (see our letter of December 13th), an infiltration trench would have limited hydraulic head. Only by building a lake in the 100 Mile Swamp could enough head be generated to push enough recharge into the bedrock to create an adequate mound.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3472	18	The co-lead agency memo concludes with identification of a new conceptual model of site hydrology that is contrary to 8 years of statements by the applicant, their consultant and the co-lead agencies. The memo proposes a conceptual model that includes high vertical flow rates through the 100 Mile Swamp into the bedrock. If such a conceptual model was correct, then project impacts to wetlands due to pit dewatering would be substantial, an impact denied by the applicant and the co-lead agencies.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3473	20	The project mine site MODFLOW model distributed to cooperating agencies on January 5, 2015 was used by the applicant to predict that contaminants would flow from the mine site at closure to the south and south-east (for example: Large Figures 28 & 29 of FEIS reference PolyMet 2015m, attached as Figures 3 and 4). In those project runs of closure conditions, the water levels in the P-M taconite pits were assumed to remain at the level found in 1996. At closure the P-M pits will not be at 1996 levels but over 300 feet lower. In fact those 1996 levels were atypical; they did not occur in the 1980s, do not occur now and will not occur at closure. A plot of water levels in the Area 003-East P-M pit, the pit closest to the PolyMet east pit, show how atypical the mid-1990s water levels were (attached as Figure 5). In the project predictive models of closure conditions, the adjacent taconite pits to the PolyMet project site were set to have a 1996 water elevation of 1616 feet or 493 meters. However, the P-M taconite pit water levels expected at P-M pit closure are 1300 feet or 396 meters. After reflooding of the P-M pits, the water levels in those pits will be maintained by an outfall in the north-east at 1500 feet or 457 meters (see figure from Barr Engineering’s Northshore Watershed Mitigation Plan (FEIS reference Barr 2010e), attached as Figure 1).	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3474	21	Given the large effect that the project groundwater MODFLOW model and ERM's MathCad cross-section model indicate the water in the taconite pits has on the local bedrock hydrology, one would expect that a large change in the elevation of the water in the taconite pits would have a significant impact on local hydrology and predictions of closure conditions. The close proximity of the P-M pits to the Partridge River and PolyMet mine features (attached Figure 6) suggests that the taconite mine pits would impact the hydrology of these features. In fact, runs of the project model indicate that the groundwater flow direction between the PolyMet project and the taconite pits would be reversed if the taconite pits had the correct P-M pit closure water elevation of 396 meters or even the very long-term level of 457 meters.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3475	22	Additional MODFLOW modeling with recharge to the top of the surficial layer set at over 8 in/yr also showed northward flow from the PolyMet project at closure. Under this high recharge modeling scenario, a small mound does develop in the bedrock aquifer but one not nearly large enough to prevent northward flow. Development of a groundwater mound is limited, not because of low recharge, but because of the low vertical conductivity of the surficial deposits and the strong pull of the low water levels in the P-M pits.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3476	24	What has not been demonstrated by the co-lead agencies is that the 8 inches per year of leakage into the bedrock is theoretically possible, given the low vertical conductivity of the overlying wetlands. Our analysis reported in our letter of December 13th demonstrates that it is not possible.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3477	25	No natural mechanism for such a mound has been articulated. A bedrock groundwater mound at the level necessary to prevent northward flow, i.e. a mound of elevation of approximately 1600 feet, appears to be hydrologically impossible without long-term active management.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3478	26	Preliminary MODFLOW modeling of the surficial aquifer shows northward flow of contaminants from the PolyMet east pit in the surficial aquifer. This is the case if model recharge is limited to the 0.75 in/yr used in the PolyMets closure model (PFEIS page 5-27) but also if the model is run with more than 8 in/yr of recharge to the surficial aquifer. The drawdown by the over 300 foot deep taconite pits is so great that the surficial aquifer becomes partly dewatered and all baseflow in the upper Partridge ceases.	S	O
28344	Unique			WAT	john.coleman	GLIFWC	3479	27	A coherent conceptual model needs to be articulated, either one in which surface water features are poorly connected to the bedrock aquifer and are therefore, unaffected by pit dewatering, or one in which surface water features are well connected to the bedrock aquifer and can provide leakage to support a groundwater mound between the PolyMet and Peter-Mitchell pits. If the first model is accepted then wetlands and the upper Partridge River may be little affected by pit dewatering but dewatering of the Peter-Mitchell pits causes a bedrock northward flowpath to develop at closure. If the second conceptual model is accepted then a bedrock groundwater mound develops, but wetlands and the upper Partridge River are severely impacted by PolyMet and Peter-Mitchell pit dewatering.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3484	32	? The stated and actual uses for the MODFLOW modeling are documented in our letter of December 14th. Despite the many uses that the MODFLOW results were put to in formulating the FEIS, the co-leads appear to be now claiming that it is only appropriate for evaluating flow to the south. A model that is only appropriate to predict one preconceived result (flow to the south) is not a predictive model at all but simply a tool to support preconceived notions.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3485	33	? If the project data was adequate for modeling water movement to the east pit from the north, it should also be adequate to look at flow to the north from the east pit.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3486	34	? The applicant and the co-lead agencies have contended since before 2008, that the vertical conductivities under the 100 Mile swamp are likely to be low because of thick wetland soils. Even with higher conductivities than those previously supported by the co-leads, it is impossible for enough leakage to enter the bedrock to support a bedrock groundwater mound adequate to prevent northward flow	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3487	35	? Bedrock wells, relatively far from the Area003-East pit, without greater clarity as to the hydrologic effect of one full and one empty taconite pit, and without the context of regional water levels do not tell us very much about the relationship of the Peter-Mitchell taconite pits and the PolyMet site hydrology. ?	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3488	36	The feasibility of any particular monitoring plan must be evaluated against what is known about the bedrock aquifer and the bedrock formations. Such evaluation has not been done. Without such an evaluation it is doubtful that the proposed monitoring plan would detect relevant hydraulic head in the bedrock. At this point it is very unclear what useful information would be collected by the monitoring plan as proposed by the co-lead agencies or how that information can be translated into knowledge on the existence of a hypothetical mound at closure.	S	N

28344	Unique			WAT	john.coleman	GLIFWC	3489	37	Given that analysis based on the bedrock formations, their conductivities, and the elevation of the land surface and bedrock top does not support the maintenance of a bedrock groundwater mound adequate to prevent northward flow, a monitoring and adaptive management approach is not appropriate.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3490	38	The success of grouting as a mitigation approach depends on the location and extent of the transmissive features on the north side of the PolyMet pits, some of which may occur at great depth. Given that northward flow may occur at great depth, grouting to stop northward flow does not appear to be feasible.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3491	39	Given that disposal of reactive waste rock in the east pit is integral to the current mine plan, eliminating that possibility by implementing east pit lake depression is tantamount to proposing another mine plan entirely. Such a plan must be evaluated under NEPA.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3492	40	If the northward flow is primarily fracture driven or at great depth the effective installation of injection or extraction wells would be a difficult if not unworkable proposition.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3493	41	The physical constraints of the site make it unlikely that an infiltration trench could create a bedrock mound adequate to prevent northward flow. As with natural recharge in the 100 Mile Swamp (see our letter of December 13th), an infiltration trench would have limited hydraulic head and would not be able to create a northward flow-stopping bedrock groundwater mound.	S	N

² Response ID - the table for reference is on the tab "Codes, Terms and Definitions"

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
28344	Unique			WAT	john.coleman	GLIFWC	3494	42	The results of modeling with the correct closure water elevations indicate that water in bedrock will flow to the north from the PolyMet site at closure. No natural mechanism for such a mound has been articulated. A bedrock groundwater mound at the level necessary to prevent northward flow, appears to be hydrologically impossible without long-term active mitigation. The proposed mitigation approaches do not appear to be feasible or practical.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3495	43	In addition to potential for northward flow of contaminants in the bedrock, there is evidence that flow to the north may occur in the surficial aquifer at closure.	S	O
28344	Unique			WAT	john.coleman	GLIFWC	3496	44	Because of more highly conductive bedrock to the north, the scale of flow from the PolyMet pits when the P-M pits are set at their correct closure levels appears to be approximately an order of magnitude greater that the quantity of flow previously considered in FEIS contaminant transport to the south.	S	N
28344	Unique			WAT	john.coleman	GLIFWC	3497	45	A coherent conceptual model needs to be articulated, either the one previously supported by the co-leads in which surface water features are poorly connected to the bedrock aquifer and are therefore, unaffected by pit dewatering, or one in which surface water features are well connected to the bedrock aquifer and can provide abundant leakage to support a groundwater mound between the PolyMet and Peter-Mitchell pits. If the first model is accepted then wetlands and the upper Partridge River may be little affected by pit dewatering but dewatering of the Peter-Mitchell pits causes a bedrock northward flowpath to develop at closure. If the second conceptual model is accepted then a bedrock groundwater mound develops, but wetlands and the upper Partridge River are severely impacted by PolyMet and Peter-Mitchell pit dewatering.	S	N

28739	Form Letter	1	Variant	WAT	Jon Ridge		2338	3	The Prospecting Draft EIS relies on insufficient analysis of water quality impacts, water consumption, and other critical issues.	NS	X
7482	Unique			WAT	Joseph Heegaard		548	2	My main concern is water contamination, especially groundwater, that could pollute the watershed which would have catastrophic implications for humans and wildlife. Based on past sulfide mining projects,the risk of groundwater contamination is to great and will eventually cost our public more than the supposed economic benefits. In the process of trying to confine that waste water, treat it, and return it, there are too many opportunities for error and past sulfide mining projects have not been able to do so effectively.	NS	X
7482	Unique			WAT	Joseph Heegaard		549	3	n chapter 5 under "Contaminant Transport in Groundwater from Waste Rock," there is a claim that "over time the concentration of contaminants leaking from the sources would decrease, as the sources would gradually degrade, diminishing in strength. Those, and other processes would result in contaminant concentrations decreasing with time and distance from the source." It is hard for me to believe this project can be done safely when there is acknowledgement of the contaminants being leaked. Despite contaminants being purportedly diminished and degraded as they leak away from the source, the contaminants have still entered the environment, many of them heavy metals, that will not break down for hundreds of years. These contaminants will accumulate in the environment, threatening our precious water sources, our fragile ecosystems, and our socioeconomic well being.	NS	X
29083	Unique			WAT	Josh Gregorich		2415	3	What do the people of Minnesota and the rest of the United States have to lose if any engineering control fails? This is a risk too great and the stakes too high. This risk is not only the surrounding and nearby ecosystem and people who reside there, but also the greatest fresh water lake in the world; Lake Superior.	NS	X
29984	Unique			WAT	Josh Gregorich		2760	6	What do the people of Minnesota and the rest of the United States have to lose if any engineering control fails? This is a risk too great and the stakes too high. This risk is not only the surrounding and nearby ecosystem and people who reside there, but also the greatest fresh water lake in the world; Lake Superior. Again, for the sake of Minnesota's future, please do not be one of Minnesota's government agencies that allow activities in the Polymet/Northmet project to commence.	NS	X
28803	Unique			WAT	Julie Viken		2352	1	The Polymet Mine will drain into the St Louis River which drains into Lake Superior. Lake Superior is the water source for many residents who live in MN, WI, MI and Canada. This water cannot be polluted with sulfide runoff.	NS	X
28803	Unique			WAT	Julie Viken		2353	2	The pollution of the river in CO this past summer is a wide awakening of what kind of issues our precious clean waters of northern MN will turn into after sulfide mining is permitted.	NS	X
28803	Unique			WAT	Julie Viken		2354	3	We have not had this kind of mining in MN but we are also one of the only states in the US to have a national treasure of wilderness area in the BWCAW. MN is the land of 10000 Lakes and we don't want to have them polluted so badly fish won't live in them any more, people cannot drink from their water anymore.	NS	X
28803	Unique			WAT	Julie Viken		2355	4	This is going to affect generations of Minnesotans and anyone who lives near Lake Superior. This doesn't make sense now or ever in MN. Keep our waters pure! That is the job of the DNR.	NS	X
467	Unique			WAT	K Tharaldson		221	1	I would like to request as a member of the public and a taxpayer that you have a completely independent analysis of the groundwater movement at the mine and contaminants the mine will produce. Much of this "analysis" in the FEIS is done by BARR Engineering. Though theyare reputable, they stand to benefit greatly from this project and even though no contracts have been drawn- they have a relationship with Polymet. This type of mine pollutes, there is no question about that. We need to make sure that our land of 10,000 lakes stays as great as it is for future generations- it is our responsibility. There are taconite mine pits near the proposed Polymet site and this needs to be taken into account. It is irresponsible of the DNR to utilize a company that has an existing relationship with the mining company to do unbiased analysis. The responsible thing to do- and the honest thing to do- is have someone unrelated to the project assess everything- including the surrounding taconite pits and how they affect the movement of water and will affect the movement of what we know will be contaminants leaving the mine.	NS	X
26225	Unique			WAT	Kaitlin Seiberlich		1286	3	The FEIS seems to be ignoring the fact that they are constructing an open-pit mine near several large bodies of water, all of which lead to even larger ecosystems. At the very least, the mine itself is located almost on the Partridge River, which then continues onto Lake Superior after merging with the St. Louis River. The plant site is located on the banks of the Embarrass River, which follows the same path. If any pollution were to enter the waters, this pollution would not simply remain in the same place. Instead, clean-up crews would have to pursue the pollution all the way into the Great Lakes, a task that would cost millions of tax-payer dollars.	NS	X
26225	Unique			WAT	Kaitlin Seiberlich		1288	5	Polluted water could also flow north into the Boundary Waters Canoe Area Wilderness (hereafter referred to as BWCAW) through groundwater or through other rivers or drainages. Because the waters there have no existing baseline of sulfide levels or other chemicals, there is currently no way to prove that the mine could be the reason for the theoretical pollution. No matter how perfect a scenario laid out on paper seems, there will always be room for unintended consequences. Pollution of the BWCAW, an unintended consequence, would not just disrupt social development in parts of Northern Minnesota, it would also disrupt economic development.	NS	X
26225	Unique			WAT	Kaitlin Seiberlich		1289	6	The second issue identified in the FEIS is the use of existing infrastructure. The existing tailings basin that would be repurposed for this project is currently unlined and has a history of seepage. Even if the basin were to be restructured and updated for the current purpose, there is some 10% of the wastewater that is assumed to leak and make its way into surface- and ground-water. This is not taking into effect all the pollutants that would be washed into other sources with rain and snowmelt over the course of the 20 year mine longevity. That 10% of the leaked wastewater, laden with sulfides and other pollutants, would be more than enough to have ill effects on the ecosystems surrounding the plant.	NS	X
26225	Unique			WAT	Kaitlin Seiberlich		1290	7	Water treatment is another major issue with the PolyMet mine, one that is not adequately discussed in the FEIS. While PolyMet agrees that it will treat water for as long as is necessary, the fact remains that historically, many mining companies have not followed through on that promise. Many times, the mining companies will stay until they have all the resources they need, make an attempt at cleaning up, then pull out of the area after declaring it "satisfactory." In most cases, their attempts at cleaning up are simply backfilling the mine with waste rock, a far cry from the wilderness area they originally dug into. Even if PolyMet were to restore the area to as pristine a condition as possible, they would still end up treating polluted water for decades, if not centuries after the mine and plant both closed down. While this would allow for continued jobs, it would also present the problem of a continued point source of pollution for as long as the water existed. This would prevent the restoration of the mine to its previous pristine conditions.	NS	X
27736	Form Letter	1	Variant	WAT	Karen Eckman		2128	2	Clean, fresh water is essential for all living things. We cannot live without it. It is a finite resource. We can live without copper and nickel and even jobs and profits but we cannot live without water. The risks to our waters are too great.	NS	X
30097	Form Letter	1	Variant	WAT	Karen Graham		2811	2	This report and it's recommendations continue the deep denial about the critical conditions of our lakes and the responsibility our officials and citizens share in their demise. Maintaining fresh water should have higher importance to our state than other considerations on the agenda. Our abundance of water has led to gross neglect of maintaining this essential resource. Frequent headlines in the news lead with issues of water poisoned due to runoff from mining, farming, development, yard maintenance.	NS	X
30109	Form Letter	9	Variant	WAT	Karen Graham		2828	5	We are exchanging our health, our safety, our precious water, our forests and marshes for 20 years of mining operation.	NS	X
30109	Form Letter	9	Variant	WAT	Karen Graham		2830	7	Maintaining fresh water should have higher importance to our state than other considerations on the agenda. Our abundance of water has led to gross neglect of maintaining this essential resource. Frequent headlines in the news lead with issues of water poisoned due to runoff from mining, farming, development, yard maintenance. Not to mention the mercury contamination due to drift from burning coal for power.	NS	X
29982	Unique			WAT	Karen Katz		4307	3	Climate change is expected to affect Minnesota severely. Situated at the intersection of three major biomes, our state will be subject to significant changes in climate – affecting our precipitation and temperatures – which will put large amounts of stress on our ecosystems. Plants and wildlife will not be able to handle additional pressure from mining pollution and habitat disruption as they face the challenge of quickly adapting to a new climate. Additionally, increased chances of extreme weather, including large precipitation events, blowdowns, and forest fires that are expected with climate change in Minnesota will increase the chances of damage to the proposed PolyMet mine and threaten the capability of any wastewater holdings tanks to contain pollution. The flow of groundwater and surface water could easily change as climate change puts pressure on natural and human systems, which means that any decision based on water flows is insufficient data in the FEIS. Our climate has been changing and is going to continue to change significantly over the next 100 years, and I do not think the Final EIS for PolyMet sufficiently addresses how PolyMet will operate responsibly under those changing conditions.	S	O
29809	Unique			WAT	Karen Williams		2642	7	The FEIS does not evaluate the impact of polluted seepage north of the mine site on the 100 Mile Swamp, the Rainy River basin, and the Boundary Waters. Water modeling data conflict, and these assumptions have not been independently verified.	NS	X
29514	Unique			WAT	Kathleen Miller		2537	2	2. No modeling for climate change: we have seen how unpredictable the weather is. The drastic changes in precipitation either excessive rain fall, snow or drought will challenge the modeling estimates for the impact of the tailing pond capacity to hold contaminants indefinitely. Water flow cannot be predicted with 100% accuracy as we do not know precisely how ground water moves.	S	O
29514	Unique			WAT	Kathleen Miller		2538	3	The use of industrial drilling techniques put the bedrock at risk for creating fissure for water to escape.	NS	X
29514	Unique			WAT	Kathleen Miller		2540	5	4. Water quality testing: Furthermore, the water testing should be conducted by an outside agency and not the mining company itself.	NS	X
29514	Unique			WAT	Kathleen Miller		2544	10	I would hope that you would defer this project and ask the following if it is to be considered in the future: 1. Utilize the 'proven' water quality treatment methods today to improve Minnesota's waters (since you have polluted them already).	NS	X
18	Unique			WAT	Kathy Klietz		55	2	I request you look more closely at the water flow charts put together by the Ojibwe tribes.	NS	X
32	Unique			WAT	KatieWilli@aol.com		95	3	As one who treasures the BWCA and visits there every year, I am concerned that this mine would negatively impact water quality there and pollute our national treasure.	NS	X

23323	Unique			WAT	Kayla Wagner		927	1	I am a concerned citizen of Minnesota. Why would anyone want to risk mining next to the Boundary Waters, who is home to multiple different species and types of wildlife? Thousands of people come to the Boundary Waters to get away from the noise of cities and enjoy the serenity of nature. I have been there both in the summer and winter and cannot wait until the next time I can go back. With Polymet's nonexistent history with mining coupled with Glencore's history of destroying the environment, this proposal should not be passed. If one thing goes wrong, the entire 1,000 miles of Boundary Waters will be forever destroyed. It is time to look past the money and business side of things and begin to think about our planet. We are destroying land extremely fast and it is predicted that 50% of all species will be extinct in less than 50 years or so. You should watch the documentary Racing Extinction. Please stop this project and finally be a business who values something more than greed and money. The Earth won't be habitable forever at the rate we are going. So stop the mining and SAVE THE BOUNDARY WATERS.	NS	X
27142	Unique			WAT	Ken Gilbertson		1667	2	Water quality, loss of wetlands, threats to wildlife, and the introduction of heavy metals and sulfuric acid into the environment are simply not acceptable options. Our state waters and natural resources are far too valuable - beyond any value the mine might bring - to take this risk.	NS	X
26854	Unique			WAT	Kenneth Swanson		1474	2	Hoyt lakes Mn is in the middle of three different water sheds north to Hudson's bay east and south to lake superior and west to Mississippi all three are some of the most important water sheds in the continent and no body seems to care. The partridge river just miles from poly met has been leaking since the 70's and no one has figured out how to stop it yet.	NS	X
29193	Unique			WAT	Kevin Heaslip		2439	2	Water is a vital resource, and the high quality water in the Rainy River watershed and Lake Superior watershed is even more valuable than copper, nickel and other metals. Sulfide mining has never been safely done. The proposed PolyMet mine would expose a massive amount of tailings and waste rock to the elements. Acid mine drainage and heavy metal pollution will have to be monitored for centuries. Risking high quality water for short-term economic gain is a poor trade.	NS	X
29193	Unique			WAT	Kevin Heaslip		2443	6	The FEIS does not speak to the degradation and loss of water resources. Allowing high quality water to be degraded is not in the public's interest.	NS	X
379	Unique			WAT	Kevin Kramer		185	4	How long before their waste leaks into our drinking water? Who cares which way the waste water drifts? Whether it drifts towards the Boundary Waters Wilderness or whether it drifts towards Lake Superior. Either way is an environmental tragedy.	NS	X
425	Unique			WAT	Krishna Woerheide		200	3	I urge you to truly consider the science, and the current world wide water issues. We cannot afford to poison our fresh water. And don't listen to the DNR officials - sulfides do not become sulfates and then turn into hydrochloric acid.	NS	X
29850	Form Letter	1	Variant	WAT	Kyle Lind		2672	5	Poly Met's mine plan and the lead agencies Environmental Impact Statement is based on faulty water flow data. It openly admits that water treatment of the waste rock piles will be necessary on an indefinite basis, 100's of years. TELL ME, HOW MUCH IS THE ELECTRICITY TO TREAT THIS WATER GOING TO COST IN 100 YEARS, 200 YEARS, 500 YEARS, LONG AFTER POLY MET IS OUT OF THE PICTURE? IS THE COPPER FROM THIS MINE GOING TO BE USED TO CREATE THE "GREEN ENERGY" NECESSARY TO TREAT THIS SITE 500 YEARS FROM NOW? IF SO WHY EVEN EXTRACT IT? USING THIS COPPER OR ANY OTHER COPPER EXTRACTED IN THIS WAY, TO TREAT TOXIC WASTE ROCK PILES CREATED GETTING THE COPPER KIND OF DEFEATS THE ALTRUISTIC PURPOSE OF EXTRACTING IT TO CREATE GREEN ENERGY, RIGHT? This mine's only purpose is to generate profits and coincidentally a few local jobs by robbing the public blind.	NS	X
29850	Form Letter	1	Variant	WAT	Kyle Lind		2673	6	THE POLY MET NORTH MET PROJECT IF ALLOWED TO GO FORWARD AS CURRENTLY DRAFTED IS GOING TO BE AN ENVIRONMENTAL DISASTER AND A DRAG ON THE STATES ECONOMY FOR HUNDREDS IF NOT THOUSANDS OF YEARS. This FEIS's adaptive mitigation strategies for stopping the very likely scenario that polluted water from the waste rock piles will flow down hill to the north and the BWCAW ecosystem are a joke at best (again the water flow data is all wrong, and the water table is going change significantly when a mine pit lake to the north is drained in the coming years). The problems with this FEIS are glaring, the most important fundamental parameters for determining ground water flow on the Poly Met site are incorrect, AND MOST ALARMINGLY THERE IS NO WAY OF CLOSING THIS MINE DOWN. LONG AFTER THE MINE CEASES TO PRODUCE COPPER AND NICKEL AND FALSE PROFITS (VIA EXTERNALIZED COSTS PASSED ON TO MINNESOTAN TAX PAYERS) MINNESOTANS WILL BE PAYING FOR THE ENVIRONMENTAL AND HEALTH EFFECTS OF THIS MINE. Not to mention the lost potential of sustainable jobs and resources forever lost to 20 years of irresponsible resource extraction that primarily benefits multi-national big wigs and shareholders.	NS	X
29850	Form Letter	1	Variant	WAT	Kyle Lind		2677	8	There are known safer alternatives for operating this type of mine and Poly Met chose not to use this alternatives because Poly Met does not care about Minnesotans, Iron Rangers, or our environment. Poly Met has taken shortcuts at every step of the process to making this mine a reality. For example, despite numerous warnings from scientists and hydrologists representing the Lake Superior Chippewa that the stream flow and ground water flow data that Poly Met officials were gathering was an incorrect picture of reality due to extended drought and associated drastically reduced water flow Poly Met and the Lead Agencies used this uncharacteristic water flow data anyway. Later on when the Tribes hydrologists were proven right, the lead agencies and Poly Met Officials claimed it did not matter, as they could take adaptive mitigations strategies like filling cracks in rocks to deal with any unanticipated flow of polluted water from the mine, and waste rock sites. These adaptive mitigation strategies are not an adequate response to faulty data, and SHORTCUTS LIKE THESE WILL ENSURE THAT THE POLY MET NORTH MET MINE AS CURRENTLY DRAFTED WILL BE AN ABYSMAL FAILURE. THE COST OF WHICH WILL NOT ONLY LEAVE MINNESOTANS WITH HUGE ENVIRONMENTAL AND HEALTH RELATED CLEAN UP COSTS, BUT WILL ALSO TARNISH THE FUTURE OF HARD ROCK SULFIDE, COPPER NICKEL MINING IN MINNESOTA.	NS	X
29421	Form Letter	1	Variant	WAT	Laura Berglund		2531	1	The risk to Minnesota water quality and human health just isn't worth the short-term financial gain.	NS	X
29898	Unique			WAT	Laura Carrero		2693	1	I understand that the waste produced by this project will be in the ground for 500 years. Given that is such a long time period, I am not convinced that Polymet can guarantee that absolutely no hazardous waste will seep into the BWCA.	NS	X
29898	Unique			WAT	Laura Carrero		2694	2	I have read that the nearby water level measurements used by Polymet in its study were wrong and, had accurate data been employed, the results would have showed a possibility of waste water flowing into the BWCA.	NS	X
				WAT	Laura Gauger		3257-1	3	On August 11, 2015, the Great Lakes Indian Fish and Wildlife Commission (GLIFWC; the "Commission"), in coordination with its member tribes, submitted a report into the public record entitled "Comments on PolyMet mine site contaminant northward flowpath and groundwater model calibration." The Fond du Lac Band of Lake Superior Ojibwe, a formal cooperating agency in the EIS process, is a member tribe of GLIFWC. The cited report was addressed to the co-lead agencies working on the PolyMet EIS. The Commission's report stated the following with regard to groundwater flow at the PolyMet mine site: "Detailed (MODFLOW) and simplistic (MathCad) models predict that a northward contaminant flowpath is probable under likely closure conditions." As the report explains, the northward flow is expected because of a "strong bedrock gradient" toward the existing Northshore Peter-Mitchell taconite mine pits located about a mile north of the PolyMet mine site. According to the FEIS, "Predicted ultimate outflow from the [Peter Mitchell pit] would be from the northeast end of the pit, to the Dunka River in the Rainy River watershed." The Rainy River system flows through the Boundary Waters Canoe Area Wilderness (BWCAW) and into Canada. The Commission's report goes on to state: "In addition to potential for northward flow of contaminants in the bedrock ... there is evidence that flow may be to the north in the surficial aquifer," again related to the proximity of the mine site to the Peter-Mitchell pits. "The drawdown by the over 300 foot deep taconite pits is so great that the surficial aquifer becomes partly dewatered and all baseflow in the upper Partridge [River] ceases." The Commission's report conflicts with conclusions drawn by PolyMet consultant Barr Engineering, who had used the same MODFLOW computer program but predicted exclusive southward flow of contaminated waters from the NorthMet mine site to the Partridge River (a tributary of the St. Louis River in the Lake Superior watershed). As the Commission explains, Barr "incorrectly bounded and calibrated" the mine site MODFLOW model, rendering it "unlikely to generate accurate predictions." In other words: Garbage In = Garbage Out. When Barr's mistakes were corrected by GLIFWC staff, the MODFLOW computer program indicated that, at closure, "contaminants are likely to flow north in addition to the southward direction currently assumed by project reports." As stated in Mazina'igan (a publication of GLIFWC), there is concern that "with such a major flaw in [PolyMet's] evaluation of the groundwater system, accurate predictions to impacts on natural resources are impossible."

				WAT	Laura Gauger		3257-2	3	Still, for some reason the conclusions drawn by Barr Engineering with regard to exclusive southward flow of contaminated waters from the NorthMet mine site have been and continue to be relied upon by state and federal agencies charged with preparing the PolyMet EIS. Indeed, the FEIS shows little change from the PFEIS or earlier drafts in terms of its focus on the southward flowpath at the mine site. Nor is there any acknowledgement in the FEIS of the errors made by Barr in running the computer model (even though GLIFWC’s findings were issued months before the November 2015 release of the FEIS). A careful review of the FEIS reveals that, instead of incorporating the Commission’s findings into the FEIS and instituting a rigorous review of impacts likely to occur from the probable northward flow of contaminated waters from the mine site, the following new sentence was added to the EIS that, in effect, actually defends Barr’s flawed modeling: “The GoldSim model does not consider a northward flowpath north of the Mine Site facilities as there [is] uncertainty that such a flowpath would ever exist” (FEIS, p. 5-63). This makes no sense at all, based on how the co-lead agencies handled the evaluation of environmental impacts earlier in the EIS process. When Barr originally predicted a probable southward flow of contaminated waters from the PolyMet mine site, that indeed is what drove the ensuing impact analysis, an analysis that resulted in hundreds of pages of the PFEIS and earlier drafts being devoted to an examination of likely environmental impacts from the modeled southward flowpath. Now we have credible evidence that Barr’s computer modeling was flawed and that a northward flowpath is probable (using the very same computer program utilized by Barr, but this time correctly bounded and calibrated). But instead of including a rigorous assessment of potential impacts along the northward flowpath (as the co-lead agencies had required earlier for the then-deemed probable southward flowpath), the FEIS continues to lean on the earlier flawed analysis done by Barr and has devoted a mere 4 pages (FEIS, pp. 5-240 to 5-244) to a bare-bones discussion of what would appear to be a rather complicated and costly system of “contingency mitigation measures” that perhaps could be implemented in response to a northward flowpath. The northward flowpath, now that it has been shown to be probable by the very same computer modeling program relied upon by Barr, must receive the same rigorous evaluation required by the co-lead agencies of the southward flowpath (which we now know to be flawed).		
27688	Unique			WAT	Laura Gauger		3257-3	3	That means the same kinds of analyses set forth earlier to evaluate environmental impacts along the southward flowpath must now be applied to the northward flowpath. Anything less would make a mockery of the EIS process and all of those earlier decisions made by the co-lead agencies when trying to insure adequacy in the EIS process. It’s not the State of Minnesota’s fault, the federal government’s fault, the Tribes’ fault or the public’s fault that Barr Engineering got it wrong or that PolyMet has spent the last 10 years or so providing the co-lead agencies with what we now know to be flawed information. Yet, the co-lead agencies, for whatever reason, have not required PolyMet to reconstruct its impact analysis so that the FEIS might be reflective of true site conditions. For this reason alone, the FEIS must be considered inadequate. As stated in the Commission’s report, “Evaluation of contaminant flow to the north must be conducted and impacts predicted.” What’s more, even though the corrected MODFLOW model shows the northward flowpath is probable, the FEIS states that the “contingency mitigation measures” identified for dealing with the flow of contaminated water northward will not be initially included in the financial assurance package (FEIS, p. 5-239). Again, this makes no sense at all in that it undercuts the whole idea behind financial assurance: to provide guaranteed funding for dealing with probable impacts. The State of Minnesota must not be left holding the bag for mitigation measures designed to deal with the probable northward flow of contaminated waters from the PolyMet mine site. The FEIS must be updated to not only provide greater detail regarding what those measures will be, but to require that they be initially included in the financial assurance package. Anything less would deem the FEIS to be not only inadequate, but negligent.	S	N
27688	Unique			WAT	Laura Gauger		3261	8	The FEIS characterizes the planned subaqueous disposal of waste rock at the PolyMet mine site as “the preferred method of disposal for the more reactive waste rock” (page ES-23). Sulfide-containing waste rock will be back-filled into the unlined east mine pit, lime will be added in an effort to control acid generation, and water will then resaturate the waste. At first glance, you might think there would be nothing to worry about with regard to the backfill plan. After all, the “preferred method” of handling the waste is being implemented. But using the “preferred” method of waste disposal does not necessarily mean it will be effective in minimizing groundwater contamination. Take the example of the Flambeau Mine, where subaqueous disposal with limestone amendment was utilized as the preferred method of waste disposal. Specifically, the Flambeau mine pit was backfilled with roughly 9 million tons of sulfide containing waste rock, over 30,000 tons of limestone was added to the portion of the waste with the highest sulfide content, and groundwater was then allowed to resaturate the backfilled materials. Preferred method of disposal? Yes. Effective at controlling groundwater pollution? No. Groundwater monitoring within the backfilled Flambeau pit has shown and continues to show failure of the subaqueous disposal technique to control metals leaching. For example, computer modeling done by Flambeau consultant Foth Infrastructure and Environment of Green Bay, Wisconsin (also a PolyMet consultant) predicted a maximum manganese level of about 550 mcg/l in the groundwater within the backfilled Flambeau pit. But now that the real data has started to come in, levels as high as 42,000 mcg/l have been reported – 76 times higher than Foth predicted. The public needs (and deserves) to know that PolyMet’s “preferred method” of waste disposal does not necessarily equate with it being effective at controlling groundwater pollution. The absence of this information in the FEIS renders it inadequate.	S	N

27688	Unique			WAT	Laura Gauger		3262	9	The PolyMet FEIS depends heavily on computer modeling for predicting levels of contaminants in the groundwater at the project site, but the FEIS fails to deal with the fact that this type of modeling has limitations in terms of its accuracy. As alluded to above, computer modeling for the Flambeau Mine supplied by Foth Infrastructure & Environment (also a PolyMet consultant) has proven to be very inaccurate in terms of predicting maximum levels of contaminants in the groundwater within the backfilled Flambeau pit. Here are the numbers: Contaminant Foth Prediction Max Reported Level, to date, now that real data has started to come in Manganese 550 mcg/l 42,000 mcg/l (76 times higher than Foth predicted) Iron 320 mcg/l 15,000 mcg/l (47 times higher than Foth predicted) Copper 14 mcg/l 810 mcg/l (58 times higher than Foth predicted) Sulfate 1,100 mg/l 2,400 mg/l (2 times higher than Foth predicted) The above data has also been graphed (see Appendix B of the Flambeau – v – PolyMet report). It’s an error of omission for the PolyMet FEIS not to have included: (1) a discussion of how computer modeling can sometimes prove to be inaccurate; or (2) provisions for dealing with potential inaccuracies in the computer modeling offered in the PolyMet FEIS. The public needs (and deserves) to have this information in order to decide how much confidence to place in PolyMet’s modeling. The absence of this information renders the FEIS inadequate.	S	O
27688	Unique			WAT	Laura Gauger		3264	11	Case in point: The FEIS does not offer baseline water quality data for Second Creek (a tributary of the Partridge River) even though it states that “groundwater in some portions of the [existing LTV] Tailings Basin flows to the south to form the headwaters of Second Creek” and that the creek “could be notably affected by the NorthMet Project.”	S	N
27688	Unique			WAT	Laura Gauger		3266	14	Even though the hydromet residue basin at the PolyMet plant site will exist in perpetuity and contain some of the nastiest waste products generated by the mine operation, the FEIS states: “It is assumed for purposes of the FEIS that the leakage from this [lined] facility into underlying groundwater or adjacent surface water would be negligible and therefore is not further evaluated.” That’s a big assumption to make, and the FEIS does not provide detailed justification for so doing. Even if the liner beneath the hydromet residue basin remained intact for several hundred years, that doesn’t give PolyMet the right to create a future mess that others may have to deal with several hundred years from now. The public needs (and deserves) to know more about this critical “assumption” made in the FEIS, and modeling needs to be provided for what would happen if the assumption of “negligible leakage” turns out to be wrong.	S	O
27688	Unique			WAT	Laura Gauger		3267	15	The section of the FEIS entitled “NorthMet Project Detailed Description,” includes no plans for installing a groundwater capture system around the 207-acre unlined east/central pit (unlike plans clearly outlined in the FEIS for installing capture systems around the 526-acre Category 1 waste rock stockpile and a portion of the 1,325-acre tailings dump). Still, the FEIS states: “During reclamation (year 21-40), ‘water from the East Pit would ... be pumped to the WWTF [Waste Water Treatment Facility] and treated ...’ after which treatment of water in East Pit Backfill may continue into closure and long-term maintenance.” Since the NorthMet plan does not include provisions for installing a groundwater capture system around the unlined mine pit, it is unclear from the limited information in the FEIS how the contaminated pore water will be captured so that it can be treated. Nor is there any indication of how efficient the employed system might be in capturing pore water from a mine feature as large as the unlined pit (207 acres in size, extending up to 700 feet beneath the surface and containing roughly 140 million tons of waste rock). Cleaning up the contaminated water within the backfilled PolyMet mine pit would indeed be a mammoth undertaking. Yet the FEIS provides no real detail for how it might be accomplished (or how it will be handled in terms of the financial assurance package). The public needs (and deserves) to have this information in order to truly assess impacts from the PolyMet project.	S	N
27688	Unique			WAT	Laura Gauger		3269	13	Questions have been raised regarding PolyMet’s goal of eventually transitioning from mechanical to non-mechanical water treatment. As stated in comments from the Minnesota Department of Natural Resources (Section of Fisheries): “The overview of the transitional approach from mechanical to non-mechanical treatment technologies as presented is highly speculative, particularly in terms of success in development of and timing of installation of a successful system.” (Extended comments on NorthMet PFEIS, Minnesota Department of Natural Resources – Section of Fisheries, Comments 4 and 5, 2015). The Department itself, therefore, has exposed the inadequacy of the FEIS to address all issues of importance. Another consideration is that non-mechanical water treatment methods (biofilter and infiltration basin systems) have proven ineffective at the Flambeau Mine site in treating contaminated stormwater runoff. For example, in 1998 (after the Flambeau pit was backfilled), runoff from the southeast corner of the mine site was directed to a man-made biofilter/detention basin in efforts to “clarify collected runoff ” and “improve water quality.” Soil sampling in this particular corner of the mine site, where the ore crusher, high-sulfur waste rock stockpile and rail spur were located during operations, has demonstrated elevated levels of copper that appear to correlate with high levels of copper in runoff. Prior to 2012, the biofilter discharge was directed to a small tributary of the Flambeau River known as Stream C, declared navigable at the time of the mine permit hearing in 1990. Despite non-mechanical treatment of the runoff, however, the discharge consistently contained copper levels exceeding the toxicity standard set to protect fish and other aquatic species (the toxicity standard for copper, adjusted for hardness conditions at Flambeau, is about 3-5 ppb). Environmental monitoring reports show that at times the copper levels in the water exiting the biofilter (e.g., 42 ppb in Sep 2011) were actually higher than the levels measured in the runoff entering the biofilter for treatment (e.g., 17 ppb in Sep 2011), the exact opposite of the desired effect. In 2010 the Wisconsin DNR initiated a study to assess the health of Stream-C and later issued a report in which the Department concluded, “Water quality monitoring done at the site between 2002 and 2011 showed that Stream C and its contributing drainageways contained copper and zinc concentrations that frequently exceeded acute toxicity criteria (ATC). On average, copper exceeded ATC’s in 92% of samples, and zinc exceeded ATC’s in 46% of samples.” Upon recommendation of the Wisconsin DNR, Stream C was added to the EPA’s Section 303(d) Clean Water Act list of “impaired waters,” effective April 2012, for copper and zinc toxicity linked to the Flambeau Mine operation. In early 2012 the owner of the Flambeau Mine converted the biofilter to an infiltration basin (another form of nonmechanical treatment), but this option, too, was a failure. Instead of water percolating downward into the earth with the desired effect of contaminant attenuation, the basin and a second one constructed at the Flambeau site tended to fill to capacity and nearly overtop each year with the Spring melt. As noted by the Wisconsin DNR in an email sent to Foth (the Flambeau consultant responsible for designing the infiltration basins), “we clearly cannot continue responding frantically every spring when the North and East Basins fill up to capacity. This is not a viable management strategy.” The failure of non-mechanical water treatment systems at Flambeau does not bode well for PolyMet’s stated goal of eventually transitioning from mechanical to non-mechanical treatment methods. The PolyMet FEIS is inadequate in that the possibility of outright failure in establishing workable non-mechanical treatment systems has not been fully evaluated.	S	O
24487	Unique			WAT	Lawrence Brault		1043	1	I’m concerned about the impact that PolyMet’s proposed sulfide mine would have on Minnesota’s water. I think PolyMet would do more harm than good. Pollution from PolyMet threatens our clean water legacy and would pollute water for hundreds of years after the mine has closed. The impact on the environment is too great to allow this type of mining.	NS	X
5820	Unique			WAT	Lawrence Miller		438	1	I am finding that the analysis of water flow is incomplete and could be easily rectified if the U of M was allowed to use the roads that Polymet owns north of the proposed site and get access to the watershed there. But since Polymet has been unwilling to allow access to the sites north I find it highly suspect that your findings are correct because apparently the company fears something being discovered. If the company was confident about the water flow they would allow access, and let this issue be settled. It would be a shame to ruin the BWCA and the tourism economy for some volatile short term mining jobs. Please not that at least one of the taconite mines closed do to the fluctuation in the market.	S	N
23643	Unique			WAT	Le Lind	Save Lake Superior Association	2940	9	The main conclusion of the tests described above was that it is very difficult to “manage a mitigation” of a source that varies in both size and composition. Scaling results from the test to the mine and the processing waste dumps was defined as being “too difficult” by MDNR scientists. PolyMet is proposing covering and routing water from storage piles to their pit but have limited understanding of where all of the water would be flowing. These tests show that the discharge of polluted water from waste rock and slime storage would be impossible to effectively manage and treat. The FEIS does not define a project that protects the Lake Superior watershed from acid mine drainage consisting of sulfuric acid, sulfates and toxic minerals produced during sulfur dissolution in the waste storage methods being proposed.	S	O
27689	Unique			WAT	Lea Foushee	North American Water Office	3273	3	Portions of the river waterways involved in the NorthMet project are wild rice waters. Three of the five lakes (Wynne, Whitewater, and Sabin) identified in the FEIS (p. 6-87) are identified as wild rice waters in Lake, St Louis, and Itasca Counties on spreadsheets developed by the MPCA for the wild rice rule. http://www.pca.state.mn.us/index.php/view-document.html?gid=23416 http://www.pca.state.mn.us/index.php/water/water-permits-and-rules/waterrulemaking/sulfate-standard-and-wild-rice/draft-proposal-for-protecting-wildrice-from-excess-sulfate.html	NS	X

23643	Unique			WAT	LeRoger Lind	Save Lake Superior Association	2939	8	As evidence of the difficulty in analyzing and controlling acid mine drainage from similar sulfide ore material, over burden containing sulfide ore from the Dunka Mine near the proposed PolyMet NorthMet mine was studied for 16 years at the MDNR facility in Hibbing, MN. Samples from other sites such as AMAX were also tested. The sulfur in the piles dissolved in about 6 years. Acidity increased as sulfates increased with levels varying from one pile to the next. Their tests also show that sulfates and acid are produced at higher volumes and at faster rates from finely ground sulfide ore. It was difficult to control sulfate discharge in the short term after the fine waste rock was generated. Stored rock reacted less quickly due to less surface area.	S	O
23643	Unique			WAT	LeRoger Lind	Save Lake Superior Association	2941	10	In an associated waste management issue, the MDNR personnel were concerned that sorting and storing various grades of solid waste would be difficult if not impossible. Sorting and storing waste rock is one of the “mitigation schemes” discussed in the FEIS and at other presentations by PolyMet and the MDNR. Resolution of this problem is not adequately addressed in the FEIS.	S	O
23643	Unique			WAT	LeRoger Lind	Save Lake Superior Association	2943	12	The FEIS and other reviews which predict post mining closure water quality use “known” oxidation rates based on a study financed by PolyMet. A very crude model is being used to justify the prediction of the amount of sulfur that would be removed at the processing plant in 100 years. The amounts of sulfur available for reaction vary from 5% to 33% depending upon the stage of processing and waste storage. The FEIS does not adequately describe a reliable method of determining the amount of sulfur that would be mitigated as a function of time from initial production through 100 plus years.	S	O
26141	Form Letter	1	Variant	WAT	Leslie Limberg		1273	1	Why must we continue to put our water at risk, water we need to survive? That is foolish.	NS	X

10215	Unique			WAT	Lisa Lenz		675	2	The boundary waters and Lake Superior are too important to risk contamination and we should not rely on the study sponsored by Polymet.	NS	X
24610	Unique			WAT	Lisa Wrabek		1052	1	I have no issue with employment opportunities in NE Minnesota. But when this project first came about there was talk of the impact on waters (mostly north) of the mining project lasting for 700 years. If that is the case, why are we even still considering this? If not, talk to us about the research showing this original consideration debunked	NS	X
29080	Form Letter	9	Variant	WAT	Liz Dahl		2409	2	The FEIS water model is flawed in that it significantly underestimates the amount of untreated water that will escape and the direction it will flow.	NS	X
7689	Unique			WAT	LK Woodruff		565	5	The FEIS is inadequate because it has still not answered fundamental questions such as which direction the pollution will flow, or how PolyMet can provide financial assurance for the hundreds of years of mechanical water treatment that would be required to comply with water quality standards.	S	O
29978	Unique			WAT	London Bresette		4289	1	Be it that there is a permitting process in place, Red Cliff could only trust that the Co-lead Agencies were working in good faith along with the Cooperating Agencies. However, it has been clear for some time that the validity of scientific methodology utilized by the applicant for the proposed PolyMet Mine, has been legitimately called into question by the Cooperating Agencies (Grand Portage and Fond du Lac Bands as well as GLIFWC) throughout the various stages of the Environmental Impact Statements for the NorthMet Mining Project and Land Exchange. Conversely, the Cooperating Agencies scientists have presented Ground Water Hydrology Modeling that utilized historically accurate site data that more accurately reflected current conditions, with more of a likelihood of accurately predicting future conditions. Unfortunately, those findings were not adequately considered by the Co-lead Agencies (US Army Corp of Engineers, Minnesota DNR and US Forest Service).	NS	X
29978	Unique			WAT	London Bresette		4290	2	Throughout this process the Cooperating Agencies have warned that the flawed scientific methodologies utilized by the applicant would lead to faulty conclusions as to the actual environmental impacts that the proposed mine would cause if ever allowed to operate. However; definitive findings were uncovered by GLIFWC scientists and the Cooperating Agencies experts, communicated no later than July of2015 and were summarized in a letter to the Co-lead Agencies on August 11 1 h, 2015; (This GLIFWC Letter with its Documents was addressed to Michael Jimenez Minerals NEPA Project Manager, Doug Bruner USACE Project Manager and to Lisa Fay EIS Project Manager). Despite this high profile notification, the Co-lead Agencies failed to properly factor and address how the PolyMet Engineers utilized flawed scientific methodology and cherry picked data, which then supports an invalid conclusion that at mine closing; contaminants from the NorthMet Mining Project would exclusively discharge in a south and southeast flow path (south/easterly). Whereas the findings from GLIFWC and the Cooperating Agencies experts clearly demonstrate that both a south/easterly and northerly flow of contaminants would occur at mine closing. Even though it seems as the Co-lead Agencies concede the fact of a " ... northward flow of pit water from the proposed NorthMet pits to the Northshore pits" on 5-240 of the FEIS; on page 11 of Fond du Lac Band's Predecision Referral to the CEQ they point out the Co-lead Agencies contradictory conclusion, "based on their view of the flow paths that result from the applicant's incorrect identification of post-closure adjacent pit water levels, disagree with the Fond du Lac Band, and take the position that the relevant cumulative effects have been evaluated." This exchange is actually hard to discern because there is absolutely no mention in FEIS Chapter 8 Major Differences of Opinion of the competing conclusions of an exclusive southerly flow path at mine closing or that both a primarily northern and south/easterly flow path would occur. The Co-lead Agencies seem to lean on the exclusive southerly flow as they state on 5-7 of the FEIS: "It is estimated that more than 98 percent of affected groundwater seepage from the Category 1 stockpile would be captured by the containment system or would migrate as groundwater into the West Pit and East Pit (PolyMet 2015h) ... Following closure, once the West Pit is fully flooded, the treated water would be discharged, as necessary, to the West Pit Outlet Creek that flows into the Partridge River ... After project operations, the only appreciable non-treated mine water leaving the Mine Site would be about 10 gpm of groundwater seepage in the surficial aquifer that would migrate south and eventually be released to the Partridge River." Instead of directly addressing the environmental impacts, flushed out of the scientifically sound conclusion that flow paths at mine close also travel northward; they chose to simply ignore the grave implications of these findings. On one hand they totally refute its conclusion and yet on the other hand concede to its finding. This concession is convenient for their reconciliation of these findings, in order to justify their inadequate response of dealing with any of these concerns through future monitoring and mitigation efforts. This is seen as totally unacceptable and completely objectionable in how these definitive scientific findings were manipulated. Despite PolyMet engineers selecting an unusually high water elevation year and coupling that with improperly selected Hydrology Data that was gathered from an entirely different decade and scale of operation; the Co-lead Agencies still accepted their flawed scientific methodology. Although this was not the only flawed data PolyMet engineers calculated into this; their epically faulty conclusion that at the end of the mining operation there would only be contaminants flowing south/easterly is irrefutably proven false by GLIFWC and other scientists. The Cooperating Agencies experts utilized Ground Water Modeling and valid criterion with proper principles of scientific methodology, which supports their most recent findings.	S	N
29978	Unique			WAT	London Bresette		4291	3	This most important discovery advanced by the Cooperating Agencies goes beyond what had been originally brought to the attention of the Co-lead Agencies; (See March 2, 2012 GLIFWC Letter on page 2949 in Appendix C of the FEIS) however, some of the previous concerns of the improper XP-SWMM modeling utilized by the applicant resulting in base flow predictions which were greatly understated, also factor into PolyMet's conclusion that there would be no northerly flow of contaminants. Given the gravity of this most recent and conclusive finding, it can only be reasonably deduced that the entire applicant's contested declarations of hypothesis, would have to be circumspect.	S	O
11902	Unique			WAT	Lori Andresen		754	2	MCEA is concerned about how the mine will prevent metals and sulfides in massive piles of waste rock from turning into sulfuric acid and leaching into nearby waters years, or even decades, from now. MCEA is also skeptical that a strip mine, which is being proposed instead of an underground mine, is necessary. ?	NS	X
11902	Unique			WAT	Lori Andresen		755	3	Modeling at the PolyMet site shows that water running off the mine features will be hundreds or even thousands of times the safe level for wild rice.	S	O

29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3896	7	Ground water modeling has been an issue going back to the PolyMet DEIS, and is still not resolved. Modeling by the Great Lakes Indian Fish and Wildlife Commission has shown that water from PolyMet operations would flow north upon closure. According to the Timberjay, the Minnesota DNR acknowledges that this is likely, yet will not re-do the ground water modeling in the FEIS. (Tribes: FEIS water model still flawed, Dec. 2, 2015) If the water flows north, it will violate the Great Lakes Compact, a binding agreement in which Minnesota committed to not divert water out of the Great Lakes Basin.	S	N
29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3899	14	The FEIS accepts unlined waste rock piles and drainage ditches as adequate, thus allowing contamination of ground water.	NS	X
29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3902	17	The FEIS does not address treating water from areas adjacent to the pits while mining, or potential elevated concentrations of nitrate and ammonia from blasting agents.	NS	X
29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3912	27	At the same time that the PolyMet comment period has been open, the Minnesota PCA opened comments on a draft proposal to weaken the wild rice sulfate standard. Rather than protect a cherished and highly nutritious food crop, the MPCA is being politically driven to weaken the science-based sulfate standard in order to protect current and proposed mine operations from having to control their sulfate emissions. The PolyMet FEIS is inadequate in determining the extent of sulfates that would be leashed upon our waters over the course of hundreds of years, and the cumulative impact to the environment.	NS	X
29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3921	36	The ACOE must take into account the weaknesses in the PolyMet FEIS. A main point of inadequacy is the faulty ground water modeling. According to GLIFWC modeling analysis, ground water from the NorthMet mine will flow north into the Rainy River watershed. Proposed NorthMet operations would thus impact two major (international) watersheds: Lake Superior via the St. Louis River watershed and the Rainy River. It is simply unacceptable for the ACOE to ignore significant and long lasting impacts to these navigable waters of national importance (Aquatic Resources of National Importance - ARNI).	S	N
29740	Unique			WAT	Lori Andresen	Save Our Sky Blue Waters et. al.	3933	48	Health risks to downstream communities, including Duluth, Superior and Fond du Lac, are also excluded in the FEIS.	S	O

29980	Unique			WAT	Lori Andresen		4299	2	When reviewing PolyMet’s documents, the Great Lakes Indian Fish and Wildlife Commission (GLIFWC) found major discrepancies in groundwater modeling. GLIFWC used the same modeling program as that used by Barr Engineering for PolyMet. But GLIFWC found that, upon closure, water from PolyMet would flow north into the Rainy River watershed. This is a conclusion that PolyMet has consistently denied, as the mining company finds it politically correct to pollute the Lake Superior watershed, but not the Rainy River, which flows into the Boundary Waters Canoe Area Wilderness. As reported in the Timberjay ("Tribes: FEIS water model still flawed," Dec. 2), "DNR officials ... revised model runs using the water level inputs suggested by GLIFWC, and the results confirmed GLIFWC’s conclusions that groundwater from NorthMet’s east pit would flow to the north." But rather than conduct an independent review, the DNR proposes to meet any such problems as they arise, using the catch phrase "adaptive management." The DNR chooses such adaptive management techniques throughout the FEIS, since it is impossible to anticipate the amount of pollution or the efficacy of run-off containment on the grandiose scale of such mining.	S	N
29980	Unique			WAT	Lori Andresen		4300	3	The DNR also glosses over modeling that shows the proposed plant site would need to be treated for pollutants for at least 500 years.	NS	X
30072	Unique			WAT	Lori Andresen		4336	2	The PolyMet project should have been shelved in 2010. Instead, the Supplementary Draft EIS was released in December of 2013. In preliminary documents circulated prior to the SDEIS, environmental groups noticed that water treatment would be needed for at least 200 years at the mine site and at least 500 years at the plant site. PolyMet’s plan for perpetual treatment at its sulfide mine should not have been allowed to proceed, as long term treatment goes against Minnesota state law (CHAPTER 6132, NONFERROUS METALLIC MINERAL MINING, 6132.3200 CLOSURE AND POSTCLOSURE MAINTENANCE. Subpart 1. Goal. The mining area shall be closed so that it is stable, free of hazards, minimizes hydrologic impacts, minimizes the release of substances that adversely impact other natural resources, and is maintenance free.) But instead, the agencies relegated the water treatment statement to one mention within the depths of the SDEIS, claiming that only passive water treatment would be needed at the mine site, and relying on Reverse Osmosis (RO) water treatment at the plant site, post closure. The Dunka mine site, where LTV Mining Company removed some layers of sulfide-bearing rock in order to extract the taconite underneath, is a clear indication that passive water treatment is not enough. Toxic heavy metals continue to drain from the Dunka mine waste rock into Bob Bay of Birch Lake. The passive water treatment proposed by the DNR appears to be dilution, as the contamination seeps into wetlands and eventually into a larger body of water. Active water treatment proved too expensive for the mining company, and the DNR has allowed the use of man-made wetlands as a stop gap solution to the ongoing pollution; these wetland materials need to be periodically dredged, removed, and then replaced with new material. (For more information, see "Mining Vs Water, Dunka site exposes breakdown in mine regulation," Timberjay 10-7-15.) The reverse osmosis (RO) pilot test that was prepared for PolyMet by Barr Engineering does not reflect the quantity or quality of water that would need to be treated upon mine closure. It is known that RO is not effective on a large mining scale, as it is too costly, and because the concentration trapped in the RO filters is highly toxic and needs special containment. The Minnesota Pollution Control Agency exempted Mesabi Nugget from using RO as "not technically feasible" and because it "would cause the discharger undue hardship." In other words, RO was rejected due to the uncertainty of its effectiveness and its prohibitive cost. (Mesabi Nugget Delaware, LLC NPDES/SDS Permit No. MN0067687, pages 6-9, October 12, 2012) In addition, RO might be a moot point. If sulfate standards to protect wild rice are weakened by agency and legislative initiatives, or mining companies are given a variance from meeting existing standards, RO need never be installed.	S	O
30072	Unique			WAT	Lori Andresen		4337	3	Muddying the Toxic Waters. The SDEIS should have been the end of PolyMet. But instead, the final EIS (FEIS) has been publically released. Already, in preliminary documents reviewed over the summer, the Great Lakes Indian Fish and Wildlife Commission (GLIFWC) has found major discrepancies in the water modeling. GLIFWC’s results using the same water modeling program done for PolyMet by Barr Engineering found that, upon closure, and due to the proximity and interconnectedness of PolyMet and the Peter Mitchell taconite mine at Babbitt, water from PolyMet would flow north into the Rainy River watershed. This would increase pollution to both the Rainy River and Lake Superior watersheds; while adding pollution to the Rainy River watershed, water would be drained from the Lake Superior watershed, leaving the pollution there more concentrated. In its faulty final EIS process, the DNR is circumventing this information, and rather than running its own modeling, is relying on something called "adaptive management," a concept that allows them to adapt to a problem as it comes up. But the DNR record shows limited success in problem solving. Right now, all six taconite mines are operating under expired permits or variances--whereby the mine can continue polluting while claiming it will comply with standards somewhere down the line. In effect, the taconite mines have been allowed to continue mining and to expand without meeting existing environmental standards. For example, the issue of mercury and sulfates impacting our fish and wild rice has not been resolved. The DNR is attempting to figure out how to control ongoing sulfate pollution from Minntac’s tailings basin, while at the same time allowing Minntac to add more tailings as it expands. Meanwhile, the Minnesota Pollution Control Agency is being pressured by legislators to lower or adjust the sulfate standard in order to accommodate mining expansion. Proposed adjusting of the standard to fit various waterways would be basically impossible to monitor or enforce--thus perpetuating the problems caused from mining pollution. Yet the same agencies that have failed to control taconite pollution are now set to permit higher polluting sulfide mining.	S	O
29370	Unique			WAT	Lori Olinger		2515	1	The FEIS states that lime will be added to the East Pit during backfill to maintain PH. I am concerned about ARD into the filled pits and wetland over time. I think the FEIS is not clear on what will happen if the acid level continues to rise due to ARD over time. The Berkeley Pit in Butte, Montana is dealing with ARD. The pit filled with ground water and has a PH equal to battery acid. Right now ground water is still flowing into the pit and it is very close to the level where water will begin to flow out of the pit. To prevent that, a RO water treatment plant is being built and it will treat water there forever. It is expensive but Butte has no choice. The alternative is much more expensive. Minnesota still has choices and we should not go down the same path as Butte. How has the PH level of the pits and wetland been calculated for the next 500 years?	S	O
9792	Unique			WAT	Lori Rumpf		633	2	The FEIS is inadequate because it hasn’t answered fundamental questions such as direction of pollution flow and how PolyMet will provide monetary resources for the hundreds of years of water treatment that would be necessary to comply with water quality standards.	NS	X
9792	Unique			WAT	Lori Rumpf		634	3	The FEIS also fails to evaluate pollution risks and impacts using scientifically-supported assumptions concerning how much polluted seepage is likely to be captured and treated both during and after the proposed mining operations.	NS	X
23991	Unique			WAT	Lorrie Ogren MA. LPC, LPCC		988	1	I am strongly opposed to the proposed polymet mine in Northern MN, and here are my reasons: St. Louis River is one of the top 10 Endangered Rivers in the U.S. The mine pit and processing plant would be located upon the headwaters of the St. Louis River watershed, which empties into Lake Superior at its estuary near Duluth, Minnesota and Superior, Wisconsin. The copper-nickel mineralization of the Duluth Complex — a rock formation that underlies northeastern Minnesota between Lake Superior, the Boundary Waters Canoe Area Wilderness, and Lake Vermilion —is highly disseminated and low grade, with less than 1 percent metals. Mining this rock formation would result in 99 percent waste rock, including the fine ground tailings. Both waste rock piles and tailings leach toxic, heavy metals and acid mine drainage (AMD) into surface and ground waters	NS	X
23991	Unique			WAT	Lorrie Ogren MA. LPC, LPCC		989	2	The Sierra Club mining committee has been studying PolyMet’s mine plan since it was proposed, and came to the conclusion that water modeling for the proposed mine project is woefully inadequate and ground water testing has not taken into account the fractured bedrock of the area. The scale of mining leaving 99 percent waste rock is too monumental to manage for pollution control, and the value of our clean water is too great to put at risk.	S	O

23991	Unique			WAT	Lorrie Ogren MA. LPC, LPCC		990	3	In 2010, the Environmental Protection Agency gave PolyMet’s Draft Environmental Impact Statement a grade of EU-3, Environmentally Unsatisfactory-inadequate with many concerns about lack of water modeling. In 2015, the Great Lakes Indian Fish and Wildlife Commission’s (GLIFWC) analysis of PolyMet’s water modeling for the final Environmental Impact Statement showed that ground water seepage at mine closure would flow north into the Rainy River watershed (Boundary Waters), thus displacing or concentrating pollution within the St. Louis River watershed — and putting pollution into an adjacent watershed.	S	O
23991	Unique			WAT	Lorrie Ogren MA. LPC, LPCC		992	5	In another bio-chemical process, sulfates become sulfides which attach to wild rice roots, destroying entire wild rice beds in the most polluted areas, or greatly reducing plant yield in other stretches of the St. Louis River. Both fish and wild rice impacts affect the Fond du Lac, Grand Portage, and Bois Forte Bands of the Lake Superior Chippewa nation’s treaty rights, as well as affecting fishermen, resort owners, and local residents. As sulfates, mercury and other pollutants work their way downstream, they impact the health and economy of both the Fond du Lac Tribal nation and the citizens of Cloquet, Duluth, MN and Superior WI.	NS	X
27921	Form Letter	1	Variant	WAT	Louis Mielke		2231	3	The prices of Copper and Nickel have dramatically dropped in the past 5 years. PolyMet and Glencore say they will be able to pay for it, but how can one completely restore tainted groundwater? PolyMet discharge of pollutants and wetlands destruction and impairment would degrade surface and groundwater and violate federal, state and tribal water quality standards.	S	O
27186	Unique			WAT	Lynn Bottge		1690	2	Because the site of this project is located in three major water sheds it is inconceivable that a twenty year business that would require 500+ years of water treatment be allowed. This is absolute insanity. There is legitimate scientific concern that toxic pollution will find its way into the BWCAW and Lake Superior.	NS	X
27186	Unique			WAT	Lynn Bottge		1692	4	The hydrological assumptions of the FEIS have been shown to be false. The claim that stored toxic pollutants will not affect the ground water and wetlands of the area are untrue. For this reason alone, this project should not be allowed.	S	O
21726	Unique			WAT	Maki Christopher G.		844	1	I was born on the Iron Range. Members of my family worked and still work in the mines. I understand the frustration some have with the boom and bust years that happen up here. However, this project will not solve that problem and we will be back to this issue when the mine shuts down in 20 years. When they are complete, the best case scenario the state is left with is a heavily pollutes hole in the ground that is incompatible with any form of life and whose water must be treated for longer than this country let alone this state has been in existence. Maybe people could visit it like they do in Butte MT.	NS	X
21726	Unique			WAT	Maki Christopher G.		846	3	These types of mine are the number one polluters. They are the hardest to clean up. Once the chemical reaction starts it can’t be stopped. It’s like a coal fire. It won’t stop until all the reactants are consumed. There has yet to be a sulfur rock mine in this type of location that not polluted. At least not to my knowledge. They are just hoping to mitigate it. Once these heavy metals get into the rivers, they cannot be removed easily or cheaply.	NS	X
23885	Form Letter	1	Variant	WAT	Malgorzata Schmidt		968	1	This is not the time for mining. This is the time to cherish clean water.	NS	X
26648	Unique			WAT	Margaret A. Redmond		1399	9	5. There is a credible case to be made for the argument that a significant proportion of the wastewater will flow north, not south, as regarding the composition of the north side of the proposed wastewater pit, and issues of height and pressure of the water contained therein. Thus, the possibility of wastewater flowing into the Kawishiwi River and thence the BWCAW has not been adequately examined. Recent admission by the DNR that the flow could in fact go North AND South should clearly send this FEIS back to the drawing board. –Given this ambiguity, where’s the FEIS analysis of the possible (probable?) water flowing north. -Where is the analysis of possible environmental impacts on water quality, fish, wildlife? -Where’s the modeling and the planning for this contingency? These issues should be settled before the permitting phase.	S	O
29323	Unique			WAT	Margaret M Kieilty		2505	1	Please do not approve the Poly met mine for northern Minnesota. It will devastate the environment and pollute the water. These are priceless! We need clean water more that ore!! the land is for all the people	NS	X
7533	Unique			WAT	Margaret Seibel		551	1	First of all, where does the overflow go? Is it treated? Does it collect somewhere else? And secondly, with global warming, we don’t know the definition of a rare event. The probability of high rainfall storms may increase. What volume of overflow is expected as a function of total rainfall in an event at different freeboards? How long would the bypass event last vs. total rainfall for different freeboards? This is where XY plots are needed. What mass of pollutants makes it to the Polymet boundary? What happens if the ground is frozen? Or if it’s very saturated?	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3669	34	Even though the FEIS states that 90% of the seepage from the surficial aquifer and bedrock to 100 feet below the top of the bedrock will be captured81 there are no plans to capture any seepage flowing through bedrock fractures. In fact, bedrock is the part of this seepage capture system that is supposed to prevent seepage from escaping from the east side of the tailings basin. Without any examples worldwide of such high seepage capture efficiency, the FEIS alleges that this is a fail-safe method of seepage collection able to collect 90 percent of the surficial aquifer seepage and seepage through the upper 100 feet of bedrock.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3677	30	existing studies of area hydrology,69 it is perplexing that the preparers have continually refused to use them, even as tribal cooperating agencies have repeatedly requested that they be used. Just a few publicly available examples include: the Minnamax Project;70 the LTVSMC Dunka Pit;71 historic MNDNR fisheries documents;72 data required under the Cliffs Erie Consent Decree;73 and the GFLOW model for the Upper St. Louis River Watershed.74 All these resources should be used to supplement the hydrologic analysis and fully inform the permitting agencies and the public.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3678	31	Contaminants from the Project will likely contribute additional loading to these existing exceedences of MN WQS in the Embarrass River, Colby Lake, and the Partridge River. And, as a result of the Project, it appears that arsenic will exceed drinking water standards in Colby Lake.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3680	22	During subzero temperatures January 25-26 and February 15-16, 2011, the minimum baseflow measured by the MNDNR four miles south of the LTVSMC tailings basin13.9 to 15 cfs in the Embarrass River. Model estimated the average annual baseflow for the Embarrass River, based on data more than 50 years old, at 8.7 cfs.	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3681	23	FEIS indicates that mine pit dewatering impacts will be very limited or non-existent based on the assumption that there is little or no connection between the bedrock and surficial aquifers.50 This assumption is not supported by the data used to characterize mine site hydrology; instead, it is based on an unsupported “professional opinion.”51	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3709	20	Not only is the Project modeled baseflow inconsistent with published literature, none of the measured data supports the baseflow predicted by XP-SWMM at SW003 of 0.5 cfs. XPSWMM’s extrapolation of unrealistically low baseflows was used to calibrate the MODFLOW model and therefore influences virtually all aspects of the Project water quality and quantity characterization and impact prediction,	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3710	21	Higher baseflows in the Partridge River indicate that the wetlands and river are connected to the groundwater aquifer, that mine pit inflow will be greater; and that groundwater will travel through the aquifer will occur at a much faster rate.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3712	18	The baseflow rate predicted by XP-SWMM is three times lower than flow data indicates, and implies recharge to the groundwater system from precipitation that is not consistent with published literature.43	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3713	19	The extrapolated baseflow used 20-year-old stream gauging data collected seventeen miles downstream of the mine site in the Partridge River,46 and stream gauging data that is more than 50 years old collected 11 miles downstream of the plant site in the Embarrass River.47 In fact, the data used to model impacts in the Embarrass River (1942-1964) watershed precedes the LTVSMC mining operations at the site. Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3719	32	No water samples have been collected from lakes near the tailings basin (including Hiekillilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3720	33	existing LTVSMC Tailings Basin is not lined and currently releases seepage with elevated concentrations of sulfate, TDS, and hardness, among other constituents.”80 It just does not propose any effective means of remediating them.	NS	X
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3722	5	Insufficient or inaccurate characterization of the hydrology: The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size.18	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3723	6	Insufficient or inaccurate geochemical characterization of the proposed mine:19 The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy.20	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3724	7	Peter Mitchell Pit water levels from 1986-1987 were not used for model construction. Instead, water levels were used from 199627—a year when the Peter Mitchell Pits were full and discharging water to groundwater in the Partridge River basin. If Peter Mitchell Pit water levels had been incorporated from the same period of time that stream flow measurements were taken, i.e. 1986-87, groundwater flow direction predicted by the MODFLOW model would have been reversed and groundwater recharge predictions may have more closely mirrored the best available science for the project area. That is, 0.9 inches per year of recharge used in the PolyMet MODFLOW model versus the U.S. Geological Survey’s 9.0 inches of recharge per year for the same area. Because baseflow and water levels were used from different time periods, accurate flow directions and gradients for groundwater, either in 1986-87 or for present and future conditions, are impossible to determine.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3725	8	The Partridge River was digitized so that in some of the MODFLOW model cells, the stage (surface) of the river (actually flowing downstream) is shown flowing uphill. Water flowing uphill is physically impossible and this defect contributes to the illusion of an endless supply of water.	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3726	9	in the top layer of the PolyMet groundwater model, the water table was modeled using parameters for a confined aquifer with the potential to convert to an unconfined layer.29 By definition, the water table is unconfined.30 Modeling the top groundwater layer as confined produces the illusion of no drawdown	S	N

29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3727	10	instead of using the MODFLOW model to estimate water table drawdown effects, the co-lead agencies decided in 2010 that an analog method would be used. That analog approach was to use water table drawdown observations that had occurred at existing taconite pits on the Iron Range. However, the co-lead agencies did not use all of the available data and instead chose to “cherry pick” data that supported a similar range of drawdown that the “modified” contour lines indicated. Although tribal staff on multiple occasions provided the colead agencies with supplemental analog drawdown information, collected by MNDNR staff from additional taconite projects on the Iron Range that indicated drawdown was likely to impact an area similar to the unmodified MODFLOW model, the data was never considered. This is another major defect in the modeling.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3728	11	The scope of work did not require the usual steps to determine if the model inputs were similar to other published scientific information for the area, including: hydraulic conductivity, recharge, specific yield, and specific storage. And most of the values for the parameters employed to create the groundwater model were at least one order of magnitude less than any published scientific information for the same area.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3729	12	the scope of work did not require review to determine if the Peter Mitchell Pit water levels had been incorporated from the same period of time that stream flow measurements were taken.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3730	13	several well and surface water monitoring stations’ data completely excluded from the water quality models used to predict Project impacts.36 Specifically, all data collected from groundwater monitoring wells GW008 (13 sampling events), GW009 (12 sampling events), and GW010 (9 sampling events), were excluded from the models.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3731	14	nine surface water quality sampling events collected at PM 11, a sampling station on unnamed creek located northwest of the tailings basin half-way between the tailings basin and the Embarrass River, were used in the Projects models.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3732	15	excluded from the models were data from nine sampling events collected at Station PM 12.1 in the Embarrass River upstream of the tailings basins.39	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3733	16	models intended to predict impacts from the Project were not calibrated to existing water quality in Colby Lake.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3734	17	hydrologic models for the Project were built using modeled inputs rather than actual measurements or estimates from scientific literature. This makes the Project models unable to accurately characterize groundwater flow direction, water tables, potentiometric surface in the aquifers, fluxes to rivers and streams drawdown/mounding impacts to the water tables or surface waters, or to predict water quality impacts. The models for the Project should have been calibrated using all available measured data and scientifically credible basic model inputs.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3735	24	information beyond the flow data collected by PolyMet implies that there may be substantial connection between the bedrock and surficial aquifers and that groundwater travel time will be exponentially faster than predicted. Water quality data collected from two deep boreholes in the area where the Project mine pit(s) will be located found tritium and un-ionized ammonia nitrogen. Both tritium and un-ionized ammonia indicate a strong connection with surface water. Tritium indicates that the water found in the deep boreholes was on the surface sometime after 1950, during or after nuclear testing when atmospheric deposition of this pollutant occurred. Un-ionized ammonia is produced by ore blasting activities. The bore holes where this pollution was measured are approximately one mile southwest of the Peter Mitchell Pit, which is the closest potential source of this pollution and has violated its NPDES permit on several occasions for exceeding un-ionized ammonia limits. Therefore, this data indicates that the PolyMet mine site is already hydrologically connected to the Peter Mitchell Pit through fractures. The distance between the Peter Mitchell Pit and the Project proposed pit(s) is approximately one mile, indicating that groundwater travel time through bedrock fractures will be orders of magnitude faster than Project modeling suggests. Such a connection means that dewatering of the mine pits will cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams. This also indicates that when the mine pit(s) refill, polluted water will seep and leak out into groundwater surrounding the project.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3736	25	The monitoring wells that do exist near the tailings basin have concentrations of pollutants including iron, sulfate, manganese, aluminum, and fluoride that exceeded drinking water standards. But because of the limited distribution of monitoring wells, the extent of the existing contaminant plume is not known. No bedrock monitoring wells have been drilled in the vicinity of the tailings basin. However, domestic wells near the northern property line show substantial contamination of the groundwater aquifer.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3737	26	the FEIS entirely skirts the question of overall impacts on the groundwater aquifer from putting an already-contaminated site back into production, and then releasing yet more contaminants.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3738	27	Blasting and shoveling ore will increase both the number of fractures and the connectivity of fractures potentially increasing baseflow and pit leakage into the bedrock layers below the bottom of the pit: the Virginia Formation and Biwabik Iron Formation.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3739	28	The FEIS asks the public to believe that the most environmentally sound way to dispose of highly reactive waste rock is to put it back into the pit(s) and cover the piles with water.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3740	29	Project baseline data used for both the Mine Site and the Tailings Basin are insufficient. A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3741	35	Anthony Runkel, Chief Geologist with the Minnesota Geological Survey, himself contradicted this approach in his comments on the NorthMet SDEIS:85 Investigations aimed at characterizing the hydrogeologic conditions of fractured bedrock for the purposes of predicting solute transport in crystalline bedrock elsewhere on the Canadian Shield routinely use a number of well-known techniques that were not applied in the hydrogeologic studies at the NorthMet Mine Site and Plant Site/Tailings Basin area. A key component of those investigations is the acquisition of hydraulic and water chemistry data at relatively discrete intervals of bedrock, with the focus on fracture characterization. In part this is accomplished through testing and water sampling of boreholes constructed with relatively short open hole intervals at variable depths (e.g. “nested” wells) and/or discrete interval packer testing and water sampling of long open holes. When these techniques have been used in generally similar hydrogeologic settings elsewhere on the Canadian Shield, the results support hydrogeologic conceptual models that differ substantially from those proposed for the Duluth Complex and Giants Range Batholith described in the SDEIS. Of particular significance for solute transport, the conceptual models commonly include key fractures or fracture zones of relatively high hydraulic conductivity, and multiple flow systems within the bedrock at individual sites. These flow systems are variably connected to the surface water system, have variable residence times, can have upward and downward vertical gradients within a local area, and horizontal flow directions that differ from one another. The data collected thus far from the proposed NorthMet Mine Site and Plant Site/Tailings Basin area are not sufficient to recognize the kinds of hydrogeologic features known to be characteristic of other crystalline bedrock settings on the Canadian Shield, described above. Nor are the data sufficient to adequately support the simpler conceptual model currently depicted in the SDEIS. Nevertheless, the FEIS dismisses fracture flow at both the mine site and tailings basin as insignificant	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3742	36	Because of the aforementioned hydrologic characterization flaws and incorrectly calibrated groundwater model, none of the analyses based on hydrologic or water quality impacts are scientifically based and are therefore not credible.	NS	X
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3743	37	The completed tailings height of 1,735 feet above sea level87 is 60 feet above the highest land surface feature to the east, and 200 feet above the highest land surface features to the west, northwest, north and south sides of the basin, creating immense hydraulic head pressure that will push substantial amounts of seepage through bedrock fractures into the surrounding environment.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3744	41	it appears extremely unlikely that PolyMet will be able to capture 90 percent or more of the seepage discharging from an unlined, leaking tailings basin that will ultimately be 60 to 200 feet above the land surface.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3745	38	Seepage capture rates projected by the Project Proponent and accepted by the Co-Lead Agencies are unrealistic and cannot be demonstrated by any other project that has been cited as a reference. Yet the tailings basin seepage capture system efficiency rates used to determine impacts are: 100 percent of the Tailings Basin’s surface seepage;100 percent of the groundwater approaching the containment system from the Tailings Basin’s east and south toes, and; 90 percent of the groundwater approaching the containment systems from the Tailings Basin’s north, northwest and west toes (PolyMet 2015d).88 The proponent’s claim that 90 percent or more of the seepage from this tailings basin can be captured is unrealistic, to say the least. Tribes requested any example of the “90 percent or better” capture efficiency rate to be provided by the Co-Lead Agencies, but they were not able to provide a single example anywhere in the world.89 Instead, they provided just one citation from an EPA guidance document that provided: Most barriers in the study have been in place for fewer than 10 years; therefore, long-term performance can only be extrapolated... All sites included in the study were existing sites that had vertical barriers and, in many cases, caps. None of the sites has an engineered bottom barrier. Therefore, the effect of leakage through aquitards was not evaluated in this study.90 But that report also indicated that “10% of the containment systems reviewed failed to meet the performance objectives and required corrective action, and 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not.”91 In other words, even the Co-Leads’ own authority does not support a 90 percent capture efficiency rate here.	S	O

29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3746	39	tailings ponds in Fort McMurray, Alberta, Canada, are cited by PolyMet as an example of successful seepage containment: Another example is the installation of a soil-bentonite cutoff wall around the perimeter of a mine tailings pond located in the province of Alberta, Canada. The cutoff wall is approximately 100-feet deep and 3 feet wide, and has a hydraulic conductivity of less than 1x10 ⁻⁷ cm/sec. The cutoff wall was used to isolate the tailings pond from down gradient surface water features including wetlands and the Athabasca River. Unfortunately, Environment Canada, a federal agency, published research in 2014 that substantiates that the Athabasca River has been contaminated by toxic chemicals seeping from Alberta's tar sand tailings ponds in spite of the fact that ditches, cutoff walls, groundwater interception wells, and a water pumped back system were used to prevent the seepage pollution from occurring. One of the two leaky tailings ponds studied reportedly seeps toxic wastewater at a rate of approximately 2.65 cubic feet per second, or more than 625 million gallons per year, into the Athabasca	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3747	40	The Zortman-Landusky Mine in Montana installed containment and pump-back systems to be used in conjunction with a wastewater treatment facility. However, they “did not capture all surface and subsurface drainage.” ⁹⁵ The Molycorp, Inc. Mine site in New Mexico concluded that “[t]he pathway for contaminant migration is the leaching of tailing seepage downward from the tailing facility to ground water that migrates through fractures to surface water.” ⁹⁶ The FEIS ultimately provides no credible support for its claim of seepage capture rates by these means.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3748	42	Although the seepage flow has been reduced by approximately 55%, ¹⁰² at SD026 the concentrations of most pollutants have increased. Therefore, only a small pollutant load reduction has been accomplished. But the FEIS provides that: The only untreated Tailing Basin water entering the surrounding environment would be groundwater bypassing the northern, northwestern, and western parts of the containment system at a rate of 20 gpm, a 90 percent reduction of the groundwater flow rates occurring under current conditions. Most of the seepage affected groundwater bypassing the containment system would flow along the north, northwest, and west flow paths towards the Embarrass River and would affect down gradient groundwater quality. ¹⁰³ Without installing a single monitoring well in the bedrock to test this assumption, the FEIS provides that this is “conservative” because the modeling done by the Project proponent assumes that bedrock hydraulic conductivity is extremely low. ¹⁰⁴ So the FEIS’s conclusion that the method would be effective essentially is unsupported.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3749	43	The Hydrometallurgical Residue Facility (“HRF”) is proposed to be located where the LTVSMC emergency overflow basin currently is. The photo on the cover of the SDEIS shows that emergency basin is flooded right now from groundwater seepage. Even though the PolyMet project proposes to use a double-liner to prevent leakage from the facility, head pressure from the existing seeps and springs at this site mean that the liners, even installed perfectly will not last long before rupturing. This is the most toxic of all the wastes created by the Project. Therefore, a new, dry location must be found for HRF placement. Furthermore, all cap and liner systems leak; therefore, some pumping of water that enters the hydrometallurgical residue cells would be needed in perpetuity.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3750	44	PolyMet has determined that water seeping out of the mine pits will flow towards the Partridge River based on their MODFLOW model. However, when the water elevation of the Peter Mitchell Pit is set to its closure elevation in MODFLOW, groundwater from PolyMet flows north towards the Peter Mitchell Pit and the Boundary Waters Canoe Area Wilderness (“BWCAW”) instead of south towards the Partridge River.	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3751	45	Currently no bedrock monitoring wells are located near the tailings basin or in the area between the proposed mine pits and the Peter Mitchel Pit, and too few monitoring wells have been placed in the surficial aquifer to provide early detection of potential exceedances of water quality standards.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3752	46	Further, the amount of groundwater flowing out of the east pit northward is at least one order of magnitude more than the Barr MODFLOW model estimates. ¹⁰⁷ More groundwater flowing from the PolyMet mine pits and the tailings basin than has been predicted by PolyMet’s modeling will cause concentrations of pollutants to increase due to less dilution from background groundwater concentrations, likely causing excursions above groundwater and surface water quality standards for several pollutants including mercury, sulfate, arsenic, copper, nickel, aluminum, manganese, and cobalt.	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3753	47	based on PolyMet’s own data showing un-ionized ammonia and tritium in groundwater from a deep bore hole at the proposed mine site, the rate of travel is likely at least one order of magnitude faster than projected. This means that pollutants from the mine site and plant site could reach compliance points in 20 to 50 years instead of 200 to 500 years as PolyMet claims.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3754	48	Using the flawed hydrologic characterization and incorrectly calibrated groundwater model to assess impacts on stream flows in the vicinity of the Project allows PolyMet to claim that with flow augmentation for streams near the tailings basin, the Project will not change stream flows at the mine site or plant site more than 20 percent, plus or minus. And PolyMet further claims that there will be no cumulative effects on stream flow because of the augmentation planned for the tailings basin, and the lack of connection between the bedrock and surficial aquifer at the mine site.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3755	49	Since baseflow is itself partially supported by wetland drainage, it is likely that wetlands between PolyMet and the Peter Mitchell Pit will experience drawdown.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3758	52	Statements regarding which wetlands will be monitored are contradictory on page 5-307 and 5-308 of the FEIS. On page 5-307 monitoring is recommended for wetlands with moderate sensitivity to drawdown, while on 5-308 monitoring plans would be developed for wetlands with a high likelihood of indirect effects. Monitoring and mitigation is not anticipated for wetlands with a “slight potential” for indirect effects. So not only are the Co-Leads deferring identification of impacts until after PolyMet begins operations by stating that monitoring is the best way to determine after-the-fact Project impacts, they are suggesting that monitoring may not be required for hundreds of acres of wetlands in the moderate and slightly sensitive categories. Further, these categories are not based on science, ¹¹⁶ and without monitoring impacts can’t be identified and compensation won’t be required.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3759	53	The USACE is deferring identification of project impacts until PolyMet begins operations, and deferring final determination on the LEDPA for the EIS Record of Decision. ¹¹⁸ 40 C.F.R. Section 230.10(a) states that compensatory mitigation may not be used as a method to reduce environmental impacts in the evaluation of the LEDPA and that LEDPA must come before considerations of compensation. And the burden of proof to demonstrate compliance with Guidelines rests with the applicant; where insufficient information is provided to determine compliance, the Guidelines require that no permit be issued. ¹¹⁹	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3760	54	The FEIS’s failure to properly model and mitigate seepage and baseflow rates could result in profound impacts on wetlands. The estimates of groundwater drawdown are currently based on anecdotal and limited observations. ¹²⁶ Because of the generally flat topography and extensive wetlands, mine pit dewatering would likely cause substantial dewatering in nearby wetlands. Estimated indirect impacts to wetlands due to groundwater drawdown at the mine site are summarized in FEIS, ¹²⁷ but without the use of a reliable groundwater model. Instead, dewatering impacts are assessed using an analog method where wetlands impacted by another “equivalent” site are compared with wetlands surrounding the Project to provide an estimate of both the depth and distance from the mine pit(s) that dewatering occurs. The decision to use an analog method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include: (1) the PolyMet proposed mine pit will be hundreds of feet deeper than any of the “analog” mine pits; (2) PolyMet mine pit walls will be crystalline and sedimentary bedrock versus the analog mine pits in sedimentary bedrock only; (3) data collected from the site would be relatively inexpensive and should be used to inform impact assessment; and (4) relying on only a partial set of available “analog” data as the source of information to estimate dewatering impacts is selective and not scientifically robust.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3761	55	the FEIS states that perched wetlands cover over 50% of wetlands at the mine site. Unfortunately, wetlands interaction with the surficial and bedrock aquifer cannot be reasonably determined due to inconsistent hydrologic characterization, incorrectly calibrated groundwater models, and selectively used analog data. Perched water tables have not been documented by hydraulic head measurements from nests of piezometers; therefore the notion that most of the bogs in the mine site area are ombrotrophic is merely conjecture: The datasets that supports the NorthMet wetland classification does not allow an explicit critique of whether the wetlands within this site are ombrotrophic bogs or minerotrophic fens.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3763	57	the Project proponent has suggested that “most (70 percent) of the NorthMet waste rock would be the low-sulfur, non-acid-generating” and will never cause acid mine drainage. However, the north wall of the east pit is composed of the Virginia Formation (sulfur concentration 0.4 -5%) meaning that it will be exposed to both air and water and will likely contribute a substantial load of sulfate and metals to mine pit water. 20 feet of pit wall will never be submerged and as such constitutes a perpetual source of mine related contaminants.	NS	X
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3764	58	PolyMet claims bedrock transport of contaminated water is negligible due to the very low bulk hydraulic conductivity of bedrock and that groundwater flow rates in these flowpaths were not large enough to affect water quality at the groundwater and surface water evaluation locations. As stated previously, due to the flawed hydrologic characterization and incorrectly calibrated groundwater model, these claims are unsubstantiated.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3765	59	The flowpaths and evaluation locations that resulted from this flawed analysis are south of the mine pit instead of north. This means that the Co-Leads are literally looking in the wrong direction and simply not considering some of the most severe Project impacts.	S	O

29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3766	60	Because of continued inputs from the stockpiles and the pit walls, the pit lake could exceed surface water quality standards essentially forever.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3767	61	an MPCA document from the Minnamax Exploration Project, a test shaft drilled into the Duluth Complex, the rock formation where the mine would be sited, by AMAX Corporation in the 1970s, approximately three miles from the Project mine site. This document states that water was encountered 147 feet below the surface infiltrating into the test shaft at approximately 14 gallons per minute and identified another potentially water bearing fracture zone at 900 feet below the surface.141 This means that the volume of bedrock groundwater that may be encountered by the Project mine pit has been vastly underestimated.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3768	62	Other MPCA documents detail an unexpected saline water discharge that resulted as part of the AMAX Exploration Project from a water pocket 1,391 feet below the surface. The large quantities of saline water discharged, as much as 275 gallons per minute to Langley Creek, killed much of the vegetation en route. Data show severe impacts to wetlands in the vicinity of the project. Water from stockpiles that were minuscule in comparison to the stockpiles proposed for the PolyMet Project drained water with very high concentrations of nickel, cobalt, copper, zinc, and sulfate, and discharged that water into Langley Creek and the Partridge River. The project polluted streams, groundwater, and a large wetland complex in its vicinity in order for the MNDNR to study potential impacts and mitigation strategies for non-ferrous mining. Yet the data collected from the AMAX project was not used to predict water quality or wetlands impacts presented in the PolyMet FEIS. Also ignored was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3769	63	The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5- volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex.158 Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were ignored when the technical documents and SDEIS were drafted for PolyMet. Therefore, water quality impacts have likely been underestimated and the mitigations proposed may not be effective.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3770	64	The cumulative public information regarding risks to area hydrology from mining the PolyMet site cannot be dismissed by inserting extrapolated data in place of measured data, or by cherry-picking measured data. Impacts to surface waters, groundwater, and wetlands for a project of this size and complexity demand a scientific, data-driven approach, rather than one based on opinion and selectively used data.	NS	X
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3773	66	the tailings basin seepage capture rate of 90 percent or more assumed in the preferred alternative has not been demonstrated anywhere in the U.S.166 and is simply not possible because the tailings basin was built without a liner.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3780	73	RO-treated water should be used to augment streamflow at both the plant site and mine site. RO will not cause waters in the vicinity of the plant site to comply with WQS due to low seepage capture efficiency at the tailings basin.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3783	76	Grout curtains (grout injected into fractures via a series of closely spaced drilled holes) are a fairly common mitigation strategy that can be effective if installed around the entire perimeter of the pit prior to mining. However, due to expense, PolyMet is only planning to try to grout individual faults or fractures once a water quality or quantity problem has occurred. This adaptive management concept has no trigger point associated with it to make clear when and if it would be employed: “At the NorthMet Mine Site, if monitoring and analysis indicate conditions could arise that create a northward flowpath, PolyMet would have the necessary information about site conditions to grout fractures and faults.”196 Even PolyMet has admitted this is not likely to be successful stating “its effectiveness at the NorthMet site is uncertain.”197	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3785	78	Another AMC is groundwater extraction wells, which have the potential to reduce or prevent a northward flow of contaminants. But similar to the two previous AMCs, there is no trigger point associated with it to make clear when and if it would be employed. It also suffers from the same lack of exploratory rigor and evaluation objectivity. The number, location, and capacities of the wells are unknown, along with the associated number of acres of ground disturbance because access roads to the wells would be required in addition to electrical and water lines for pumped water. Further, wetlands would be directly impacted, but the acreage and wetland types are not known. Nevertheless, without support, the FEIS assures the reader that “[i]f the number of wells necessary resulted in unacceptable wetland impacts, other mitigation measures used in tandem with extraction wells would lower the number of required extraction wells.”	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3786	79	Artificial recharge using an infiltration trench or wells simply will not work at this site because it is too flat—but it still appears as an AMC. But clearly this concept hasn’t been rigorously explored or objectively evaluated. The elevation of the bottom of the surficial deposits shown in an October 12, 2015 Co-Lead memo204 is 1,625 to 1,650 feet above sea level; however, the land surface or top of the surficial deposits is only at an elevation of 1,600 feet above land surface based on MNDNR topographical maps using LiDAR technology.205 In other words, in the Co-Lead memo, the land surface is depicted as floating 25 to 50 feet in the air! The science fiction of floating surficial deposits is not simply a graphical error; it is in fact the only way a groundwater mound could be “created” at this site because of its topography.208 In addition, the size of the groundwater mound, the source of water, the number of wells or the size of a trench; the acreage of land disturbance created by roads, wells, or a trench, water supply and electrical lines; or the acreage of wetland disturbance, are all unknown.209 Mining need not be synonymous with pollution: “In the right place – and with conscientious companies, new technologies and good planning –many of the potential impacts are avoidable. In fact, most mine pollution arises from negligence, not necessity.”210 But the NEPA “hard look” requires agencies to “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project”211 when analyzing alternatives. Defects in the AMC and alternatives analysis here are stark enough to suggest lack of rigor on by the Project proponent at best, and data manipulation at the worst. Either way, the FEIS’s analysis of AMCs and alternatives is insufficient to comply with NEPA.	S	N
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3789	82	There has been no analysis of off-site cumulative effects to groundwater flow. And changes to flows would decrease by approximately 5.0 cfs in the upper Partridge River. Based on FEIS text it is unknown what the changes in flows to the lower Partridge River may be, and flows would increase 3.6 to 7.8 cfs in the Embarrass River.	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3806	97	The FEIS also fails to analyze cumulative effects on water quality and quantity, which has a particular impact on the 1854 Ceded Territory as a whole. The relevant spatial scale for water quality and hydrologic cumulative effects analysis is the entire St. Louis River watershed, and the Dunka River sub-watershed. These watersheds have experienced substantial historic, current, and proposed expanded mining activities, as well as other industrial, agricultural, and urban development. In addition to the direct surface water and wetland impacts (here meaning loss and/or degradation) from these activities, nearly half of the St. Louis River watershed has experienced hydrologic alteration from extensive ditching. This analysis is particularly important in light of the current expansion of mining (new copper-nickel projects and the expansion of existing taconite operations). It is reasonably foreseeable that an additional 3,000 acres of wetlands within the watershed will be directly impacted by proposed new mining projects and expansions that are in active permitting and/or environmental review: the Project, U.S. Steel Minntac mine expansion; U.S. Steel Keetac expansion; United Taconite Tailings Basin 3 construction; and Cliffs Northshore mine pit expansion. The FEIS also fails to adequately analyze cumulative impacts to the water quality of the Partridge and Embarrass Rivers, much less the St. Louis River. In fact, in Colby Lake (the community water supply for the City of Hoyt Lakes), aluminum, iron, copper, and mercury concentrations already exceed Minnesota WQS.257 Modeled concentrations of arsenic also exceed Minnesota WQS. This existing, large number of water-quality exceedences and the suite of constituents, particularly trace metals, that exceed WQS not only confirm the total lack of remediation for the previous mining activities at the LTVSMC site, but demonstrate the importance of evaluating the cumulative losses to water quality. Community drinking water wells, wetland degradation resulting from dewatering, and pollution of community and private drinking water aquifers by previous mining activity should have been assessed throughout the St. Louis River watershed and Dunka River sub-watershed as part of this Project, as well as for all the other mining projects currently underway. Instead, the FEIS concludes that the Project will meet MN WQS and that “the potential for exceedances of water quality evaluation criteria as a result of cumulative effects from the NorthMet Project Proposed Action and other reasonably foreseeable actions is considered unlikely.”258	S	O
29397	Unique			WAT	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3822	111	The Project will contribute additional sulfate to the Embarrass River from tailings basin groundwater seepage that is not captured and treated; to Second Creek via tailings basin groundwater seepage that is not captured and treated; and the Partridge River through fractures in the mine pit walls once the pit has filled with water, along with stockpile infiltration and run-off. Furthermore, there are other projects (e.g., Mesabi Nugget and Laskin Energy) that are discharging water into the Embarrass River, Second Creek, and the Partridge River with elevated pollutants, including sulfate. Impacts to wild rice in the vicinity of the Project must be more rigorously analyzed and reported, and cumulative impacts to wild rice in the 1854 Ceded Territory addressed. The Project must provide mitigation for impacts to wild rice.	S	O
6124	Form Letter	1	Variant	WAT	Marlise Riffel		447	1	As I read the FEIS, I am not convinced that the NorthMet project will be safe. On page 36 of the Executive Summary, the FEIS identifies 10 gallons per minute of untreated water to be released during closure from the Mine Site and 20 gallons of untreated water per minute released from the Tailings Basin. That's 43,200 gallons of water per day or about 1.29 million gallons per month. An Olympic swimming pool contains 660,000 gallons of water, so this ongoing release of UNTREATED water is the equivalent of 2 Olympic swimming pools per month seeping into Northern Minnesota's groundwater.	NS	X
26457	Form Letter	1	Variant	WAT	Martha Roberts		1318	4	The mining interest and state agencies have failed to evaluate pollution risks to drinking water, fish, wild rice and human health using realistic assumptions about how much polluted seepage will be captured and treated during operations, reclamation, and closure.	NS	X
26457	Form Letter	1	Variant	WAT	Martha Roberts		1320	6	The assessments conducted do not evaluate the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin. Allowing mineral extraction near to the Boundary Water Wilderness Area and posing this kind of threat to the water and environment within and surrounding this irreplaceable designated wilderness area is both immoral and illegal.	S	O

26997	Unique			WAT	Maureen Johnson		1528	7	The FEIS does not tell decision-makers or the public what concentration of acids, salts metals and other components is predicted for the hydrometallurgical process wastes and filtered sludge that would be deposited in the HRF. No documents among the FEIS references model the overall chemistry of the hydrometallurgical residue facility at any relevant time period. Neither the FEIS nor any document identified to date documents apparent verbal explanation of any analysis that was done by any regulatory agency to determin whether the HRF should or should not be characterized as hazardous waste.	S	O
26997	Unique			WAT	Maureen Johnson		1529	8	Humidity cell tests reported in the 2007 RS33/RS65 PolyMet report, using water, rather than hydrometallurgical process fluid/waste fluid, predicted that solid form residues would not reach the level of corrosiveness to be characterized as hazardous. The TCLP is designed for solid waste landfills, and although a required test, the TCLP is different from actual conditions that will exist in the HRF or in the HRF leachate.	S	O
26997	Unique			WAT	Maureen Johnson		1530	9	RS33/RS65....This report concluded, “Eventually, it is expected that acid buffering minerals will be exhausted and the residues will become acidic unless additional buffering capacity is added. (Id., p. 28, 29). Report). Apparently, theoretical calculations will be used to combine lime or limestone with residue prior to disposal in the HRF in the hope that this addition will prevent acid generation from exceeding the neutralization capacity of the residue. (PolyMet 2014r, Residue Management Plan, Dec. 12, 2014, p. 6). It is unknown whether the limestone will be sufficiently distributed into the natrojarosite and whether it will be effective to prevent formation of acidity over time. This approach did not work well enough at two other sites to prevent acidity. In addition, the potential for deposit of any toxic metal ions and formation of toxic metal ions and transport prior to neutralization of acidity has not been addressed.	S	O
26997	Unique			WAT	Maureen Johnson		1532	11	The FEIS does not discuss the chemical composition or process by which the WWTF will produce filtered sludge. I found no analysis of the volume or chemistry of the filtered sludge proposed to be deposited in the HRF. However, levels of sulfates and metals in reject concentrate, even before dewatering to form sludge, indicate that sludge may pose a hazard if released to the environment.	S	O
26997	Unique			WAT	Maureen Johnson		1533	12	I found no estimate of volumes of treatment facility wastes going to the HRF. There is no description found for the detailed management of wastes at the WWTF and WWTP.	S	O
26997	Unique			WAT	Maureen Johnson		1536	15	In all of its pilot tests, PolyMet chose not to collect a representative sample of the hydrometallurgical processing liquid for proper characterization.	S	O
26997	Unique			WAT	Maureen Johnson		1537	16	Minnesota law precludes establishment or construction of either a hazardous waste facility or an industrial solid waste facility in a “wetland” or in a location “where the topography, geology, hydrology, or soil is unsuitable for the protection of the ground water and the surface water.” Minn. R. 7045.0460, subp. 2; Minn. R. 7035.1600. Location of the HRF on top of wetlands is prohibited pursuant to Minnesota rules. There are two directly impacted wetlands located in the HRF covering 7.51 acres (Large Figure 10). The type of direct wetland impact includes fill (100%). The wetland type that will be directly impacted includes shallow marsh (100%) which is currently a low quality wetland. The PolyMet FEIS proposes to construct the PolyMet hydrometallurgical residue facility on two shallow marsh wetlands totaling 36.1 acres.	S	O
26997	Unique			WAT	Maureen Johnson		1538	17	There is also a fault running directly beneath the proposed HRF location. (See Map of Faulted Bedrock and Surface Topography provided by WaterLegacy). Rather than investigate the condition and conductivity of the fault, the FEIS admits no faults at PolyMet have been investigated and assumes with no evidence that the fault will not be a risk to the project.	S	O
26997	Unique			WAT	Maureen Johnson		1544	23	The FEIS fails to provide any analysis of the impacts of liner leakage on modeled water quality. Since the DEIS was released in 2009, the Co-Lead Agencies made the strategic decision that, with a double liner system, it can be assumed “that the Hydromet Facility will have no leakage.” (Water Resources/Groundwater IAP Memo, SDEIS reference MDNR et al 2011b, pdf p. 13). Because “it is assumed that the HRF will have negligible leakage . . there is no reason to model the chemical loading from the HRF.” Thus, “the HRF will not be included as a source in the probabilistic water quality modeling.” (Waste Characterization Data Package, Feb. 13, 2015, FEIS reference PolyMet 2015q, pp. 44, 155) This position is indefensible. ... Even under normal operations, liners leak. The HRF leakage collection system would reduce the amount of leakage passing through the most recently available (2014), technologically more efficient, geosynthetic clay liner, but any leakage through that lower liner would be groundwater seepage. Minnesota Rules do not explicitly prescribe allowable flow rates through liner systems. Maximum allowable permeabilities of equal to or less than 1 x 10-7 cm/sec are typically required by the Minnesota Pollution Control Agency for liner systems. (November 26, 2014,NorthMet Project Geotechnical Data Package (Volume 2) Hydrometallurgical Residue Facility Version: 5. Page 4).	S	O
26997	Unique			WAT	Maureen Johnson		1548	27	The Hydrometallurgical Residue Management Concept lacks and must include ground water monitoring wells to prove no leakage occurs through the lowest geomembrane liner.	S	O
26997	Unique			WAT	Maureen Johnson		1549	37	• The FEIS must be revised to model water quality impacts from the HRF based on a reasonable and conservative range of liner leakages under normal conditions.	S	O
26997	Unique			WAT	Maureen Johnson		1550	38	• The FEIS must be revised to model water quality impacts from HRF discharge in the reasonably foreseeable event of liner failure or stability failure.	S	O
26997	Unique			WAT	Maureen Johnson		1552	28	Leakage through the composite bottom liner will not be detected, since the FEIS has proposed no leakage monitoring specific to the HRF (NorthMet Project Water Management Plan – Plant, Version 4. March 10, 2015 (PolyMet 2015i), Large Table 15 Monitoring Plan – Internal Streams – NorthMet Plant Site). Groundwater monitoring is required at Minn. Rules 6132.2200 REACTIVE MINE WASTE. Subp. 2. Requirements. “A mining operation must meet the requirements in items A to D...C. The reactive mine waste storage facility design shall: ...(2) identify monitoring locations to ensure compliance with the design;”. The NPDES/SDS permit should also include this requirement, since the groundwater in the area of the FTB will also move likely northward to surface water, and a portion of this ground water and surface water will not be captured by the Northwest Toe collected seepage system.	S	O
26997	Unique			WAT	Maureen Johnson		1554	30	The FEIS should assure a schedule for monitoring liquids removed from the leak detection system, or for inspections to ensure that the pumping system is not clogged due to solids accumulation. Although the FEIS p. 5-109, claims, “mitigation measures would be undertaken if there was any indication of potential solute releases to groundwater or surface water” from the HRF, the nature of these measures is not specified.	S	O
26997	Unique			WAT	Maureen Johnson		1555	31	The FEIS must be revised to provide detailed disclosure of the chemical composition and pH of all individual wastes proposed for disposal in the HRF, including but not limited to hydrometallurgical process wastewater and WWTF sludge.	S	O
26997	Unique			WAT	Maureen Johnson		1556	32	FEIS must be revised to analyze the chemical composition of all HRF wastes based on additional leachate testing that reflects the current hydrometallurgical and WWTF sludge formation processes, and must evaluate chemical changes over time.	S	O
26997	Unique			WAT	Maureen Johnson		1562	41	Climate change FEIS p. 4-20, Table 4.2.2-1 with 1986 as the last date of record is 30 years out of date. Leave this in showing the past and add another chart for the missing 30 years to show the difference in climate that must be addressed in this FEIS. A third chart should be created that projects the anticipated climate changes during the life of the proposed project.	S	O
26997	Unique			WAT	Maureen Johnson		1563	42	Major precipitation events must be acknowledged; several 500- and 1000-year events have occurred already: More 500 and 1000 year events can be anticipated to occur due to climate change’s more intensive storms. If all the basins for tailing, hydrometallurgical processing, mine waste water, WWTF and WWTP storage and pre-treatment, and stormwater are designed based only on annual precipitation from before 1987, they are not sufficient to prevent single event volume overflows that contaminate surface water, ground water and soils.	S	O
26997	Unique			WAT	Maureen Johnson		1566	56	PolyMet has not committed to full control of its pollution because it cannot -- the technology is all fully experimental -- that is why they have an "adaptive management" plan -- if one pollution control technique doesn't work, they will try to figure out another -- that is "cost-effective" or, the option is always there, to ask for a variance from the MPCA, and MPCA has been generous with variances	S	O
26997	Unique			WAT	Maureen Johnson		1568	46	PolyMet 2015i, Large Table 5 Estimated Tailings Basin Seepage Water Quality from the South Toe, demonstrates unacceptable readings in the seepage at the South Toe. This indicates monitoring of the ground water should be planned all around the southern edge and at areas downstream that would show the capture at SD026 is adequate to protect ground water all around the outside of the capture zone. 26997	Unique			WAT	Maureen Johnson		1573	51	The FEIS Glossary definition does not match the Chapter 5 text explanation of P90. Neither explains definitively whether the P90 used in the modeling is the P90 of the likely maximum or the P90 of the anticipated concentration range of possibility.	S	O
26997	Unique			WAT	Maureen Johnson		1576	54	Background wells The wells that have been chosen for background are not far enough away to escape influence from the LTV Tailing Basin seepages. The basis for this is the FEIS-admitted fact that Chloride from the TB has been transported all the way to the Embarrass River. This has been going on for many years since the 1950's, so there has been ample opportunity for transport of other light and heavier contaminants especially during spring thaw and heavy rainfall events, on top of molecular dispersion of higher concentrations. Sampling for the range of possible contamination is inadequate and should be part of the plan for remediation of contamination not captured by the Containment System. Appropriate capture of all species of Mercury should be included in all studies.	S	O
26997	Unique			WAT	Maureen Johnson		1578	57	As far as the state legislation mandating long-term economic gain, let's talk about what long-term means: in PolyMet's case, long-term is 500 or more years of having to "mitigate" its pollution, which means pollution will only be partly resolved in waters from the tailing basin, the dump and the mining pits that will turn meromictic...Mining is not a long-term economic gain.	NS	X
26997	Unique			WAT	Maureen Johnson		1583	64	The FEIS admits that TDS and other contaminants will not be controlled unless they are told to do so in permitting. The feasibility and expense of treating these contaminants must be studied, and the commitment of PolyMet to treat them is required in the FEIS.	NS	X

26404	Form Letter	1	Variant	WAT	Michael Kinzer		1310	1	I have had experiences with this kind of mining in Colorado, as I understand it. I have seen the disastrous impact of the leaching out of this kind of poison into the environment. This is a terrible idea for our state, for our environment, for our resources, for our people, for the animals and plants that will not understand why they are dying when they drink the water. I do not trust that there is any adequate way for Polymet or any other mining company to control the effluent that will certainly occur for hundreds if not thousands of years after they have extracted what is profitable. They will be gone and our descendants will be left with the mess, the cancer, the deaths, the depredated environment. You have the capacity to do the obviously right thing. Please do the right thing, the only right thing, and put a stop to this proposal now. If you are not sure whether this is hyperbole, go to Colorado. Go to the Climax Mine above Leadville. Go to Helena Montana. Ask them about swimming in the rivers in and around Missoula. Ask yourself this simple question: is there one single mine of this kind, of this scale, that has a long-term history of safe concealment after they have mined it out? Not one. Sure, there may be examples of mines that are still going in which the company has a strong economic vested interest in keeping things safe. I am talking about a mine in which sulfides encounter the exposed environment, and the mining is long done, and now you have to keep the exposure sealed, to a minimum. The idea is frankly impossible to achieve.	NS	X
29546	Form Letter	1	Variant	WAT	Michael Lein		2548	1	As someone who has spent over 40 years developing environmental protection programs in Minnesota, I strongly oppose the current PolyMet NorthMet copper-nickel sulfide mine proposal. I have seen the destruction that new and old mining practices had brought to the western United states. As an environmental professional who has operated water treatment facilities- and regulated them - I also understand the difficulties in dealing with issues such as water waste treatment and the impacts that result from both technology failure and human error. 24759	Unique			WAT	Nancy Aronson Norr MP	Jobs For Minnesotans	2953	3	The agencies considered the project’s potential effects on air and water quality with respect to human health and identified no adverse health risks. Water modeling shows that PolyMet’s treatment and mitigation plans will meet all water quality standards and prevent acid mine drainage. Furthermore, the FEIS states that any possible groundwater flow would be prevented and therefore will not affect the Boundary Waters Canoe Area Wilderness or Voyageurs National Park.	NS	X
30459	Form Letter	1	Variant	WAT	Nancy Feldis		389	1	Save the Boundary Waters!!!	NS	X
12638	Unique			WAT	Nancy Gibson		767	2	Secondly, the issue of the quality of water has been marginally addressed. Polymet’s designs are no different than the open pit collapse of the Mount Polley copper mine in British Columbia and the November spill of an iron mine in Brazil. It is not state of the art mining as stated in their presentations. What is different? The quantity of water will be immense and the impact on groundwater and surface water in the era of global climate change needs clarification. Where is it coming from and then the outflow modeling.	NS	X
7	Unique			WAT	Nancy Karjalahti		12	1	We need you to protect the waters for future generations. This is a bad thing, look at their track record. What little jobs this will provide will never make up for the amount of money it will take to clean up (if you can) the waters that will be polluted.	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3284	5	As detailed in extensive comments submitted by tribal cooperating agencies to the Co-lead agencies over the past eight years, water quantity and water quality analyses for both the Mine Site and Plant Site are inadequate. Subsequent water modeling results, whether deterministic (DEIS) or in the form of probability distributions (SDEIS, FEIS) are based on flawed understanding of hydrology. One example of this flawed understanding is the error in baseflow calculations, which is carried forward in the MODFLOW hydrologic modeling.6 At the mine site, MODFLOW under-predicts the amount of water that would flow into the mine pits and thus under-predicts the amount of water treatment needed for both short and long term closure. Most of the deficiencies in hydrologic characterization and water modeling dating from the 2009 DEIS and the 2013 SDEIS persist in the 2015 FEIS.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3285	6	But perhaps the most stunning deficiency of this environmental review process has been the continued application of the fundamentally flawed MODFLOW model, which the Co-lead agencies have long maintained was intended only to predict mine pit inflow, but which was inappropriately used for numerous other purposes (i.e., defining contaminant flowpaths from the mine pits at closure; using those flowpaths to define the Area of Potential Effect for cultural and cumulative impacts analysis; critical inputs to the GoldSim water quality model). The MODFLOW model cannot generate reliable outputs for these and other environmental impact predictions, because it was calibrated to conditions that did not exist at the same point in time: water levels in the Northshore Peter Mitchell taconite pits from 1996, and Partridge River baseflows from 1979-1988. Furthermore, the MODFLOW model fails to incorporate the Peter Mitchell pit elevations predicted for closure conditions, which will be 300 feet lower than the bottom of the NorthMet pits. The PolyMet engineers’ approach, which has become the Co-lead agencies’ approach in the FEIS, is in conflict with accepted modeling methodology and represents an unacceptable calibration error.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3286	7	Because of refusal on the part of the Co-lead agencies to properly calibrate the MODFLOW model for the Mine Site, GLIFWC staff undertook independent review of the MODFLOW model in order to better characterize the hydrology at the Mine Site and understand potential environmental impacts from the Proposed Project and at closure8. By simply correcting the calibration error in PolyMet’s model, the model generates results showing clearly that the majority of bedrock groundwater flow from the NorthMet pits and the permanent Category 1 stockpile will move north from the Mine Site towards the Peter Mitchell pit, which outflows to Birch Lake in the Rainy River/BWCAW basin, not south as shown in the FEIS. This fundamental discrepancy invalidates any conclusions in the FEIS about Mine Site water quality at closure, and the lack of any analysis of impacts to Birch Lake and the BWCAW is a major FEIS deficiency.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3287	8	Despite tribal analyses that firmly dispute this characterization of groundwater hydrology at the Mine Site, the Co-lead agencies have concluded that their flawed approach represents the most likely scenario, but that any future evidence that groundwater is flowing northward towards the Peter Mitchell pit could be solved through “contingency mitigation”11such as grouting pit walls, lowering West Pit and/or East Pit water levels, groundwater extraction wells, or artificial recharge. Unfortunately, each of these potential contingency mitigation actions, individually or in combination, actually represents a significant departure from the existing Project, as it has been defined for environmental review. There has clearly not been adequate evaluation or analysis of the relative feasibilities, never mind costs, associated with these alternative mine/reclamation plans, to fulfill NEPA requirements.	S	O

27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3288	9	Actually, the Co-lead agencies eventually agreed that GLIFWC’s MODFLOW analysis is correct, and that the northward flowpath would result when the correct Peter Mitchell pit elevations are used for calibration. ¹² But they have also put forward, as their official position, the Project Proponent’s rationale for the unlikelihood of northward groundwater flow at closure: that a groundwater mound would form in the bedrock underlying the Hundred Mile Swamp (north of the Mine Site), and this mound would prevent northward flow of groundwater at closure ¹³ . This scenario is physically impossible, but despite repeated requests by the tribal cooperating agencies to have a technical discussion with the Co-lead agencies about this theoretical groundwater mound, they have flatly refused to do so. It is truly unfortunate, in the context of an environmental impact disclosure process, that this absurd basis for rationalizing the dismissal of a valid technical criticism has apparently justified the Co-lead agencies ‘waving away’ serious consideration of likely Project impacts. This conclusion represents a new Major Difference of Opinion between the tribal cooperating agencies and the Co-lead agencies that is not presented in Chapter 8, and the tribes have presented sufficient evidence to justify the need for independent analysis of the Project’s hydrologic characterization.	S	N
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3289	10	At the Plant Site, insufficient consideration of bedrock fracture has resulted in claims of virtually complete seepage collection by PolyMet engineers ¹⁵ , and this conclusion has been accepted by the Co-lead agencies and presented in the FEIS ¹⁶ . However, no bedrock monitoring wells were installed near the tailings basin. Storage coefficients used to model the entire Plant site area are not consistent with any peer reviewed scientific literature.	S	N
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3290	11	The FEIS assumes that 100% of tailings surface and groundwater seepage would be captured on the east side and south side of the tailings basin, ¹⁷ and that 100% of the surface seepage and 90% of the groundwater seepage would be captured at the north, northwest and west toes of the basin. ¹⁸ These assumptions are not consistent with expert opinions from geologists, submitted in response to the SDEIS. For example, geologist J.D. Lehr was critical of the “simplistic and cursory treatment of the role that bedrock fractures may play in the transmission of groundwater” at the tailings basin, and objected to the assumption of a “no-flow boundary” underneath the basin, which implied that groundwater flow through bedrock at the site “is so insignificant that it can be ignored”. He considered a “major omission” the failure to identify fractures or assess groundwater flow through fractured bedrock, and noted that the result was “unsupported assumptions and inadequate information regarding groundwater flow at the tailings waste site”. He was also critical of the failure to include any hydraulic testing of bedrock, and emphasized that “what the SDEIS requires is data.” Based upon his professional expertise in regional geology, Lehr concluded “bedrock fractures will play a significant role in groundwater and contaminant transport” at the tailings basin.	S	O

27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3291	12	The Project XP-SWMM model is based on a stream gauging station for the Partridge River that is seventeen miles from the mine site and the data from that station are twenty years old ¹⁹ ; and stream gauging data for the Embarrass River that is based in data that is more than fifty years old from eleven miles downstream. ²⁰ Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site. This baseline hydrologic data deficiency has been carried forward from the 2009 DEIS and the 2013 SDEIS, despite ample time and opportunity to collect sufficient new hydrologic data.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3292	13	In a report comparing predicted and actual water quality at hard rock mines, two types of characterization failures were identified that led to differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began. ²⁶ These included: (1) insufficient or inaccurate characterization of the hydrology The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size. ²⁷ (2) insufficient or inaccurate geochemical characterization of the proposed mine. ²⁸ The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy. ²⁹ The primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. The NorthMet FEIS includes all of these characterization failures.	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3295	15	Evidently, the public is expected to uncritically accept the Project proponent’s conclusion that a 700-ft deep open pit sulfide mine, with a 526-acre permanent reactive waste rock stockpile, a pit lake requiring water treatment in perpetuity, a tailings basin that has already contaminated ground and surface water that now will also host reactive sulfide tailings, and a permanent hazardous waste facility constructed within a wetland, will collectively result in only two exceedances of water quality standards – and they are not even directly attributable to the Project Proposed Action! This astonishing conclusion is a result of flawed modeling assumptions (baseflow, hydraulic connectivity, etc.), dubious decisions on data usage (omitting ‘outliers’, concentration caps, etc.), fuzzy compliance thresholds, and inordinate reliance on engineering controls that must perform flawlessly, most of them in perpetuity. In short, the assurances provided in the FEIS Executive Summary are not supported by the underlying analysis. Surface water quality remains insufficiently characterized or left uncharacterized, and the defects in analysis are profound in this area. The limited data used indicates that surface waters have already been adversely impacted by mining activity, which should give rise to more scrutiny, not less. ³⁰ Contaminant transport modeling suggests that the Project will cause manganese, aluminum, and sulfate to exceed Minnesota Water Quality Standards (“MN WQS”). ³¹ Mercury, sulfate, and specific conductance already exceed surface water criteria in surface water samples collected near the tailings basin at nearby Area Pit 5, and mercury and aluminum exceed surface water criteria in the Partridge River downstream of Colby Lake. ³² Aluminum, iron, manganese, and mercury all exceed MN WQS in Colby Lake. ³³ Contaminants from the Project will likely contribute additional loading to these existing exceedances of MN WQS in the Embarrass River, Colby Lake, and the Partridge River. It appears that, as a result of the Proposed Project, arsenic will exceed drinking water standards in Colby Lake. ³⁴ There have not been any water samples collected from lakes in proximity to the tailings basin (Hiekillia, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies.	S	O
				WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3296-1	16	The claim that 100% of the seepage from the tailings basin can be captured is implausible and is unsupported by authority. The Tribes requested that the Co-lead agencies or their contractor provide references for a similar facility to the 90% or greater capture efficiency rate they were confident could be achieved (which was also claimed in the SDEIS); they were not able to provide a single example from anywhere in the world. The Co-lead agencies provided a single citation from a USEPA guidance document (generally intended to inform solid waste sites) that revealed: [M]ost barriers in the study have been in place for fewer than 10 years; therefore, long-term performance can only be extrapolated... All sites included in the study were existing sites that had vertical barriers and, in many cases, caps. None of the sites has an engineered bottom barrier. Therefore, the effect of leakage through aquitards was not evaluated in this study. Regardless of this study’s applicability (or lack thereof) to seepage capture systems proposed for the PolyMet Project, the EPA found that 10% of the reviewed containment systems failed to meet the desired performance objectives and required corrective action. An additional 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not. There is no information on the effectiveness of any of these facilities at timeframes remotely comparable to what will be required for PolyMet. In the EPA study, ‘long term’ is considered 30 years, whereas the seepage capture requirements for PolyMet facilities are on the order of centuries for the flotation tailings basin and category 1 stockpile, and in perpetuity for the hydrometallurgical residue facility. None of the facilities in the study are as large as the one proposed by PolyMet. A search for examples similar to the Project Proposed Action identified the Zortman-Landusky mine in Montana, which installed containment and pumpback systems to be used in conjunction with a wastewater treatment facility. However, they “did not capture all surface and subsurface drainage”. At the Molycorp, Inc., mine site in New Mexico, “The pathway for contaminant migration is the leaching of tailing seepage downward from the tailing facility to ground water that migrates through fractures to surface water.” Examples of similar seepage capture systems installed and operating in northeastern Minnesota are at the US Steel-MINNTAC tailings basin, and the former LTV tailings basin seep SD0026 (the same tailings basin PolyMet proposes to re-use), and demonstrate capture rates of less than 60%. The US Steel - MINNTAC tailings basin is of similar age and design as the former LTV tailings basin that PolyMet proposes to reuse. Both are large, unlined facilities that are designed to allow massive volumes of water to seep to surface and groundwater in order to maintain structural stability.		
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3296-2	16	Both facilities have been discharging many thousands of gallons per day of high sulfate wastewater into the environment for decades. US Steel-MINNTAC, as required under a schedule of compliance for their long-outdated NPDES permit, has begun constructing a multi-phase seepage capture system that is intended to bring the facility into compliance with applicable water quality standards. The capture system is similar to the one proposed by PolyMet, in that it consists of a trench for capturing seepage and a pumping system that would return tailings effluent back into the facility. The US Steel-MINNTAC system was originally intended to extend to bedrock, but that proved impossible in some locations because of the presence of large boulders within the glacial till that hindered construction. Because the surficial geology is similar at the LTV facility, it is likely that similar difficulties will be encountered by PolyMet, which will significantly decrease expected seepage capture efficiency. It is important to note that seepage capture of greater than 95% would be required at MINNTAC in order to achieve compliance with applicable water quality standards. However, at this facility, this high capture efficiency was concluded to be infeasible, and MINNTAC predicted that their capture efficiencies would not exceed 60%; actual performance of the capture system is below 50%. The primary purpose of this system was to achieve compliance with MN WQS, yet the capture system alone will not be able to achieve that goal. The primary purpose of the seepage capture at the Proposed Project is to achieve compliance with MN WQS, but it is not likely to be successful, based upon limited but relevant regional experience. The FEIS acknowledges that seepage from the existing LTV tailings basin continues to drain south to Second Creek long after LTV operations have ceased ⁴⁷ . PolyMet and the state regulatory agencies are fully aware that that this seepage pumpback system is not nearly as effective as claimed in the SDEIS ⁴⁸ . According to MPCA staff, the pumpback system has not resulted in the water quality improvements required under the Consent Decree, so there are two modifications currently proposed by Cliffs Natural Resources: 1) dewater the pond that is an additional source of water contributing to water quality concerns (pending a US EPA wetlands determination); or 2) create an additional barrier (dam) for seepage collection and pumpback between the existing dam and monitoring station SD026. ⁴⁹ But the need for evaluating water quality impacts is simply dismissed by the statement “PolyMet has committed to future upgrades to achieve 100% capture by this system if the NorthMet Project Proposed Action is approved.” ⁵⁰ There has been no bedrock hydrogeologic study at this site to even determine what possible engineering alternatives would be effective in capturing 100% of the seepage that surfaces to the south of the tailings basin.	S	O

27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3297	17	There is simply no evidence to support the rosy scenario that PolyMet will be able to capture 97% of the shallow seepage and 90% of the deep seepage from an unlined, purposefully 'leaky' tailings basin, despite the Co-lead agencies' assurances. The FEIS has not adequately evaluated the impacts of polluted tailings basin seepage to Second Creek and the Partridge River.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3299	18	The unsupported prediction of complete seepage capture efficiency is unfortunately carried forward into other critical analyses. The FEIS claims that construction of a groundwater containment system along the north, northwest and west sides of its unlined tailings basin "would capture virtually all of the Tailings Basin seepage presently flowing in those directions to restore water quality" (FEIS 5-186 (based upon PolyMet 2015(d)). Without even a single bedrock monitoring well installed to confirm or deny this assumption, the FEIS maintains that this is prediction is "conservative", because the modeling done by PolyMet assumes that bedrock hydraulic conductivity is "negligible" (FEIS p. 5-29). Disturbingly, the tailings basin model uses storage coefficients that are not found anywhere in peer reviewed scientific literature ⁵¹ .	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3300	19	These parameters are highly critical for establishing a reliable model, because the volume of groundwater that a geologic formation can contain (storativity or storage coefficient) and the rate of flow (hydraulic conductivity) are functions of the amount of open pore spaces or fractures/faults in rock, the quantity of water that infiltrates from the surface, and the groundwater gradient. The storage coefficient incorporated in the plant site model (including the tailings basin) for bedrock is 0.20, and for the surficial deposits 0.0002 (FEIS 5-46, Table 5.2.2-9), suggesting that the bedrock contains several orders of magnitude more water than the surficial deposits. When questioned about these extraordinary storage coefficients, the Co-lead agencies' explanation was that the model was "calibrated to match predicted and measured groundwater levels". Essentially, this model is simulates a bedrock 'storage tank' where large volumes of water go in but virtually nothing comes out. Since this is not conceptually accurate, the modeled hydraulic conductivity and/or modeled storage coefficients cannot be relied upon to estimate the amount of seepage that will bypass the seepage capture system, or the amount of time before seepage upwells to surface waters in adjacent wetlands and the Embarrass River, where MN WQS must be met.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3301	20	The FEIS maintains that mine pit dewatering impacts will be very limited or non-existent based on an assumption carried forward from the DEIS that there is little or no connection between the bedrock and surficial aquifers. This assumption is based solely on an unsupported "professional opinion," when in fact there is ample evidence that there may be substantial connection between the bedrock and surficial aquifers. Such a connection indicates that dewatering the mine pits could cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3302	21	Tritium and unionized ammonia nitrogen were found in water samples collected from two deep boreholes in the area where the Project mine pits will be located. Both tritium and unionized ammonia are classic indicators for a strong connection with surface water. Tritium indicates water found in the deep boreholes was surface water that originated post-1952, during or after nuclear testing. The boreholes are approximately one mile southwest of the Peter Mitchell Pit, which is the closest and most likely source of this pollution. Production at the Northshore mine started in 1955. Review of the Peter Mitchell Pit discharge monitoring data for SD001 from 2006 and 2008 shows the average concentration of unionized ammonia exceeded their 0.04 mg/l NPDES permit limit. Unionized ammonia and tritium in the deep boreholes suggest that travel time of contaminants through bedrock fractures will be on the order of decades, not the hundreds or thousands of years that are assumed in the FEIS. Impacts to surface waters, groundwater, and wetlands for a Project of this size and complexity demand a scientific, data-driven approach rather than one based on opinion and scant, selectively used data.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3303	22	The lack of fracture and fault analysis remains a major deficiency in this FEIS. The map provided by GLIFWC in their SDEIS comments, Geologic Faults at the PolyMet Mine and Plant Site ⁵⁹ , indicates: 1. There are several faults extending from Northshore pits to the PolyMet mine site. This may explain why there is ammonia and tritium in the deep borehole samples. 2. There is an inferred fault running right through the area of the Hydrometallurgic Residue Facility. (Not only is the HRF proposed to be constructed within wetland, with a buried stream and springs, but it will also be receiving seepage from the tailings basin and it could be geologically predisposed to facilitate groundwater movement. 3. There is a fault system right where water would exit the tailings basin on the east side. Notice that the inferred fault may connect to other fault systems running east-west to the south of the facility.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3306	23	The FEIS also diminishes the lessons learned from the Dunka Pit, located on the former LTVSMC site approximately five miles north and east of the PolyMet Project mine site. Within the Dunka Pit, LTVSMC contacted the Duluth Complex and the Virginia Formation while mining for taconite in the Biwabik Iron Formation. ⁶⁰ By 1991, LTVSMC had removed about 50 million tons of Duluth Complex material from the Dunka pit and placed it in "gabbro" stockpiles. ⁶¹ Monitoring of the drainage from these stockpiles beginning in 1976 revealed a decrease in pH and an increase in trace metals. ⁶² Copper and nickel concentrations as high as 1.7 and 40 mg/l respectively were observed in seepage/run-off from the Duluth Complex waste rock stockpiles and pH was observed as low as 5.0 at seep 1 between 1976 and 1980. ⁶³ Most of the seepage from waste rock piles at the Dunka site was discharged to Bob's Bay in Birch Lake via Unnamed Creek. ⁶⁴ A 1976-1977 study of trace metals in Bob's Bay found that concentrations of copper, nickel, cobalt, and zinc in the water of the Bay were higher than regional average concentrations and decreased with distance from the mouth of Unnamed Creek. ⁶⁵ Additionally, it was determined that Unnamed Creek contributed more than 90% of the trace metals load to Bob's Bay. ⁶⁶ The NPDES permit for this discharge expired in 2005 ⁶⁷ and another variance request is expected. A WWTF located at the site has been inactive because Cliffs Erie, LLC, the owner who acquired the property from LTVSMC, declared bankruptcy and claims it is simply too expensive to continue running. ⁶⁸ Unfortunately, the passive wetland treatment system did not function well enough to remove nickel and copper in waters still discharging from the mine pit and stockpiles to a concentration that complies with MN WQS.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3307	24	The potential for water quality impacts from prospecting and mining operations that have contacted the Duluth Complex have long been known to the MNDNR and MPCA. The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5-volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex. Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were unheeded when the technical documents and FEIS were drafted for PolyMet.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3310	25	Similarly, the Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. ⁷² The study clearly identified those state ground and surface water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present; it prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source; and it rejected using natural wetlands for mine effluent treatment ("as a toxic metals dumping ground"). ⁷³ The tribal cooperating agencies have also consistently elevated our concerns for the Proposed Project's potential to adversely impact groundwater quality and quantity. "Groundwater maintains stream flows and wetlands during dry periods, supporting significant ecosystem functions. Groundwater is an important source of drinking water in the Great Lakes Basin, where 8.2 million people, or 82% of the rural population, rely on groundwater for their drinking water." ⁷⁴ In Minnesota, all groundwater is protected for drinking water supplies, "constituting the highest priority use, and as such, to provide maximum protection to all underground waters." ⁷⁵ When considering water allocations, drinking water is supposed to be considered the highest priority by the MN DNR. ⁷⁶ According to MPCA's groundwater profile for Northeastern MN including the Project area: "Glacial aquifers are commonly thin and limited in their extent and yield. Bedrock aquifers have limited yield, generally from fractures; groundwater movement is difficult to define. There are no large-scale regional aquifers. The Biwabik Iron Formation is the only source of groundwater for many Iron Range cities." ⁷⁷ Yet despite the importance of this critical resource, the FEIS has not adequately evaluated the potential for impacting drinking water sources, and it is clear from the state regulatory agencies' uncertainties about the frequency, volume, and water quality of other mine discharges (i.e., the Peter Mitchell Pit) even while regulated under permits, that this issue remains a significant deficiency in the FEIS analysis.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3311	26	The tribal cooperating agencies have consistently raised concerns about reactive dust and ore fines along the Transportation and Utility Corridor, and potential for water quality impacts to the three streams and wetlands that are crossed within the corridor. Yet these concerns have been repeatedly kicked back and forth between the Air IAP and Water Quality IAP work groups, with neither group ultimately resolving the information and risk analysis gap. The end result of this 'oversight' in the FEIS is that little consideration, discussion, or proposed management of this potential water and wetland quality impact is provided for the public to review.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3312	27	"An estimate of the spillage of ore fines along the rail corridor is provided in Section 8.4.3 of the Waste Characterization Data Package (PolyMet 2015q). Assuming that all spillage of the coarse material would occur in a 2-meter-wide strip on both sides of the centerline of the railway (total width equals 4 meters) over the entire haul distance after loading (approximately 8 miles or 13,000 meters), results in approximately 0.11 kilograms per square meter (kg/m2) of ore fines annually or 2.14 kg/m2 for the 20-year NorthMet Project Proposed Action. This equates to 0.002 inch of depth annually or 0.05 inches for the 20-year NorthMet Project Proposed Action". (FEIS page 5-313). However, the above FEIS language is incorrect because PolyMet 2015q, Section 8.4.3 (page 101) actually says "Assuming that all spillage occurs in a 2 meter wide strip along this portion of the rail corridor, it is estimated that approximately 2.78 kg/m2 could spill annually or 55.7 kg/m2 over the life of the Project. This is equivalent to 1.25 inches of spilled material over a 2,000 m2 area". The values of "total width = 4 meters", "0.11 kg/m2", "2.14 kg/m2", "0.002 inch of depth annually" and "0.05 inches deposited for the 20-year Project" mentioned in the FEIS actually come from a different document - PolyMet 2015b (page 57, Section 5.2.3.2.1). These numbers also appear in Attachment D to PolyMet 2015b, which is a 2012 memo from Barr Engineering (PolyMet 2015b, page 259/273). There are three issues that arise from the above discussion. First, the FEIS incorrectly references its estimated deposition values. Second, there has been no discussion of the differences between what is stated in PolyMet 2015b and PolyMet 2015q, nor any discussion of why the lower overall numbers from the older document (the Barr memo from PolyMet 2015b was dated December, 2012, while PolyMet 2015q is dated February, 2015) were chosen for inclusion in the FEIS. Third, there has been no discussion of the fact that there will be 55.7 kg/m2 of potentially reactive dust deposited near the rail line over the estimated life of the mine. The FEIS does not include this number at all.	S	N
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3313	28	Regardless of the 'footprint' of the equalization basins, the liner leakage estimate of 5 gallons per acre per day (gpad) is not consistent with what we have found in the literature for the maximum allowable, or "Action Leak Rate", above which a leak must be found and repaired.	S	O

27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3315	29	US EPA terms this the ‘de minimis’ leak flow rate, which for a reference evaporation pond 70 acres in area and with an average depth of 30 feet is 28 gpad , or a total of 840 gallons per day for a 0.040-inch thick HDPE geomembrane.81 The Band was unable to find detailed designs for the equalization basins in either the Adaptive Water Management Plan or the Water Management Plan – Mine (PolyMet 2013i), to determine the size of the basins or specifications for the proposed geomembrane liner system, but it is fundamentally understood that all liners leak. Some liners are damaged during installation, but most damage occurs when the liner is covered by drainage or protective soil.82 The relevance to water quality predictions is again linked to model inputs. The west equalization basin receives highly contaminated process water from stockpile liner drainage, OSP liner and reject concentrate (brine) from the WWTP, all with high levels of sulfate and metals. The east equalization basin receives drainage from the haul roads, the RTH, pit dewatering and the Category 1 Waste Rock Stockpile drainage, with relatively lower sulfate and metals concentrations but still requiring ultrafiltration/nanofiltration.83 If a substantially higher (and more realistic) rate of concentrated contaminant leakage to groundwater is incorporated into the mine site water model, it would likely result in significantly different water quality model predictions.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3319	39	It is clear that the NorthMet Project Proposed Action would require long term treatment of water at both the Plant and Mine Sites. The minimum duration of this treatment is on the order of centuries, but the FEIS does not provide an estimate of when mechanical treatment would no longer be needed to meet MN WQS. Therefore, as provided in multiple comments on the preliminary SDEIS, Fond du Lac conservatively assumes that water treatment for the proposed PolyMet mine is perpetual and the FEIS should be clear on this issue.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3320	33	Despite years of raising concerns for mercury mobilization and increased methylmercury release from excavated peat soils at the Overburden Storage and Laydown Area (OSLA), this mercury source is completely missing from FEIS Fig. 3.2-12 (Water Management Schematic – Initial Years of Operations – Approximately Years 1-11). A significant portion of the pulse of mercury released to the surrounding environment will neither be contained nor captured; rather, it will flow unabated through surficial till to the Partridge River and contribute to existing mercury impairments in fish and water. Table 5.2.2-27 indicates that the groundwater flow rate from the OSLA would be 14 gpm. Further, the FEIS does not evaluate the effect of peat overburden storage on methylmercury formation, through recurring wetting and drying cycles that not only release stored mercury, but also regenerate sulfate89 and promote mercury methylation. This recurring deficiency in the Project mercury mass balance is unacceptable.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3321	34	The FEIS also assumes that existing tailings in the LTV Tailings Basin will indefinitely adsorb mercury. However, the data in Tables 4.2.2-23, 4.2.2-24 and 4.2.2-35 clearly demonstrate that existing seepage mercury concentrations exceed the GLI standard, and are higher than many of the data shown for most of the tributary streams. Coupled with the lack of confidence in predicted seepage capture rates, Tailings Basin seepage is another source loading that has been greatly underestimated in the FEIS analysis.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3326	41	In addition to water treatment, there will also need to be a substantial investment in long-term or perpetual operation, maintenance and replacement of other environmental controls for the Project, including seepage capture and pumping at multiple locations at both the mine site and plant site, repair and replacement of liners, managing appropriate stream augmentation and Tailings Basin pond elevation, and pumping, treating, and disposal of seepage from the HRF: The rate of drainage would decrease over time as the pore water within the hydrometallurgical residue is collected and removed. Once the entire facility is closed, the volume of water from the drainage collection systems would decline. In the long term, the volume of water requiring treatment would decline to the point that the remaining reclamation activity may consist of periodic pumping of remaining drainage into tank trucks for transportation, treatment, and disposal, as appropriate, and of inspection of the closed cells to verify integrity of the reclamation systems. ...The water quality of both mine pits, however, is predicted to improve over time as the pits become flooded, thereby effectively eliminating oxidation of the pit walls, the primary source of solutes, except for the upper few feet where water levels may fluctuate. Figures 5.2.2-41, 5.2.2-42, and 5.2.2-43 show how the water quality in the West Pit is predicted to improve over time for three representative solutes: cobalt, nickel, and sulfate. It is expected that eventually the solute concentrations in the pits would stabilize to more or less steady-state values, although the timeframe for this would likely be greater than 200 years as indicated by Figures 5.2.2-41 to 5.2.2-43, which show solute concentrations continuing to decrease at year 200, although still above the evaluation criterion. These predicted improvements in water quality suggest that the WWTF may not need to operate permanently, but that at some point, non-mechanical treatment systems may be sufficient to meet water quality based effluent limits. The FEIS frequently states the long-term goal is to transition to non-mechanical treatment, but there is little evidence to suggest that current treatment technologies can consistently treat large volumes of water to meet WQS. Furthermore, constructed wetlands would require substantial acreage to handle the volume of wastewater that will perpetually be collected, and do not function well in our cold climate for at least half of the year (when vegetation is not actively growing). They are not likely to be able to treat wastewater sufficiently to consistently meet water quality standards, including the wild rice sulfate criterion. Given the absence of scientific or evidentiary support, it is irresponsible for the FEIS to sustain the myth that long-term water quality maintenance at the Project area can ever transition to non-mechanical treatment.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3327	67	Another inadequacy of the FEIS is its failure to predict impacts from sulfate from both fugitive dust and railcar spillage on methylation of mercury in wetlands and waters on-site.	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3329	42	However, the true legacy of this Project, should it be permitted and operated, will be the unquantified volume and mass of contaminants that will be released to groundwater, untreated and in perpetuity, in both the Partridge and Embarrass River watersheds (and ultimately the St. Louis River), and to the north (and ultimately the BWCAW). Some of this contaminated groundwater will ‘daylight’ to surface water features, including streams and wetlands, and will result in unacceptable hazard to aquatic species and wildlife dependent upon these waters. This is not conjecture; existing ferrous mines have already adversely impacted surface and groundwater resources (private drinking water wells near the tailings basin; aquatic life use impairments identified in the final MPCA 2012 303(d) list) from what the regulatory agencies consider relatively ‘benign’ ore bodies and the customary permitted mining practices (i.e., storage of waste rock, “leaky” unlined tailings dumps). Contaminant loads from even this low-grade, disseminated sulfide ore will be significantly more toxic than the releases that Minnesota waters have received over the past century of ferrous mining. Furthermore, peak concentrations in this contaminated groundwater won’t reach surface waters until many decades after closure. There is no analysis in the FEIS that acknowledges, let alone addresses, the perpetual and uncontrolled release of highly contaminated groundwater, affecting water resources far beyond the Project boundary. The FEIS requires substantially more public transparency and less equivocation on what is arguably one of the most fundamental issues at stake for this Project: how long will the company be required to flawlessly operate and maintain expensive mechanical treatment to comply with MN WQS? Clearly there are other engineering controls and management actions that will also have to operate faultlessly and that will require maintenance in perpetuity (seepage collection, liners, pumps, waste rock stockpile cover systems, waste disposal, stream augmentation, Tailings Basin pond elevation management). This singular issue has significant repercussions for the public interest determinations and the scale of required financial assurance.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3333	47	The initial description of wild rice’s preferred habitat and life cycle118 is strangely silent on one of the most significant - and regulated - water quality parameters under evaluation for Project impacts: sulfate. The Co-lead agencies acknowledge that distribution and abundance of wild rice is dependent upon specific habitat requirements, including “Water chemistry – wild rice grows within a wide range of chemical parameters; however, productivity is highest in water with a pH of 6.0 to 8.0 and alkalinity greater than 40 mg/l “(FEIS 4-31). Yet there is no background or context provided for the section titled Regulations Applying to Waters that Contain Wild Rice. Minnesota’s sulfate criterion for the protection of wild rice waters has been in approved state rules since 1973, and has been the subject of considerable controversy, legislative overreach, and accelerated experimental research throughout the entirety of the PolyMet environmental review process. The tribal cooperating agencies have, concurrently with our involvement as cooperating agencies for the EIS process, been engaged with the MPCA in consultation on the state’s legislatively-directed water quality rules revision for wild rice waters. In fact, our very legitimate concern for new sulfate loadings to wild rice resources in the ceded territories originates with documented impacts from existing hard rock (ferrous) mining and patently inadequate regulatory oversight to protect this significant cultural and subsistence resource.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3334	48	The Band has consistently challenged the conclusion that the NorthMet Project will not result in damage to wild rice waters in the Partridge and Embarrass Rivers and their watersheds. Our skepticism arises from growing knowledge of the extent to which state and federal regulatory agencies have consistently failed to enforce standards and regulations on the mining industry that are intended to protect wild rice. We have exhaustively commented on the specific threats of this Project from the very beginning of our involvement as a cooperating agency, and our previous concerns are carried forward to the FEIS, despite the inclusion of engineering controls and water treatment. It is commendable that PolyMet has committed to constructing wastewater treatment plants that include reverse osmosis, which has the potential to meet the low sulfate effluent limit if designed and operated properly, including at the Mine Site at year 1. But the damage to wild rice will be just as real and just as permanent if it results from inadequate regulatory controls, as if it results from inadequate engineering controls.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3335	49	Minnesota tribes have engaged in consultation with the MPCA on this culturally vital issue and provided recommendations for better protection of the wild rice that remains across a much-diminished range. The tribal cooperating agencies have engaged in consultation with the federal Co-lead agencies under Section 106 of the National Historic Preservation Act, continually elevating the need for protection of all remaining wild rice in the 1854 Ceded Territory. During consultation the Bands have provided information about tribal wild rice harvest in the Embarrass River far upstream of where the MPCA has recommended as ‘waters used for the production of wild rice’. The wild rice sulfate standard must apply throughout the Embarrass River watershed. The scant remaining stands in the upper reaches have already been severely impacted by previous mining disturbances and continued releases of high-sulfate water, and are in need of restoration.	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3336	50	This contorted interpretation of ‘compliance’ under the Clean Water Act is not defensible. The NorthMet Project Proposed Action must meet MN WQS, including the sulfate criterion to protect wild rice. The FEIS fails to acknowledge that under the Clean Water Act, the state of Minnesota is required to bring impaired waters into compliance through TMDLs and other watershed restoration actions. The existing LTVSMC tailings basin, along with other inactive mine features, is clearly causing an exceedance of the wild rice sulfate criterion and has led to the decline in stand density and productivity within the watershed. The CEC scenario is not representative of the state’s CWA obligations to restore impaired beneficial uses. As stated previously, our concerns for protecting wild rice within this region of the 1854 Ceded Territory is based as much upon inadequate implementation of MN WQS protections, as upon the high likelihood that surface and groundwater discharges from the Project will exceed MN WQS. We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact.	S	O

27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3348	65	Further, the FEIS confuses the results from PolyMet 2015b and PolyMet 2015q. The FEIS statement: “An estimate of the spillage of ore fines along the rail corridor is provided in Section 8.4.3 of the Waste Characterization Data Package (PolyMet 2015q). Assuming that all spillage of the coarse material would occur in a 2-meter-wide strip on both sides of the centerline of the railway (total width equals 4 meters) over the entire haul distance after loading (approximately 8 miles or 13,000 meters), results in approximately 0.11 kilograms per square meter (kg/m2) of ore fines annually or 2.14 kg/m2 for the 20-year NorthMet Project Proposed Action. This equates to 0.002 inch of depth annually or 0.05 inches for the 20-year NorthMet Project Proposed Action” 137 is incorrect because these results actually came from PolyMet 2015b. What PolyMet 2015q finds is different. See PolyMet 2015q, Section 8.4.3 - “Assuming that all spillage occurs in a 2 meter wide strip along this portion of the rail corridor, it is estimated that approximately 2.78 kg/m2 could spill annually or 55.7 kg/m2 over the life of the Project. This is equivalent to 1.25 inches of spilled material over a 2,000 m2 area”. The FEIS also leaves out any mention of the 55.7 kg/m2 value. Additionally, the FEIS (page 5-164) states that the spilled material would become rapidly depleted of sulfide materials compared to the waste rock stockpiles. This statement offers nothing in the way of quantification of the amount of sulfide that would be released, nor does it address the metals that would also leach from the material. As mentioned above, PolyMet 2015q predicts that metals concentrations have the potential to exceed water quality standards for four metals: aluminum, cobalt, copper, and nickel. On the basis of this and the above arguments, the Band believes that the FEIS does not adequately address this topic. The FEIS discusses refurbishment of existing ore cars that would reduce spillage by 97%, to 0.20 tons per year. (PolyMet 2014a)”. The Band proposes that this modification requirement be incorporated into the final permit for the facility. The FEIS states that most of the potential spillage from the rail cars will occur within the first 1,000 meters of rail from the Rail Transfer Hopper (page 5-164). The Band disagrees with this assessment. “The Fugitive Dust Risk Management Plan (FDRMP) for Red Dog Operations, Alaska (August 2008, draft) states: “Elevated metal concentrations have been identified in tundra in areas surrounding the DMTS, primarily as a result of deposition of fugitive dust originating from the DMTS corridor, which is used to transport zinc and lead ore concentrates from the Red Dog Mine, operated by Teck Cominco Alaska Incorporated (Teck Cominco)”. The use of 2 meters on either side of the railway is inadequate.	S	N
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3358	79	Any leakage that escapes from the geomembrane liner has an increased risk of draining to shallow groundwater in this environment as compared to a dry, upland environment. That is why modern landfills cannot be sited as proposed for the NorthMet Project; federal standards or equivalent state standards must be met. Minnesota statutes preclude the siting of a hazardous waste or solid waste facility in a wetland or in a location where the topography, geology, hydrology or soil is unsuitable for the protection of the ground water or surface water. Although the Co-lead agencies maintain that the HRF is not subject to RCRA, and exempt from hazardous waste restrictions and reporting, it is still subject to state law on the matter.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3360	81	The potential for substantial volumes of seepage flowing from the Tailings Basin to the HRF has not been addressed in the FEIS; this represents another potential structural hazard. We can assume that the HRF has been designed to capture toxic drainage from the hydromet residue itself, with seepage volume estimates associated with the hydromet process. But we have no assurance that the HRF is designed to structurally withstand thousands of gallons per day of Tailings Basin seepage along the dikes that do not have seepage capture features installed.	S	O
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3376	97	The potential adverse impacts on water quality illustrate this risk. The natural resources on which the Band depends have already been damaged by pollution. As discussed above, many of the waters that would be affected by the Project and their fish have been significantly affected by toxic methyl mercury and are designated as impaired waters. Mercury contamination in these waters is of grave concern to Band members, who fish in them. The increasing methylmercury bioavailability in these watersheds is unacceptable because access to fish that can be safely consumed is an essential component of treaty resource harvest rights. The Band is equally concerned about the impact of increased sulfide levels on the viability of wild rice. Wild rice has been and continues to be a staple of Band members’ diet and at the core of Chippewa culture. The continued loss of wild rice resources is an impermissible adverse impact on the rights reserved by Treaty.	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3381	119	the cumulative effects analysis is partially based on the flawed hydrologic characterization, the incorrectly calibrated groundwater model, unrealistic seepage capture rates, and adaptive management concepts that have not been rigorously explored and objectively evaluated. Based upon these flawed presumptions, the Co-lead agencies maintain that the Project will meet MN WQS, and that “the potential for exceedances of water quality evaluation criteria as a result of cumulative effects from the NorthMet Project Proposed Action and other reasonably foreseeable actions is considered unlikely.”	NS	X
27901	Unique			WAT	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3399	117	The tribal cooperating agencies’ review of the water modeling data packages for the NorthMet Project Proposed Action led to our conclusion that GoldSim did not accurately predict existing conditions, and cannot be relied upon to accurately predict future Project conditions.	NS	X
27408	Unique			WAT	Nicholas Eltgroth		1724	4	The money they make on mining can never clean up the water and land they pollute in the Lake Superior Basin, and the Boundary Waters.	NS	X
28097	Unique			WAT	Noreen Tyler	Izaak Walton League Minnesota Division	3433	2	The PolyMet Final EIS should be rejected as inadequate because it fails to accurately model water seepage from the tailings basin, some of which will flow north towards the Boundary Waters Wilderness, due to alteration of the Laurentian Divide from nearby taconite mining.	S	O
28097	Unique			WAT	Noreen Tyler	Izaak Walton League Minnesota Division	3444	3	The PolyMet Final EIS should be rejected as inadequate, because the mine plan does not detail plans to protect Birch Lake and the Boundary Waters from centuries of this toxic drainage, instead, it assumes the planned clay-lined trench will collect 100% of groundwater seepage (Figure 3.2-28).This is patently impossible. The mine plan proposes only monitoring of groundwater flows leading north to the Boundary Waters (p 3-150, Section 3.2.3.3.4) with the possibility of future “adaptive management.” This is insufficient analysis and incomplete planning for this likely outcome.	S	O
27575	Unique			WAT	Pamela and Alexandra Thompson		1774	1	The most recent iteration of the EIS STILL maintains that waste water would have to be isolated for over 500 years! (This is longer than the time that has elapsed since Christopher Columbus came to the Americas!!)People gloss over this sticking point, but it is like something from a Saturday Night Live script!! How can water remain sequestered safely ANYWHERE for 500 years, much less in our Arrowhead topography, which is so much wetland, bog, lake and stream? Water table high, water running off in three directions from the Laurentian Divide? It is ludicrous to think anyone could successfully sequester water for any length of time, and potable water is our northern Minnesota’s MOST valuable asset, much above the value of a 20 year span of jobs in copper and nickel mining.	NS	X
29263	Unique			WAT	Pat Hawkinson		2465	1	How can the direction of the water flow matter? It’s okay if any polluted water flows south to Lake Superior instead of north?	NS	X
29263	Unique			WAT	Pat Hawkinson		2466	2	10% of polluted water will escape untreated, which of course is an optimistic prediction to begin with. Seems like a small percentage, but to an average Joe like me, seems like a heluva lot when you are talking about millions of gallons as a whole.	NS	X
29263	Unique			WAT	Pat Hawkinson		2467	3	Residential water treatment companies can’t even get the non-toxic iron and tannins out of my well water on a reliable consistent basis. Why should I trust Polymet with millions of gallons of far more toxic process water annually in a real world setting? Because they tested it in a downtown Virginia warehouse?	NS	X
28479	Unique			WAT	Paul Mandell		2269	1	With regard to the first issue, clearly the pollution will be hazardous, as evidenced by the extent to which capture and eventual dilution of any runoff has been addressed in the proposal and in the EIS. I believe that for the EIS, the two processes were tested, but for taconite tailings, not one we know will produce sulfuric acid and which is dramatically different from taconite. My understanding is that the proposed process is a cheaper and more problematic one that has failed in several locations, most notably in northwest Canada. It is inferior to the safer “reverse osmosis” process. Given that we are looking at a clean-up that may last more than two hundred years, long after the mine is closed and probably long after the company or those financially benefitting from the project may themselves be long gone, why should we not demand the more proven albeit more expensive process in order to protect both our environment and our people.	S	O
28479	Unique			WAT	Paul Mandell		2271	3	Lastly, where are the failsafe measures to address any possibility that the plume of toxic runoff may head north, as some have speculated using different models, is a possibility.	NS	X
6129	Form Letter	1	Variant	WAT	Paul Musegades		449	1	Every article I have read states that the water around the mine will need to be cleaned for 200+ years. So I ask can you to name a mining company that has been in business for half of that time period, how many companies can you name that are still in business after 200 years, who will pick up the bill for cleaning the water after the PolyMet leaves Minnesota?	NS	X
26151	Unique			WAT	Paul Winslow		1275	1	I am not confident in the water flow projections and fear that run off will enter the Boundary Waters Canoe Area.	NS	X

27085	Unique			WAT	Paula Maccabee	Water Legacy	698	93	Objections raised by geologist J.D. Lehr in his review of the SDEIS have not been addressed in the FEIS. Mr. Lehr objected to the “simplistic and cursory treatment of the role that bedrock fractures may play in the transmission of groundwater” at the tailings site. (Lehr, 2014, p. 3). He objected to the assumption of a “no-flow boundary” beneath the tailings piles and the resulting implication that groundwater flow through bedrock at the tailings site “is so insignificant that it can be ignored.” (Id.). He commented that the failure to identify fractures or assess groundwater flow through fractured bedrock “was a major omission, resulting in unsupported assumptions and inadequate information regarding groundwater flow” at the tailings waste site (Id., p. 4) and raised concerns that neither the project proponent nor the Co-Lead Agencies have required any study of bedrock fractures or their hydrogeologic properties. (Id., p. 15) Mr. Lehr objected to language in the SDEIS interjecting ambiguity by stating that faults have been “inferred but not confirmed.” He explained, “Essentially all aspects of geologic maps are inferred because they usually cannot be viewed or measured directly. This fault’s location [beneath the tailings site] is mapped based on sound geologic inference or it wouldn’t be shown.” He noted that faults can only be “confirmed” by excavation along their entire length. (Id., p. 14).	S	O

27085	Unique			WAT	Paula Maccabee	Water Legacy	3025	20	No references are provided for the FEIS’ conclusions about mercury treatment, but in various other places the FEIS cites PolyMet’s “pilot testing” of reverse osmosis to reassure the reader that water quality standards would be met for all constituents of interest at both the WWTP and the mine site wastewater treatment facility (WWTF), once the latter facility is upgraded to a reverse osmosis or equivalent technology in approximately year 52 (FEIS, 3-65, 5- 104, 5-147, 5-170, 5, A-639). On closer review, the reference to a pilot test for PolyMet NorthMet mine pollution treatment is somewhat of a misnomer, particularly as applied to mercury reduction. The single pilot test report cited in the FEIS is a Barr document (FEIS ref. Barr 2013f). This report does not substantiate the efficacy of NorthMet wastewater treatment to remove mercury in compliance with the 1.3 ng/L standard. The PolyMet pilot test was conducted on water drawn from a seep and an aquifer well at the existing LTVSMC taconite tailings waste facility (Barr 2013f, p. 11). Mercury was below detectible levels in the influent for the test (Id., autop. 64-69, Table 1, Table 2). The only conclusions regarding mercury in Barr report were based on literature and an inquiry to the membrane supplier. Barr reported, “Mercury removal by RO membranes is highly dependent on the type of membrane used. Mercury rejections [the percentage removed by treatment] ranging from 22 to 99.9% have been reported,” (Id., p. 39). The report continued, “Mercury removal by RO is highly variable and dependent upon its speciation and the membrane selection. For these reasons, its removal is difficult to quantify,” (Id., p. 41). Should mercury influent to the WWTP exceed 1.3 ng/L, the FEIS does not provide any basis to conclude that water quality treatment will result in compliance with the 1.3 ng/L GLI and Minnesota water quality standard for mercury.	S	N
27085	Unique			WAT	Paula Maccabee	Water Legacy	3027	62	• The numbers presented in Table 5.2.2--8 [similar to data in FEIS Table 5.2.2-8] show very small recharge fluxes for the East and West Pits. These rates can be no more than assumptions that are not justified. Not only are the materials in the East and West Pits fractured, their fractures are certain to be further enhanced by the blasting associated with open pit mining. The assumed low conductivities result in lowered fluxes of contaminants from the pits with reduced concentrations. The information contained in this Table is misleading.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3028	63	Although new illustrations showing the direction and location of fractures and bedrock mine site geology were provided in a Barr report (Barr 2014b, Figures 1 and 2, Exhibit 3), no such depiction of fractures appears anywhere in the 3,576-page FEIS. The FEIS still minimizes the potential impacts of fractures and focuses its discussion on the primary conductivity of Duluth Complex rock. (FEIS, 4-51 to 4-52) The FEIS agrees that secondary porosity affects groundwater flow (FEIS, 4-48), but provides no new testing or modeling of secondary porosity features or assessment of the impacts of these secondary channels as conduits for mine pollution.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3032	26	FEIS’ claims that mercury concentrations in untreated tailings basin seepage will be 1.0 ng/L (FEIS, 5-230, Table 5.2.2-51) cannot be supported. Given that more than two trillion gallons a year of tailings seepage are predicted for the NorthMet project,5 the implications of mercury in tailings seepage are likely to be significant.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3034	28	WaterLegacy’s prior comments in the SDEIS raise raised concerns about the implications on mercury methylation of unsubstantiated assumptions that 99.5 percent of seepage from the unlined tailings waste facility and more than 90 percent of seepage from the unlined Category 1 waste rock pile would be captured without effect on the environment. The FEIS uses the same unsupportable seepage capture assumptions and modeling. These assumptions substantially understate the potential for sulfate seepage, indirect discharge to surface waters and increases in mercury methylation both near the project site and downstream in St. Louis River sediments.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3040	61	• Fractured media are very conductive in the fractures but not conductive in the unfractured portion of the media. Consequently, pump test data interpreted as porous media yield an average value that underestimates the transport rate in the fractures. The connectivity of the fractures is also difficult to interpret simply from pump testing. Tracer testing is best used to establish the connectivity of fractures.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3041	34	The FEIS’ discussion of sulfur deposition as a result of spillage and dust are provided in other sections of the document. This discussion minimizes the impacts of ore spillage. The FEIS accepts as fact PolyMet’s assertion that refurbishing old rail cars (at about one-sixth the cost of new rail cars) would reduce potential spillage from each car to 0.2 tons per year, a 97 percent reduction from the original calculation of 6.14 tons per year potential spillage from each car (FEIS, 5-164, citing PolyMet 2014a). The Co-Lead Agencies do not require verification that refurbishment will succeed; they simply assert the position taken in the SDEIS that no impacts from rail car spillage and dust on wetlands and streams are expected (FEIS, 8- 24). The FEIS states that surface water quality in the mine site Upper Partridge tributary streams (Wetlegs Creek, Longnose Creek, proposed West Pit Outlet Creek and Wyman Creek) “would be affected by ore spillage from the rail cars,” but fails to analyze either the magnitude of this effect or the impacts of ore spillage on wetlands and mercury methylation.(FEIS, 5-164) Approximately 543 acres of wetlands along the railroad corridor could be affected by rainfall contacting spilled ore and fines and releasing solutes (FEIS, 5-314).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3042	35	As explained in WaterLegacy’s comments on the SDEIS, assessment of sulfate impacts on methylation in mine site wetlands should also consider the potential that mine site seepage in the surficial aquifer will daylight in wetlands. At the mine site, although predictions have been changed since the SDEIS to model fewer project impacts as compared to continuation of existing conditions,10 at P90 sulfate is predicted to more than triple along the overburden storage and laydown flowpath and along the West Pit flowpath (FEIS, 5-129, Table 5.2.2-23). There are 516 acres of wetlands within the mine site surficial aquifer flowpaths (FEIS, 5-320; Table 5.2.3-7). Rather than recognizing that the NorthMet project would increase production of methylmercury as a result of sulfate in wetlands adjacent to the mine site, the FEIS minimizes this significant environmental impact, stating “methylmercury produced in wetlands is not necessarily incorporated into food chains and concentrated to levels of concern” and proposing that the potential incremental change in methylation “may warrant future monitoring.” (FEIS, 5-339)	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3046	38	Dr. Brian Branfireun reviewed pertinent sections of the preliminary FEIS, the FEIS, supporting documents and recent peer-reviewed literature to update his opinions on the PolyMet NorthMet SDEIS (Branfireun, 2014). His opinion on the FEIS (Branfireun, 2015) is attached as well as summarized below.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3056	48	Dr. Branfireun’s prior Opinion 6 stated that the SDEIS inadequately addressed the potential for discharges of mercury and sulfate from the tailings site and understated the potential for downstream water quality impairments.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3057	50	Dr. Branfireun found the FEIS has not changed its reliance on unsubstantiated assumptions regarding seepage collection from both the mine site and the tailings site. Based on the comments of environmental consultant Daniel Pauly, Dr. Branfireun reviewed the underlying Barr report (Barr 2013f) and concluded that the pilot test “includes no testing and provides no certainty concerning the removal of mercury or methylmercury from tailings basin seepage or other recovered waters” of the NorthMet project. He concurred with Pauly that biogeochemical lag time would mean that potential impacts may not be revealed in a way that would allow adaptive engineering to prevent a permanent downstream impairment.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3059	52	The PolyMet NorthMet FEIS does not address either WaterLegacy’s comments on the SDEIS or those of experts sponsored by WaterLegacy pertaining to insufficient data and unsubstantiated and unreasonable assumptions regarding the chemistry of mine site sources of contamination and the efficacy of contaminated seepage character. The opinions of chemist Bruce Johnson regarding insufficient and potentially biased sampling of mine site rock and inappropriate characterization of mine site chemistry have not been addressed or resolved in the FEIS.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3060	53	Similarly, the opinions of mechanical engineer and hydrologist Donald Lee that the SDEIS contained unsubstantiated and unreasonable assumptions regarding seepage collection efficiency, liner impermeability beneath the toxic WWTF equalization basin, efficacy of subaqueous disposal in reducing contaminants, and regarding the risk of degradation of capture and treatment facilities over a time frame exceeding 100 years, apply equally to the FEIS.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3061	54	The FEIS, similarly, makes no change and provides no additional justification for its use of “evaluation criteria” rather than water quality standards and its failure to determine water quality impacts at surface water locations closest to the source of seepage and discharge. The FEIS’ claims that the NorthMet mine would not violate water quality standards or would not increase the violations beyond the “continuation of existing conditions” scenario are based on these improper qualifications of the data as well as the unsupported assumptions of its modeling. WaterLegacy’s prior comments on the SDEIS regarding these issues still stand.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3062	55	WaterLegacy’s FEIS comments in this Section focus on mine site hydrogeology, and concerns raised in the expert opinions of Dr. Lee and geologist J.D. Lehr on the SDEIS. Our concerns have been exacerbated, rather than resolved, as a result of additional disclosures and investigations since the SDEIS was released and treatment of hydrogeology and water modeling issues in the FEIS. As a result of concerns about the completeness, accuracy and reliability of water modeling performed to date for the PolyMet NorthMet sulfide mine project and about the potential harm that would result from the project, WaterLegacy requests that federal agencies and state reviewers of the FEIS require that independent water quality modeling for the project be performed by the U. S. Geologic Survey or other undisputed experts.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3064	57	When the PolyMet NorthMet SDEIS was released, WaterLegacy’s comments and the expert opinions of J. D. Lehr and Donald Lee challenged errors and omissions in PolyMet’s technical references adopted in the SDEIS to minimize the transmission of pollutants from the mine site’s unlined sources of perpetual pollution, the Category 1 waste rock pile, the East Pit and the West Pit. Their opinions included the following: • Bedrock beneath the mine site is known to contain fractures and faults. Groundwater flow through bedrock occurs through fractures or other secondary porosity features. (Lehr, 2014)	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3065	58	• It cannot be assumed that mine site bedrock fractures lack hydrologic significance. There is a potential that mine site bedrock fractures will serve as conduits for significant quantities of contaminated groundwater. (Id.)	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3066	59	• Weathering from mine dewatering may increase the aperture of existing bedrock fractures. (Id.)	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3067	60	SDEIS bulk horizontal and vertical conductivity values for Duluth Complex bedrock fail to consider transmission through faults, fractures and secondary porosity features. (Id.) • Average bulk conductivities for SDEIS surficial zone modeling fail to reflect and inappropriately exclude zones of much higher than average conductivity. Hydrologic significance of mine site bedrock fractures, faults and secondary porosity features should be evaluated through further testing. (Id.)	S	O

27085	Unique			WAT	Paula Maccabee	Water Legacy	3068	64	As the end of environmental review approached, PolyMet updated its modeling of hydraulic conductivity. The purpose of this exercise was not to evaluate pollution or wetlands impacts, but “to estimate transient flows to the mine pits during operations and subsequent closure.” (FEIS, p. 5-19, citing PolyMet 2015m). It is instructive. As a result of PolyMet’s new MODFLOW calibration, several bulk horizontal and vertical conductivity values changed between the SDEIS and the FEIS. Mean horizontal conductivity of wetland deposits increased to 400 percent of that calculated in the SDEIS (from 5.6 feet per day to 23.7 ft/day), as did both mean horizontal and mean vertical conductivity in lower Virginia Formation bedrock (from 0.019 ft/day to 0.079 ft/day for horizontal conductivity and from 0.0019 ft/day to 0.0079 ft/day for vertical conductivity). (Comparison is based on SDEIS, 5-27, Table 5.2.2-7 and FEIS, 5-29 Table 5.2.2-7). Updated estimates of groundwater inflow rates to the pits (FEIS, 5-511) are also significantly different from the predictions in the SDEIS. There are modest decreases for most years in the predicted inflow to the West Pit, with a maximum decrease of 20 gallons per minute (gpm) inflow. However, for the East Pit, as a result of recent recalibration of hydraulic conductivity for Virginia Formation bedrock, significant increases in inflows are predicted from year 1 through year 20. Total increased East Pit inflow for the 20 years increases by 5,890 gpm, with an average annual increased inflow of 294.5 gpm and an average annual percentage increase of nearly 300 percent (289%). (Comparison is based on SDEIS, 5-91, Table 5.2.2-18 with FEIS, 5-111, Table 5.2.2-19).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3069	67	Neither the FEIS nor responses to comments addressed WaterLegacy’s comments or the opinion of Dr. Lee (Lee, 2014) that assumptions regarding seepage collection at the permanent, unlined Category 1 waste rock pile were unsubstantiated and unreasonable. The hydrogeologic conditions beneath the unlined Category 1 waste rock piles are not discussed in the FEIS. But comparing the Mine Site Plan (FEIS, Figure 4.2.14-1) with figures in the Barr Hydrogeology of Fractured Bedrock report (FEIS ref. Barr 2014b, Figures 1 and 2, Exhibit 3) shows that the majority of the Category 1 waste rock pile would be located on Virginia Formation rock, rather than less hydraulically conductive Duluth Complex rock. There are two faults confirmed by Barr and at least one additional inferred fault transecting the proposed site for the Category 1 waste rock pile. (Id.) The FEIS predicted, based on PolyMet’s modeling and assumptions (PolyMet 2015h), that more than 98 percent of affected groundwater seepage from the Category 1 stockpile would be captured by the containment system or would migrate as groundwater into the West Pit and East Pit. (FEIS, 5-7). PolyMet’s modeling (PolyMet 2015h), also adopted in the FEIS, predicted that only negligible volumes of uncaptured seepage would flow north. (FEIS, 5-65).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3071	65	Although the FEIS is quick to deny that its newly-calibrated information could be used to predict mine site wetlands impacts due to the “complex geology with the presence of bedrock, surficial deposits, and wetland soils at the Mine Site” (FEIS, 5-111), WaterLegacy remains unconvinced that modeling NorthMet drawdown impacts on wetlands is infeasible rather than just a potential source of inconvenient truth. Tribal Cooperating Agencies have long maintained that an uncalibrated analog approach should not be the only method used for evaluating drawdown impacts on wetlands. (FEIS, App. C, autop. 2985, 2994). In his review of the SDEIS, hydrologist Dr. Donald Lee bluntly rejected the argument that MODFLOW could not be used to evaluate NorthMet wetlands impacts. At this stage of the SDEIS, where MODFLOW has already been used extensively to evaluate the consequences of the proposed action, suggesting MODFLOW cannot be used for wetlands assessment discredits all of the preceding analysis of hydrology and water quality. Suggesting MODFLOW cannot be used because of the nature of the surficial deposits is to say MODFLOW has not been appropriate to evaluate all of the preceding impacts of the proposed action contained in the SDEIS. This internal contradiction is sufficient to reject the analysis of hydrology and water quality in the SDEIS as inadequate. (Lee, 2014, p. 12) Mercury and wetlands expert Dr. Brian Branfireun also opined that wetlands impact modeling should be completed for the PolyMet NorthMet mine project, The reliance on the analog case to evaluate the potential extent and magnitude of the cone of depression and dewatering impact of surface wetlands and streams is completely unsatisfactory, in my opinion, given the availability of robust hydrogeological models that could reasonably evaluate potential impact scenarios. (Branfireun, 2014, p. 14). At this point in the development of the NorthMet project, when PolyMet has recalibrated its models to accurately address inflow to pits during mining and water balance needs, denying that models are available to evaluate secondary wetlands impacts strains credulity.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3072	66	New information on faults and hydraulic conductivity also underscores the need to effectively model impacts on water quality from the East and West mine pits. New mapping shows that inferred faults transect the locations where the West Pit and East Pit would be located. (Barr 2014b, Large Figures 1 and 2, Exhibit 3). The 100 Mile Swamp wetlands and the northern side of the East Pit are located in Virginia Formation bedrock. (Id.) Faults and higher measured conductivity could increase seepage from mine pits as well as affecting wetlands.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3073	153	Despite a contrary recommendation by the Commissioner of the Minnesota Department of Health, the FEIS continues to use “evaluation criteria” based on the projection of current pollution into the indefinite future, rather than applying Minnesota Health Risk Limits (HRL) or Risk Assessment Advice (RAA) to evaluate releases of manganese, beryllium and thallium to groundwater. (Ehlinger SDEIS Comment, Mar. 13, 2014, p. 3, Exhibit 17).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3074	154	The FEIS also fails to discuss hydrogeology at the tailings site that may reduce seepage capture efficiency and impact residential supply wells, despite Dr. Ehlinger’s recommendation. (Id., pp. 1-2)	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3075	68	Reference documents undermine these claims for seepage collection. Although the FEIS refers to the containment to be installed to collect seepage as a “low-permeability cut-off wall keyed into bedrock” (FEIS, 5-7), the actual design provides for the use of “compacted soil” as a barrier around the waste rock pile. (FEIS ref. PolyMet 2015h, p. 10). Specifications for the hydraulic conductivity are 1 x 10-5 centimeters per second (Id., p. 13), which is generally classified as “semi-permeable” soil. The drainage system would consist of pipes and ditches and rely only on gravity for collection. (Id., p. 14). PolyMet admits that along the west, north, and east sides of the stockpile, there may be localized areas where the drain pipe cannot be installed at an elevation low enough to ensure that groundwater will not flow beneath the cutoff wall. (Id.)	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3076	69	Dr. Lee has summarized after reviewing PolyMet’s seepage collection plan, “the proposed drainage system is unlikely to work as anticipated.” (Lee, Category 1 stockpile opinion, 2015).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3077	70	Failures of engineering controls for seepage are not counted in PolyMet’s modeling. Instead, “PolyMet assumed that water collection performance monitoring points will be defined in SDS permitting to confirm (via monitoring differential hydraulic head) whether or not post-construction seepage loss is occurring beneath the cutoff wall. If monitoring confirms that seepage losses are occurring to an extent potentially detrimental to water quality, then groundwater recovery wells can be installed to supplement the containment system. (Id., emphasis added).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3078	71	The FEIS’ predictions of minimal Category 1 seepage flow were also based on assumption that the cover placed on the rock pile would reduce infiltration by more than 99 percent (from 360 gpm to 2.8 gpm). (FEIS, 5-145). PolyMet’s document from which this conclusion is drawn admits that geomembranes have not been used for many waste rock stockpile covers and that use is generally limited to projects with an average size of less than 30 acres. (PolyMet 2015d, p. 45). Yet, PolyMet (2015d) and the FEIS calculate infiltration solely on the basis of liner defects per acre of liners, without considering the topography of massive waste rock piles. PolyMet identifies three mine sites where geomembranes have been used as a cover, but does not describe seepage results. One of these featured sites is the Dunka Mine (Id., p. 46). Unsurprisingly, the FEIS does not cite the Dunka Mine in its predictions that infiltration and seepage will be prevented. Despite its geomembrane, Dunka Mine waste rock seepage has resulted and continues to result in ongoing violations of Minnesota water quality standards for copper, nickel, hardness and specific conductivity. (See Dunka Mine DMR summaries, provided in Exhibit 34).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3079	72	Prior comments by WaterLegacy and expert opinions of J.D. Lehr and Donald Lee disputed assertions in the SDEIS that all PolyMet NorthMet mine site surficial aquifer flow would migrate to the south or southwest. J.D. Lehr cited a PolyMet technical document (SDEIS reference PolyMet 2012s, Figure 2-3) showing flowpaths from the mine site north to Yelp Creek and the 100 Mile Swamp with travel times of 1-10 years. (Lehr, 2014, p. 30). Dr. Lee noted the fact that existing runoff from the northernmost part of the mine site currently drains north to the 100 Mile Swamp and stated that absent explanation or analysis, any conclusion excluding northern surficial flow was “simply unjustified.” (Lee, 2014, pp. 6, 12)	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3080	73	When the SDEIS was released, neither WaterLegacy nor the experts we consulted were aware that there was a risk that groundwater would flow north from the East Pit and across the Laurentian Divide to the Rainy River Basin. That changed in October 2014 when a proposal was submitted by Northshore Mining Company (Northshore) for a 108-acre expansion into high sulfur rock at the Peter Mitchell Pit. The Environmental Assessment Worksheet (EAW) for the Northshore expansion (Northshore EAW 2014, Exhibit 6) established that Northshore had already removed the pillar within the Peter Mitchell Pit that historically separated the two watersheds, maintaining the divide only by the placement and operation of pit sumps. (Id., p. 8). The EAW stated that the maximum level of the pit lake at mine closure would be 1,500 feet above mean sea level (AMSL) and that the outfall from the low point at the east end of the Peter Mitchell pit would discharge to the Dunka River in the Rainy River Basin. (Id., p. 5). Barr Engineering maps provided by MDNR in connection with the Northshore expansion (Barr Maps 12 and 13, Current and Post-Closure Pit Stratigraphy, Exhibit 7) showed current Peter Mitchell Pit depth of approximately 1,550 feet AMSL at its lowest point and planned expanding depth to less than 1,300 feet AMSL. (Id.)	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3081	76	The response of Co-Lead Agencies to the potential for northward flow was memorialized in an Interagency Technical Memorandum on October 12, 2015. (FEIS reference MDNR et al. 2015c). This Memorandum suggested that the PolyMet MODFLOW model used by GLIFWC might need to be adjusted to accurately predict northward flow, but admitted that “the well data and the NorthMet Mine Site MODFLOW model do not exclude the possibility of a future northward bedrock flowpath from the proposed NorthMet pits to the Northshore pits.” (Id., pp.1- 2). Without assessing the reasonableness of a “leakage” assumption or the consequences for wetlands if it were to be valid, the Memorandum then hypothesized, “If this leakage rate is large enough, a bedrock groundwater mound would form between the two mines and prevent water from the proposed NorthMet pits from flowing northward to the Northshore pits.” (Id., p. 1) This theory is carried forward in the FEIS. (FEIS, 6-40 to 6-41).	NS	X

27085	Unique			WAT	Paula Maccabee	Water Legacy	3083	74	Not only had the MDNR allowed the Northshore Mining Company to do away with the watershed divide between the Lake Superior and Rainy River Basin. The planned expansion promised a significant increase in the hydraulic gradient from the NorthMet mine site down to the base of the Peter Mitchell Pit and the potential for inter-Basin transfer of water and contaminants from the Lake Superior Basin to the Rainy River Basin. As part of work on behalf of Tribal Cooperating Agencies to analyze mine site groundwater baseflow, GLIFWC examined documents related to historic and future Peter Mitchell Pit levels. GLIFWC then communicated to Co-Lead Agencies that PolyMet’s most recent baseflow modeling erroneously assumed that water flowed out from rather than into the Peter Mitchell Pit from 1979 to 1988, resulting in an inaccurately low assessment of base flow groundwater in the upper Partridge River. (GLIFWC letter to Co-Lead Agencies Northward Flowpath & Groundwater Modeling, Aug. 11, 2015 with attachments and figures, Exhibit 8) Reviewing the expansion and closure plans for the Northshore Mine in conjunction with the PolyMet NorthMet project, GLIFWC informed the Co-Lead Agencies that “detailed (MODFLOW) and simplistic (MathCad) models predict that a northward contaminant flowpath is probable under likely closure conditions.” (Id., p. 1). GLIFWC provided attachments and figures with the August 2015 Northward Flowpath letter to illustrate both the errors in baseflow modeling and the new prediction of northward groundwater flow, given the water levels expected at closure of the Peter Mitchell Pit. GLIFWC explained that water flows downhill and that the base of the Peter Mitchell Pit at closure and the surface elevation of the Peter Mitchell Pit lake under long-term reclamation would draw groundwater from NorthMet mine site features, particularly the backfilled East Pit. The hydraulic gradient would result in groundwater flow downhill between the saturated East Pit water level (1,592 feet AMSL) and the Peter Mitchell water level at closure (1,300 feet AMSL) and under long-term reclamation (1,500 feet AMSL). (Id., p. 4, Attachments autop. 13, 27) The volume of northward groundwater flow from the East Pit may be quite significant. GLIFWC’s preliminary modeling using the PolyMet MODFLOW model suggests that approximately 90% of the post-closure outflow from the NorthMet East Pit would migrate north due to the higher conductivity of the Virginia Formation and Biwabik Iron Formation and the lower elevations of the Peter Mitchell Pit at closure (1,300 feet) and over the long-term (1,500 feet) as compared to the Duluth Complex rock and Partridge River elevation (1,548 feet) on the south of the mine site. At closure, when the Peter Mitchell Pit is 1,300 feet deep, northward outflow is estimated at 300 gpm, stabilizing at 75 gpm in long-term closure. (GLIFWC letter to Co-Lead Agencies Discharge from PolyMet East Pit at Closure, Oct. 20, 2015, Exhibit 9).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3084	75	GLIFWC also analyzed the potential that contaminants in the PolyMet NorthMet mine surficial aquifer would flow northward as a result of the increase in pit depth and future closure of the Peter Mitchell Pit. Given the proximity of the NorthMet Category 1 stockpile (0.8 miles) and East Pit (1.2 miles) to the Peter Mitchell Pit and the experience with other taconite pits where a cone of depression affecting surficial water can extend 1.4 to 1.5 miles from the pits, preliminary MODFLOW modeling showed northward flow of contaminants at the time of the Peter Mitchell Pit closure. (GLIFWC Northward Flowpath Letter, Exhibit 8, p. 5).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3089	105	The NorthMet Plant Site Water Modeling Plan stated that “performance of engineered systems” is an “uncertain input,” for which a probabilistic distribution should be defined. (FEIS ref. Barr 2012d, pp. 1-2). Although slurry walls, trenches, and pumps to capture tailings seepage are engineered systems, the FEIS contains no modeling of impacts for a reasonable range of tailings seepage capture probabilities. It assumes near-perfect collection for the indeterminate future.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3090	106	As with the potential mine site contamination discussed previously, the FEIS proposes a combination of monitoring and “contingency mitigation.” It is suggested that we wait and assess fractures “that could function as high-permeability conduits for groundwater” or “lead to violation of water quality standards” by monitoring once the PolyMet NorthMet project is in place and contaminated seepage is detected. At that point, unspecified “contingency mitigation measures would be employed to mitigate the fracture-related effects.” (FEIS, 5-37).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3093	85	WaterLegacy believes the current FEIS is incomplete and unreliable in its characterization of the groundwater system at the mine site, in its description of the connection between surficial deposits and groundwater and in its characterization of the volume and direction of polluted seepage. We are concerned that the FEIS fails to evaluate environmental impacts, such as an increase in propagation of pollutants due to fractures, destruction or degradation of wetlands through mine dewatering, and northward groundwater flow of pollutant to the Boundary Waters watershed not because these impacts cannot be modeled, but because to do so could reveal significant environmental concerns. We have also found the MDNR’s changes in position regarding the appropriate level of mine site groundwater baseflow15 both troubling and confusing.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3094	86	Although characterization of groundwater seems like an arcane issue, we share GLIWFC’s perception that it is the key to understanding both the NorthMet project’s impacts on water quality and its impacts on wetlands. As John Coleman explained in GLIFWC’s recent letter to Co-Lead Agencies, Adequate characterization of the groundwater system at a proposed mine site is essential to understanding most of the potential impacts from the project. The amount of water entering the groundwater system, be it precipitation or discharge from the bed of lakes, rivers or mine pits, determines the direction of flow and dilution of contaminants, and dictates points of compliance for both ground and surface waters. The horizontal and vertical conductivity of the soil and bedrock materials determines how the groundwater system responds to stresses and the rate at which the groundwater flows horizontally and vertically. The character of interaction between surface water features and the groundwater system, whether it is loss of water from rivers or wetlands to the groundwater system, or discharge from the groundwater system to the surface water features, determines predicted impacts to surface water features by stresses such as mine dewatering. (GLIFWC Northward Flowpath Letter, Exhibit 8).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3098	87	With so much at stake, we believe it is incumbent upon responsible agencies to test a project proponent’s modeling and verify the proponent’s conclusions. According to GLIFWC’s Preliminary FEIS Comments, this has never been done: We have learned from the MNDNR project managers that ERM and lead agency staff never ran the mine site MODFLOW model during their technical review. In fact, only the applicant’s consultant (Barr Engineering) and Tribal staff have run the model and tested its functionality. It is surprising to discover that at no time during the eight years of project review have the lead agencies and/or their consultant tested how the model works. This fact leads to serious questions about the legitimacy of the conclusions reached by the ERM and lead agencies regarding the quality of the applicant’s model. (GLIFWC PFEIS Comments, Technical Review of the Mine Site MODFLOW Model, Exhibit 12). By this point in project review, when the Co-Lead Agencies have already vouched for the FEIS and the modeling done by PolyMet’s consultants, it is too late for these agencies to perform the role of independent review. WaterLegacy requests that the U.S. Geologic Survey or other undisputed and unbiased experts be retained to perform independent water modeling for the NorthMet project. The late timing of this review is certainly not ideal. But no other course of action would ensure that reliable information is available to assess significant environmental effects of the PolyMet NorthMet sulfide mine project on Minnesota’s wetlands and waters.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3099	88	One of the most basic requirements of environmental review is that an EIS must not rely on the unsubstantiated claims of a project proponent to draw conclusions as to the environmental impacts of a proposal. Fundamentally, EIS modeling and predictions must work forward from substantial evidence, not work backwards to model a desired result.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3101	90	Although the PolyMet NorthMet FEIS relies on many other dubious and unsupported claims, those made for seepage collection at the tailings waste facility are among the most clearcut and troubling. Former agency staff, engineers and hydrologists find the FEIS claims of nearly perfect seepage collection laughable, while citizen advocates refer to tailings seepage claims as The “Big Lie.” Comments below summarize changes made since the SDEIS and remaining concerns about the analysis of tailings seepage collection that we believe must result in a finding that the FEIS is inadequate under applicable laws and insufficient to protect water quality.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3102	91	PolyMet NorthMet tailings would be deposited in a wet slurry on top of the existing unlined LTVSMC taconite tailings piles. (FEIS, pp. 4-427, 5-5, 5-185) The 4 ½ mile square LTVSMC tailings waste facility was built above wetlands and three small streams to facilitate drainage of water through taconite tailings piles. The historical development of the tailings waste facility over wetlands and streams is shown in Exhibit 13. The NorthMet tailings waste facility would not be lined to contain seepage. (FEIS, 3-104, 3-158). NorthMet sulfide mine tailings slurry would be deposited immediately above LTVSMC tailings and slimes. (FEIS, Figure 5.2.14-6) The completed tailings height of the NorthMet waste cells would be 1,735 above sea level. (FEIS, 3-104). That is 60 feet higher than the highest feature to the east and more than 200 feet higher than gradient on the west, northwest, north and south sides of the tailings. (FEIS, Figure 4.2.2-17). Elevations above surrounding land create hydraulic pressure for seepage. The PolyMet NorthMet project would produce 110,736 tons of wet tailings slurry per day, of which liquids would be 68.5 percent by weight or 86 percent by volume. (FEIS ref. PolyMet 2015q, autop. 621). The seepage rate from slurry tailings is considerably higher than that of either past or thickened tailings. The Senior Director of Geotechnical Engineering and Hydrogeology for Newmont Mining Corporation has estimated the seepage rate from slurry tailings at 6.4 gallons per minute per acre, the seepage rate from paste or thickened tailings at 0.06 gallons per minute per acre and the seepage from dry filtered tailings at 0.007 gallons per acre.16 As compared to dry filtered tailings, slurry tailings produce approximately 914 times as much seepage. PolyMet’s wet slurry tailings waste facility is predicted to produce 3,880 gallons of tailings seepage per minute. (FEIS, 5-179, 5-181), equivalent to 2,041,000,000 gallons of contaminated seepage per year.17 PolyMet NorthMet tailings seepage would be collected from the toe of the tailings heaps and would contain sulfates and heavy metals from copper-nickel processing slurry, effluent from the mine site treatment plant, and LTVSMC tailings. (FEIS ref. NorthMet 2015j, FEIS Figure 3.2-12).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3103	92	PolyMet’s modeling of seepage at the tailings toe is likely to understate actual tailings chemistry. Since leaching depends on surface area, data from MinnAMAX copper-nickel tailings would provide more comparable field experience than data from waste rock piles used in FEIS modeling. (FEIS, 5-62). Such data was not used. Leachate from MinnAMAX copper-nickel tailings contained maximum levels of cobalt more than 30 times the tailings seepage concentration predicted for the NorthMet project, levels of nickel more than 21 times the predicted P90 NorthMet concentrations, and sulfate concentrations more than 11 times higher than predicted NorthMet concentrations. (Johnson, 2015).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3105	94	Mr. Lehr also criticized the prior EIS for failing to include any hydraulic testing of bedrock in the tailings site area. (Id., p. 12, p. 15). He explained that analogies between Duluth Complex at the mine site and Giants Range Granite at the tailings site cannot be used to assume hydraulic conductivity of bedrock at the tailings site, since Giants Range Granite is 1,600 million years older than Duluth Complex and “would have experienced a different stress, weathering and erosional history than the Duluth Complex.” (Id., p. 15). Mr. Lehr emphasized that, to assess hydraulic conductivity, “What the SDEIS requires is data.” (Id., pp. 15-16). “Unless a solid scientific basis is provided, the SDEIS’ claims – both explicit and implicit – that groundwater flow through bedrock is minimal, cannot be sustained.” (Id., p. 16). Based on the scientific literature and his professional knowledge of the region’s geology, J.D. Lehr concluded, “bedrock fractures will play a significant role in groundwater and contaminant transport” at the tailings site.	S	O

27085	Unique			WAT	Paula Maccabee	Water Legacy	3106	95	Anthony Runkel, the Chief Geologist for the Minnesota Geological Survey, echoed these concerns, in an opinion on the SDEIS attached as Exhibit 14. Mr. Runkel stated that the investigations done for the NorthMet mine and tailings site “are not sufficient to recognize the hydrogeologic features known to be characteristic of other crystalline bedrock” on the Canadian Shield and not sufficient to support the modeling used for the project. He described techniques needed to investigate the Hydrogeologic conditions of fractured bedrock and explained: When these techniques have been used in generally similar hydrogeologic settings elsewhere on the Canadian Shield, the results support hydrogeologic conceptual models that differ substantially from those proposed for the Duluth Complex and Giants Range Batholith described in the SDEIS. Of particular significance for solute transport, the conceptual models commonly include key fractures or fracture zones of relatively high hydraulic conductivity, and multiple flow systems within the bedrock at individual sites. These flow systems are variably connected to the surface water system, have variable residence times, can have upward and downward vertical gradients within a local area, and horizontal flow directions that differ from one another. (Runkel, opinion on SDEIS, 2014, p.1, Exhibit 14) Mr. Runkel stated that use of a Duluth Complex analogy to assume that Giants Range Granite has a similar stress, weathering and erosional history “is not valid.” (Id., p. 2). He noted that faults are known to be common across much of mapped extent of the Giants Range Batholith, including in the plant site/tailings basin area. Mr. Runkel explained that nearby fractures in the same bedrock have had significant environmental effects, reporting, “Hydraulically significant fractures in the Giants Range Batholith are documented to have transported contaminants at the Northwoods Closed Landfill (MPCA reports) several miles north of the Plant Site/Tailings Basin area.”	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3108	97	Although fractures beneath the tailings site are mapped in an FEIS reference document (FEIS ref. Barr 2014b, Large Figures 1-2, Exhibit 3), the FEIS continues to minimize the significance of geologic evidence of fractures, stating “on published geologic maps, the faults in these areas are dashed and identified as conjectural with inferred (not exact) locations.” (FEIS, 4-445). The FEIS conceptual cross-section of the tailings basin groundwater containment system still characterizes the bedrock as an “assumed no flow boundary.” (FEIS, Figure 3.2-28). Responses to comments on the SDEIS state that the no-flow boundary has been changed at the “toe of the east embankment.” (FEIS, A-179, A-251, A-259, A-284, A-612). However this “change” is meaningless, since the FEIS assumes 100 percent collection of all seepage on the east side even without a no-flow assumption. (FEIS, 5-186). The FEIS also continues to use the mine site Duluth Complex bedrock for an analogy to assume hydraulic conductivity at bedrock depths in the Giants Range Granite beneath the tailings piles. (FEIS, 4-44). The FEIS contains no investigation of fractures beneath the tailings waste site. The FEIS estimates the hydraulic conductivity of the top 20 feet of bedrock around the plant site at 0.14 feet per day (FEIS, 4-113), but neither the FEIS nor the recent hydrogeology report prepared for PolyMet provide any information on hydraulic conductivity of tailings site bedrock beneath the top 20 feet. (See FEIS ref. Barr 2014b, pp. 21-22). Even the maps of geologic conditions identify only the top layers of schist beneath the existing LTVSMC tailings site. (Id., Large Figures 1-2, Exhibit 3).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3109	98	In addition to explaining EIS inadequacies in modeling transmission of pollutants through groundwater at the tailings site, J.D. Lehr demonstrated that NorthMet tailings seepage would emanate from the south and east sides of the tailings waste piles as elevations of tailings in Cell 1E increased above Spring Mine Lake, reversing topography and hydraulic flow. (Id., pp. 18-19).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3112	99	On first reading of the FEIS, it might seem that the document addressed comments of WaterLegacy and J.D. Lehr’s opinion regarding seepage, since both south side and east side tailings seepage are now discussed. That impression would be mistaken. The FEIS mentions seepage on the east side of the tailings piles only long enough to assert that seepage containment “would be expected to capture 100 percent of tailings surface seepage and groundwater seepage.” (FEIS, 5-8). Similarly, on the south side, the FEIS simply asserts, “an existing seepage containment system would be upgraded by PolyMet to achieve 100 percent capture of tailings surface and groundwater seepage that otherwise would flow into Second Creek, a tributary of the Partridge River.” (FEIS, 5-102). The Change Definition Form documenting the direction given by the Co-Lead Agencies on modeling changes resulting from east pit seepage is instructive. The form states, “The capture efficiency of the East Side Seepage Containment System is assumed to be 100% (i.e., all water that reports to the East Containment System both surface and/or groundwater, is captured).” Thus, modeling can reflect 100% collection and 0% flow toward Mud Lake and no “eastern” flowpath need be added to the project description. (NorthMet Project CDF 251, East Dam GoldSim Modeling Changes, Sept. 12, 2014, Exhibit 15). Based on the information provided by PolyMet in its Water Modeling Data Package (FEIS ref. PolyMet 2015j) the FEIS claims that, during mine operations, 3,860 gallons per minute of the total 3,880 gpm modeled would be collected. (FEIS, 5-181, Table 5.2.2-37). This would be a nearly perfect collection rate of 99.5%. The FEIS and underlying PolyMet documents characterize all but 200 gpm (0.5%) of NorthMet tailings seepage as “surface seepage,” since that is the volume that currently seeps out of groundwater at the toe of the existing LTVSMC basin. (FEIS, 5-179, PolyMet 2015j). No analysis is done to determine if the increased volume and hydraulic head created in the tailings piles during NorthMet operations would result in more water being retained further into groundwater than under existing conditions. As Dr. Lee noted in his opinion regarding tailings basin performance, given the lack of data on bedrock groundwater, it is an open question how much groundwater is actually flowing in bedrock. (Lee, tailings opinion, 2015, p. 4).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3113	100	PolyMet’s underlying analysis (PolyMet 2015j) and the FEIS do not evaluate a range of tailings seepage collection performance or the effects of that performance on environmental quality; “for purposes of impact evaluation they are assumed to capture: 100 percent of the Tailings Basin’s surface seepage; 100 percent of the groundwater approaching the containment system from the Tailings Basin’s east and south toes; and 90 percent of the groundwater approaching the containment systems from the Tailings Basin’s north, northwest and west toes.” (FEIS, p. 5-186).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3114	101	The claims of capture efficiency on the northwest, north and east sides made in the FEIS are based on PolyMet’s assumptions and models: “The capture efficiencies in water quality modeling were provided by the PolyMet (Barr 2015e, as cited in the FEIS).” (FEIS, A-583). “[T]he assumed capture efficiencies of the groundwater containment systems are justified and supported by modeling.” (FEIS, A-578, A-612). “Performance modeling of the north and northwest flowpaths has indicated that the proposed systems would provide greater than 90 percent capture of surficial aquifer and bedrock groundwater to 100 ft below the top of bedrock. Containment systems are assumed to capture 100 percent of tailings surface seepage.” (FEIS, 5-77). On the south side of the tailings piles, the FEIS’ claims of 100 percent tailings seepage collection are based on a promise by PolyMet. Since 2011, the current owner, Cliffs Erie, LLC has installed a seepage collection system on the south side of the existing LTVSMC tailings waste facility at surface discharge location SD026. This system includes a cutoff berm and trench, seep collection sump, pump and pipe system. (PolyMet 2015i). Although neither the FEIS nor PolyMet documents specify what percentage of south tailings seepage is currently collected by Cliffs Erie, water is bypassing the cutoff dam, and improvements in collection would be required to comply with the Cliffs consent decree. “It is acknowledged that there is currently incomplete capture of impacted water at SD026.” (FEIS, A-625). Claims in the FEIS that the proposed NorthMet project will result 100 percent seepage capture on the south side of the tailings piles are based on a vague but repeated promise that unspecified future upgrades will achieve perfect collection: “PolyMet has committed to future upgrades to achieve 100 percent capture by this system if the NorthMet Project Proposed Action is approved.” (FEIS, 3-120, A-84, A-195, A-197, A-616, 3-120). Although several possible changes in the dam on the south side are listed, no evidence is provided that any of them would be effective in capturing all seepage that comes to the surface on the south side of the tailings piles. (FEIS, 3-120, 5-102). No discussion in the FEIS proposes to identify or collect contaminated groundwater seepage on the south side of the tailings site. Even though no investigation has been done of bedrock groundwater at the tailings waste site, the FEIS assumes, “groundwater migration is not expected to the east or south.” (FEIS, 5-77) Dr. Lee reviewed the FEIS conclusions on tailings basin performance and concluded, “The analytical support for these conclusions is based on assumptions of performance that are not justified or supported by data.” (Lee, tailings opinion, 2015, p. 1). Dr. Lee’s concerns included the failure to verify modeling to show that the predictions of groundwater movement were representative of the tailings basin site (Id., p. 3) and the fact that the plant site model did not include bedrock or consistently describe groundwater flow in and around the tailings basin. (Id., p. 4).	S	N
27085	Unique			WAT	Paula Maccabee	Water Legacy	3115	102	In responses to comments, the Co-Lead Agencies explained, “The design basis for the containment system is . . . to reverse the pre-existing hydraulic gradient (and flow direction) across the facility.” (FEIS, p. A-547). They also acknowledged, “Relatively few capture systems have been built with this degree of pumping to cause a reversal of the pre-existing hydraulic gradients.” (FEIS, p. A-548). WaterLegacy’s research has disclosed no similar systems operating long-term to reverse hydraulic gradient.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3116	103	Field experience and local geological conditions do not support claims made in the FEIS that a bentonite slurry trench would serve as an impermeable “cut-off wall” (FEIS, p. 5-197), or that it could be “keyed into” the tailings site bedrock. (FEIS, p. 5-185). J.D. Lehr explained in his comments on the SDEIS that the granite bedrock at the tailings site would not be favorable to allow a keyed in trench. Large boulders and cobbles known to exist at the site would also impede construction of an effective slurry trench. (Lehr, 2014, pp. 17-18). Dr. Lee noted that the proposed slurry wall at a depth exceeding 40 feet in some locations was a significant undertaking, and that claims that a slurry wall would be nearly impermeable for the indefinite future were not justified. (Lee, tailings opinion, 2015, p. 3). These concerns are similar to those raised by Barr Engineering in a 2007 evaluation report of Tailings Basin Modifications to Eliminate Water Release via Seepage. (FEIS ref. Barr 2007f). The Barr 2007f report noted that variability in ground surface elevation would complicate construction, and both open trench construction and the “low strength of slurry walls” could also affect long-term embankment stability. Further, a slurry wall was “not suitable if boulders or cobbles are present.” (Id., p. 21).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3117	107	The FEIS identifies several likely failures of the proposed tailings seepage collection system: new surface seepage locations may emerge as the tailings basin is developed; tailings pond water quality may be worse than expected; and groundwater or surface water downgradient of the tailings basin may fail to comply with water quality standards. (FEIS, 5-239 to 5-240). Such failures may or may not be revealed by monitoring, may be revealed only after irreparable harm has been caused to fish, wild rice or human beings or may only come to light after mining has ceased and the mining company has declared bankruptcy to minimize liabilities.	S	O

27085	Unique			WAT	Paula Maccabee	Water Legacy	3121	104	WaterLegacy’s SDEIS comments reflected our efforts to find field experience verifying the feasibility and efficacy of the proposed seepage containment and pump-back system. FEIS reference CDs include a 2012 Barr Engineering memo for PolyMet citing the common use of slurry walls and collection trenches for water quality management. (FEIS ref. PolyMet 2015h, Attach. D, Groundwater Containment System: Degree of Use in Industry). This memo cites several examples of allegedly successful containment facilities. No information was found for any of these examples suggesting that the capture efficiency claimed for the PolyMet NorthMet tailings seepage collection system was achieved in practice. Barr’s memo highlighted the Fort McMurray tailings pond seepage containment system in Alberta Canada as an example of the successful use of slurry walls to isolate mine tailings seepage from downgradient water: Another example is the installation of a soil-bentonite cutoff wall around the perimeter of a mine tailings pond located in the province of Alberta, Canada. The cutoff wall is approximately 100-feet deep and 3 feet wide, and has a hydraulic conductivity of less than 1x10-7 cm/sec. The cutoff wall was used to isolate the tailings pond from downgradient surface water features including wetlands and the Athabasca River. (Id., pp. 1-2). However, information available since 2012 demonstrates that the Fort McMurray tar sands tailings seepage containment has been a serious failure. Canadian federal research using chemical profiling to confirm the contaminant source in the Athabasca River has shown that toxic chemicals from McMurray Formation oil sand tailings ponds are leaching into groundwater and seeping into the Athabasca River, despite ditches, cutoff walls, groundwater interception wells and a system where captured water is pumped back into tailings ponds. One dam has been reported to seep wastewater at a rate of 75 liters per second (625,200,000 U.S. gallons per year) into groundwater feeding the Athabasca River.20 Industry is working to address the tailings seepage issue, budgeting more than \$1-billion in tailings-reduction technology. WaterLegacy is unaware of any data on capture of unlined tailings waste seepage that would support PolyMet’s modeling assumptions. In Minnesota, MPCA concluded in 2008 that the maximum estimated percentage of seepage to the Sandy River that could be collected from the unlined Minntac tailings waste facility was approximately 55 to 60 percent.22 In 2013, U.S. Steel confirmed that the dike and pump back system on the east side of the Minntac facility was collecting roughly 50 percent of the total seepage volume.23 After extensive research, the highest rate of seepage capture identified for any unlined facility using slurry walls appears to have been at the Hill Air Force Base in northern Utah, where a combination of the slurry walls, landfill covers, groundwater interception and extraction wells, and treatment succeeded in reducing metals concentrations from a Superfund site by 80 percent. In the EPA’s recent Pebble Mine assessment, the Agency recently concluded, “Water collection and treatment failures are a common feature of mines.” EPA stated that the probability of potential failure of water collection and treatment during operations is 93 percent, and results include “exceedance of standards potentially including death of fish and invertebrates.” Post-closure probability of failure of water collection and treatment was “somewhat higher than operation,” and “failures are likely to result in release of untreated or incompletely treated leachates for days or months. If the site were to be abandoned, EPA noted that failure of water collection and treatment was “certain.”	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3122	109	WaterLegacy’s comments on the SDEIS reflected our concern that the hydrometallurgical residue facility (HRF) would contain some of the most concentrated and toxic wastes produced by the PolyMet NorthMet project. Yet, the SDEIS failed to disclose the chemical composition of the HRF wastes and failed to disclose the seepage rate under various reasonable assumptions of liner leakage. Instead, without providing any information from which it could be verified that this conclusion was reasonable, the SDEIS determined that any leakage from the HRF could be ignored and need not be modeled to evaluate environmental impacts. The FEIS does not address WaterLegacy’s prior concerns. The FEIS provides no information regarding the chemical composition of the 313,000 tons per year of HRF waste expected to be produced by autoclave processing of metals at the Hydrometallurgical Plant. Since the SDEIS was prepared, the FEIS has proposed two additional sources of contamination to the HRF waste facility. Water treatment plans solids, primarily gypsum, and coal ash wastes from the existing LTVSMC site Coal Ash Landfill are proposed to be located with the HRF wastes. (FEIS, 5-178, PolyMet 2014c). These additional and potentially toxic and reactive wastes may represent up to 10 percent of the HRF facility solids volume. (FEIS, 4-445). As with the residue from the Hydrometallurgical Plant, the FEIS provides no characterization of the mass or concentration of chemicals resulting from disposal of gypsum and coal ash wastes.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3123	110	The FEIS’ conclusion in that HRF waste will not exceed federal RCRA hazardous waste thresholds is based on 2005 pilot test residues from a different process and on incomplete testing in 2009. Rather than assessing the contaminant levels actually proposed for the HRF under the current project plan, the FEIS states that, if the project is approved, the residue should be tested to verify that it is not hazardous. (FEIS, 5-609).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3124	111	Once the HRF pond becomes full and during reclamation, water from the HRF pond and drainage from the residue would be removed and treated at the plant site WWTP. (FEIS, 3-134). However, the modeled WWTP influent water quality during project reclamation does not reflect any of the expected concentrations from HRF contaminated wastewater. (FEIS ref. PolyMet 2015j, pp. 274-275). The FEIS continues to assume that leakage from the HRF into underlying groundwater or adjacent surface water “would be negligible” due to the double liner proposed and does not evaluate any potential environmental impacts from HRF waste facility seepage. (FEIS, 5-179). The PolyMet plant site Water Modeling Data Package explains, “The double liner system designed for the HRF is impermeable enough so that its effect on the environment can be ignored.” (PolyMet 2015j, p. 117).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3125	112	The Data Package assumes a leakage rate of 2 defects per acre in the upper layer and that defects are circular with a diameter of 1 centimeter and that no defects will occur in the lower liner. (Id.) However data in PolyMet’s own Residue Management Plan suggests that 40% of installed liners have a defect density from 4 to 10 per acre and 10% a defect density from 10 to 20 per acre. (FEIS ref. PolyMet 2014r, p. 11). Although the hydraulic head between the upper and lower liner may be low, leakage could still occur.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3127	114	The FEIS now recognizes that Minnesota Geological Survey maps show the existence of a fault directly beneath the proposed HRF location. (FEIS, 4-435, Barr 2014b Large Figures 1 and 2, Exhibit 3). The FEIS has identified yet another risk to liner deformation and integrity. Seeps along the southern edge of the existing LTVSMC tailings basin Cell 2W have been observed with the potential to create phreatic build-up below the HRF liners. The HRF would require a collection drain beneath the proposed embankment and liner systems to transmit the collected seep to the exterior of the HRF facility and reduce this risk. (FEIS, 5-662 to 5-663).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3128	115	Concerns about potential failure of containment related to the hydrometallurgical residue facility are discussed in Section IX, infra, along with other risks of failure not assessed by the FEIS. The FEIS remains inadequate both due to its inappropriate secrecy regarding the nature and concentration of hydrometallurgical residue facility contaminants and because it has assumed a level of liner integrity that is inconsistent with the unsuitable location selected for disposal of PolyMet’s hydrometallurgical wastes.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3137	130	Mine site water quality impacts on wetlands are also discussed in the FEIS only to be summarily dismissed. The FEIS discloses that there are 515.9 acres of wetlands within mine site groundwater flowpaths, 351.2 acres of which are designated minerotrophic (FEIS, 5-320, Table 5.2.3-7). The FEIS states that it was assumed that all downgradient minerotrophic wetlands located within the five mine site surficial aquifer flowpaths “may have potential indirect wetland effects related to water quality changes as a result off leakage/seepage from mine features.” (FEIS, 5-313, 5-319). However, by now unsurprisingly, the impact of reasonably foreseeable mine site leakage/seepage on wetlands is not modeled or assessed in the FEIS. The FEIS explains that PolyMet’s water quality model “assumed that the leakage/seepage from mine features releases directly to the Partridge River; therefore, it is assumed that groundwater would not emerge in surface water or wetlands along intermediate portions of the flowpaths (PolyMet 2015m).” (FEIS, 5-320, emphasis added). The FEIS does not propose a new or better model. It advises, “The water quality model cannot be used to quantify the amount of leakage/seepage from mine features that discharge directly to individual wetlands” (Id.), and more generally, “The leakage/seepage analysis could not indicate or suggest that an effect or adverse effect would occur on wetlands.” (Id.) In the same text emphasizing that no water modeling would assess or mitigate an actual adverse effect, the FEIS insists that this approach was “conservative” because it had identified a potential effect. (Id.) The only consequence of this elaborate discussion: wetlands with potential effects would be “identified for consideration in the proposed wetland monitoring plan.” (FEIS, 5-319). The potential that tailings seepage/leakage would have an indirect water quality impact on wetlands is similarly mentioned only to be dismissed. The FEIS identifies 4,638.4 acres of wetlands potentially indirectly affected by changes in water quality (FEIS, 5-345, Table 5.2.3- 12) only to say that the potential for indirect effects as a result of changes in groundwater quality is “identified to be small.” (FEIS, 5-346). Since the hydrology downstream of the tailings basin is “too complex” to be incorporated into PolyMet’s model for the plant site, again no adverse effects are identified and monitoring is proposed. (FEIS, 5-346). It should be clear from the preceding discussion that the FEIS has not only asserted without grounds that information on wetlands drawdown impacts is “unavailable,” it has systematically provided “conservative” assumptions about potential adverse impacts, only to completely avoid modeling or evaluating any actual adverse indirect impacts on wetlands from the NorthMet project. The replacement offered by the FEIS for assessment and mitigation of adverse indirect impacts on wetlands is monitoring. However, even this monitoring proposal comes with a catch. Potential risks to wetlands are rated based on a system devised by PolyMet, where each different impact factor (several of which are categorically excluded in the above discussion) is given a point from 1 up to a maximum of 6 (FEIS, 5-361, PolyMet 2015b). Monitoring is generously proposed, “within all wetlands containing a potential indirect wetland impact factor rating of 3 to 5 and a sampling of those wetlands with factor ratings of 1 or 2.” (FEIS, 5-390). A quick look at the data reveals that this rating system would place only 3% of the 7,694.2 (or 6,568.8) acres of wetlands in the zone where they would be thoroughly monitored. (FEIS, 5-361, Table 5.2.3-15). Other wetlands would be sampled “based on those wetlands that would have a high likelihood of indirect effects as a result of groundwater drawdown,” (FEIS, 5-397) a definition, as discussed above, that excludes both ombrotrophic and minerotrophic bogs.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3144	139	In addition to the Conductivity Evaluation, the Minnesota Pollution Control Agency’s (MPCA) Draft St. Louis Stressor Identification Report explicitly attributed impairments in the vicinity of the PolyMet NorthMet project to specific conductance discharge from mining facilities: Fish results from the upper Embarrass River (the portion upstream of the town of Embarrass) show extremely low fish counts and limited taxa richness. . . Two of the impaired streams in this watershed zone, Spring Mine Creek and the Embarrass River, receive water originating from mine pits. Sampling results from these streams show elevated specific conductance and sulfate concentrations. (MPCA, Draft St. Louis River Stressor Identification Report, October 2013, p. 16, provided as Attachment B to the Conductivity Evaluation, Exhibit 16).33	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3145	140	The Tribal Cooperating Agencies Cumulative Effects Analysis concluded that elevated specific conductance is a water chemistry “signature” for mining discharges that should be analyzed in the PolyMet NorthMet EIS. (FEIS, App. C. Tribal CEA, autop. 3001-3003).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3146	141	The FEIS provides no data on existing concentrations of specific conductivity in any receiving waters for the proposed NorthMet tailings site or for the mine site tributary creeks, although the FEIS provides average existing conductivity concentrations at several Partridge River sites. (FEIS, 4-258, Table 4.2.6-3).	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3147	142	Moreover, none of the narrative, tables, or figures in Chapter 5 model or predict specific conductivity levels that would result from NorthMet mine or plant site facilities.	S	O

27085	Unique			WAT	Paula Maccabee	Water Legacy	3156	151	Preparation of the FEIS has resulted in no additional sampling of residential wells potentially impacted by contaminated seepage, and 23 out of 38 wells downgradient from the tailings waste site remain unsampled. (FEIS, 4-120).	S	N
27085	Unique			WAT	Paula Maccabee	Water Legacy	3158	155	The method by which the FEIS addressed concerns about Hoyt Lake drinking water remains opaque to WaterLegacy, despite our review of all the data in the FEIS. Where the SDEIS had concluded that PolyMet NorthMet project Colby Lake arsenic would increase by 38.5% as compared to continuation of existing conditions (SDEIS, Table 5.2.2-34), the FEIS reassures the reader that the increase resulting from the project would be less than 1 percent (FEIS, Table 5.2.2-34). Differences in SDEIS arsenic concentrations predicted for the proposed action and continuation of existing conditions along the Partridge River are no longer evident in the FEIS. (compare SDEIS Table 5.2.2-31 with FEIS Table 5.2.2-31). The FEIS provides no explanation for this discrepancy, and none is evident from review of sampling data.	S	N
27085	Unique			WAT	Paula Maccabee	Water Legacy	3159	156	Commissioner Ehlinger also raised concerns about Hoyt Lakes drinking water, stating that modeling of seepage of contaminants from the mine site appears to be inconsistent with field leaching tests and hydrogeological conditions. (Ehlinger SDEIS Comment, Exhibit 17, pp. 2, 4). These concerns have not been addressed in the FEIS.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3163	173	In addition to the risk of catastrophic and costly impoundment failure (Section IX, supra), hydrologic changes and routine lapses in seepage collection at the proposed NorthMet wet tailings storage facility would increase the risk of mercury methylation (Section I, supra; Branfireun, 2015) and impairment of wetlands (Section V, supra). Modeled rates of tailings seepage collection are unsubstantiated, and seepage may violate water quality standards, requiring expensive and uncertain mitigation. (Section III, supra; FEIS, 5-240). Even without catastrophic or routine performance failure, the proposed NorthMet unlined wet tailings disposal facility would require indefinite mechanical water quality treatment for pollutants modeled to exceed water quality standards for at least 500 years. (Section X, supra).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3166	177	The NorthMet proposed action currently calls for construction of reverse osmosis (RO) water quality treatment at approximately year 52. (FEIS, 5-142). That RO facility would be scaled to treat overflow discharge from the West Pit. Prior to the predicted filling of the West Pit, at least 52 years away (more if mining is continued beyond 20 years), all water from the Upper Partridge River would be sent to the processing plant nine miles away and removed from the watershed.	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3169	163	The FEIS improperly failed to disclose what chemicals would be collected in the HRF and at what concentrations and where they would flow if containment were to fail. This information is vital to decision-makers and the public to evaluate alternative methods of storing hydrometallurgical wastes and to plan for contingencies.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3170	178	The FEIS proposes that stream augmentation at the tailings site would mitigate effects on Embarrass watershed wetlands due to the maintenance of surface flows within 20 percent of existing conditions. (FEIS, 5-183). Yet, although wetlands at the plant site are degraded by the existing impoundment (FEIS, 4-186) and wetlands at the mine site are high quality (FEIS, 5- 266), the proposed action makes no plan to treat and return water to the mine site watershed.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3183	180	The liquefaction and failure of containment at the hydrometallurgical residue facility (HRF) may or may not be a likely occurrence. But it would be a catastrophic occurrence that can be readily avoided. Nowhere in the FEIS, prior EIS drafts or supporting documents are the actual mass and concentrations of chemicals in the hydrometallurgical residue facility disclosed to the public or to decisionmakers. But, as explained in Section V and Section IX, supra, the mercury, sulfates, copper-nickel mining metals, processing chemicals from the hydrometallurgical plant, coal ash, and reject concentrate sludge proposed to be contained at the HRF would present enormous risks to downstream water quality, aquatic life, wild rice and human health should containment fail.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3190	183	As with the dry stack tailings alternative, reliance on PolyMet’s unsubstantiated assumptions of nearly perfect seepage collection allowed the Co-Lead Agencies to dismiss the West Pit Backfill alternative without analyzing its potential environmental benefits. Based on PolyMet’s modeling and assumptions (PolyMet 2015h), the FEIS stated that more than 98 WaterLegacy Comment on PolyMet NorthMet FEIS percent of affected groundwater seepage from the Category 1 stockpile would be captured by the containment system or would migrate as groundwater into the West Pit and East Pit (FEIS, 5-7) and that only negligible volumes of uncaptured seepage would flow north. (FEIS, 5-65). These claims are unsupported. The actual design for Category 1 seepage containment provides for the use of compacted soil as a barrier around the waste rock pile with conductivity specifications generally classified as semi-permeable. (FEIS ref. PolyMet 2015h, pp. 10,13). The drainage system would consist of pipes and ditches and rely only on gravity for collection. (Id., p. 14). PolyMet admits that along the west, north, and east sides of the stockpile, there may be areas where the drain pipe cannot be installed at an elevation low enough to ensure that groundwater will not flow beneath the cutoff wall. It is improbable that this system will work as anticipated. (Lee, Category 1 opinion, 2015). The FEIS’ predictions of minimal Category 1 seepage flow were also based on assumption that the cover placed on the rock pile would reduce infiltration by more than 99 percent (from 360 gpm to 2.8 gpm). (FEIS, 5-145). Geomembranes have not been used for many waste rock stockpile covers or projects approaching the size of the Category 1 waste rock stockpile. (PolyMet 2015d, p. 45). Seepage results from Minnesota’s Dunka Mine, one of the three examples cited by PolyMet (2015d) of similar liner application, have resulted in significant infiltration and contaminated seepage violating Minnesota water quality. (Dunka Mine DMR summaries, Exhibit 34)	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3209	194	The FEIS denies that the PolyMet NorthMet sulfide mine project would have any adverse impact on “mercury loadings” to the downstream St. Louis River, into which both the Partridge River and Embarrass River drain. (FEIS, 5-10). The FEIS, relying exclusively on Barr data, claims that increases in mercury loading in the Embarrass River from 22.3 to 22.5 grams per year loadings would be more than offset by the decrease in mercury loading from 24.2 to 23.0 grams per year in the Partridge River. (FEIS, 5-572, 6-32). As the result of this alleged “net decrease” in mercury loading, the NorthMet project “is not considered to have the potential for cumulative effects on hydrology and water quality in the St. Louis River.” (FEIS, 6-32) As summarized in Section I, supra, mercury expert Dr. Branfireun has carefully analyzed the Barr mercury data used to support the FEIS, and concluded that it does not meet basic scientific standards for analysis, reporting or addressing the margin of error in data collected. (Branfireun, 2105, pp. 2-9). Dr. Branfireun specifically reviewed the “mass balance” model used by Barr and incorporated into the FEIS and concluded that if an analysis of the margin of error in projections of mercury releases had been performed, the FEIS statements of certainty based on grams of mercury “could not be supported.” Thus, Dr. Branfireun explained, “conclusions from this asserted mass balance that the proposed development will not have appreciable impacts on water quality would be similarly unsupported.” (Branfireun, 2015, p. 14).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3218	203	Since the FEIS hasn’t assessed the effects of specific conductance, there is also no assessment of the cumulative effects of mining discharge on specific conductance levels in the St. Louis River. As explained in Section VII, supra, elevated specific conductance is a water chemistry “signature” for mining discharges. Regression analysis performed as part of the Tribal Cooperating Agencies Cumulative Effects Analysis suggested that concentrations were highest nearest to mine discharge sites, and tended to gradually decrease downstream, remaining above 150 µS/cm at 203 kilometers (126 miles) downstream of the nearest upstream mine discharge site. (FEIS, App. C. Tribal CEA, p. 16, FEIS autop. 3041). Elevated concentrations of specific conductance could persist far downstream in the St. Louis River, as illustrated in Exhibit 29, a map of cumulative mining discharge impacts on specific conductance included as part of the Tribal CEA.	S	O
27085	Unique			WAT	Paula Maccabee	Water Legacy	3219	204	The FEIS adheres to the most optimistic predictions of PolyMet’s modeling and assumes that the project’s impact on any water quality exceedance will be insignificant. (FEIS, 6-45).	NS	X
27085	Unique			WAT	Paula Maccabee	Water Legacy	3220	205	The FEIS doesn’t consider potential failures of engineering or modeling (FEIS, 5-236 to 5-244) in its assessment of cumulative effects.	S	O
28540	Unique			WAT	Pauline Callahan		2320	2	The added threat that it could pollute our drinking water is one that we SHOULD NOT risk.	NS	X
27600	Unique			WAT	Pete Fleming		1782	1	I have read the Exec Summary and various media articles on the Polymet project and conclude that there are still significant concerns with the water drainage from/through the site making it is unwise to proceed with this project. There is a large risk of water pollution into Lake Superior and the BWCA.and no certainty in the water models . The science and technical analysis performed is not enough. Don't take the chance.	NS	X
29999	Unique			WAT	Peter Shulman		2766	1	The aspect of the FEIS that I’m concerned about is how PolyMet threatens the BWCA because of hydraulic conductivity between the mine site and the Dunka River. The FEIS response to public comments is absurd. They are implying that a line on a map which is the continental divide as it crosses a body of water prevents flow of water in the body of water from one side of the divide to the other. That’s ridiculous, and the type of response someone would make that if they were expecting that no one was paying any attention.	S	O
29999	Unique			WAT	Peter Shulman		2767	2	The FEIS treatment of movement of water in the One Hundred Mile Swamp has other incorrect statements. The Partridge River does not provide a sink for pollution from the mine site. Instead it completely disappears into the One Hundred Mile Swamp and groundwater contours in the One Hundred Mile Swamp indicate that water exchanged with the Partridge River will be pulled towards Langley Creek.	S	O
29999	Unique			WAT	Peter Shulman		2768	3	The sensible answer to the issues of polluted water moving through the swamp is to measure th hydraulic conductivity and test waters in Langley Creek.	S	O
29999	Unique			WAT	Peter Shulman		2769	4	Langley Creek water now is pure without sulfate, it should stay that way, and if anything happens to change that, there should be a cessation of mining activities until a corrective action plan can be made and put into practice.	S	O
9713	Unique			WAT	Peter Spink		631	1	I am very concerned about potential water quality issues associated with the potential PolyMet mine and urge you to consider further testing and to listen to the many water experts who have raised serious issues about this project. We will never be able to reclaim our lakes and water supply if something goes wrong. Virtually every mine of this type has ended up with water contamination related issues. I urge you to engage in further testing and err on the side of safety.	NS	X
30501	Form Letter	1	Variant	WAT	Philip Mesteahouser		2867	1	Please save our waters for future generations!	NS	X
24644	Unique			WAT	pj jensen		1058	1	I’m writing because I’m concerned about the impact that PolyMet’s proposed sulfide mine would have on Minnesota’s water. I think PolyMet would do more harm than good. Pollution from PolyMet threatens our clean water quality legacy and would pollute water for hundreds of years after the mine has closed. It isn't worth the risk today or in the long run. I think that’s a bad deal for Minnesotans. Please put Minnesota’s water first when deciding on PolyMet. Here is too much at stake when considering the potential devastation seen in other mines. Thank you for your consideration.	NS	X
9	Unique			WAT	rayyoungsmn@aol.com		15	2	Please see the long-term consequences of polluted fresh water supplies and vote against this and any other proposals that threaten our natural resources.	NS	X

26137	Unique			WAT	rayyoungsmn@aol.com		1270	1	The most valuable resource in the world is clean water. DO NOT allow this mining venture to go through because they mine can just walk away and we will be stuck for generations with clean up.	NS	X
39	Unique			WAT	rb hughes		105	1	Please look cautiously at the remaining unknown variables post comprehensive studies. The ways in which we still can not accurately predict the level of environmental damage by contamination to our beautiful (traveling) waters is enough to halt this project.	NS	X
29019	Unique			WAT	Rev. Elton W. Brown		2395	13	Given the recent revelation that the Partridge River actually carries a much larger average flow than the numbers used in the SDEIS modeling, should not the company at the very least redo its environmental impact predictions by using more accurate data?	S	O
29019	Unique			WAT	Rev. Elton W. Brown		2396	14	should not the SDEIS include more details on what will happen when natural water levels are high? Specifically, when the mine experiences torrential rains (such as the recent flood that washed out bridges and undermined roads in Duluth), can we be assured that the containment dikes will hold, that all mining operations will cease until such time as the flood waters in the Partridge River have safely receded, in short, that PolyMet has a foolproof plan to avoid all unwanted discharges during the ever-more-frequent “storms of the century”?	S	O
29273	Form Letter	1	Variant	WAT	Rhoda Liebo		2480	1	It is beyond belief for me that the group of people that are managing the groundwater and other resources of our state(DNR), have got this so wrong and yet are supposedly preventing harm and pollution from occurring As you are well aware, the land in northern Minnesota is part of a large system of interlocking lakes. These lakes and streams provide shelter and homes for many fish and,birds and other mammal's, It is with extreme certainty that I realize that there will be a hundred years of pain and pollution in our treasured lands.	NS	X
28922	Unique			WAT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3578	3	Unfortunately, for decades the DNR and PCA have failed to enforce the sulfate standard of 10mg/liter that was in the law. Wild rice stands downstream of the iron mines declined or disappeared over time, apparently as a result of the sulfate pollution from iron mines, and co-opted by the disregard or inability of regulatory agencies to enforce the sulfate standard. The twenty-plus years of regulatory failure by DNR and PCA to address the renewal of expired mining permits for a number of mines that are not meeting water pollution standards, leaves the public really wondering and concerned about the effectiveness of the regulatory process for the mining industry.	NS	X
28922	Unique			WAT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3579	4	With PolyMet’s FEIS, regulators appear to be ignoring yet another Minnesota law, Chapter 6132.3200 of the Nonferrous Metallic Mineral Mining Law - Closure and Post Closure Maintenance which states, “...the mining area shall be closed so that it ... is maintenance free”. DNR appears ready to approve the FEIS mining plan knowing full well that it cannot meet the objective of this statute, that there is no ongoing maintenance once the mining operation is completed. The models knowingly referenced that ongoing water treatment would be necessary for hundreds of years after mining is completed. It appears to us that DNR would fail to uphold the letter of the law, and ignore their duty to protect the environment and safeguard the public’s health by permitting the NorthMet mine with an indefinite maintenance time frame.	NS	X
28922	Unique			WAT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3580	5	PolyMet’s FEIS modeled the issue of where the runoff from the mining operation would flow. This is a foundation upon which this plan is built. We find it troubling that outside scientists from the Great Lakes Indian Fish and Wildlife Commission (GLIFWC) have questioned the “modeling assumptions” provided by DNR and used by PolyMet’s engineering firm, Barr Engineering, a firm that could gain substantial economic benefits by the mine’s approval and construction. The GLIFWC results showed that most of the runoff would run into the St. Louis, but some could also flow into the Rainy River watershed, where it could impact the nearby Boundary Waters Canoe Area Wilderness and possibly even downstream to Voyageurs National Park. It is our understanding that DNR rejected the request for an independent third party to review the findings, but has rerun the model and now concurs with the GLIFWC findings. The FEIS proposes to deal with this issue through adaptive management. But again, as described above, we are concerned about the ability of regulatory agencies to successfully enforce permit requirements or of the mining industry to implement them, especially when significant costs are involved to fix the problem. Air and water quality violations, large fines, and costly fixes have been frequent and persistent with our modern taconite industry, yet pollution problems continue today.	S	O
28922	Unique			WAT	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3581	6	The PolyMet FEIS in page 119 (sections 3.2.2.3.10 Engineered Water Controls) says, “The Plant Site would include water management features designed to control water potentially affected by sulfides and metal leachates from tailings and hydrometallurgical residue.” But in reading through the details of this plan there are critical assumptions we question, including that the company will successfully capture 90+% of the surface water and 100% of the groundwater (pg 154). These seem unrealistic. Because of this assumption, the plan does not recommend the use of a geo membrane to reduce infiltration, nor is there a double liner with monitoring and leachate collection between liners, a standard practice for modern landfills, which is what this essentially is. There is also an assumption that there is no water flow through the fragmented bedrock. Anyone familiar with the Canadian Shield certainly understands that the rock has fractures. And if it doesn’t have multiple fractures before mining begins, the initiation of mine blasting is likely to induce some fractures within the area. Actual empirical data on rock permeability are needed for scientific conclusions.	S	O
10464	Form Letter	1	Variant	WAT	River Point Resort Outfitting Co.		694	7	PolyMet would require treatment of polluted water “indefinitely”. In other words, forever.	S	O
9824	Unique			WAT	Robert & Anne Haas		640	2	The recently released Final Environmental Impact Statement (FEIS) is plainly inadequate, as it has still not answered fundamental questions such as which direction the pollution will flow, or how PolyMet can provide financial assurance for the hundreds of years of mechanical water treatment that will be required to comply with water quality standards.	NS	X
24806	Unique			WAT	Robert and Catherine Kohlmeier		1112	1	Regarding Polymet mining in Northern Minnesota, at this point my wife, Catherine, and I are opposed. Along with everyone else, we are fully aware of known negative health affects of water pollution runoff caused by sulfide mining. It has been acknowledged in the FEIS report that there will be a small percentage of hazardous pollutants caused by the Polymet mining process which will end up in Lake Superior by way of the St. Louis River and the Embarrass River. We drink the water from Lake Superior and therefore it is unacceptable for us to support this project. Further, we wonder why anyone, including the Minnesota DNR, Governor Dayton, or even Polymet themselves could go forward with this knowingly harmful and risky project. Until we can get assurances of zero percentage of water pollutants from the Polymet mining process can we lend our support to this project.	NS	X
27114	Unique			WAT	Robert Essian		1657	2	My concerns are that with AMD (Acid Mine Drainage) have NOT been fully studied in the rush to get Polymet permitted, and that Polymet or any mining operator can safely mine the material tonnage that has been proposed.	NS	X
29400	Unique			WAT	Robert G. Tipping		3839	1	Important aspects of bedrock hydrogeology at the NorthMet site remain uncharacterized in the FEIS. As stated often in the document, it is “common practice” to use bulk hydraulic conductivity as an input into groundwater modeling. This practice is reasonable when applied to problems of well yield (water quantity) but is not appropriate when applied to transport problems. Contrary to common practice in characterizing sites where transport problems are a concern, no borehole geophysics - gamma log, multiparameter tool (fluid conductivity, fluid temperature), video, caliper, or flowmeter – were conducted on observation or pumping wells at the site. This data gap is particularly acute when considering the Virginia Formation, where stratiform, hydraulically active fractures (Figure 1) can readily be identified using borehole geophysics . Their stratiform nature also makes the distribution of hydraulically active fractures within the Virginia Formation more spatially predictable (mappable) – which makes borehole geophysical methods ideally suited for the proposed site.	S	O
29400	Unique			WAT	Robert G. Tipping		3840	2	The northern edge of the east pit will expose the Virginia Formation, potentially encountering hydraulically active fractures such as the one shown in Figure 1. The engineering and monitoring implications of this type of feature at the pit site are two-fold: 1.) Such features may provide a direct hydraulic connection between the pit and surface water bodies/wetlands northwest - as the pit is dewatered, such features, if identified beforehand, can be prepared for; 2.) Such features may account for the high chloride concentration found in the first sample taken from observation well Ob-3 (93.1 mg/L). Under this scenario, hydraulically active bedding plane fractures within the Virginia Formation provide a pathway for potentially saline waters to move up-dip from the Virginia Formation-Duluth Complex contact.	S	N
29400	Unique			WAT	Robert G. Tipping		3841	3	Borehole geophysics and discrete interval sampling and head measurements (packer tests) are routinely used for hydrogeologic characterization. Results from these techniques would benefit site plans for both construction and monitoring of the mining operation.	S	O
27690	Unique			WAT	Robert Topliff		2080	4	Polymet could possibly ruin three watersheds? We cannot afford to sacrifice one watershed or even the area around the Extraction site, (ground water).	NS	X
6298	Unique			WAT	Robin Vora		471	3	I am concerned about 90% thresholds being adequate for water resources, if I am understanding that correctly. I want to know if there is a 99-100% chance of no significant contaminants at my property downstream on the St. Louis River. For example, as an analogy, 3% of wildfires cause 97% of the damage. I don't want that 3% or even 1% event to effect me and my neighbors, and the environment. I would like to see a better explanation of these thresholds used in analyses and why they are appropriate.	S	O
25207	Unique			WAT	Rome Jeffrey D. M.D.		1142	2	This risk is underscored by the fact that the validity of the water model itself has been challenged in a credible analysis by GLIFWC. If the water model itself is in dispute, certainly the implications for human health remain uncertain and require further study before sulfide-mining can be permitted.	NS	X
29246	Unique			WAT	Ron Brodigan		2455	4	There is presently and for quite some time pollution from the former LTV taconite mine – into Birch Lake and other lands and waterways.	NS	X
29246	Unique			WAT	Ron Brodigan		2461	10	My family owns two businesses and a homestead only ten miles east of the proposed mine. We are separated from it entirely by bogs and wetlands – known as the 100 Mile Swamp. Our ground water is categorically threatened by the prospect of a metallic minerals mine and accompanying industrial area, not to mention our air quality.	NS	X
29246	Unique			WAT	Ron Brodigan		2462	11	This mining project will affect both the Lake Superior Watershed (via St. Louis River and other waterways) and the Rainy River/Lake of the Woods Watershed (via Kawishiwi River and other streams and lakes of the BWCAW. This is not made clear in the FEIS and neither is the inescapable fact that pollution of these important watersheds, once it occurs, can never be undone or rectified.	S	O
11	Unique			WAT	RONALD & JEANETTE		23	1	The waters of northern Minnesota must be kept pristine for future generations. Lake Superior, with 10% of the world's fresh water, must be preserved at all cost.	NS	X
10134	Unique			WAT	Ryan Clark		664	3	the EIS points out several impaired waters within the same major watershed of the proposed mine site. Allowing an unpredictable circumstance such as coppernickel- precious metal mining in a wet environment would likely be opposed in any TMDL, Watershed Restoration and Protection Strategy (WRAPs), 1 Watershed 1 Plan, and any Comprehensive local Water Management Plan implemented in the region to address impaired waters.	NS	X

29746	Unique			WAT	Sandra Wagner		2592	1	I do not believe the water models are accurate.	NS	X
29746	Unique			WAT	Sandra Wagner		2597	8	There is simply no resource more important than water. It is your duty to insure that it is protected at all cost for all the beings that rely on it for life, not the short term gain of a few.	NS	X
29289	Unique			WAT	Sandy Sterle		2493	1	I am writing because I am dismayed that the Minnesota DNR continues to push a mining project, which would create ongoing heavy metal and sulfate pollution in the St. Louis Watershed and groundwater flowing north towards the BWCA.	NS	X
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		1307	11	Accurate prediction of the onset and aggressiveness of low---quality acidic water discharge is perilously difficult using the best available science.	NS	X
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4228	5	Why wasn't the hydraulic conductivity of the Biwabik formation re-tested even though it is expected to have the highest permeability?	S	N
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4229	6	No mention is made of the effect of the MODFLOW model's limitations on the accuracy of the EIS predictions. For instance, MODFLOW's inability to incorporate non-orthogonal anisotropies, such as those expected from flow in faults and fractures.	S	O
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4312	4	There is no indication that the groundwater or geologic sampling design is supported by a proper spatial analysis. What types of interpolation were used? Were the effects of spatial autocorrelation considered? Not even the basic geostatistics of the proposed project are addressed. This is a particularly troubling aspect of the proposal and EIS.	S	N
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4313	7	In addition, Northmet's flawed parameterization of the Peter Mitchell pits water levels and the fact that the MNDNR did not independently test Northmet's water flow models is extremely troubling and indicates that much further analysis is needed to adequately assess the proposal's impact. For instance, the EIS states that "'Site specific groundwater monitoring data and the measured lack of surface water effects near the dewatered Northshore pits are consistent with the conceptual model that downward leakage from surficial deposits into bedrock could create a groundwater mound. This would prevent the formation of a northward bedrock flowpath from the proposed NorthMet pits to the Northshore pits.'" The proposal that a barrier groundwater mound would be created is unsupported by any physical models. In addition, the nature of the 'site specific groundwater monitoring' is not specified and is critical to the outcome of the model. In addition, the EIS acknowledges that a northward flow is possible, yet the proposed 'adaptive mitigation measures' – which would at that point be the last safeguard to protect ecosystems such as the BWCA – are not specified. I am troubled by the inadequacy of the model implementation by Northmet, the failure of the DNR to test the model, and the complete lack of response to these points in the FEIS.	S	N
29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4314	8	Large uncertainties exist in the long-term prediction of acid generation, and the track record of accurate AMD predictions is appallingly poor. This warrants exceedingly rigorous analyses of risk and measures to prevent risk. That has not been achieved in the Northmet EIS. See, for instance, Kuipers et al. (2006) who conducted a detailed study of 25 mining operations involving ore with acid-bearing minerals. They found that nearly all (89%) of the mines that ultimately developed acid drainage predicted in their EIS that there was low or no potential for acid production in their operation. It is clear that, historically, EIS predictions of acid production potential are not trustworthy. 6. Kinetic tests of acid generation are variable and unreliable. See, for instance, Moring and Hutt (2000). Over a 3-7 year period, there is a 50% chance of stabilization of acid generation. Significant fluctuation was observed in half of the cells throughout the test period. 7. Lab tests of acid generation do not adequately predict long-term field acid generation. 8. Detailed considerations of mineralogy and particle size are critical for accurate interpretation and prediction of acid production. This has not been addressed in the EIS.	S	O

29985	Form Letter	1	Variant	WAT	Sarah Elizabeth		4315	9	The effects of periodic and intense freeze-thaw conditions on the hydraulic conductivity of barriers, barrier caps, and natural sediments are inadequately addressed. See Kim and Daniel (1992) who found that the hydraulic conductivity of clays that had undergone freezing increased 100-fold.	S	N
29241	Unique			WAT	Sarah Poznanovic		3644	1	A major deficiency in the PolyMet FEIS is the lack of cumulative analysis that would take into account the impacts of opening a sulfide-mining district in the Superior National Forest, and in the headwaters of both the Lake Superior and Rainy River watersheds. The pollution potentials of a sulfide mine district, exuding acid mine drainage (AMD) and toxic heavy metals into two watersheds, is not adequately addressed.	S	O
29241	Unique			WAT	Sarah Poznanovic		3646	3	A third major deficiency in the PolyMet FEIS involves discrepancies in groundwater modeling. Elanne Palcich from the MinnPost states that “The Great Lakes Indian Fish and Wildlife Commission (GLIFWC) found major discrepancies in groundwater modeling. GLIFWC used the same modeling program as that used by Barr Engineering for PolyMet. But GLIFWC found that, upon closure, water from PolyMet would flow north into the Rainy River watershed.	S	O
22343	Unique			WAT	Scott DyAnne		862	2	As an example, PolyMet’s proposed land swap with the U. S. Forest Service would transfer federal land that is currently part of the Superior National Forest to the private ownership of PolyMet. The Minnesota Pollution Control Agency cannot enforce groundwater quality standards until contaminated water departs from private land and flows into public property. Unfortunately, water doesn’t know where to stop; it doesn’t recognize boundaries.	NS	X
22343	Unique			WAT	Scott DyAnne		863	3	PolyMet’s computer modeling shows that the levels of pollutants in their water will be many times greater than Minnesota’s water-quality standards. Therefore, according to the law, PolyMet is free to pollute within their boundaries. But that same water will flow into the Embarrass, Partridge and Dunka rivers, and eventually into the Boundary Waters and Rainy River watersheds, and the St. Louis River which drains into Lake Superior. As a result, Minnesota’s highly touted water-quality regulations are actually a sham.	NS	X
24692	Unique			WAT	Scott Einbinder		1085	1	Water is the most valuable natural resource we have and this project puts our water resources at risk. The trade-off of a few jobs is not worth that risk. I am against this project.	NS	X
29231	Unique			WAT	Scott William Mills		2445	1	It fails to accurately predict total volumes and direction of flow of untreated water, both during and after operations. Liners and existing LTV tailings pond are assumed to function as predicted with new tailings impoundment over it. Surface water levels predicted in the EIS are in doubt.	S	O
29231	Unique			WAT	Scott William Mills		2447	3	It fails to accurately assess creation of methyl mercury and the inclusion of heavy metals in downstream water systems, both North and South of the mine site.	S	O
23401	Unique			WAT	SHARON NATZEL		947	1	My concern is the ongoing need for treating the water for possibly hundreds of years all for a 20-year project life. The background for my concern is on Page A-568, where the thematic response explains the need for ongoing monitoring of the water and treatment and the indefinite timeframe. Also the mining operation comes within 130 to 150 feet of affecting water resources for communities via the Biwabik Iron Formation -- see page 385. This is a very short distance and could easily be overstepped with mining equipment. The mining project is very close to the Laurentian Divide and polluted water may flow in directions unforeseen. The project should not move forward as it risks our healthy Minnesota waters which are necessary for life.	NS	X
29404	Unique			WAT	Shaun Braun		2530	2	It is evident that after 10 years of evaluating the possible project effects, the FEIS clearly indicates the project’s groundwater flows will not affect the local watersheds and that the project’s treatment and mitigation plans will meet all water quality standards.	NS	X
23349	Form Letter	1	Variant	WAT	Shelley Selstad		931	1	If there is any likelihood that mercury and other contamination could affect the Boundary Waters or the 10 percent of a warming planet's fresh water contained in Lake Superior, we should not risk it!	NS	X
6029	Form Letter	1	Variant	WAT	Shirley Anderson		444	1	Can anything replace the loss of precious water? This mine will pollute both the Boundary Water area and Lake Superior.	NS	X
28488	Unique			WAT	Shirley Huskins		2287	6	Direction of water flow – would be hazardous to any direction – to St. Louis River and to Lake Superior; north to Quetico region or wherever.	NS	X
14	Unique			WAT	Spencer Shaver		37	3	Part of my coursework concerns water sustainability, and the construction of this mine would jeopardize some of the most important water systems in North America, mainly Lake Superior.	NS	X
14	Unique			WAT	Spencer Shaver		41	5	Despite the precautions outlined in the FEIS, I'm concerned that the system Polymet has proposed to treat sulfate-latent wastewater is inadequate. Similar wastewater treatment systems were used by every open pit copper-nickel mine ever operated in North America, and each one has polluted.	NS	X
12889	Unique			WAT	Stephen Arkulary		773	1	If the Poly Met operation is to include a Mile Post 7 tailings basin that is already in bad shape, how will Mile Post 7 be fortified in order to prohibit 100% of the discharge of heavy wet tailings from reaching Lake Superior?	NS	X
12889	Unique			WAT	Stephen Arkulary		774	2	How does the short term need for these low grade metals along with 300 jobs justify the pollution of Lake Superior, the largest body of fresh water on the planet? Water is a long term necessary resource.	NS	X
12889	Unique			WAT	Stephen Arkulary		776	4	Are we going to learn after the fact that the greatest watershed on the planet is beyond repair?	NS	X
17945	Unique			WAT	Stephen P. Arkulary		824	1	If the Poly Met operation is to include a Mile Post 7 tailings basin that is already in bad shape, how will Mile Post 7 be fortified in order to prohibit 100% of the discharge of heavy wet tailings from reaching Lake Superior?	NS	X
17945	Unique			WAT	Stephen P. Arkulary		825	2	How does the short term need for these low grade metals along with 300 jobs justify the pollution of Lake Superior, the largest body of fresh water on the planet? Water is a long term necessary resource.	NS	X
26659	Unique			WAT	Steve Jay		1411	3	a. Weather data from 2 stations (Fig 4.2.2-1). The measurements end at 1984 and 1986. Given dramatic changes in weather patterns over the past two decades resulting from GHG emissions, more recent measurement periods should be used. Rainfall projections must incorporate the latest meteorological data from UNIPCC and U.S. sources: NASA, NOAA etc.	S	O
26659	Unique			WAT	Steve Jay		1412	4	b. The NorthMet project would degrade surface and groundwater, violating the Superior National Forest plan and state, federal, and tribal water quality standards.	NS	X
26659	Unique			WAT	Steve Jay		1413	5	c. The assumptions in this proposal regarding both quantity and directional flow of contaminated ground water are flawed. It is critical that estimates of the amount of groundwater that leaves the mine (10 gallons/min or 100's of gallons/min) are correct. Scientists have come to different conclusions about the total groundwater flow rates and the direction of flow from the proposed mine. Specifically, work by scientists at Great Lakes Indian Fish and Wildlife Commission show that after mine closure, a million gallons of polluted groundwater a day could flow north, into the Peter Mitchell pit, and then Birch Lake. This raises the prospect that the NorthMet project could contaminate both the St. Louis River and the Boundary Waters watersheds, simultaneously. The co-lead agencies must address this question given the potential threat to the Boundary Waters Canoe Area Wilderness. The assumptions about the impact of extreme weather events should be incorporated into these analyses.	S	O
26659	Unique			WAT	Steve Jay		1418	10	a. It is stated that “The NorthMet Project Proposed Action would have the potential to affect groundwater and surface water hydrology and quality in both the Partridge River and Embarrass River watersheds. ...the rivers do not flow to or affect the water quality of the BWCA.” The assumptions upon which this statement are based are not delineated in the FEIS nor data presented that eliminate the possibility of alternative conclusions.	S	O
26659	Unique			WAT	Steve Jay		1430	22	d. There is no evaluation of the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River (Boundary Waters area) Basin and potential health impacts.	S	O

29325	Unique			WAT	Steven Ring		3687	2	Direction of flow of ground---water: there is no evaluation of the impact on the environment from possible large ground---water flows in a northerly direction from one of the pits. We are just provided with “we will monitor and adapt”. We, the public, have been monitoring and adapting on the Dunka Pit’s drainage for many years without solving the issue. The implications of the GLIFWC modeling suggest there could be millions of gallons per day flowing north. Where is the description of potential impacts? Where is the clear description of the technology and actions that will be taken?	S	N
24693	Unique			WAT	Sue Ramthun		1086	1	On December 9, the Quetico Superior Foundation Newsletter contained information regarding an error in the water flow analysis. It said that the DNR acknowledged that the water flow analysis was flawed and that untreated mining discharge would flow towards the BWCA waters. If this information is correct there should be several follow up steps: 1. The FEIS needs to be corrected with an accurate water flow analysis 2. The FEIS verbiage regarding the water flow analysis needs to be modified to reflect the corrected analysis 3. The FEIS needs to include mitigation procedures for the untreated mining discharge flow towards the BWCA The water flow analysis is a very big deal in this mining proposal. If the flow cannot be mitigated and BWCA waters protected, the mining should not be allowed. Please protect our water and other natural resources.	S	O
29900	Unique			WAT	Susan Lynn		2700	2	Sulfide mining carries tremendous risk to the water and to the people of our state and the continent. The risk is well documented.	NS	X
29900	Unique			WAT	Susan Lynn		2706	8	We are being put at risk by decisions to allow risk to our water from Sulfide Mining in the Northeast of Minnesota. Lake Superior holds 1/10th of the nation’s fresh surface water and every person on the continent has a right to that water. It is not something the people can allow you, as the trustees of our lands and water and air, to permit it to be destroyed. We ask that until such time as there is a means to extract the disseminated body of minerals without risk to the water; that you not allow it. Please, uphold your duty to the people to hold their lands in safe trust, with the gravity due, to that duty.	NS	X
27701	Unique			WAT	Suzanne Steinhagen		2105	1	Clean water is intrinsically more important than money, especially with the effects of global warming arriving sooner than we may suppose. Remember water goes everywhere: wherever it can go, it will go – taking with it any load of pollutants. Please choose clean water which is synonymous with life. I ask you for the many, fellow animals, plants, and human beings.	NS	X
29110	Unique			WAT	T. Chandler		2424	1	One of the glaring problems is omission of accurate, recent groundwater elevation data. To rely on 10 year old data is not only ridiculous, it's unethical. No ethical scientist or engineer would stand by an "estimated" groundwater contour map and no ethical company would not spend the money to gather real, current data. With all the exploratory drilling, where are the actual groundwater data?	S	O
27703	Unique			WAT	T. Darwin		2107	1	As a 25 year resident of the arrowhead of Minnesota, I urge you not to allow the PolyMet mine so close to Lake Superior	NS	X
29356	Unique			WAT	Tara Widner		3695	1	The rivers nearest the proposed mine, the Partridge and Embarrass Rivers, are wild rice waters that will likely be damaged by sulfide runoff from the proposed PolyMet mine.	NS	X
27459	Unique			WAT	Terrie Christian		1749	3	A few hundred jobs for 20 or so years does not warrant the risk to our water. Water is life itself. Without nothing can live.	NS	X
29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3855	10	WHEREAS, the DNR acknowledges significant uncertainty regarding the direction of polluted water by means of groundwater flow, but has resisted further modeling or an independent review of the model itself and the untenable assumptions about water levels at the point of mine closure;	S	N
29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3856	11	WHEREAS, if polluted water were to flow as expected by the FEIS into the St Louis River, it would put at risk the estuary and river corridor where considerable public funds that have been spent for restoration;	NS	X

29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3857	12	WHEREAS, the FEIS does not evaluate the impacts of polluted seepage north of the mine site on the 100 Mile Swamp and the Rainy River Basin, which should acknowledged as an international issue;	S	N
29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3862	16	WHEREAS, it is unrealistic to assume and claim that nearly all the polluted water would be captured for treatment;	S	O
29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3864	18	WHEREAS, mines that would potentially require perpetual treatment of acid mine drainage have been banned in other states due to the severe threat to future generations;	NS	X
29478	Unique			WAT	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3867	21	WHEREAS, the grade of ore in sulfide rock in northeastern Minnesota is very low, at a mere 1%, which will produce a vast amount of sulfide tailings exposed to the weather, in turn requiring extensive protections against great risk, making the project both very dangerous and economically unsustainable to provide adequate protections;	NS	X
443	Unique			WAT	thun440@netscape.net		214	2	In your environmental statement you say the the Polymet project "would not cause any significant water quality impacts". My question is, what do you consider an insignificant water quality impact. ANY impact is unacceptable----PERIOD!!! And who's going to do the on-going clean-up necessary after it's all over with?	NS	X
29046	Unique			WAT	Tim Gihring		2405	3	The FEIS concludes that water-treatment controls would need to be in place definitely but does not further analyze how this will be possible, punting some of this analysis to the permitting process. Unfortunately, this undercuts the entire analysis, let alone the statement that "the project as proposed meets state standards." There is a great deal we don't know and very good reasons we should find out: No business, after all, has existed indefinitely, or even for very long, particularly not mining companies. The greatest liability of the project, its indefinite need for water treatment, is among the least analyzed aspects of the project in the FEIS.	NS	X
29046	Unique			WAT	Tim Gihring		2406	4	The DNR has suggested that it should be viewed as the independent, third-party evaluator of the project. This is fair enough, as far as it goes. But it doesn't go very far, apparently, since other independent analysis has been given short shrift, including the Great Lakes Indian Fish and Wildlife Commission's finding that water from PolyMet would indeed flow north into the Rainy River watershed and in greater volumes than PolyMet claims. Why hasn't all analysis, competing conclusions or not, been reviewed and evaluated and explicated in the FEIS?	S	O
22249	Unique			WAT	Tim Schwarz		856	2	Part of my coursework concerns water sustainability, and the construction of this mine would jeopardize some of the most important water systems in North America, mainly Lake Superior. I stand with the Duluth Downstream Coalition of businesses in their opposition to any hard metal mining on the North Shore of Minnesota, as well as the countless Outdoor Recreation businesses in around the Boundary Waters that oppose development like this around their homes.	NS	X
22249	Unique			WAT	Tim Schwarz		857	3	Despite the precautions outlined in the FEIS, I'm concerned that the system Polymet has proposed to treat sulfate-latent wastewater is inadequate. Similar wastewater treatment systems were used by every open pit copper-nickel mine ever operated in North America, and each one has polluted. The Mount Polley mine in British Columbia, the Gold King mine in Colorado, and the Gilt Edge mine in South Dakota are just a few examples of the kind of legacy this industry leaves. Each of those mines passed a similar environmental impact statement process, then left unacceptable amounts of pollution to clean up, paid for mostly by taxpayers.	NS	X
26996	Unique			WAT	Timothy Weulander		1516	4	Potential groundwater flow northward from the Mine Site to the Northshore Mine, if determined possible through monitoring, would be prevented. - to me, this reads that if we are able to determine underwater flows heading north, they would be prevented. Well, what if they are not determined? What if not all are found? This particular statement is worrisome to me.	NS	X
26996	Unique			WAT	Timothy Weulander		1517	5	In-pit underwater disposal of the most reactive waste rock to minimize chemical reactions that could affect water quality. - This statement seems to admit and recognize that there will be reactive waste and chemical reactions. Just at what level, apparently. The only level that should be acceptable is none.	NS	X
26996	Unique			WAT	Timothy Weulander		1520	8	And please, explore that worst case scenario. A major pile of their sulfuric residue spills, contaminates waters in the Superior Watershed or northern traveling underground waterways, you are dealing with nothing less than an international disaster as there is no way Canadian waters do not get affected.	NS	X
30605	Form Letter	1	Variant	WAT	Tom Clarke		2880	1	Keep our water safe Please study the public health effects of copper sulfide ore mining	NS	X
24770	Unique			WAT	Tom Thompson		1105	4	There is a proposal to use reverse osmosis to treat water decreasing the chance of surface waters containing sulfides from polluting other surface water. This will need to be done for at least 500 years of indefinitely. What assurances are there that Polymet will be able to do that. Of course they won't. Reverse osmosis does not treat water seeping into local ground water underneath holding ponds. What will be done with this?	NS	X
6967	Form Letter	1	Variant	WAT	Trout Lowen		527	1	PollyMet is a mistake and once permitted there will be nothing we can do but watch and weep as waste water from PollyMet finds its way to the BWCA, the jewel of Northern Minnesota's natural landscape.	NS	X
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2976	2	Evaluating the duration of water treatment necessary during/throughout operations and after project closure does not give the public an opportunity to have an informed opinion on the project as a whole, does not properly inform permitting decisions, and does not provide for a reasonably accurate evaluation of financial assurance before the project is initiated. There needs to be a reasonable evaluation and estimate of how long water treatment would be needed before the project starts. This would also inform whether the project would be "maintenance free" at closure.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2977	3	Effectiveness of the proposed water treatment and seep collection methods are vital to the project meeting water quality standards. Analysis and design detail are lacking in the FEIS as a whole. More detail is needed on water treatment and seep collection, including long-term operation and maintenance, since they are essential components of the project meeting environmental standards. The seep collection system around the tailings basin is modeled to have a capture efficiency of 99% (100% of shallow surface seepage and greater than 90 percent of groundwater seepage) along the northern, northwestern, and western portions and 100% along the eastern portion (section 5.2.2). Description is needed on how this efficiency rate was determined. We question if such a high capture rate can be achieved, and it would be helpful to include examples and citations of other projects operating seep collections at that efficiency rate. Further, if such capture rates are not achieved, the resulting impacts to water quality and quantity should be described in the FEIS.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2978	4	Concern exists over the methods used to estimate baseflow in the upper Partridge River (sections 4.2.2.2.2 and 5.2.2.2.2). XP-SWMM model estimates of Partridge River baseflow presented in the FEIS have been found to be three times lower than observed values. The XP-SWMM projections, which are based on USGS hydrometric station data from 17 miles away collected from 1978 to 1987, do not align with the rating curve from the Minnesota Department of Natural Resources (MNDNR) winter monitoring data, or the results of the Great Lakes Indian Fish and Wildlife (GLIFWC) projections taken from two years of recent data from the Dunka Road gage in the XP-SWMM model. Co-Lead Agencies have worked with Cooperating Agencies on this issue, but it is not addressed in the FEIS regarding how it may affect modeling results. The models may be under-predicting the amount of water and contaminant load that will need to be treated and contained at the Mine Site. Questions have also arisen on data use, including if new data is being utilized and how existing data was selected (or not selected) for use. Although the FEIS includes a groundwater baseflow sensitivity analysis that considers the effect of variable groundwater baseflow inputs on water quality, additional analyses should be performed and included in the FEIS that investigate how the XP-SWMM model predictions may change with using more recent baseflow measurements for the upper Partridge River and how that may affect the MODFLOW and GoldSim model predictions.	S	O

27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2979	5	Significant uncertainties exist with groundwater flows and related contaminated water transport that are not adequately addressed in the FEIS. In particular, the potential for groundwater to flow north from the proposed Mine Site to the existing Northshore Mine, ultimately to the Rainy River Watershed and Boundary Waters Canoe Area Wilderness (BWCAW), has been largely ignored. Although some details for the potential of a northward flow path is acknowledged in sections 5.2.2.3.5, 5.2.2.3.6, and 6.2.2.3.1, it is portrayed as being unlikely and little detail is given on the potential impacts that would occur and how those impacts could be avoided/mitigated. Given that a northward flow path currently cannot be ruled out, greater detail on the potential impacts need to be included in the FEIS. There should also be inclusion of additional analyses performed by GLIFWC and provided to the Co-lead Agencies that details how a northward flow path could occur and is likely to occur since their results have not been refuted.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2982	6	Of the potential contingency mitigation options provided in Section 5 .2.2.3 .5 of the FEIS (grouting, pit lake depression, ground water extraction wells, and artificial recharge), none of which have supporting literature and/or examples provided to support their potential use nor any detail about the potential cost for implementation and how that would affect financial assurance for the project as a whole. What is clear in the FEIS is that the existence of a northward flow path and the feasibility of using any mitigation option would not be determined until the project is up and running. This is a major concern and inadequacy of the FEIS. Not knowing if there will be groundwater flow to the north (impacting the Rainy River Watershed, an entirely different watershed than what is described in the FEIS) and the feasibility of the proposed mitigation options until operations have commenced is unacceptable. If a northward flow path is determined while in operation, it is likely that impacts will have already occurred and mitigation (not avoidance) will be the only option. Also, there should be an explanation of what will happen if, while in operation, a northward flow path occurs and it is determined that none of the proposed mitigation options are feasible. As the project is currently proposed, this is a possibility and should be addressed.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2983	7	We disagree with the conclusion in the FEIS that the NorthMet project is not predicted to result in any significant changes to groundwater and surface water flows when compared to existing conditions in the Partridge and Embarrass Rivers (Executive Summary, page ES-36 and Section 5.2.2). Augmenting stream flow to tributaries with treated water treated at the WWTP will impact surface water hydrology. We believe that the interaction of the project's impacts with natural variability in precipitation would be more adverse than reported in the FEIS. This is because effects of climatic variability are additive to the project-related change, which would be especially true for drier periods. It is also noted in the Executive Summary (page ES-38) and in Section 5.2.3 that indirect effects on wetlands are expected due to groundwater drawdown. Groundwater drawdown will impact groundwater hydrology and it's connectivity to the surficial aquifer, which will likely impact surface water hydrology.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2984	8	Disagreement exists over application of the 1 0 mg/L wild rice sulfate standard (Section 5 .2.2.1.2, page 5-22). Although some of these comments relate more to Minnesota Pollution Control Agency (MPCA) determinations and permitting issues, they are important considerations for the project to meet water quality standards and should be clearly addressed in the FEIS. It is arbitrary to define how much rice presence is required for an area to be defined as a water used for the production of wild rice, especially given the lack of long-term monitoring data in the receiving waters of this project. Application of this standard may be evolving/changing as research has been completed and the standard is currently being evaluated by the MPCA.	NS	X
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	2997	24	On page 5-687, the FEIS states that the proposed land exchange would result in a net increase of wild rice beds to the federal estate. Please revise. Wild rice in these locations are found in public waters and would not be on federal lands or under federal ownership/management. Some resource protection advantages may exist to gaining adjacent federal ownership as it relates to land management, but it is not accurate to state that they would be under federal ownership/management.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	3001	28	We disagree with the conclusion that no cumulative effects to groundwater resources would result from the project (Section 6.2.2, page 6-31). Bedrock and surficial ground water pollution is already documented at the old LTVSMC site (i.e., plant site; area pits 5, 6, and 9S) and the Dunka Pit. Cumulative effects at these locations should be assessed with the proposed project along with potential groundwater pollution from the Peter Mitchell Pit, Laskin Energy, ArcelorMittal, United Taconite, and US Steel Minntac.	S	O
27061	Unique			WAT	Tyler Kaspar	1854 Treaty Authority	3002	29	A future action that should be considered in the cumulative effects analysis is any potential future backfill of Virginia Formation waste rock for in-pit disposal at the Cliffs Peter Mitchell Pit. Potential dewatering-related interaction effects between the proposed NorthMet Project and the Peter Mitchell Pit should also be evaluated for cumulative effects.	S	O
28822	Form Letter	1	Variant	WAT	Walt and Marcie Moe		2358	1	My main concern is that there will be inadequate testing done to ascertain the degree of water contamination from the mine runoff, the pits, the process, etc. Are there going to be wells drilled to check the water infiltrating below the surface? Are there baselines to be established for all rivers and streams that could be affected by the discharges? What agency will do the testing? Not Poly-Met I hope! Will the MPCA allow mining operation to continue if the standards are exceeded? And for how long? I believe they base their rules on Company revenue, people's employment wishes and then the Environment! I think this is wrong it should be the environment first!	NS	X
28822	Form Letter	1	Variant	WAT	Walt and Marcie Moe		2360	3	We need clean water to live a healthy life! Have you looked at the cancer rate in the mining region?	NS	X
28477	Unique			WAT	Wendy Robertson		2264	3	To date about \$750,000,000.00 has been spent to clean-up from the industrial pollution disaster of the St. Louis River watershed area. It is still unsafe for certain human populations to consume fish from the river without heeding the MN Dept. of Health's warning guidelines. It is still considered an endangered river without the additional impact of sulfide mining.	NS	X
29367	Unique			WAT	William K. Dustin		2496	1	the type of mining proposed here is going to pollute, and a massive low grade deposit in a wet environment is guaranteed to generate acid mine drainage essentially in perpetuity.	NS	X
29367	Unique			WAT	William K. Dustin		2510	3	A ten percent chance that a pollutant will exceed the evaluation criteria is simply too high. At a minimum the standard should be P95 and ideally it would be P99. Computer models are quite uncertain as is evidenced by the climate models that have woefully underestimated the amount of global warming that is occurring.	S	O
29734	Unique			WAT	William K. Dustin		2576	1	the type of mining proposed here is going to pollute, and a massive low grade deposit in a wet environment is guaranteed to generate acid mine drainage essentially in perpetuity.	NS	X
29734	Unique			WAT	William K. Dustin		2578	3	A ten percent chance that a pollutant will exceed the evaluation criteria is simply too high. Computer models are quite uncertain as is evidenced by the climate models that have woefully underestimated the amount of global warming that is occurring.	S	O
29973	Unique			WAT	William Robbins		2745	2	Reverse osmosis (RO) is given lip service in the final EIS as the "cure" for water pollution. RO could help improve the situation, but only if the RO system is properly engineered, properly operated, constantly monitored and rigorously maintained. Of course, RO only separates the water into a cleaner stream and a more concentrated waste stream. Choice of operating pressure in the RO sets the ratio of flow of cleaner water to flow of wastewater. Without knowing the design operating pressure, a decision maker would not know the following: 1) How much wastewater will have to be stored or treated by secondary methods. 2) The intended size and cost of the RO system, including pre-filtration equipment. 3) Costs of long-term maintenance, monitoring and repair of the RO system. Without adequate maintenance, monitoring and repair, the cleaner water stream will soon cease to meet even minimum water quality standards.	NS	X
29973	Unique			WAT	William Robbins		2746	3	There seems to have been a focus on controlling water effluent from tailings. This is important, to be sure, but the huge amount of water, both meteoric and ground source water from the mine will likely dominate water flow that needs to be treated, so sizing of the RO system needs to accommodate large, erratic flows from storm runoff.	NS	X
1368	Form Letter	1	Variant	WAT	Winifred Tillmann		279	1	I am th owner of property in northern Minnesota. The property is on a large lake with a large watershed. The possibility for spills and leaks; although assurances have been given that they would be minimal or none at all, is too great a risk to take in this vulnerable area.	NS	X
26780	Unique			WET	Alaina Pilate		1456	6	The direct destruction of 913 acres of wetlands and impairment or destruction of over 8,000 wetlands does not align with federal policy to protect wetlands. The imminent degradation of surface and groundwater violates water quality standards of the Superior National Forest as well as state, federal and tribal guidelines.	NS	X
26780	Unique			WET	Alaina Pilate		1459	11	Please fix the plan with improved wetland protection and replacement.	NS	X
22622	Unique			WET	Anne Uehling		875	3	All of The replacement wetlands for mitigation of impacted wetlands are not within The St. Louis River watershed.	NS	X
27377	Unique			WET	Beth Lewis		1702	4	Insufficient mitigation of wetlands.	NS	X
29807	Unique			WET	Bruce Ludewig		2635	4	the lands to be given up for the NorthMet project are high quality ancient wetlands, thousands of years old, that once destroyed can never be replaced with anything equivalent. Even if a land swap could be justified, I do not believe the Forest Service, in this proposal, gets nearly enough in exchange for these precious wetlands.	NS	X
27184	Unique			WET	Carl Sack		1677	9	These impacts may extend beyond the watershed itself to areas chosen as wetland mitigation sites. The fact that there is no way to compensate the 914 acres of wetlands that will be permanently lost on the Mine Site with comparable wetlands elsewhere in the St. Louis River watershed should prohibit the project from moving forward. The FEIS admits that few potential restoration sites of any significant size in that watershed and northern Minnesota in general exist. Those that do could not approach the high quality of the wetlands that will be lost. The Aitkin site that is proposed for mitigation is 100 miles from the mine site and in the Mississippi River watershed, so will not compensate for the loss of wetlands that feed the St. Louis River and Lake Superior. The Hinkley site is even further from the mine site and within a very different ecological context. Any restoration activity conducted by Polymet puts the areas to be "restored" at risk of environmental damage. During the DEIS period, Polymet prematurely attempted to "restore" existing wetlands and biologically rich uplands in the Floodwood area to count toward its compensatory mitigation requirement under an agreement with St. Louis County. That agreement was subsequently voided by the Sixth District State Court (Wetlands Action Group vs. St. Louis County, 2007). Polymet should not be trusted to conduct further compensatory mitigation activities. It is also unacceptable that final compensatory mitigation ratios are not included in the FEIS, and thus will be unavailable for public comment when decided upon by USACE.	NS	X
2759	Unique			WET	Catherine Johnson		338	2	1) Copper mining in such a valuable wetland area will permanently harm this valuable resource that we hold dear to us, including Lake Superior.	NS	X

26823	Unique			WET	Cheryl Kallio	Multiple Groups	2963	4	More than 66 percent of the Great Lakes’ original wetlands have been filled in or destroyed. Wetlands provide essential services for people such as reducing flooding, preventing erosion and improving water quality. They also provide vital habitat to wildlife, waterfowl and fish, and are the backbone of the region’s outdoor economy. The PolyMet project would destroy over 900 acres of wetlands. Additionally, the mine will adversely “impact” between 6,600 and 7,500 additional acres of wetlands. The sheer physical impact of this immense amount of habitat destruction and its impacts to wildlife remain undisclosed, as do the effects of the loss of the ecological function of these wetlands. We believe this would be the single largest permitted destruction of wetlands in the Great Lakes basin since the passage of the Clean Water Act, over 45 years ago and should not be allowed.	S	O
29801	Unique			WET	Daniel Pauly		4208	48	The unique nature of the soils at the NorthMet site result in delivery of tailings seepage to the wetlands, rather than to the drainage pipe. The Containment System called for in the FEIS is shown in cross section below, which is taken from Figure 4 of reference PolyMet 2013f. This figure is a useful one for evaluating containment system flow during mine operations because it is taken on the north end of the Tailings Basin where the greatest amount of discharge is predicted. The black lines show the flow path of the seepage according to NorthMet Project Modeling. Notably, according to the model, 78 percent of the seepage water is delivered to the wetlands, while only 22 percent of it is delivered to the Containment System Drain Pipe. The reason for this flow path, according to FEIS documents, is that the relatively low hydraulic conductivity of the soils forces the water to the surface, where wetlands will likely expand and proliferate. Within these large perimeter wetlands, the ideal conditions for mercury methylation are likely to occur: abundant mercury, sulfate, dissolved organic compounds (DOC), and water. The FEIS entirely fails to consider what will happen when the mercury, sulfates, DOC and water combine in these perimeter wetlands.	S	N
25385	Form Letter	1	Variant	WET	David Witt		1172	14	- The PolyMet proposal quantifies for mitigation of indirect loss of up to 8,264 acres of wetlands, and provides adequate mitigation plans for direct destruction of 913 acres of wetlands within the Lake Superior Basin.	S	O
29164	Unique			WET	Deborah Huskins		3605	11	The proposed exchange of land with the Superior National Forest is not an even exchange, and will not produce an equivalent amount of high quality wetlands in other locations. 913 acres of currently high quality wetlands will be directly affected and permanently damaged. Reclamation after the damage has been done will not restore the wetlands to what they are now, before the damage occurs.	NS	X
29164	Unique			WET	Deborah Huskins		3606	12	The possibility of northward flow of contaminated water toward Birch Lake and the watershed of the Boundary Waters Canoe Area Wilderness has been raised, and the solution offered is that the water flow will be “monitored.” If monitoring finds that northward flow is happening, how quickly can sufficient measures be in place to stop it? Will the monitoring be continuous? And for how many years? Who will do the monitoring, and will there be adequate funding to make sure the monitoring is as effective as possible for as long as is needed? How long is that? Contingency measures should be in place to stop any northward flow before it happens.	S	O
27675	Unique			WET	Deborah Mielke		1836	4	Wetland mitigation is rarely as effective as leaving natural wetlands in their current environment.	NS	X
27685	Unique			WET	Dennis Szymialis		1892	47	p.3-136 "Compensatory wetland mitigation for the proposed North Met project is expected to be approved and constructed" -Constructed wetlands?	S	O
27685	Unique			WET	Dennis Szymialis		2000	155	The Aitkin and Hinkley sites WILL not compensate for wetlands lost in The St. Louis River watershed. wetlands need to be retained and justly deserve to be retained to provide environmental filtering effect, retention of water for flood control, et.	S	O
27685	Unique			WET	Dennis Szymialis		2001	156	The Zim site is already wet and serves The functions of a wetland. Calling The Zim site a wetland or flooding it with more water serves no wetland purposes. I have walked The area composing The Burns sod farm as one of their customers.	S	O
27685	Unique			WET	Dennis Szymialis		2002	157	none of The given sites should be qualified as mitigation.	S	O
27685	Unique			WET	Dennis Szymialis		2003	158	a key component ofthe adaptive management plan should be to identify additional compensatory wetlands in advance that would actually serve an additional wetland function within the St. Louis River watershed to compensate for wetlands lost in the St. Louis River watershed. 27685	Unique			WET	Dennis Szymialis		2004	159	as previously indicated in these comments Mine settings chosen are not comparable for The reasons previously given in these comments.	NS	X
27685	Unique			WET	Dennis Szymialis		2005	160	indirect wetland effects need to be assessed for evaporation resulting from loss of vegetation cover these should include ombrotrophic wetlands.	S	O
27685	Unique			WET	Dennis Szymialis		2006	161	Analog mine sites are dissimilar to PolyMet because as previously indicated. The water table at PolyMet maintains a higher elevation and puts the water under more pressure to flow farther. Rather than restrict the area of drainage the Partridge River expands the zone because it is within the zone of bedrock fractures which the surficial water flow follows as indicated elsewhere in this SDEIS. All wetlands to the Northwest, North, and Northeast will run into the PolyMet mine pit. Drawdown will occur following the Partridge River beyond the 10,000 foot boundary until pumping from the pit augments and restores the river flow downstream of the pits.	S	O
27685	Unique			WET	Dennis Szymialis		2007	162	disregarded in this analysis are the cumulative effects of evaperation drawdown from defoliated ground, accelerated defoliation from drying, dusting, the toxic effects of toxic dust or watering, increase runoff from dry defoliated ground, and draw down from the mine pit on vegetation. It is clear that the co-lead agencies have taken a myopic view of cumulative impacts.	S	O
27685	Unique			WET	Dennis Szymialis		2008	163	evidence of erosion that should be expected to continue from PolyMet seepage. this eroded ground should not be expected to support a containment wall or boulders reinforcing The base of The tailings basin.	S	O
27685	Unique			WET	Dennis Szymialis		2009	164	indirect wetland impact WILL occur at The plant site from evaporation caused by The trampling of vegetation.	S	O
27685	Unique			WET	Dennis Szymialis		2011	166	disregarded in this analysis are The cumulative effects of evaporation draw down from defoliated ground, dusting, The toxic effects of toxic dust or watering on defoliation of water preserving ground cover, and draw down from The Mine pit on vegetation. Further disregarded is The contribution of traffic to defoliation evaporation.	S	O
27685	Unique			WET	Dennis Szymialis		2013	168	Analog method not representative, wetland draw down underestimated from Partridge River hydrology, etc. as previously indicated in these comments.	S	O
27685	Unique			WET	Dennis Szymialis		2014	169	state and Federal governments want mitigation on private lands because they plan to continue The degradation of wetland environments on their own lands in violation of state and Federal laws.	NS	X
27685	Unique			WET	Dennis Szymialis		2015	170	it is incorrect to characterize ditched peat lands as adversely effected. These lands could be utilized as productive farmlands. These lands have diminished value because of the pollution of the St. Louis River that has diminished the regional agricultural economy.	S	O
27685	Unique			WET	Dennis Szymialis		2017	172	mining should replace lost wetlands destroyed by mining. The intent of The law is not to make agricultural perpetually subservient to mining. Furthermore, replacing wetlands lost to mining does not functionally compare when replacing them with agricultural lands.	S	O
27685	Unique			WET	Dennis Szymialis		2019	174	The mere fact that farm land can be turned into wetlands is testimony to the health of the land. Mining land cannot replace wetlands because wetlands cannot be created from mine lands. There is a qualitative difference between protecting wetlands from mining and using farm lands to replace wetlands that are destroyed by mining and to fail to recognize the difference is simply a lie.	NS	X
27685	Unique			WET	Dennis Szymialis		2020	175	turning existing sod farms into wetlands is a sham and a waste. People need sod. these WILL simply be replaced by draining other wetlands and no net gains WILL occur.	NS	X
27836	Unique			WET	Ellen Hawkins		2194	18	This project would result in the direct destruction of 914 acres of wetlands as well as the destruction or impairment of up to 7,694 additional acres of wetlands. More, it would apparently degrade surface waters and groundwater to the extent that they would not meet state, federal and tribal water quality standards.	NS	X
27836	Unique			WET	Ellen Hawkins		2195	19	The FEIS does not provide for real mitigation of wetland destruction. It seems that there is no way to replicate the rich mix of plant and animal communities from the great diversity of wetland types: coniferous bog, shrub swamp, coniferous swamp, shallow marsh, deep marsh, sedge/wet meadow, hardwood swamp, and open bog – all of which would be lost from the very large project area. The FEIS does not provide assurance that a wetland credits system could come close to replicating the degree of biodiversity that would be lost.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4056	132	The Conservation Organizations strongly disagree with the premise in the FEIS that by changing the description of potential indirect effects to “low likelihood” as opposed to no likelihood allows the co-lead agencies to avoid analysis and disclosure of potential for negative effects to wetlands from the project. This shorthand and non-analytical approach is inadequate and misleading.	S	O

29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4062	124	17.0 The FEIS fails to adequately disclose, analyze or discuss the effects of the project on area wetlands. The FEIS still fails to adequately disclose, analyze, or discuss a number of questions regarding the environmental effects of the PolyMet mine and processing facility on area wetlands, addressing few of the questions and issues raised in the extensive comments on the SDEIS. Therefore, the Conservation Organizations restate and incorporate in their entirety, the comments and accompanying expert reports of MCEA, Friends, and CBD on wetlands and related issues regarding hydrology, air deposition, and financial assurance. The Conservation Organizations address below the change from the SDEIS to the FEIS identifying a number of wetlands as not likely to be indirectly affected to “low likelihood” of indirect effects, as well as a few of the relevant responses to comments (and their failure to adequately address issues raised). The Conservation Organizations will also highlight and emphasize some of the continuing wetland issues that are critical to permitting decisions moving forward.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4063	125	17.1 Wetland identification and classification is impermissibly skipped over in the FEIS.One of the primary issues raised in comments on the SDEIS concerned the failure to adequately classify and the potential misclassification of minerotrophic wetlands as opposed to ombrotrophic wetlands. While Eggers’ January 2015 Memorandum appears to agree with Dr. Glaser regarding the references and guidance to be used in such identification, the FEIS is at best conflicted, and at worst simply wrong, in its approach to identifying project-affected wetlands as either ombrotrophic or minerotrophic and the resulting potential for negative effects and type of negative effect. Instead of identifying wetlands that may be affected and their type, the FEIS now simply assigns a “low likelihood” of effect to area wetlands in an effort to avoid assessing wetland character as minerotrophic and to negate or minimize the importance of identifying specific wetlands as minerotrophic in the affected area. While it is correct that this is a slightly more conservative approach than the approach originally taken in the SDEIS, it is neither an accurate nor complete approach and tends to trivialize why it is important in environmental review to make the distinction. Type of wetland will be relevant for more than assessing indirect effects as a result of hydrology and it is a required component of an EIS as well as for the analysis for the purposes of issuing a C.W.A. § 404 permit.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4064	126	First, as discussed below, hydrology is not the only manner in which wetlands will be and are affected by the project, but it is a component among several. In order to fully understand effects, all ways in which wetlands might be affected should be addressed. Therefore, simply changing the NEPA document conclusion from no likelihood of effect to low likelihood does nothing to address the overall potential for effects to area wetlands, including the heightened potential for effects to minerotrophic wetlands and their unique characteristics.	S	N
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4065	127	Second, low likelihood as a blanket statement utterly fails to demonstrate the required level of analysis and disclosure for an EIS. There is no analysis in this blanket probability statement in the FEIS. A generic statement about all wetlands on and around the site tells the co-lead agencies, decision-makers, and the public absolutely nothing about what may occur as a result of the project and what is lost because of it. And the blanket “low likelihood” statement, absent assessment and analysis of wetlands that are actually in the area and their hydrologic character, is simply inaccurate. It is unlikely that all ombrotrophic and minerotrophic wetlands in the area are vulnerable to effects from the project in the exact same manner and degree. This is not analysis based upon evidence and science; this is just an effort to escape the requirements for environmental review. Third, the blanket “low likelihood” coupled with the FEIS’s simplistic use of distance from the pit in areas between the East Pit and the PMP as the only measure of whether a wetland might be affected by drawdown, fails to adequately assess potential wetland effects.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4066	128	Fourth, also discussed in more detail below, the type of wetland is important to identifying type and difficulty of mitigation needed and may affect whether the effect must, under applicable law, be completely avoided. As the FEIS acknowledges, both state and federal law require that full function of wetlands be mitigated if they cannot be avoided (avoidance is by far preferable and the required first step in analysis and decision-making for projects that will affect all types of wetlands)281 Function includes the hydrology and the plants and wildlife that are dependent upon that hydrology and the characteristics of a particular wetland type, including whether that wetland is ombrotrophic or minerotrophic.282 It also includes placement of the wetland in the landscape and relationship to the habitat and ecosystems within the area. Where a wetland is unique, rare, and/or difficult to restore or mitigate, avoidance is even more important and mitigation ratios must increase.	NS	X
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4067	129	While it may be correct that an EIS does not always require original scientific research, it does require assessment and analysis of the site of the project itself sufficient to adequately characterize the environmental effects. Analysis of the actual site is not original research, it is in fact the very point of environmental review. There is no reason the project proponent and/or its consultants and/or the Co-Lead Agencies cannot access the site and survey potentially-affected wetlands to determine type through soil and plant analysis. The FEIS has been years in the making and this issue in particular was raised by the Conservation Organizations and their experts in comments over twenty months, and two entire growing seasons, prior to the issuance of the FEIS. In particular, MCEA’s original comments on the SDEIS, at 87, criticized the lack of vegetation plots for assessment of wetland types and potential effects. Moreover, when the Conservation Organizations requested access to the site to conduct their own analysis during the 2015 growing season (something that the proponent and co-lead agencies should have done, but that non-profits were willing to do nonetheless), PolyMet denied access to public lands and the Forest Service allowed PolyMet to do so.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4069	131	The FEIS fails to adequately identify minerotrophic wetlands potentially affected by the project and has plainly made no attempt to do so.	S	N
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4072	135	17.2.2 Indirect wetlands effects are not adequately disclosed and analyzed and are defined too narrowly in the FEIS. Both federal and state law are clear that wetland effects that must be avoided and/or mitigated include all direct effects (e.g. where wetlands will be destroyed by the mine pit) and indirect effects—which includes changes in size, type, hydrology, or plant composition of a wetland as well as overall biodiversity and function of the wetland within the larger landscape. Both direct and indirect effects must be mitigated under state and federal law, and the mitigation must replace the full functions lost by virtue of either the direct or the indirect effects.	NS	X
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4073	136	Yet, the FEIS fails to adequately identify and analyze indirect effects and further defines and treats indirect effects very narrowly. The FEIS appears to constrain the definition of indirect effects on wetlands as including only changes in the hydrology of a wetland as a direct result of mine or processing facility activities or by virtue of “fragmentation,” further appearing to narrowly define fragmentation as a diminishment in physical size (i.e. acreage) of a specific individual wetland.297 Even fragmentation is largely regarded through a hydrological lens. These constraints fail to address and disclose all potential impacts to wetlands from the PolyMet project and in turn fail to address the full mitigation obligation primarily by fragmenting the analysis itself on a ‘wetland by wetland’ basis instead of looking at the entire, complex wetland and ecosystem assemblage that is the mine site.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4074	137	First, the FEIS fails to adequately disclose and analyze potential indirect effects even within the narrow definitional constraints used. The FEIS simply states there will be a “low likelihood” of indirect effects and leaves the analysis for another day, likely after the mine has already started operation and it is far too late to avoid effects; the damage will occur by the time it is identified as even a possibility. This is unacceptable	NS	X
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4075	138	While the Conservation Organizations acknowledge that the Co-Lead Agencies may be currently unable to identify and analyze all indirect effects to wetlands, they can certainly identify some and begin to assess which are more likely than others.	S	O
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4078	141	Third, the narrow definition tied almost exclusively to hydrologic measures also does not take into account the obvious effects on the overall complex of wetlands and the diminishment of the function of the area known as the Hundred Mile Swamp. As noted previously and as is plain from maps and the Co-Lead Agencies’ own documents and statements, the area of the PolyMet mine site is a very large intact northern wetland complex, including many high-quality natural communities. This area, as a whole, is the headwaters for the Partridge River. This area functions as a whole, not as a group of smaller, isolated wetland and/or upland ecosystems. Therefore, the FEIS treatment of this area as a group of small isolated wetlands each of which can be destroyed or negatively affected without regard to others is scientifically unsupported and unsupported by the agencies’ own previous assessment of the area. The system of assigning a value of 0 to 6 to “assess” risk to each small increment in the system is simply the appearance of an iterative process, but it is in fact a purposefully artificial constraint on assessing the potential risk to this integrated wetlands complex and ecosystem and the need to avoid or mitigate effects to it. The Co-Lead Agencies make the classic error of slicing and dicing an integrated ecosystem in order to minimize negative effects and to effectively deny their consequences. This is an illegal segmentation of NEPA analysis.	S	N
29745	Unique			WET	Erin Mittag	Minnesota Center for Environmental Advocacy	4080	143	17.2.3 The FEIS inadequately addresses climate change implications for wetland impact avoidance and mitigation. Climate change and its effect on northern wetlands is also inadequately addressed in the FEIS. The FEIS is lacking in this regard in two ways. First, the FEIS fails to adequately identify and analyze the effect that climate change will have on the northern peatlands landscape and how that should shape the avoidance component of wetlands regulation and/or the mitigation requirement. Nowhere in the wetlands section is climate change mentioned. Only in the Response to Comments on wetlands does the document claim a “qualitative assessment of the potential impacts of climate change on wetlands is included in FEIS Section 5.2.7.2.4.”304 Section 5.2.7.2.4 follows on the air quality section, not an obvious placement for wetland impacts. More to the point, Section 5.2.7.2.4 contains little to no assessment of climate impacts on wetlands, much less a “qualitative assessment” stating only that climate change may affect some wetlands in some ways. It then references Barr 2012l. Barr 2012l can be summarized as stating climate change may make some wetlands wetter, some drier, some hotter, some shadier and that increased temperatures may release more methane. The total amount of text devoted to the topic is no more than a page and can hardly be described as a qualitative assessment of what is actually going to occur with wetlands on the site and more importantly contains no discussion of what the may mean regarding impacts from the project and need for and location of mitigation. A quick search of even a single piece of local research would have produced more detailed information. Recent research suggests that Minnesota boreal peatlands may suffer most from the effects of climate change. Most vulnerable will be the southern extent of those lands---the very areas where PolyMet proposes two of the three mitigation sites. Coupled with the science on how questionable mitigation for peatlands is, it is plain that the agencies must consider avoidance of effects to the PolyMet wetlands as an important hedge against the effects of climate change. Maintaining intact ecosystems is plainly identified as the preferable path in the face of climate threats. In light of the science, the FEIS must discuss how eliminating a vast area of high-quality and intact wetland will affect overall system resiliency in the face of climate change. At a minimum, the FEIS must analyze and discuss how climate change may affect the success of the proposed mitigation and whether or to what extent the mitigation proposal may have to adjust in light of climate effects, whether in terms of location, overall size, watershed, and/or ratios.	S	O

28547	Unique			WET	Esteban Chiriboga	GLIFWC	3502	5	The 2009/2014 analog approach was previously chosen by the lead agencies because they contended that a more quantitative method based on MODFLOW groundwater modeling and field collected data would not yield information useful to assess indirect impacts. GLIFWC staff disagree with this contention (see indirect wetland impact section). A site specific MODFLOW model that incorporates existing information could provide reasonable estimates of the potentiometric surface (water table). The model could then be stressed by incorporating the proposed PolyMet Mine pits and the neighboring Northshore Mine pits and reasonable estimates of drawdown under the wetlands could be developed. The development of this model, including field data collection to support it, could have been accomplished in far less than the 8 years the EIS process for this project has lasted. Groundwater models, using the MODFLOW software, are standard techniques for assessing groundwater impacts of proposed mines at newly proposed projects across the country. Statements in the FEIS regarding the complexity of the site and the impossibility of successfully modeling water table drawdown cannot be supported. GLIFWC staff disagree with further simplification of the indirect wetland impact analysis. This approach relies on monitoring that by definition would detect impacts after they have already begun to occur. Only then would adaptive management techniques be used to attempt to mitigate the damage. This approach is contrary to the goals of the NEPA process, which is designed to be forward looking.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3520	23	There are 1,387,630 acres of wetlands in the St. Louis River watershed, with 1732 individual wetlands impacted by ditching, totaling 198,989 acres. Approximately 50% of the sub-watersheds have had some degree of impact from ditching, while some have experienced ditching in nearly 100% of their wetlands. These historic impacts are not accounted for in the FEIS. Tens of thousands of acres of high quality wetlands within the St. Louis River watershed have been entirely and permanently lost to historic and current mining operations, many of them prior to regulatory requirements for mitigation. Most mitigation (since it has been required) has taken place outside the St. Louis River watershed and has not replaced the wetland types and functions that have been lost.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3524	27	Since 2008, GLIFWC staff have consistently provided information to the co-Lead agencies on methods that could be used to properly characterize indirect impacts to wetlands from hydrologic disruption. This information is based on experience developed in the review of other proposed mines including the proposed Crandon Mine. This is important because the NorthMet FEIS states that the Crandon method is used in the assessment of indirect wetland impacts. Having participated in the development and application of the Crandon method, we can definitively state that the FEIS does not use the Crandon method. The Crandon method of indirect wetland impact assessment relies on two critical pieces of information; a) a detailed delineation of wetlands leading to accurate wetland classifications, and b) an accurate characterization of groundwater hydrology supported by a calibrated groundwater model. Uncertainty in Wetland Delineation. At the mine site, the applicant has delineated wetlands that are within the land proposed for exchange with the Superior National Forest. The delineation work has been reviewed and concerns regarding the accuracy of the delineation have been raised. Field work conducted in September of 2010 by staff from the co-lead agencies, tribal cooperating agencies, intertribal agencies and the consultant for the applicant determined that 25% of the wetlands that were visited were incorrectly classified. All of those wetlands were found to have more connectivity with groundwater (more minerotrophic) than the original classification indicated. Furthermore, the field observations did not definitively rule out groundwater connectivity for a number of wetlands (Eggers, 2015). Following the field review, the applicant conducted additional characterization of wetlands using remote sensing techniques (observations from a helicopter). However, these observations are not appropriate to determine groundwater connectivity in wetlands. The co-Lead agencies did not conduct any additional characterization of wetland – groundwater connections. Monitoring sites have been established in a subset of wetlands, but the data is not used in the analysis of indirect impacts.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3530	29	In lieu of a groundwater model the co-lead agencies decided to use drawdown data from a taconite pit as an analog. This method is flawed for two main reasons. First, the Canisteo pit is located in a different geology and at a different elevation than the NorthMet Mine site. In short, the sites are not analogous. Second, the co-lead agencies used analog data in a selective fashion. They used wells that supported a conclusion that the drawdown in adjacent wetlands would be minor and ignored wells that indicated a substantial effect. To demonstrate this error, GLIFWC conducted an independent indirect wetland analysis for the NorthMet Mine site (Attachment A). The analog data in this analysis was provided by the former MNDNR Mining Hydrologist and ignored by the co-lead agencies. The GLIFWC analysis also used the Crandon method to determine the susceptibility of different wetland types to groundwater drawdown. We submit that the GLIFWC analysis is more defensible from a scientific point of view than the analysis in the FEIS because it uses all available data to establish impact zones and properly assigns impact values based on the Crandon method. One important difference in the analysis of the co-lead agencies and the analysis done by GLIFWC is in the assumption of impacts to ombotrophic and minerotrophic bogs. The co-lead agency analysis assumes that there is a low risk of drawdown impacts to ombotrophic bogs while the GLIFWC analysis assumes that impacts are more likely. The Crandon method did not make the assumption that ombotrophic wetlands have a low risk of impact. It relied on the groundwater model to determine the stress on a wetland and then used the wetland classification to characterize the potential impact. The GLIFWC position is supported by literature and expert analysis. Whittington and Price (2013) describe drawdown impacts to peat bogs in the James Bay lowland of northern Ontario. Dr. Paul Glaser, a recognized authority on peatlands, indicated in his 2014 comments on the SDEIS that “Even if ombotrophic raised bogs are present within the study area, they may still be hydraulically connected to groundwater flow systems and sensitive to impacts from mine development unless they support perched water table mounds (i.e. perched recharge mounds).” Dr. Glaser goes on to say that “no convincing evidence is provided to support their presence.” Finally, even if raised bogs occur at the site, there are a number of publications that report direct connections to groundwater flow systems in the underlying mineral sediments (Siegel and Glaser 1987; Siegel, et al., 1995; Glaser et al., 1990; 1997; 2004ab; 2006). Dr. Glaser states that “[t]hese publications demonstrate that peatland development is dominated by the hydrogeologic setting and not by surface processes.” This conclusion supports GLIFWC’s analysis assumption that wetlands labeled ombotrophic by the co-lead agencies may indeed be impacted by drawdown. Additional support for Dr. Glaser’s conclusions and for the GLIFWC independent wetland analysis is found in the co-lead agency response to public comments on distinguishing between ombotrophic and minerotrophic bogs (Eggers 2015). This document states that “all wetland types within this zone would experience some degree of hydrologic effects due to groundwater drawdown” and supports GLIFWC’s analysis by stating that “the potential for indirect impacts to all bog communities within the 0 to 1000 foot analog zone is acknowledged.” In conclusion, the analysis of indirect wetland impacts in the FEIS is not adequate. It relies on questionable wetland classifications, includes a flawed understanding and implementation of the Crandon method, uses a selective subset of available data, and includes a flawed understanding of the connection between bog wetlands and groundwater flow systems.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3531	30	The proposed mitigation plan is inadequate. The vast majority of mitigation and/or restoration credits to come from outside the Partridge, Embarrass, and St. Louis River watersheds. There is no justifiable reason to permit out-of-watershed mitigation when in watershed opportunities still exist, especially when the St. Louis River watershed as a whole has experienced cumulative wetland destruction, degradation and hydrologic alterations in well over 50% of the watershed. There is a defined hierarchy for determining the appropriate type and location of wetland mitigation: 1. Credits at a mitigation bank 2. In-lieu fee program credits 3. Permittee-responsible mitigation using a watershed approach 4. Permittee-responsible mitigation through on-site- and in-kind mitigation 5. Permittee-responsible mitigation through off-site and/or out-of-kind mitigation The 2008 Federal Mitigation Rule also states that mitigation sites should be located in within the same watershed as the impact site, and where they are most likely to successfully replace lost functions and services. The Corps is required to “use a watershed approach to establish compensatory mitigation in their permits to the extent appropriate and practicable.” In fact, adhering to the watershed approach in approving compensatory mitigation sites is the only exception to the requirement for in-kind mitigation (§332.3(e)(2)). Although the Corps has some discretion in establishing compensatory mitigation, it must systematically consider options in the prescribed order. And although out-of watershed mitigation can be permitted, its appropriateness is usually considered at the scale of either 8-digit or 6-digit Hydrologic Unit Codes (HUCs). In the case of the NorthMet Proposed Project, PolyMet is proposing that two-thirds of its mitigation will occur outside the major continental drainage divide (see map in Attachment C), within a different 2-digit HUC scale, and based upon the lowest tier of compensatory mitigation types in the hierarchy.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3532	31	The potentially impacted wetlands have been recognized as Aquatic Resources of National Importance (ARNI). These wetlands have high functional values and 92% of them are of high overall quality. Finally, the entire mine site area has been characterized as an area of high biodiversity significance. Given the ecological value of the mine sites wetlands and habitat, the proposed mitigation ratios and mitigation sites are inadequate.	S	O
				WET	Esteban Chiriboga	GLIFWC	3533-1	32	As detailed in comments submitted to the lead agencies for the 2009 DEIS, the 2014 SDEIS, and the 2015 PFEIS, the water quantity and quality analyses for the Partridge and Embarrass Rivers are inadequate. The results, be they deterministic (DEIS) or in the form of probability distributions (SDEIS), are based on a flawed understanding of hydrology at both mine site and plant site. This flawed understanding, reflected most prominently in the errors in the MODFLOW hydrologic modeling, are carried forward to the GoldSim water quality modeling. The co-lead agencies appear to disregard these problems because there is faith that the seepage capture and treatment systems will work at over 90% effectiveness for centuries. The FEIS claims of long term compliance with applicable water quality standards depend entirely on this leap of faith. On conference calls scheduled to discuss these issues, the lead agency consultants have stated that the effectiveness of the capture systems have not been questioned and the lead agencies have not been able to provide any references that would support their position. We suggest that there are substantial reasons for skepticism regarding capture efficiency for the flotation tailings basin, hydrometallurgical tailings basin, and Category 1 stockpile seepage capture systems. This skepticism is based on available literature and the performance of other facilities in the immediate vicinity. The EPA has conducted an analysis of the effectiveness of seepage capture systems (EPA, 1998). This analysis looked at capture systems at 36 facilities and evaluated their effectiveness based on the performance requirements at each site. It is difficult to extrapolate the results of this analysis to the PolyMet setting because a) the required effectiveness varied from facility to facility; b) the way in which effectiveness was measured was different (i.e. water quality improvements downstream versus change in hydrologic head pressure); and c) data collection varied between facilities. Despite these difficulties, the report indicates that 10% of the reviewed containment systems failed to meet the desired performance objectives and required corrective action.

				WET	Esteban Chiriboga	GLIFWC	3533-2	32	An additional 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not. Furthermore, there is no information on the effectiveness of any of these facilities at timeframes remotely comparable to the needs at NorthMet. In the EPA report, long term is considered 30 years whereas the water capture needs at NorthMet are likely perpetual for the flotation tailings basin, Category 1 stockpile and hydrometallurgical tailings basin. Finally, none of the facilities in the study are as large as the one proposed by PolyMet. At the tailings basin, PolyMet has proposed to install a seepage collection system around the north, east, and west sides of the facility. The scale of this engineering control is extensive. It would be approximately 5 miles long and would have to be keyed to bedrock that is 25 to 50 feet below ground surface. The most likely pathway for leakage at this barrier will be in the vicinity of the key with bedrock (EPA, 1998). This feature and the similar containment system at the Category 1 waste rock stockpile are assumed to capture 93% of water leaving the facilities for an indeterminate period of time. As previously stated, there is no scientific justification for this number. The only examples we are able to identify at this time suggest capture rates that are lower. In the Iron Range, GLIFWC staff are aware of two examples that are directly analogous to the proposed PolyMet containment system. These are the seepage collection system at SD026 on the LTV basin itself, and the seepage collection system at the MINTAC tailings basin. SD026. The system is supposed to capture 100% of water leaving the tailings basin and entering Second Creek. The FEIS acknowledges that this water capture system is not operating as effectively as anticipated. Adaptive management is being proposed to augment the effectiveness of the system but no specific methods are identified. MINNTAC. The MINNTAC tailings basin is of similar age and design as the LTV tailings basin that PolyMet proposes to use. Both are large, unlined facilities that are designed to allow water seepage to surface and groundwater in order to maintain structural stability.		
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3533-3	32	Both facilities have been discharging thousands of gallons per minute of high sulfate wastewater into the environment for decades. MINNTAC, as part of a schedule of compliance, has begun constructing a seepage capture system that is intended to bring the facility into compliance with applicable water quality standards. The capture system is similar to the one proposed by PolyMet in that it consists of a trench to capture seepage and a system that would pump tailings water back into the facility. The MINNTAC system was originally intended to extend to bedrock but that extension was not possible in some locations because of the presence of large boulders that made construction difficult. Because the geology of the surficial deposits is similar at the LTV facility, it is likely that similar difficulties will be encountered by PolyMet that would decrease capture efficiency. It is important to note that seepage capture of greater than 95% is needed at MINNTAC in order to achieve compliance with applicable water quality standards. However, this high capture efficiency was not considered feasible and MINNTAC predicted that their capture efficiencies would not exceed 60% (US Steel Corp., 2007). Actual performance of the capture system is below 50%. Ultimately, the main purpose of the system is to comply with water quality standards. The capture system will not be able to achieve that goal. Because MINNTAC is the only facility that is analogous to the LTV basin, there are serious doubts about the predicted 90% or greater capture efficiency used in the PolyMet FEIS. The prediction of water quality standard compliance for this proposed project hinges on the perfect operation of the water capture systems. The reliance on this engineered containment system that uses overly optimistic capture rates and must function in perpetuity is not scientifically supported and therefore is not appropriate for the FEIS.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3549	50	Ombrotrophic bogs, which are peat-dominated, primarily rain-fed, and acidic, are extremely efficient mercury methylating environments. This methylation can be further enhanced by the addition of sulfate containing runoff. The FEIS does not present a consistent model for mine site hydrology. For many years the lead agencies have maintained that these peatland bogs are “perched” and therefore independent from any mercury and sulfate impacts on receiving waters (See GLIFWC comments on indirect wetland impacts above). In contrast to this position, the FEIS states that water can move from the surficial aquifer (where the wetlands are) to bedrock in a dewatering situation (FEIS page 5-111). These conflicting conceptual models of mine site groundwater hydrology are mutually exclusive. For mercury and methylmercury related conclusions to be defensible, a consistent model of the mine site hydrology must be developed. Any wetlands that have at least a partial connection to the groundwater should be considered a potential source of methylmercury. Enhanced vertical hydraulic gradients resulting from mine pit dewatering could result in significant interactions between the bogs and groundwater, even dewatering wetlands that may be entirely surface water dependent under normal conditions. If groundwater under these wetlands were to be drawn down, the wetlands would be impacted and there would be a likely dewatering of peat deposits. This cycle of wetland dewatering and rewetting is known to enhance mercury methylation. The resulting effect on methylmercury production and release, and ultimately on fish tissue mercury, have not been adequately evaluated in the FEIS.	S	O
28547	Unique			WET	Esteban Chiriboga	GLIFWC	3550	51	The assessment of environmental impacts resulting from spillage of ore fines along the rail corridor is inadequate. The FEIS acknowledges that PolyMet would use old side-dump rail cars and states that they would be refurbished. This refurbishment merely involves tightening screws and hinges and would do absolutely nothing to reduce the escape of ore fines. These dust sized particles of ore are highly reactive and would escape through hinges and openings on the rail cars. Given the duration of this proposed project and the large quantity of materials to be moved, approximately 228 million tons of ore and 394 million tons of waste rock, there will be tracking, dusting, and spillage of material that has been demonstrated to leach contaminants when exposed to air and water. Even a loss of only one thousandth of one percent (0.001%) of the extracted material to tracking, dusting or spillage would result in 6,220 tons of fine leachable material being released into the environment. Our experience with a much smaller, shorter duration, sulfide mine in Wisconsin (Flambeau Mine) indicates that tracking and dusting of ore and waste rock, even at a level that is unnoticed during operations, can result in soil and runoff contamination that exceeds standards.	S	O
12727	Unique			WET	F Jeff Verito		760	2	It’s shocking that of 1,580 acres of wetlands in the Project Area, 913 would be directly affected. This is too many acres to compromise regardless of how many wetland acres we’re receiving versus exchanging. Furthermore, the document states we’d lose Mud Lake, wetlands and a large black spruce and tamarack stand.	NS	X
29229	Unique			WET	Gail C. Roberts		3575	9	LAN03, LU06 – The wetland quality of the dispersed parcels of land is not comparable in quality to the wetlands that would be lost. The thematic responses do not discuss the negative impact on the St. Louis River Watershed, given that most of the lands proposed for replacement are in different watersheds.	S	O
29229	Unique			WET	Gail C. Roberts		3624	14	WILD01 – The thematic response to my comment (18041) is not adequate to address the concerns that have been raised related to the loss of 6,700 acres of public land in the Superior National Forest. The unintended consequences of environmental degradation of the BWCA due to likely northward flow of some contaminated water from the mine site and tailings basin have not been addressed (See GLIFWC analysis of water flow).	S	N
29976	Unique			WET	Gina Byrne		2751	1	Permanent loss and fragmentation of wetlands is unacceptable even with the proposed “compensatory mitigation”. The local wildlife does not understand that the destruction of their habitat would attempt to be mitigated and it is insane to think that we can rebuild or restore what Mother Nature made once it has been destroyed.	NS	X
28494	Unique			WET	Ivan Weber		2303	11	Wetlands, especially naturally occurring wetlands of an extensive nature, like those that create wild rice habitat types, must be valued at the lofty level that recognizes what they are and do. Wetlands plants and their microbiological contexts are as near to magic as exists. Wild rice is surely the Boundary Waters indicator of a penultimately magical condition, one that is as sacred as Native American tribes contend. We honor them, as we pray the Minnesota regulatory community will do, as well.	NS	X
7393	Form Letter	4	Variant	WET	Jane Beattie		428	1	The mine will destroy nearly 1,000 acres of high-quality wetlands many of which have already been lost to mining.	NS	X
7393	Form Letter	4	Variant	WET	Jane Beattie		540	7	There is no plan to compensate for the thousands of acres of direct and indirect impacts to high quality wetlands.	NS	X
23365	Unique			WET	Janet Keough		942	5	Further, the FEIS outlines the destruction of more than 12 square miles of wetlands in the headwaters of Lake Superior and its watershed....this will result in a NET LOSS of wetlands in this watershed and in the State. Mitigation banks would restore existing degraded wetlands and would not replace the destroyed wetlands. There is no plan in the FEIS to AVOID destruction of wetlands.	S	O
23917	Form Letter	1	Variant	WET	Jim Steitz		971	3	I understand that, even under a best-case scenario, approximately 1,400 acres of wetlands would be destroyed. This is one of the worst single death warrants for wetlands in the history in the Clean Water Act, when we can ill afford to lose any more wetlands and our populations of migratory birds and waterfowl are crashing.	NS	X
30068	Unique			WET	John Herbst		2800	5	On p. ES-50 it states: “913.8 acres of wetlands in NorthMet Project area would be directly affected and 6,568.8 to 7,694.2 acres of wetlands in NorthMet Project area could be indirectly affected” My comment is: Studies by wetland professionals published by academics in peer-reviewed reputable journals have repeatedly demonstrated overall reductions of 30% or more in wetland values for hydrological function, hydrophytic vegetation, and wetland wildlife, for mitigated/restored wetlands vs. original undisturbed wetlands, across the board for all wetland types studied in many different geographical locales.	S	O
27696	Unique			WET	Judith Derauf		2095	3	This bothers me, but what bothers me the most is the fact that wetlands will be destroyed and our most precious resource, fresh water, will be jeopardized for the sake of corporate greed and a small number of fleeting jobs.	NS	X

32	Unique			WET	KatieWilli@aol.com		96	4	I am concerned that streams and wetlands in western Ontario and Manitoba could also be affected by sulfide mines in northern Minnesota.	NS	X
29193	Unique			WET	Kevin Heaslip		2442	5	Wetland losses on this large mining undertaking would be significant. The Army Corps of Engineers is the land steward, and should protect the Superior National Forest ecosystem.	NS	X
29794	Unique			WET	Kristine Vesley		2619	4	I oppose any federal Clean Water Act permit for PolyMet discharge and wetlands destruction because PolyMet discharge of pollutants and wetlands destruction and impairment would have adverse impacts on municipal water supplies, aquatic life, wildlife, human health and welfare, environmental justice and special aquatic sites. The PolyMet proposal fails to quantify or provide mitigation for indirect loss of up to 8,264 acres of wetlands, and provides wholly inadequate mitigation for direct destruction of 913 acres of wetlands within the Lake Superior Basin.	NS	X
27688	Unique			WET	Laura Gauger		3202	7	Nor does the FEIS offer any baseline water quality data for any of the wetlands that will or could be impacted by the project. To properly assess for wetland impacts and hold the company accountable for potential violations of the Clean Water Act, this type of data is crucial. Its absence from the FEIS demonstrates a major inadequacy in the document that could very well result in the State of Minnesota and the general public being left “holding the bag” regarding potential Clean Water Act violations caused by the PolyMet operation.	S	N
27688	Unique			WET	Laura Gauger		3260	6	The FEIS states that 913 acres of wetlands will be “directly impacted” by the PolyMet project (permanently lost due to fill or excavation) and that most of these wetlands are rated “high quality.” It also states that up to an additional 7,694 acres of wetlands located within and around the PolyMet project area either will or may be “indirectly impacted” by the mine – not permanently lost, but affected by changes in water quality, groundwater drawdown or other factors. The FEIS does not specify wetland quality ratings (high v. moderate v. low) for any of the “indirectly impacted” wetlands, even though indirect impacts may still be significant, and even though ratings were indeed indicated for the 913 acres of wetlands deemed to be “directly impacted” by the project.	S	N
7689	Unique			WET	LK Woodruff		563	3	The proposed mine would destroy nearly 1,000 acres of high-quality wetlands in a region that has already lost many thousands of acres of wetlands to past and ongoing iron ore and taconite mining.	NS	X
29740	Unique			WET	Lori Andresen	Save Our Sky Blue Waters et. al.	3907	22	The FEIS does not adequately address loss of wetlands and indirect impacts to wetlands.	NS	X
29397	Unique			WET	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3757	51	Unfortunately, the flawed hydrologic characterization and incorrectly calibrated groundwater model, along with cherry-picked analog data were used to assess indirect wetland impacts. In fact, the PolyMet (Barr) MODFLOW files showed a prediction of approximately 8,922 acres impacted by one foot or more of drawdown. This discrepancy of approximately 2,000 additional acres of indirect impacts associated with drawdown has not been acknowledged or addressed by the Co-Leads. Further, the USACE has not developed a monitoring plan to assess after-the-fact Project impacts to wetlands, but claims that will be the way to best determine and mitigate indirect wetland impacts:	S	O
29397	Unique			WET	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3762	56	In 2015, although not mentioned or cited in the FEIS,130 the USACE issued an amended opinion in response to SDEIS comments that states “[o]mbrotrophic bogs, although precipitation driven, can have flowpath connections with groundwater; therefore, these wetlands could be impacted by groundwater drawdown.” Several wetland hydrogeologic studies that have been published provide scientific evidence that raised bogs are directly connected to groundwater flow systems in the underlying mineral sediments both in large peat basins and smaller peatlands. These published scientific studies demonstrate that peatland development to bogs or fens is determined by the local hydrogeologic setting rather than surface processes as suggested by the Co-Leads. And, these publications provide substantial evidence that ombrotrophic bogs are susceptible to both alterations of groundwater flow and pollutant transport.	S	O
29397	Unique			WET	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3788	81	But cumulative wetland loss from direct impacts cannot even be discerned from the text, and there could be 0.1 to 12 percent cumulative indirect wetland losses in the Partridge and Embarrass River watersheds.	NS	X
29397	Unique			WET	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3795	89	Of the approximately 6,025 acres of MCBS Sites of High Biodiversity Significance under the Land Exchange Proposed Action,237 nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate, and therefore effectively lost to the Bands as usufructuary resources in the 1854 Ceded Territory, if the proposed land exchange takes place. This is significant because many tribally harvested resources are only available in coniferous bogs (e.g. cranberries, Labrador tea, creeping snowberry), and restoration of coniferous bogs is a very difficult and long process that has extremely low success rates.	S	O
29397	Unique			WET	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3799	91	Additionally, the FEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River watershed and the Lake Superior Basin. The loss of first-order headwaters streams, second-order streams, and wetlands in the Basin have the potential to significantly adversely impact downstream water quality, fisheries, and wildlife that are important to the Bands. The proposed action land exchange would trade water resources within the Lake Superior Basin for wetlands and surface water outside the Lake Superior Basin and the St. Louis River watershed, although still within the 1854 Ceded Territory. Federal lands now provide 4,164 acres of wetlands within the Lake Superior Basin. Non-federal lands contain 4,669 acres of wetlands, of which 373 acres are within the Lake Superior Basin, demonstrating there would be a loss of 3,791 acres, or 90 percent of federally-managed wetlands within the Lake Superior Basin under the proposed exchange.245 It is well known that wetlands play an important role in the condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants, thereby benefitting the quality of downstream waters. Wetlands may also function as thermal refuge for moose when summertime temperatures exceed 14o C, the point at which moose become thermally stressed.246 Additionally, wetlands with aquatic vegetation provide an important forage resource for moose during the open-water season. Furthermore, the SDEIS acknowledged, as does the FEIS, that the Land Exchange Proposed Action would create a “net increase of third-order streams and decrease in first- and second-order streams which would likely add more habitat diversity to the Superior National Forest.”247 But the FEIS underestimates the impact of this increase, and ignores basic EPA guidance: “Headwater streams are the smallest parts of river and stream networks, but make up the majority of river miles in the United States. Many headwater streams have been lost or altered due to human activities ... and this can impact species and water quality downstream.”248 The FEIS states the net increase of third-order streams and decrease in second-order streams would likely add more habitat diversity to the Superior National Forest since, generally, stream habitat diversity increases with higher-order streams. No significant habitat changes would likely occur associated with the slight decreases in first-order, headwater streams; however, the net reduction to the Superior National Forest of 0.3 mile of first order streams may result in slightly less habitat available for headwater stream dependent species.249 While greater diversity is desirable, protection of headwater streams is critical because they powerfully influence both the character and functions of downstream waters. Headwater streams transport vegetation, woody debris, organic matter, macroinvertebrates, and other organisms downstream, while providing spawning areas for brook trout. Headwaters provide most of the water to rivers, which in turn provides temperature mitigation and oxygenation which are necessary for healthy fish communities.	S	N
29860	Unique			WET	Mark Lauderbaugh		2684	1	Land exchange proposed does not adequately delineate exact parcels to be established as new wetlands. This is a poor policy decision for Minnesota . Where can you establish 6000+ acres of new wetlands in Minnesota?. Man made wetlands are not environmentally possible and the impacts from newly created wetlands on surrounding communities have not been adequately addressed.	S	O
26628	Unique			WET	Mary Adams		1382	3	We know how important wetlands are to watersheds and wildlife. Compensatory mitigation and possibly an identified management plan is cold comfort.	NS	X
28495	Unique			WET	Mary Heise		2306	1	The potential for water contamination is highlighted by the stated acreage of wetlands that will be or may be impacted.	NS	X
28495	Unique			WET	Mary Heise		2308	3	It also does not adequately compensate for the impacted wetlands.	NS	X
29319	Unique			WET	Maya Batres	The Nature Conservancy	3661	5	The FEIS analysis of wetlands and mitigation fails the first requirement since it does not propose meaningful mitigation alternatives that adequately compensate for losses and satisfy the federal mitigation rules;	S	O
29319	Unique			WET	Maya Batres	The Nature Conservancy	3667	11	The FEIS is inadequate because its analysis of wetlands and mitigation does not propose meaningful mitigation alternatives that sufficiently compensate for losses and satisfy the Federal Mitigation Rule. A. Direct wetland loss from the Proposed Action is a substantial and serious environmental impact and occurs disproportionately among wetlands designated as high quality and difficult to replace. As documented in the FEIS, at least 913 acres of wetlands will be directly affected and permanently lost, representing nearly 60% of all wetlands in the project area. If approved, the wetland loss would be one of the largest permitted losses in Minnesota history. Of the impacted acres, 59% of the wetlands are lowland conifer and bog type wetlands that are highly sensitive; provide critical habitat for declining and iconic species such as moose, Species of Greatest Conservation Need ("SGCN") such as Connecticut warblers, boreal chickadees, rusty blackbirds, olive-sided flycatchers, disa alpine and bog copper butterflies, and northern bog lemmings; and provide many other important functions for water, wildlife and ecosystems. Of the nearly 760 acres of wetlands that will be destroyed at the mine site, 92% of these are identified in the FEIS as "High Quality" and are mapped by the state as areas of High Biodiversity Significance. From the perspective of the Conservancy, this loss of wetlands represents a serious and extensive impact to the state's natural resources. 16 In our previous comments on the SDEIS and reiterated in Section 1 above, the Conservancy emphasized that lowland conifer and bog wetlands are difficult to replace, and that restoration of degraded wetlands like these have a poor track record of success. Indeed, bogs and fens are specifically identified in federal regulations as "difficult to replace resources," warranting special consideration in wetland mitigation. While the FEIS highlights new techniques for potentially improving the success of restoration and has incorporated some of these techniques into mitigation plans, their actual track record of success for these techniques is still lacking. This uncertainty as to whether the substantial and serious environmental impacts to wetlands can be mitigated warrants greater caution, skepticism of optimistic claims of success, and both regulatory and financial safety nets for wetland mitigation. 29319	Unique			WET	Maya Batres	The Nature Conservancy	3668	12	A U.S. Army Corps of Engineers ("Corps") regulatory requirement, reinforced by a recent Presidential Memorandum, states "[f]or difficult-to-replace resources (e.g., bogs, fens, springs, streams, Atlantic white cedar swamps), if further avoidance and minimization is not practicable, the required compensation should be provided, if practicable, through in-kind rehabilitation, enhancement, or preservation since there is greater certainty that these methods of compensation will successfully offset permitted impacts." The FEIS focuses solely on in-kind rehabilitation, the most uncertain, and historically least successful, of the three allowable approaches. Similar to an investment portfolio, where risk is spread among different kinds of financial instruments, a successful "mitigation portfolio" should include a range of actions. The portfolio should include a mix of sites and approaches, ranging from relatively risky wetland rehabilitation to lower risk preservation of unprotected wetlands. For these kinds of wetlands, it is important to recognize that mitigation is not likely to restore all lost functions and that restoring wetland functions of any kind will take considerable time. Thus additional regulatory and financial safeguards are needed in the event that one or more mitigation site does not or cannot attain success criteria. Although the FEIS commits to a 2:1 replacement ratio for a relatively small acreage (7 .6 acres) of directly impacted, open bog wetlands, the 1.58:1 replacement ratio identified for the much greater acreage (537.6 acres) of lowland conifer/forested bog wetlands is inadequate compensation for such sensitive and difficult to replace wetlands. The replacement ratio could and should be greater. The St. Paul District of the Corps' policy on mitigation provides for a case-by-case determination of compensation ratios for impacted wetlands that are difficult to replace or wetlands that provide an "exceptional level of functions". Arguably, the impacted wetlands for the proposed action fit into this category, as noted in Section 1 of our comments, and therefore, gives the District Engineer discretion to determine the compensation ratio with no specified maximum. State law also provides a similar authority if proposed actions will permanently and adversely affect wetlands that contain rare natural communities or sites mapped as Outstanding or High Biodiversity. When the success of mitigation is uncertain, as is the case here, and the affected wetlands are rare, difficult-to-replace or provide exceptional values, both the state and the Corps have the authority to require financial assurance, separate from that needed for mine construction, operation, closure and reclamation. The Corps' policy allows the agency to require financial assurance to ensure that compensatory mitigation is successfully implemented and permit conditions are satisfied in the event of unforeseen circumstances. Minnesota statute also allows financial assurance for wetland mitigation. The FEIS is silent as to the amount of financial assurance needed for mitigation and not responsive to previous comments on this issue by the Conservancy and others. Given the uncertainty of restoration success, the Conservancy reiterates its previous comments that financial assurance for mitigation should be set forth in the FEIS. The Corps' own guidance states that "the District Engineer shall require sufficient financial assurances to ensure a high level of confidence that the mitigation project will be successfully completed, in accordance with applicable performance standards," and notes that such assurance is needed, among other things: a. To correct or replace unsuccessful mitigation if [the] responsible party is unwilling/unable to do so; b. To allow permit issuance using permittee-responsible mitigation prior to successful mitigation implementation. The same guidance also recommends that financial assurance amounts for mitigation be sufficient to cover the full costs (including land costs) to complete the work and meet all applicable performance standards at an alternate site by a third party. An example of this would be to set aside in an appropriate financial vehicle the total cost of purchasing credits in an established mitigation bank in the same service area.27 In light of the fact that the directly affected wetlands are of high biodiversity significance, provide exceptional levels of functions, are difficult to replace, and will be permanently destroyed, the FEIS must place greater emphasis on avoiding and minimizing impacts to high quality wetlands, make a commitment to a higher replacement ratio, and provide separate financial assurance to cover the costs of this long-term and highly uncertain wetlands mitigation.	S	O
29319	Unique			WET	Maya Batres	The Nature Conservancy	3670	13	In the FEIS, three mitigation sites are proposed, two in the Mississippi River basin outside of the impacted watershed and one in the St. Louis River watershed nearly 50 miles from the Proposed Project area. Approximately 70% .of the total proposed mitigation acres are located outside the impacted watershed, representing a net loss of wetlands and their functions from the St. Louis River watershed, which has already lost 15% of its historic wetlands. 28 The proposed mitigation sites are presented in the FEIS as a fait accompli, long ago selected and decided, with no alternatives provided for public review and comment. The FEIS admits that these sites were selected using criteria developed prior to the 2008 Federal Mitigation Rule, 29 which strongly encourages the use of a watershed approach for site selection. Given the length of time it took to develop the SDEIS, which was released almost six years after the 2008 rule, there was plenty of time to develop a watershed approach to site selection. In addition to a watershed approach, Corps' regulations also require specific consideration of in-watershed mitigation options as a priority for mitigation. However, the FEIS ignored these long standing principles for in-watershed mitigation and the newer watershed approach rule and moved forward with the previously determined mitigation sites without public review and comment. The Conservancy provided detailed comments on wetland mitigation in the SDEIS and called for greater emphasis on in-kind, in-watershed wetland restoration, enhancement and preservation. The proposed wetland mitigation in the FEIS is essentially unchanged from that in the SDEIS. We continue to express concern about locking into years-old mitigation solutions identified and developed in a prior era of wetland mitigation policy, and we encourage sufficient financial and operational flexibility in the FEIS to make use of improved in-watershed options as they emerge, including the purchase of mitigation bank credits. Based on the failure of the FEIS to respond to these comments, the FEIS is inadequate and must address our concerns about the wetland mitigation favoring out-of-watershed replacement, focusing on sites selected under a long out-of-date policy, and providing no meaningful alternatives for public review and comment.	S	N
29319	Unique			WET	Maya Batres	The Nature Conservancy	3672	14	In the FEIS, there is no commitment to advance mitigation for indirect impacts to wetlands. Instead, it proposes monitoring changes in hydrology, vegetation and other indicators for the wetlands in places where indirect impacts are expected to occur. Although it acknowledges that mitigation may be required, no mitigation plans will be developed until after impacts are detected. Using a monitoring approach to determine whether mitigation is needed is insufficient for several reasons. First, the kinds of indirect impacts identified in the FEIS, especially those caused by groundwater drawdown, are reasonably foreseeable and permanent: the technical literature from across the U.S. leaves little doubt that such impacts are not only possible, but likely. Second, wetland monitoring programs established for regulatory purposes have a poor track record of being able to detect impacts before they occur. In many instances, such monitoring programs have been insensitive to impacts even after they started to occur, leading to uncertainty and dispute about the cause of the impacts until damage is already severe or irreversible. Finally, allowing impacts to occur before requiring mitigation contradicts the Corps' governing mitigation principles that "[i]mplementation of the compensatory mitigation project shall be, to the maximum extent practicable, in advance of or concurrent with the activity causing the authorized impacts." This situation may result in a loss of wetland function during the time between detecting impacts and mitigating for them, a contradiction to the no-net-loss policy that governs mitigation under both state and federal law. The FEIS is inadequate due to its failure to respond to concerns about the lack of advance mitigation for foreseeable, permanent indirect impacts to wetlands. These indirect impacts will have an effect on an estimated 6,500 to 7,700 additional acres, acreage over and above the 913 acres directly impacted and previously addressed in these comments. While the FEIS does commit to advance mitigation for 26.9 acres of impacts from wetland fragmentation, this still leaves a substantial amount of impacted acreage uncompensated. By not providing mitigation until impacts are detected, there is a high likelihood that a temporal loss of wetland function could occur. II. Summary of Necessary Action on Wetlands and Mitigation.1. Meaningful alternatives should be developed for mitigating wetland impacts that include different combinations of in-kind restoration, enhancement and preservation, and alternative options for mitigation sites that satisfy the selection criteria set forth in the Federal Mitigation Rule including permanent protection of wetlands within the St. Louis River watershed. 2. Mitigation for all direct and indirect impacts to all bog, fen and lowland conifer wetland types should be developed using replacement ratios of at least 2: 1. 3. Financial assurance estimates for mitigation of direct and indirect wetland impacts should be developed and financial assurance should be required in an amount sufficient to cover full costs to complete the work and meet all applicable performance standards at alternative sites by a third party. 4. An explicit commitment should be made and plans should be developed for advance mitigation of all reasonably foreseeable indirect impacts to wetlands identified in the FEIS. 5. As part of the EIS process, the agencies should solicit and consider public comment on mitigation alternatives and plans, including those for indirect impacts, and on financial assurance for ensuring success of mitigation for direct and indirect impacts.	S	O

27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3345	61	The FEIS states on page 5-310 that modeled annual dust deposition rates were compared to an “annual effects-level deposition rate” (background) of 365 g/m2/yr. Apparently this “annual effects-level deposition rate” is a potential effects threshold for photosynthesis due to “dusting” of the plant’s surface. However, direct physical effects of mineral dusts on vegetation can be seen at a surface load of 7 g/m2 and chemical effects of reactive materials can be seen at 2 g/m2 136. These levels indicate that the proposed “impact” level of 365 g/m2/yr is too high. Further, as the Band commented on both the PSDEIS and the SDEIS, the modeled deposition rates only look at impacts to photosynthesis due to blocking sunlight from the plants’ leaves, they do not include the effects of contamination from metals, nor contamination from other sources, such as pit leaks and seepage, nor are cumulative impacts from all of these sources included in Chapter 6. The Class I Deposition Analysis Threshold set by Federal Land Managers for both nitrogen and sulfur deposition in the eastern half of the US (including Minnesota) is 0.01 kg/ha/yr. If one takes the effects level threshold discussed on page 5-310 of the FEIS (365 g/m2/yr) and converts it to similar units (assuming the dust is 0.12% sulfur), the threshold level proposed as adequate for the area is 438 kg/ha/yr, or 43,800 times the amount of sulfur deposition that is allowed in a Class I area. While the proposed site is not a Class I area, this DAT is a better measure for the type of impact that the Band fears.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3346	62	The FEIS (page 5-312) erroneously states that “all of the receptor nodes with the highest model estimated deposition rates were located within the ambient air boundary”. The following paragraph contradicts this statement by saying “of the 234 acres of wetlands, (that could be potentially indirectly affected) 228 acres would be located within the Mine Site ambient air boundary”. While only 3% of the affected acres are outside of the boundary, these two statements should be reconciled. The inaccuracy serves to diminish consideration of any impacts.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3347	63	FEIS Figure 5.2.3-22 depicts receptors outside the plant site that are predicted to receive dust deposition rates higher than 100% of background. FEIS Figure 5.2.3-23 depicts receptors outside the plant site that are predicted to receive metal deposition rates higher than 100% of background, but there is no discussion regarding monitoring or management actions to quantify or mitigate affects. As the Band has commented before, 90% of the area predicted to be impacted does not lie within the ambient air quality boundary (text states that 90% of the receptor nodes lie within the boundary); it appears to be only about 60% contained to the ambient air quality boundary. It is also irrelevant whether these areas lie within the ambient air quality boundary, as they are not required to meet ambient air quality standards for deposition - it is more relevant whether they are all within the Plant and Mine Site, and both Figures 5.2.3-22 and 5.2.3-23 show that this is not the case.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3349	66	As the Band has noted in previous comments on this issue, the Co-lead’s only ‘mitigation’ for fugitive sulfide dust is recommending future wetlands monitoring. Additionally, the FEIS suggests water spraying for areas of fugitive dust release during dry periods as mitigation.138 In the case of dust that may have high acidic content, this would be a poor choice for management action, as the addition of water to the dust would likely create or accelerate toxic run-off, as the Band suggested in our comments on previous versions of this EIS.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3361	82	The tribal cooperating agencies have exhaustively challenged the Co-lead agencies’ approach to predicting indirect impacts to wetlands and their resulting conclusions, as an overly simplistic method based upon a flawed concept of hydrology at the mine site. This remains a major deficiency in the FEIS, and is a significant unresolved issue for the Bands, who are concerned about direct, indirect, and cumulative effects to the high quality wetland resources that would be affected by the NorthMet Proposed Project.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3362	83	GLIFWC staff have long advocated for the use of the ‘Crandon method’ of determining indirect wetland impacts; this method was based upon their experience, working with the US Army Corps of Engineers, in reviewing other proposed mines in the region including the proposed Crandon mine in Wisconsin. While the FEIS maintains that the Crandon method is used in the assessment of indirect wetland impacts for the NorthMet Proposed Project, it clearly has not been used. The Crandon method relies upon a detailed delineation of wetlands leading to accurate wetland classifications, and an accurate characterization of groundwater hydrology supported by a calibrated groundwater model. The NorthMet Project lacks both of these critical data elements.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3363	84	GLIFWC found that direct impacts of the Proposed Project would result in loss of \$1,358,089 to \$5,134,185 per year in wetland ecosystem services; over the 20 year life of the Proposed Project, the St. Louis River watershed would lose between \$27,161,780 and \$102,683,700 in wetland services. This is but one example of the possible applications of the ecosystem valuation study that should have been done by the Co-lead agencies as part of the NorthMet FEIS.	NS	X
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3364	85	The proposed mitigation plan is inadequate; it allows for the vast majority of mitigation and/or restoration credits to come from outside the Partridge, Embarrass, and St. Louis River watersheds. There is no justifiable reason to permit out-of-watershed mitigation when in-watershed opportunities still exist, especially when the St. Louis River watershed as a whole has experienced cumulative wetland destruction, degradation and hydrologic alterations in well over 50% of the watershed.162	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3365	86	The Band objects to the issuance of a \$404 permit, and the approval of any out-of-watershed mitigation credits or restoration for impacts to irreplaceable high quality aquatic resources of national importance, which include all remaining unimpacted wetlands within the St. Louis River watershed/Lake Superior Basin. ... However, given the Corps’ approval of an inadequate and inappropriate compensation plan, and failure to conduct an adequate and comprehensive alternatives analysis or identify a Least Damaging Practicable Alternative (LEDPA), the EPA should elevate the permit under CWA §404©. The same inadequacies that EPA identified in the 2009 DEIS and the 2013 SDEIS remain in this FEIS, and the NorthMet Proposed Project does not meet regulatory requirements for a permit.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3387	105	the wetland mitigation proposed will not adequately compensate for this ecosystem service; simple acre-for-acre consideration fails to account for the disproportionate loss in carbon sequestration capacity from mature, intact peatlands.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3410	147	Compounding these losses, the proposed mitigation plan provide no compensatory mitigation at all for the likely severe adverse indirect impacts that the Project will have on thousands of additional acres of wetlands from mine pit drawdown – a larger area than that described in the FEIS – and which should be addressed by up-front mitigation. The FEIS’ plan to “monitor” the indirect impacts on the adjacent wetlands and then, based on undefined criteria consider some possible additional mitigation measures, is insupportable and provides no basis on which a 404 permit could properly be issued.	S	O
27901	Unique			WET	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3414	146	A watershed approach could have been used here as in-watershed opportunities still exist. A watershed approach should have been used here especially in light of the undisputed fact, discussed in more detail in Section 1.J, that the St. Louis River watershed as a whole has experienced cumulative destruction, degradation and hydrologic alterations in well over 50% of the watershed.	S	O

27085	Unique			WET	Paula Maccabee	Water Legacy	3063	56	<p>The connection between water in surficial materials and groundwater at the mine site is an important determinant of wetland drawdown impacts from mine dewatering and may affect water quality impacts on surface waters, groundwater and wetlands. When the SDEIS was released, geologist J.D. Lehr (Lehr, 2014) challenged its conclusion that there was a “weak” connection between bedrock groundwater and surficial water and its claims that a single 30-day pump test was sufficient:</p> <ul style="list-style-type: none">• The single 30-day pump test cited in the SDEIS is insufficient to infer that there is a “weak” hydrologic connection between bedrock and surficial deposits.• It is likely that there would be significant interaction between ground water in surficial materials and bedrock along the lateral trends of bedrock fractures. It is undisputed that the FEIS still relies only a single 30-day pumping test conducted in 2006 at bedrock well P-2 to conclude that the “small amount of drawdown in the nearest deep wetland piezometer, and no detectable drawdown at other water table or deep piezometers” demonstrated “the hydraulic connection between surficial deposits and the underlying bedrock, although present, is weak or non-existent” and that there is a “general lack of interaction between the surficial and bedrock aquifers.” (FEIS, 4-47, 4-53, 4-173, 4-174). <p>Since the SDEIS was released, newly prepared and released documents call into question the sufficiency and scientific reliability of the P-2 pump test on which the FEIS relies to minimize the connection between the mine site surficial aquifer and groundwater. The location of the P-2 pump test is shown in FEIS Figure 4.2.2-8, attached as Exhibit 2. Reviewing FEIS Figure 4.2.2-8 alongside Large Figures 1 and 2 in the recent Barr Hydrogeology of Fractured Bedrock report (FEIS ref. Barr 2014b, Large Figures 1 and 2, provided as Exhibit 3), it seems that the P-2 test was located where it would be least likely to demonstrate a hydraulic connection. Although areas of high concern – the north side of the East Pit and the 100 Mile Swamp peatlands north of the East Pit -- are both located in more conductive Virginia Formation rock, the P-2 test was conducted at the edge of the rock unit for Duluth Complex. Conductivity data on Barr 2014b Large Figure 2 (Exhibit 3) illustrate the difference between Duluth Complex rock and Virginia Formation rock in the vicinity of the P-2 test. Hydraulic conductivity in Duluth Complex rock was measured between 1.3E-06 and 3.5E-06 centimeters per second and that of nearby Virginia Formation rock between 1.7E-05 to 2.5E-04 centimeters per second; hydraulic conductivity was up to 100 times greater in proximate Virginia Formation rock than the Duluth Complex rock. Barr Engineering’s report for PolyMet on the P-2 pumping test concluded that, with the exception of the deep piezometer located closest to the well, “the decrease in water levels in the piezometers are not attributed to pumping” and “significant and widespread drawdown of the water table within these deposits is not anticipated.” (Barr 2007a, p. 6, p.12). However, documents received through the Minnesota Data Practices Act show that both Tribal Cooperating Agencies and consultants for the MDNR disputed Barr’s conclusion that the RS10A pump test demonstrated a lack of wetlands impacts. GLIFWC’s John Coleman disagreed with Barr, stating that, “4 out the 5 wetland wells monitoring for drawdown showed noticeable drops in water level during the pump-test” and that “Although the pump-test was poorly designed and the results are ambiguous, if any conclusion could be made it would be the opposite of that stated in the report.” (John Coleman, GLIFWC emails to Stuart Arkley, MDNR, Sept. 10 -12, 2008, Exhibit 4). In addition, the MDNR’s own consultants, Jim Kunkel and Cory Conrad¹³ criticized both the conclusions and the methodology of the RS10A study. They concluded, “The bottom line is there was some impact on the wetlands and most likely other surface water bodies for this relatively short-term test.” (Reviewer Comments RS10A, Apr. 20, 2007, Exhibit 5). MDNR’s consultants urged additional analysis of distance-drawdown and vertical hydraulic conductivity between surficial deposits and bedrock to assess wetlands impacts. They proposed that the MODFLOW model should include a factor for surface water and groundwater interaction and, if MODFLOW could not calculate impacts to surface water during mine dewatering, a better conceptual model was needed. (Id.) A single pump test is insufficient to assess the connection between surficial deposits and bedrock, and a test solely in Duluth Complex rock seems calculated to understate the connection. Both Tribal Cooperating Agencies and MDNR’s reviewers challenged the conclusions of Barr’s consultants and recommended additional testing with better designs. Yet, seven years later, the FEIS still follows PolyMet’s lead and characterizes the P-2 pump test as demonstrating a “weak or non-existent” connection between mine site surface and groundwater without disclosing either the test’s design flaws or the scientific assessment that additional testing and modeling was needed. Both the P-2 test and the conclusions drawn from it in the FEIS fail to meet the requirements of scientific rigor, integrity and disclosure of opposing views required for an EIS.</p>	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3070	78	<p>The Co-Lead Agencies’ theory that leakage from rain through the surficial aquifer to groundwater could prevent northward flow of PolyMet NorthMet contaminants may or may not be correct. What is clear to WaterLegacy is that the potential consequences of the northward flow of NorthMet pollution into the Boundary Waters watershed and the potential consequences of a large leakage rate and significant secondary impact on 100 Mile Swamp wetlands should have been provided in the FEIS, preferably with an assessment of which risk is more probable.</p>	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3082	77	<p>GLIFWC’s analysis suggests that formation of a bedrock groundwater mound at the level necessary to prevent northward flow from the PolyMet NorthMet mine site as a result of the gradient to the expanded Peter Mitchell Pit is “hydrologically impossible.” (GLIFWC Northward Flowpath Letter, Exhibit 8, p. 5). In addition, if the Co-Leads’ theory were plausible and enough water could flow through the 100 Mile Swamp to create a large mound of water in bedrock, statements in PolyMet documents and in the FEIS that there is minimal connection between wetlands and groundwater north of the mine site would all be called into question. (GLIFWC email to MDNR et al. Bedrock-Wetland Connections at PolyMet Mine Site, July 29, 2015, Exhibit 10). The Co-Lead Agencies’ new “leakage” theory would suggest that secondary wetland impacts to the 100 Mile Swamp from NorthMet mine drawdown would be virtually certain and highly damaging.</p>	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3085	79	<p>The indefinite formulation in the Co-Lead Agencies’ Memorandum (MDNR et al. 2015c) and the FEIS (FEIS, 6-40 to 6-41) allows project proponents to have it both ways. When it is time to evaluate the adverse impacts of NorthMet mine drawdown on 100 Mile Swamp wetlands, it is claimed that there is little or no connection between wetlands and bedrock groundwater. Then, when it is time to evaluate the adverse impacts of PolyMet NorthMet pollution flowing north to the Boundary Waters, it is claimed that there is a robust connection, sufficient to form a huge underground mound of water preventing northward flow. Neither state nor federal laws allow this type of gamesmanship in environmental review.</p>	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3111	125	<p>Even if one were to assume that an analog method is preferable to using MODFLOW or another hydrological model to provide a quantitative assessment of indirect wetlands drawdown impacts, there is no logical reason why this would make an evaluation of wetlands drawdown impacts “unavailable.” Nothing would have prevented the project proponent and Co-Leads from providing a quantitative evaluation of mine drawdown impacts, sufficient to assess mitigation, using their preferred analog method. They chose not to do so.</p>	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3129	116	<p>WaterLegacy’s comments on the SDEIS discussed both the unacceptable adverse impacts of the PolyMet NorthMet project on wetlands and the inadequate mitigation proposed by PolyMet for adverse wetland impacts. WaterLegacy’s substantive arguments that the project’s wetlands impacts and improper mitigation do not allow issuance of a Clean Water Act Section 404 permit are presented in separate comments on the permit.</p>	NS	X

27085	Unique			WET	Paula Maccabee	Water Legacy	3130	119	Rather than assessing the adverse impacts on wetlands acreage and function in the St. Louis River watershed and the Lake Superior Basin resulting from the proponent’s failure to provide in-watershed and in-kind compensatory mitigation, the FEIS attempts to justify the mitigation proposal by claiming that PolyMet selected most of its mitigation before the Federal Mitigation Rule was finalized. (FEIS, 5-363). This argument is substantively invalid, as explained in the expert opinion of Morgan Robertson (Robertson, 2015, pp. 11-13) and in WaterLegacy’s comments regarding the Section 404 permit application. In addition, by advocating for some type of exemption from federal mitigation rules, rather than explaining the adverse effects of operating outside the rules, the FEIS adopts a role of justifying, rather than analyzing the proposed mitigation. This advocacy is inconsistent with NEPA regulations. 40 C.F.R. §1502.2(g).	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3131	121	Recommendation: The FEIS should quantitatively assess all indirect impacts. The FEIS should more clearly describe the proposed mitigation plan, including mitigation for indirect impacts. (U.S.EPA, Comments on PolyMet NorthMet SDEIS, Exhibit 1) The FEIS does not follow this recommendation and does not quantify indirect wetlands impacts. The FEIS states, “The indirect effects analyses performed for the EIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects.” (FEIS, 5- 259). This phrase is not an oversight, since it was repeated in the FEIS and in responses to comments at least 14 times (FEIS, 5-342, 5-348, A-25, A-37, A-39, A-116, A-225, A-294, A- 342, A-481, A-482, A-496, A-504, A-623), along with the admonishment that “the identification of specific mitigation for indirect effects . . is not a requirement for an EIS. (FEIS, A-116, A-295, A-343, A-481, A-482). By its own language, the FEIS has failed to comply with the basic requirements of NEPA and MEPA, has failed to provide the foundation for a Clean Water Act Section 404 permit and has rejected the recommendation of the EPA to quantify indirect impacts on wetlands and describe a clearer plan for their mitigation.	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3132	122	The FEIS asserts that the information needed to evaluate indirect wetland effects is unavailable, paraphrasing applicable state and federal law. (FEIS, 5-260). However, at no point in this record do the Co-Lead Agencies allege any factual basis to support this assertion. Both Minnesota law and federal law limit the situations in which a responsible agency can claim information needed for environmental assessment is “unavailable.” Under Minnesota rules, if information about potentially significant environmental effects is essential to a reasoned choice among alternatives, information is unavailable only if the “cost of obtaining it is excessive” or “the means to obtain the information are beyond the state of the art.” Minn. R. 4410.2500; Mid States Coalition for Progress v. Surface Transp. Bd., 345 F.3d 520, 549-550 (8th Cir. 2003) Under federal regulations, if information is relevant to reasonably foreseeable significant adverse impacts, it is only considered to be unavailable if “overall costs of obtaining it are exorbitant or the means to obtain it are not known.” 40 C.F.R.§1502.22(b). Absent these findings, detailed quantitative assessments of possible mitigation measures are necessary when a federal agency prepares an EIS to assess the impacts of a relatively contained, site-specific proposal. See Neighbors of Cuddy Mountain v. U.S. Forest Service, 137 F. 3d 1372, 1380-81 (9th Cir. 1988); The Wilderness Soc’y v. Bosworth, 118 F. Supp. 2d 1082, 1106-07 (D. Mont. 2000). The FEIS makes no claim that modeling to predict wetlands drawdown would be exorbitant, excessively costly, beyond the state of the art or that the means to obtain this information are not known. The FEIS merely states a preference for using the analog method to evaluate wetlands drawdown: The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland IAP Working Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies ultimately decided that the use of the analog method and the 20 percent change in watershed area metric described in this section as factors considered in identifying potential indirect effects to wetlands is a credible and reasonable approach consistent with the requirements of NEPA. (FEIS, 5-260) The FEIS also stated, citing the PolyMet Wetland Data Package, that analog data were used instead of a model such as MODFLOW because MODFLOW “could not practicably be used to estimate potential indirect wetland effects, due to complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site” and since “It is challenging to accurately represent this complex hydrology through modeling.” (FEIS, 5-257, 5-263, citing PolyMet 2015b). Acknowledging the availability of other modeling tools in responses to comments, the Co-Lead Agencies explained, “A hydrological study, pump test, and/or laser test was not performed as the Co-lead Agencies utilized the analog approach for assessing potential groundwater drawdown.” (FEIS, A-489 to A-499). The preference for the analog approach, even if it is reasonable, does not meet the requirements for “unavailable” information under either NEPA or Minnesota’s comparable MEPA rules. In his comment on the PolyMet NorthMet SDEIS, wetlands expert Brian Branfireun opined that reliance on an analog case to evaluate the potential extent and magnitude of the cone of depression and dewatering impact of surface wetlands and streams is unsatisfactory, “given the availability of robust hydrogeological models that could reasonably evaluate potential impact scenarios.” (Branfireun, 2014, p. 14). Hydrologist Donald Lee stated both that an analog approach would need to be validated, which hadn’t been done in the SDEIS and that “MODFLOW has the capability to calculate the effects of pit dewatering providing the appropriate input is incorporated into the model.” Dr. Lee also pointed out that selectively rejecting MODFLOW for the purpose of wetlands assessment called into question the legitimacy of all other EIS analysis of hydrology and water quality. (Lee, 2014, p. 12) Since the SDEIS, MODFLOW has been used to update the precise predictions most relevant to the assessment of the nature and cone of depression. As described in more detail in Section II, supra, discussing mine site modeling, PolyMet recently updated its assessment of the hydraulic conductivity of wetland deposits and of Virginia Formation bedrock (FEIS, 5-19. 5-29, Table 5.2.2-7) and revised its estimates of groundwater inflow to the west and east mine pits. (FEIS, 5-111, Table 5.2.2-19)	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3133	123	The Co-lead Agencies also recently used MODFLOW to predict the number of inches of downward leakage through wetlands necessary to prevent northward flow as a result of the downhill hydraulic gradient of the Northshore Mine Peter Mitchell Pit. (FEIS, 6-41, MDNR et al 2015c).	S	N

27085	Unique			WET	Paula Maccabee	Water Legacy	3134	120	Under both state and federal law, an EIS must analyze the significant environmental impacts of a proposed action. Minn. Stat.§116D.04, Subd. 2a; 40 C.F.R.§1502.1. Under both regulatory regimes, an EIS must provide a thorough analysis of both direct and indirect potential adverse effects. Minn. R. 4410.2300(H); 40 C.F.R. §1502.16(a)(b). In most cases, the Clean Water Act Section 404 process relies on final EIS for the evaluation of the least environmentally damaging practicable alternative (LEDPA) and related factual findings of compliance or noncompliance with restrictions on discharge. 40 C.F.R. §§ 230.10(a)(4), 230.12. Secondary effects on aquatic systems and on wetlands must be determined in order to assess whether a project may be permitted. 40 C.F.R. §§ 230.11, 230.41(b). There is no dispute that indirect effects of the NorthMet project are significant, no matter what scale of comparison is provided. The FEIS acknowledges that the proposed sulfide mine project could indirectly affect up to 7,694.2 acres of wetlands located within and around project sites. (FEIS, 5-251). This potential indirect wetland impact is more than eight times the 913.8-acre (FEIS, ES-36) direct impact of the project on wetlands. Taken together, potential impacts of the NorthMet project on wetlands in the Partridge and Embarrass River watersheds affect up to 8,608 acres, equivalent to 13 percent of the 65,567 remaining acres of wetlands in the two watersheds combined. (FEIS, 6-57, Table 6.2.3-3).28 The FEIS acknowledges that indirect effects on wetlands would result from wetland fragmentation; alteration of wetland hydrology resulting from changes in watershed area, groundwater drawdown, seepage containment at the tailings facility and changes in stream flow at the mine and plant site; and water quality changes related to deposition of dust, ore spillage and leakage and seepage and leakage from mine pits, waste rock storage and other mine features. (FEIS, 5-319, 5-347) The PolyMet NorthMet mine site and potentially impacted proximate wetlands are within the 100 Mile Swamp and the Upper Partridge River site. (FEIS, 4-481, A-509; WaterLegacy SDEIS comments, Exhibit 30). Approximately 92 percent of the wetlands within the mine site are high quality. (FEIS, 4-196) Wetlands that would be directly and indirectly impacted by the NorthMet mine site are sites of high biological diversity, based on high quality peatlands in the 100 Mile Swamp and Partridge River Peatlands sites and on the numerous rare species in the Upper Partridge River site. (WaterLegacy SDEIS comments, Exhibit 30). The EPA’s comments on the PolyMet NorthMet SDEIS emphasized the need to quantitatively assess indirect wetlands of the tailings basin and mine site project: Comment# 17. The SDEIS describes current site conditions, including the acreage, type, and quality of the wetland resources at the tailings basin and mine sites. The SDEIS also describes the proposed direct impacts remaining after measures to avoid or minimize direct impacts. However, the SDEIS does not quantitatively assess indirect impacts or measures to minimize and mitigate these impacts, except with respect to wetland losses due to fragmentation. The SDEIS also omits all indirect impacts from the cumulative impacts analysis for wetlands (Section 6.2.3.4).	NS	X
27085	Unique			WET	Paula Maccabee	Water Legacy	3135	126	However, this record does contain a quantitative assessment of wetlands drawdown impacts using the Co-Leads’ preferred analog approach. An Analysis of Indirect Wetland Impacts from Groundwater Drawdown using a calibrated analog approach was provided by GLIFWC prior to the preparation of the SDEIS in November 2013 and is included in Appendix C of the FEIS. (FEIS, App. C, autop. 2985-3025). Neither the SDEIS nor the FEIS challenged the methodology or conclusions of this analysis, even in responding to Major Difference of Opinion with Tribal Cooperating Agencies. (see e.g. FEIS, 8-13 to 8-14). Calibrating the analog method to other pits on the Iron Range, using the three zones of proximity to mine pits, and specifying the level of drawdown, acreage and types of wetlands that would be affected, GLIFWC concluded that wetlands likely to be severely impacted by dewatering totaled 3,188.62 acres in Zone 1 (0 to 1,000 feet), 2,458.12 acres in Zone 2 (1,000 – 2,000 feet) and 273.01 acres in Zone 3 (2,000 – 5,000 feet). Severe indirect impacts to wetlands from mine pit drawdown would total 5,719.75 acres. (FEIS, App. C, autop. 2994). This calibrated analog model provides available and uncontroverted quantification of indirect impacts on wetlands from mine dewatering.	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3136	129	As noted above, the FEIS text seems to recognize that there are potential impacts on wetland hydrology as a result of groundwater seepage containment at the tailings site. (FEIS, 5- 347). Given the high volume of tailings seepage proposed to be collected (Section III, supra) and the fact that there are 2,754.8 acres of wetlands abutting Mud Lake, Trimble and Unnamed Creek at the tailings facility (FEIS, 5-335, Table 5.2.3-11), one might think there would be a rigorous analysis of indirect impacts of changes on wetlands from capturing seepage. The FEIS first states that, despite augmentation, the response of complex natural systems can only be estimated. (FEIS, 5-334) Then, citing PolyMet 2015b, the FEIS concludes that due to stream augmentation within 20 percent of existing flows, no potential indirect wetland effects would be identified or anticipated for any of the wetlands abutting Second Creek, Mud Lake Creek, Trimble Creek or Unnamed Creek. (FEIS, 5-334, 5-335).	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3140	127	As with other changes in language since the SDEIS discussed in preceding Sections of our comments, there are several places where the FEIS appears to recognize the potential indirect impacts on wetlands, only to mischaracterize references and reject findings that those impacts are likely to occur. The FEIS states it “has been updated to make a more conservative assumption of the potential indirect effects for all bog communities within the zero to 1,000-ft analog zone.” (FEIS, 5-253) The FEIS admits that “although the hydrology of ombrotrophic bogs is solely precipitation-driven, these wetlands can have flowpath connections to groundwater.” (FEIS, 4- 168, citing Eggers 2015). However, the way in which the FEIS makes this update is to classify both ombrotrophic and minerotrophic bogs as having a “low likelihood” of being affected by groundwater drawdowns associated with proposed mining operations, (FEIS, 5-273) and to state that ombrotrophic bogs have a low susceptibility to effects from groundwater drawdown (FEIS, 4- 169) and a low degree of effect from groundwater drawdown associated with mining. (FEIS, 4- 169). For each of these conclusions on each of these pages the FEIS references a January 15, 2015 memorandum of U.S. Army Corps of Engineers (Corps) staff member Steve Eggers. (Eggers 2015). As Dr. Branfireun explains in his recent opinion on the PolyMet NorthMet FEIS, these statements mischaracterize the professional conclusions reached by Eggers (2015). (Branfireun, 2015, pp. 15-16). Eggers’ memorandum doesn’t minimize the likelihood of hydrology impacts on either ombrotrophic bogs or minerotrophic bogs. Eggers states, that although some reviewers would focus on whether the designation of “low likelihood” is accurate or “moderate likelihood” or “high likelihood” is a better designation, “The bottom line is that the potential for indirect impacts to all bog communities within the 0-1,000 foot analog zone is acknowledged.” (Eggers 2015, p. 4). Eggers’ reason for this recognition is simple, “Ombrotrophic bogs, although precipitation-driven, can have flowpath connections with groundwater; therefore, these wetlands could be impacted by groundwater drawdown.” (Id., p. 5). Thus, Eggers recommends, as a conservative approach responsive to public comments, that all bogs within the 0-1,000 foot analog zone be assigned to the same category for likelihood of hydrology effects “to acknowledge a potential for adverse impacts.” (Id., p. 5).	S	N
27085	Unique			WET	Paula Maccabee	Water Legacy	3141	128	Since the FEIS does not quantify any impacts of mine drawdown on any wetlands, the primary result of any new classification of ombrotrophic bogs would be related to the monitoring proposed in the FEIS. The formulation of how monitoring and mitigation might take place is unclear. In some places it is suggested that if monitoring showed indirect wetland effects had occurred “adaptive management practices to reduce wetland effects would be considered” and additional compensation “may be required.” (FEIS, 5-361). Other sections of the FEIS suggest that the agencies would be relying on potential analog impact zones to determine monitoring, but in the event that wetland monitoring identified “additional” indirect effects (additional to what is not specified) “permit conditions would likely include a plan for adaptive management practices to be implemented.” (FEIS, 5-254). Plans for monitoring, mitigation or adaptive management seem vague, but the degree to which this loose formulation fails to protect dewatered mine site wetlands becomes more clear once other indirect wetlands impacts are reviewed.	S	O
27085	Unique			WET	Paula Maccabee	Water Legacy	3224	207	EPA comments on the PolyMet NorthMet SDEIS recommended, “The FEIS should include indirect impacts in the analysis of cumulative impacts to wetlands.” (EPA Comment on the SDEIS, Exhibit 1). The FEIS provides an inadequate and misleading response to this recommendation. The FEIS’ tables only describe the cumulative losses to wetlands resulting from direct destruction of wetlands by the PolyMet NorthMet project. (FEIS, 6-58). For indirect effects, the FEIS says it is difficult to predict indirect wetland effects either for the proposed project or other mining developments. The FEIS then says, “based on the amount of potential indirect wetland effects that could occur from the NorthMet Proposed Action, there could be 0.1 to 12.0 percent cumulatively lost, in addition to the direct wetland impacts assessed, within the Partridge and Embarrass River watersheds.” (FEIS, 6-60). Read quickly, the FEIS seems to suggest that the upper bound of cumulative impacts on wetlands would be 12.0 percent. This is not the case. If both the Partridge and Embarrass River watersheds are aggregated and indirect impacts are considered, the upper bound of cumulative impacts on wetlands is 17 percent. This is calculated by dividing 11,693 acres of cumulative losses (3,085 acres under the no action alternative and 8,608 acres of loss from the NorthMet project) by the 68,251 pre-settlement acres of both watersheds combined. (See FEIS, 6-56, Table 6.2.3-2; 6-59, Table 6.2.3-5 for presettlement and no action alternative wetlands acreage). However, since most of the cumulative losses from both PolyMet NorthMet project and non-project impacts are in the Partridge River watershed, this calculation understates the impacts to high quality wetlands in the Partridge watershed. The FEIS has provided the lower bound of Partridge River watershed cumulative impacts on wetlands since pre-settlement days. If there were no indirect impacts of the PolyMet NorthMet project on mine site wetlands whatsoever, that cumulative impact would be 10 percent. (FEIS, 6-58). The FEIS does not segregate indirect impacts on the Partridge River watershed. But the GLIFWC analysis of mine dewatering impacts provides a best estimate of indirect wetlands impacts in the Partridge River watershed. Combining GLIFWC’s wetland drawdown estimate (5,720 acres), direct wetlands impacts on the Partridge River watershed (768 acres)52 and losses to the Partridge River watershed under the no action alternative (2,557) and dividing by the presettlement acreage of wetlands in the Partridge River (33,601 acres) provides the likely upper bound of cumulative wetlands loss in the Partridge River watershed based on evidence in this record.53 Cumulative wetland loss and degradation in the Partridge River watershed since presettlement days resulting from the NorthMet proposed action could reach 26.9 percent.	S	N
28922	Unique			WET	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3586	11	A major issue for us is the lack of complete information in the FEIS regarding the ultimate wetlands impacts. They are not possible to determine, given the uncertainties as to exactly how the NorthMet mine will develop, in particular with regard to the indirect wetland impacts. Therefore the FEIS should include some estimate of indirect impacts and how they would be mitigated. To leave this significant issue as a completely open question is unacceptable.	S	O
28922	Unique			WET	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3587	12	There is also concern over where the wetland mitigation will take place, since most of the mitigation occurs outside the watershed. The FEIS places less than a third (508.2 acres) of the mitigation for direct impacts in the St. Louis River watershed, and the rest (1094.5 acres) in the Mississippi River watershed. And there will be almost no mitigation in the headwaters of the Embarrass and Partridge Rivers, where all the wetland impacts occur. Additionally, there is no mention in the FEIS of if, or where, the indirect impacts and mitigation efforts would occur on potentially several thousand acres (6,568.8 to 7,694.2 acres depending on the assessment method used). Even if only 10% of these wetlands are indirectly impacted, as much as 770 acres of mitigation will still need to be found. Because it is so difficult to find acceptable mitigation sites, it is highly likely that mitigation for any indirect impacts will also be done outside of the watershed.	S	O
28922	Unique			WET	RICHARD AND CAROL STAFFON	W. J. McCabe Chapter, Izaak Walton League of America	3589	14	The FEIS also fails to recognize that even though the Superior National Forest does not lose wetland acreage, as a result of the land exchange, statewide there will be at least 900 acres of high quality, natural wetlands lost, and possibly much more. Over 50% of these are forested and open bog wetlands, with functions on the landscape that are very difficult to replace and mitigate.	S	O

27778	Form Letter	1	Variant	WET	Robert Graves		2134	3	I oppose and federal Clean Water Act permit for Polymet discharge and wetlands destruction because of inadequate protections of wetlands and water quality.	NS	X
10134	Unique			WET	Ryan Clark		661	1	During the 2015 MN Legislative Session, a statute change was made to Sec. 88 Minnesota Statutes 2014, section 103G.2242, subdivision 12 (c) (5). This change allows for the act of restoring or protecting streams and riparian buffers to earn wetland replacement credits in the >80% area of MN. Although invaluable to water quality and wildlife habitat, an argument could be made that protecting and restoring streams and riparian buffers will not have the same water quality and wildlife habitat benefits of an intact natural wetland. In addition, as of today, 12/1/2015, there are only 68.4875 available wetland credits in Bank Service Area 1 and 2 combined. This number is far short of the ~1,000 credits likely needed to mitigate for the wetland impacts proposed with this project.	S	N
10134	Unique			WET	Ryan Clark		662	2	Also approved by the 2015 Legislature was a change allowing an in-lieu fee for projects impacting wetlands, meaning a project sponsor can pay a fee to a public agency to replace the wetlands lost to permanent impacts. This is a great option for many small scale projects, but with a lack of restorable wetlands in the NE part of MN, it may not be feasible to propose this option.	S	N
29289	Unique			WET	Sandy Sterle		2499	5	The land exchange is a net loss of wetlands for the St. Louis River Watershed. The function of the 900+ acres of wetlands on the proposed mining site will be lost forever. The FEIS needs to quantify the level of indirect impacts that will occur to over 7,000 acres of wetlands and where these impacts will be mitigated.	S	O
6029	Form Letter	1	Variant	WET	Shirley Anderson		445	2	Will destroying wetlands for the profit of one company be worth this loss?	NS	X
28488	Unique			WET	Shirley Huskins		2288	7	Wetland damage – Proposal does not address this, all over the Minnesota region.	NS	X
26659	Unique			WET	Steve Jay		1414	6	a. Wetland mapping and delineation was conducted using data from 1987 to 2010. Given recent and projected meteorological changes in weather patterns, these data should be updated and projections that incorporate recent and projected future impacts of extreme weather events and climate change.	NS	X
26659	Unique			WET	Steve Jay		1415	7	a. The Functional Assessment Tools should be updated to incorporate recent dynamic changes in meteorological impacts of climate change. Does MnRAM 3.0 include such? Table 4.2.3-3, under Human Disturbance (past and present) includes “other alterations to the landscape”—does this include human activities such as burning fossil fuels, with attendant meteorological impacts?	S	O
26659	Unique			WET	Steve Jay		1416	8	b. The NorthMet proposal does not adequately consider alternatives to reduce harm to wetlands and water quality and is not the Least Environmentally Damaging Practicable Alternative.	NS	X
29478	Unique			WET	Thomas K. Nelson	Minnesota Coalition of Lake Associations	3858	13	WHEREAS, the direct loss of quality wetlands in the vicinity of the NorthMet mine would be the greatest loss ever in Minnesota, with the exchange likely in different watersheds, and with lesser quality;	NS	X
26996	Unique			WET	Timothy Weulander		1518	6	There are 1,579.6 acres of wetlands that have been identified in the proposed NorthMet project area, of which about 913 acres would be directly affected and permanently impacted by activities related to the proposed NorthMet project. Activities that would directly affect wetlands include filling, excavation, and construction and operation of the proposed NorthMet project. - Filling in the wetlands should not happen. I'm quite sure that there is a fancy plan to reinvent those wetlands somewhere else. For the sake of the animals and plant life that would be terminated on site, this is not acceptable. Just because new ones will be made elsewhere, no rights should be given to allow the destruction of old ones. Thought I have personally witnessed the DNR not really caring of wetlands being filled in, as I have personally reported such actions happening on Lake Vermilion, and nothing has happened. Actually something did happen, the land owner was told they were not wetlands at all. I have photographic evidence otherwise, but by the time anyone arrived on his newly purchased cabin/land in Greenwood Township, perhaps it was filled in enough to not look it; but any walk in the woods on the property, or any adjacent properties would show it.	NS	X
27061	Unique			WET	Tyler Kaspar	1854 Treaty Authority	848	15	We disagree with the analysis provided in the FEIS regarding indirect impacts to wetlands from mine pit dewatering and believe impacts may be underestimated (Section 5.2.3.2.2). We do not believe the proposed analog method of assessing potential indirect impacts from mine site pit dewatering is adequate, and as such should not be the sole means of indirect impact assessment for the FEIS. Resource assessment areas of concern include wetlands, groundwater, and surface waters. We do not believe the impact zones and distances are well described. Accounting for these factors, GLIFWC conducted an independent assessment using the same methods as the Colead Agencies, along with additional analog data from other mining-impacted sites. The assessment found an estimated total of 5,719.75 acres of wetlands would be potentially susceptible to severe indirect impacts from mine pit drawdown. We also disagree with the conclusion that the Partridge River would act as a “natural barrier” to the cone of depression, which suggests that the riparian zone of the Partridge River will not be affected by groundwater drawdown (page 5-279). The upper Partridge River is located in Zone 2; GLIFWC's independent analysis estimated drawdowns of 3 to 5 feet under the river, which would severely reduce baseflow in the channel, indirectly impact riparian wetlands downstream, and affect other surface water features. GLIFWC's analysis should be considered in the FEIS for estimating potential indirect effects on wetlands from mine pit dewatering. This would also have implications for the cumulative effects analysis presented in Chapter 6, Section 6.2.3.4.4.	S	O
27061	Unique			WET	Tyler Kaspar	1854 Treaty Authority	1230	16	We disagree with how the mitigation for directly and indirectly impacted wetlands are proposed (Section 5.2.3.3.2). Much of the proposed mitigation (Aitkin and Hinckley sites) for directly impacted wetlands is outside of the watershed and 1854 Ceded Territory. This is a permanent loss to these areas and should be discussed in the document. Mitigation options within the watershed and 1854 Ceded Territory should be re-visited. Proper compensation ratios are important. Upfront mitigation for wetlands susceptible to severe indirect impacts is currently not proposed, and we believe that the USACE should require up front mitigation for all severely impacted wetlands. We also contend that additional up front mitigation should be considered for wetlands that are classified in the moderate to severe category, with robust monitoring being required for wetlands in the moderate category.	S	O
27061	Unique			WET	Tyler Kaspar	1854 Treaty Authority	2990	14	We disagree with the rationale provided in the FEIS for performing the indirect effects analysis for wetlands. On page 5-259 in Section 5.2.3.1.2, the FEIS states "The indirect effects analyses performed for the EIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. The Co-lead Agencies agree that multiple actors can affect whether a wetland would experience indirect effects due to a project. This FEIS quantitatively assessed all potential indirect wetland effects from the NorthMet Project Proposed Action that may result from one of the following six factors: 1) wetland fragmentation; 2) changes in wetland hydrology from changes in watershed area; 3) changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering; 4) changes in wetland hydrology from groundwater drawdown resulting from operation of the Plant Site, including groundwater seepage containment; 5) changes in streamflow near the Mine Site and Plant Site, as well as associated effects on wetlands abutting the streams; and 6) change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations. The methodology and evaluation criteria used for assessing potential indirect wetland effects are described in detail below. The monitoring and mitigation for potential indirect effects would be determined during permitting. Section 5.2.3.3 of this FEIS includes a detailed discussion on the monitoring and mitigation plan for the indirect wetland effects. The proposed wetland impact, avoidance, minimization, mitigation and monitoring plan presented in this FEIS would be reviewed, modified as required, and approved during permitting; therefore, this information could change during permitting." This does not meet the NEP A requirements for an EIS. The purpose of an EIS is to inform potential impacts that may result from the project and not just where monitoring should take place. If the project detects impacts to wetlands after the start of operations instead of understanding where impacts could/would occur before operations, it will be too late to evaluate ways to avoid those impacts and mitigation (assuming proper mitigation is feasible) will be the only option. The analytical methods and data necessary to estimate the potential indirect impacts on wetlands is available and should be used as such in the FEIS. Please revise/remove this statement and context from the FEIS. The project as a whole puts too much emphasis on using adaptive management in lieu of collecting additional data where data is lacking and performing analyses to better characterize and estimate potential impacts.	S	O

28017	Unique			WET	Wendy Robertson		2246	1	The FEIS fails to include the value of the natural capital of the St. Louis Watershed when mitigating the wetlands for the Polymet Project. Natural capital is defined as “minerals, energy, plants, animals, ecosystems, (climatic processes, nutrient cycles and other natural structures and systems) found on Earth that provide a flow of natural good and services” (Daly and Farley, 2004). Two of the three mitigation sites for this project are not in the watershed thus result in a loss to the St. Louis Watershed area. In June 2015, a study was commissioned by the Fond du Lac Band of Lake Superior Chippewa. The band and the U.S. EPA. provided the funding for the study, “The Value of Nature’s Benefits in the St. Louis River Watershed”, which was completed by a team employed by Earth Economics, Tacoma, WA. Their findings were published in a 105 page report that may be reproduced for educational and non-commercial use without prior copyright permission from the holder provided the source is acknowledged. I have used some of their data to defend my comments. In the valuation results from this study, the total land cover of the St Louis watershed area is 2,376,286 acres. It provides between \$5 billion and \$13.7 billion (low and high figures) in benefits each year to people. The numbers indicate investment in natural capital that supports an ecosystem of services and benefits. An example would be in carbon sequestration from the extensive acreage of peatland. Peatlands hold three times as much carbon as other ecosystems. From recreation and tourism, this area is valued at \$12,843.00 per acre. Local businesses benefit from this value. The proposed mitigation plan falls short in the FEIS for three reasons: one, all the mitigation is not within the St. Louis watershed, two, there is no determination by the state and federal agencies on the drainage status of the bog restoration sites (compensatory mitigation) from active sod farms and agricultural production, and three, the USACE has not made a final decision on the mitigation ratios that would be required to compensate for direct wetland impacts. To date about \$750,000,000.00 has been spent to clean-up from the industrial pollution disaster of the St. Louis River watershed area. It is still unsafe for certain human populations to consume fish from the river without heeding the MN Dept. of Health’s warning guidelines. It is still considered an endangered river without the additional impact of sulfide mining. The amount of short-term proposed economic gains or benefits from the Polymet project in comparison with the costs of jeopardizing the long-term environmental economic value of the St. Louis River watershed should not be given any more consideration. Therefore, I am against the MNDNR giving the NorthMet Mining Project and Land Exchange project a green light. I’m asking them to state, “No Alternative Action”, in their decision on the FEIS. I am also asking the USACE not to issue any 404 permits to the Polymet project. The USAD Forest Dept. should not agree to any land exchange. Leave our future generations and the deserving non-defendable wildlife of the St Louis River watershed with the highest value of natural capital intact and do not support this project.	S	O

26780	Unique			WI	Alaina Pilate		1433	7	We are concerned of the impact and harm to endangered and threatened species like the lynx, moose, great gray owl, and the northern goshawk.	NS	X
27822	Unique			WI	Anita Tillemans		2153	3	How can protection of a species be reconciled with destruction of habitat and nesting sites? Since the various animal species do not pay attention to lines drawn on a map, they will trespass naturally. Water knows no real boundaries, either, over time; and time is the key word. In time, all things great and small in this water dependent ecosystem will be affected by actions proposed today in the Arrowhead. The FEIS notes, that approximately 1,535 acres (58 percent) of mature forest would be lost at the mine site alone, that the species of greatest conservation need (SGCN) found at the mine site would be birds from Table 4.2.5-1 and that they would be “displaced.” The FEIS goes on to state that it is likely these birds would not be injured or killed, though nesting birds could be affected. The FEIS states that the mine would not likely affect individual migratory songbirds or other bird species protected under the MBTA; but would likely affect habitat and nest sites used by them. How does one “affect” another’s home, without affecting the individual; and, as a matter of course, disturb nesting sites without disturbing the propagation of a species? With time, more species than those cited by the FEIS would be “affected” in the course of their reproductive cycles; and this, in turn, would naturally affect survival of a number of species in the area.	S	O

29361	Unique			WI	C.A.Arneson		3707	8	The PolyMet SDEIS does not [adequately] address loss of habitat and other impacts to Minnesota’s moose population by proposed sulfide mining, as well as by taconite mining. This needs to be researched. Coal mining had its canary; it could be taconite mining (and other industry) has Minnesota’s moose. Minnesota needs to have the results of an extensive moose study before it looks at sulfide mining projects; it needs to rule out any possible connections. Having suggested two reasonable possibilities that may be related to the moose losses in Minnesota, I contacted several individuals connected with the moose study and to my knowledge most have been dubious. So I am including my article, and further information I have gathered, as part of my comments, asking that it be considered seriously. I made the possible connections to sulfates and methyl mercury because I was researching the mining issue, including sulfates; if some good can come of it for Minnesota’s moose it would be worth the years of my life I have spent trying to protect Minnesota’s waters. If there were any merit to my theory I hope it would not be dismissed due to political and corporate pressures, or simply because it came from someone outside the ‘ranks.’ Minnesota’s moose are an icon of our State; I care as much as anyone. Another writer also spoke of the utter lack of reference in the SDEIS to impacts on Minnesota’s moose population: http://www.minnpost.com/communityvoices/2014/02/where-are-concerns-Minnesota-s-moose-copper-sulfide-mining-debate My article: http://www.minnpost.com/community-voices/2013/04/are-sulfates-andmethylmercury-killing-Minnesota-s-moose MinnPost received an email from a reader, an anaerobic microbiologist who said: "My PhD was in anaerobic microbiology. The theory discussed is brilliant and highly plausible; particularly the link to warming climate." I found a paper online this past summer that I had not seen when I was researching for my article; it may be that someone posted it after I wrote the article. The paper is, "Transformation of mercuric chloride and methylmercury by the rumen microflora." http://aem.asm.org/content/38/4/626.long Evidently in the 1970’s there was also concern about mercury exposure to rumen microflora. The study I linked above was done in 1979 and the results seemed to indicate that there was an equilibrium established between demethylation and methylation in the rumen that protected ruminants. Not long after I found the 1979 study, I came across a paper that reported (recently) identifying the bacterial families in a moose rumen and colon (the author, from the University of Vermont, has since been in touch and I have attached her info below).** I had been thinking that the 1979 paper had only looked at a few bacteria that the researchers felt were responsible for demethylation (and not in moose). I wondered just how many of the bacteria were responsible for mercury methylation and how many for demethylation (and how much effect each had), and if there was some way that the numbers would make a difference (could perhaps change the equilibrium). Also, the bacteria present in the rumen would be related to what a moose ate. I later learned that the Vermont researcher had seen my article and decided to take a look at demethylation in relationship to the bacteria she had identified — we were probably reading what the other wrote about the same time. Just a few months ago, I came across a paper that several college students had written; I subsequently spoke to their professor and expressed an interest in what his students had written concerning demethylation and rising temperatures. (In my article I had linked rising temperatures to the possibility of methylmercury being produced in the moose rumen — increased activity by anaerobic bacteria as temperatures increased.) The professor then told me about a paper he felt would be most helpful to me, one that his students had used for reference.* (At the time I did not discuss my theory with him, just asked about demethylation.) Basically, there is evidence emerging that indicates mercury methylation increases as temperatures rise and demethylation decreases as temperatures rise, possibly creating greater net mercury methylation. Higher temperatures and higher methylation occur in the summer months. (Also a time when more unexplained moose deaths are occurring in Minnesota.) So, my thought is this: with warming temperatures the equilibrium in a moose rumen between demethylation and methylation may no longer be balanced (or offset) as moose become increasingly overheated. Moose may no longer be protected, if indeed they were. Species with larger body mass would be most significantly affected by climate change because of difficulty with thermoregulation. The Minnesota Zoo, in an article about their work with moose, stated: "Another concern is thermoregulation. (Adult moose have low surface-area-to-volume ratio, placing constraints on their heat dissipation capacities.)" Difficulty with thermoregulation could affect any equilibrium between demethylation and methylation in the rumen. Methylmercury could in turn interfere with thermoregulation. If the effects (resulting in death of an animal) were relatively sudden, how would that affect detection during a necropsy? *The paper below is the one that I was told I would find helpful (Vermont students used it for their research). It is often cited and well respected. I copied the pertinent section on temperature:	S	N

				WI	C.A.Arneson		3708-1	9	Mercury in the Aquatic Environment: A Review of Factors Affecting Methylation Susanne M. Ullrich, Trevor W. Tanton, and Svetlana A. Abdrashitovab Dept. of Civil and Environmental Engineering, University of Southampton, U.K.; Institute of Microbiology and Virology, Almaty, Kazakhstan 2. Temperature “It has been observed frequently that Hg methylation rates in aquatic systems peak during the summer months (Jackson et al.; Callister and Winfrey; Korthals and Winfrey; Bubb et al.; Hintelmann and Wilken; Watras et al.). Most studies have shown maximum methylation activity occurs during mid or late summer, although Bloom et al. found a sharp peak in sediment MMHg production in early spring, followed by a slow decrease throughout the remainder of the year. Seasonal variations in MMHg production and decomposition generally have been attributed to temperature effects, but are probably also linked with seasonal changes in productivity/nutrient supply and redox conditions (cf. Section III.B.5). Temperature most likely affects methylation as a result of its effect on the overall microbial activity (Bisogni and Lawrence). Wright and Hamilton noted that MMHg release from sediments at 4 degrees C was only 50 to 70% of that observed at 20 degrees C, suggesting that net MMHg production may be significantly decreased in winter due to lower rates of growth and metabolic activity, and Callister and Winfrey reported microbial Hg methylation in surficial river sediments had a temperature optimum of 35 degrees C. Korthals and Winfrey found that while both temperature and anoxic conditions were important factors influencing net methylation, temperature alone accounted for about 30% of the variation. The data suggested that increased net MMHg production was partly due to decreased demethylation rather than an increase in the actual methylation rate, however. Several other workers have also found that demethylation is favored by low temperatures, whereas higher temperatures favor methylation, leading to a large increase in net MMHg production in the summer (Bodaly et al.; Ramlal et al.).		
				WI	C.A.Arneson		3708-2	9	Abiotic methylation by humic substances has also been shown to gain in importance with increasing temperature (cf. Section III.A.2), but it is probably of little/ minor significance compared with biotic methylation. In contrast to the findings of Ramlal et al. and Bodaly et al., Matilainen et al. found that the highest rates of both methylation and demethylation in surficial lake sediments coincided with maximum temperatures. Similarly, Matilainen and Verta found microbial demethylation rates in aerobic surface waters of small forest lakes (up to 13.2% d-1) were decreased by low temperatures. Temperature is clearly an important factor controlling both methylation and demethylation. It appears that moderately high temperatures have a stimulating effect on Hg methylation, which is most likely due to increased microbial activity. Together with seasonal changes in oxygen levels and organic content/primary production, this seems to account for the increased MMHg production rates usually observed in the summer. The results for Hg demethylation are somewhat contradictory, but most workers found demethylation is favored by lower temperatures. It may be that the rate of methylation increases faster than the rate of demethylation with increasing temperature.” **This is the message I received from the Vermont researcher (Suzanne Ishaq): “Sorry it took me so long to get back to you, I had to dig through some data to find what I was looking for. I have done more sequencing on moose rumen bacteria using the Vermont samples, as well as some Alaskan and Norwegian. I didn't find very many bacteria in any of the three populations which were capable of demethylating mercury or reducing sulfate, so I ended up not focusing on that in that manuscript [manuscript in review].		
29361	Unique			WI	C.A.Arneson		3708-3	9	Alaska did have more than the other two, and they were fresh off a summer diet whereas the other two locations were on a fall diet, but it still wasn't very many. I also couldn't distinguish which species they were, just that they were of the genus Pseudomonas, so they weren't necessarily capable of demethylation. And I didn't have enough Alaskan samples to know if it was just those moose which happened to have slightly higher counts than moose in other locations, or whether all moose in Alaska have elevated numbers of demethylating bacteria. Bacteria which can demethylate mercury include (but aren't limited to) some species of Pseudomonas sp., and Micrococcus sp. (Kozak S, Forsberg CW: Transformation of mercuric chloride and methylmercury by the rumen microflora. Appl Env. Microbiol 1979, 38:626?636.) and some bacteria in the genera Desulfomicrobium, Desulfovibrio, Desulfatibacillum, and Desulfobulbus (Bridou R, Monperrus M, Gonzalez PR, Guyoneaud R, Amouroux D: Simultaneous determination of mercury methylation and demethylation capacities of various sulfate-reducing bacteria using species-specific isotopic tracers. Env. Toxicol Chem 2011, 30:337?44). Your theory does sound like a good one; unfortunately I don't think anyone is working on the rumen populations with demethylation in mind. You would need to try and track moose so you knew where they were feeding, and at least sequence the plant matter in the rumen as well so you could tie the bacteria in with diet (i.e. aquatic plant species so you could tell if they were actually eating from swamps). You would also need to look into summer versus winter diets, to make sure that the bacterial levels were actually changing in response to the seasonal change of mercury. The problem with studying moose is that it is difficult to get fresh rumen samples without hunting the moose; you might have some luck looking into reindeer or wild deer species, since they are often studied in higher numbers, and then extrapolating. I know that Alaskan moose and reindeer have lower mercury levels than other wild ruminants, including those in Norway (6. Lokken JA, Finstad GL, Dunlap KL, Duffy LK: Mercury in lichens and reindeer hair from Alaska: 2005?2007 pilot survey. Polar Rec. (Gr. Brit). 2009, 45:368?374. 7. Lokken JA, Finstad GL, Dunlap KL, Duffy LK: Baseline environmental biomonitoring of mercury for risk assessment and reindeer management on the Seward Peninsula, St. Lawrence Island, and Fairbanks, AK. 2008.), so maybe it is because they have higher levels of demethylating mercury.	S	N
29361	Unique			WI	C.A.Arneson		3711	10	If I ever generate enough concrete data I will certainly let you know, but right now I don't have statistical significance so this particular info isn't really publishable. Sorry I can't be more help.” Insight into the bacterial gut microbiome of the North American moose (Alces alces) Suzanne Ishaq http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3585231/ http://www.uvm.edu/~uvmsrc/postercomp2012/posters/ishaq-pcomp2012.pdf In “Dairy Cattle Feeding and Nutrition,” a study was referenced (Neathery and Miller) that found: “Methylmercury primarily affects the nervous system producing symptoms similar to those of polioencephalomalacia in calves.” Moose: Additional information to consider: There is reason to look at the sulfate/methylmercury connectons for northwestern Minnesota moose losses as well. There are high geological sulfate concentrations, atmospheric sulfate and mercury deposition, but most importantly frequent flooding that exacerbates the spread of sulfates, the release of sequestered mercury, and the microbial production of methyl mercury; especially within the numerous impoundments that have been built to control the flooding (attractive and easy feeding locations for moose). Research has shown that these impoundments have elevated methyl mercury levels; higher than those found in natural surface waters. http://pubs.er.usgs.gov/publication/70024482 Simply put, impoundments are sulfate/mercury/methylmercury sinks. As well as prime feeding locations for moose. There are also agricultural and industrial sources. Among them, commercial wild rice fields (studies in California http://ca.water.usgs.gov/mercury/yoloBypass.html http://swrcb2.swrcb.ca.gov/centralvalley/water_issues/tmdl/central_valley_projec%20ts/delta_hg/other_technical_reports/ybwa_hg_final_rpt.pdf have found mercury and methylmercury in wild rice); coal-fired electrical plants, ash ponds and landfills; fertilizers and fungicides; use of copper sulfate; beet farming, beet processing and its waste; drainage ditches; reservoirs; water treatment plants; Boise Cascade's paper mill at International Falls, reportedly between 1990 and 1994 Boise was among the top three facilities reporting the most toxic pollution of Minnesota's waters. (What effect did ash wastes from its boilers have when spread on local farm fields?) I would also suggest that the moose study results reported in May 2013, showing Voyageurs National Park moose on the Kabetogama peninsula holding their own, may be quite significant since they would be the group most isolated from a sulfate/methylmercury connection in Minnesota.	S	N
29361	Unique			WI	C.A.Arneson		3714	11	Further information: Gypsum (calcium sulfate) I recently came across a peer-reviewed paper on sulfur: “The Relationship Between Sulfur, Thiamine, and Polioencephalomalacia – A Review.” It stated: “Sulfur was first linked to PEM in the 1980's when investigators determined that gypsum (calcium sulfate) added to cattle rations to control feed intake caused PEM. When gypsum was removed from rations, the incidence of PEM decreased.” The word gypsum struck a cord, because limestone would be used in sulfide mining processing, creating massive amounts of (synthetic) gypsum as the byproduct; gypsum would also be produced from the coal-fired electricity powering the proposed mines. (Limestone is currently used for remediation at taconite sites). [Also used as a flux in processing taconite.] I knew there already were very high sulfate levels in areas surrounding taconite mines and other anthropogenic sources (power plants, water treatment plants). However, depending on how elevated the sulfate levels are, water can be bitter tasting; if given a choice ruminants would generally choose other waters. I also knew that extensive amounts of limestone are used for treating mining waste (as well as in coal fired power plants), which would not only mix with the sulfates but I suspected would also make a difference in the taste. I was curious. So I purchased some calcium sulfate from an animal nutritionist (he has been in the business for many years; feed supplier; works with veterinarians). I discovered calcium sulfate is quite tasteless. He tried it too. I told him why I was curious about it, and he brought up another point. If moose are anything like cattle, they know enough to lick soil/calcium carbonate/gypsum, something neutralizing – like us taking Tums – when their rumens are upset (can help regulate pH so the rumen does not get too acidic) or if they are lacking calcium. So limestone or gypsum (calcium sulfate) may be very attractive to moose; if they get too much sulfate along with it however, it would also be a very big problem. Evidently, according to the DNR, PEM had not been diagnosed during the necropsies of moose that died. However, I suggest not ruling it out as a possibility, particularly when looking at proposed sulfide mining. “The most dramatic manifestations of S toxicity in ruminants are sudden death, with no lesions, and/or PEM. Polioencephalomalacia is a neurological disease of cattle and sheep, resulting in seizures, ataxia, blindness, and recumbency as the main clinical signs. It is usually fatal. Seven hundred of 2,200 ewes grazing a pasture previously sprayed with elemental S began showing signs of abdominal discomfort within two hours of exposure, and 220 ewes died within five days. Lesions of PEM were found only in the sheep that had survived for five days.” (Water Quality for Wyoming Livestock & Wildlife) https://deq.state.wy.us/wqd/wqd_home/announcements/final_draft_1.pdf Perhaps there are moose fatalities that are acute cases, without time for lesions to appear. It is possible for moose to develop PEM; there was a suspected case in North Dakota (grain overload) that was written about by DNR veterinarian Erika Butler. Which brings up the point that moose have moved into North Dakota, reinforcing the appearance that there is more at play than global warming. There have also been suspected cases of PEM in deer. What were the “ten percent of brain lesions of unidentifiable origins” found in 634 moose killed by hunters in Minnesota between 2007 and 2013? The quote was: “Another ten percent had brain lesions of unidentifiable origins?” (OnEarth) http://www.onearth.org/articles/2013/07/climate-change-could-wipe-outminnesotas- iconic-moose I also found this article interesting: http://www.nytimes.com/1996/03/12/science/acid-rain-leading-to-moosedeaths.html	S	N

29361	Unique			WI	C.A.Arneson		3715	12	Questions: What are the mercury levels in Minnesota’s moose (blood and cord blood, hair, tissue, muscle, organs, teeth)? Saying that they are “not seeing anything to be concerned about” is too vague. How much is too much? Where are moose feeding? What are they eating? Have the aquatic and terrestrial plants and browse that moose eat been tested for sulfates, mercury, methylmercury (what about cadmium, other metals)? http://www.sciencedaily.com/releases/2010/11/101105085330.htm http://www.apnewsarchive.com/1985/Maine-Moose-Hunters-Warned-Of-Possible-Cadmium-Contamination/id-7b70be903d1fbbfe79cbcaa3e6d15a8a Has anyone done the following to investigate methylmercury and the rumen? Suggestion from a scientist now working in the medical field: “I do not know much about the moose rumen but I assume it’s pretty similar to other ruminants. I actually found an article (attached here) that might point in a direction for necropsy tissue choices. The reason I found it is that I searched for the parameters that I recall being used decades ago in assessing domestic ruminant's health, which focused on papillary health. That's generally a good area to focus on in any animal's alimentary canal. This moose article used a similar approach. Two thoughts: perhaps one could assay this papillary tissue assay, based on the gross anatomical parameters as defined in the attached article, and couple that with an enzymatic transferase assay such as that noted in [the following link] http://onlinelibrary.wiley.com/doi/10.1002/etc.5620210610/abstract.jsessionid=38D9E970813AF7D03FB08B00A3F4303E.d03t03?deniedAccessCustomisedMessage=&userIsAuthenticated=false . While I realize the latter is done in soil, recall that much of the soil enzymatic environment reflects anaerobic acidic activity due to the volatile fatty acids produced by those bugs. So I think either that soil assay, or something analogous, could work well with the rumen necropsy material. If you have the capability, I would seriously try to recover the VFA rumen fluid and analyze it by liquid chromatography if you have that type of asset available to you. It's a tricky recovery if your material is remote in the field as the VFA chemistry changes quickly upon exposure to air when removed from the animal. It is best captured by aspirating with a gas tight syringe, which can then be placed directly into dry ice level chilling storage for transport.” Precisely, where are moose in Minnesota dying and are there any location relationships to high sulfate and mercury sources/levels nearby? Is there a map with the moose fatalities pinpointed for the public to see the locations? Minnesota’s moose are important! They may also be trying to tell us something. We need to understand what it is, not permit sulfide mining when we do not know what the ramifications may be to our rapidly declining moose population. I would like to add for my Final EIS comment the following: Minnesota has seen a high incidence of moose calf deaths and a surprising willingness for moose cows to abandon their young. Blame has been placed on wolves by many, but is it not possible that the effects of sulfates and/or mercury could be responsible for the calf loss and for the erratic behavior by cows? Perhaps causing an inherent weakness in newborn calves? Perhaps the effects of mercury are not enough to kill directly, but are enough to change the behavior of the mothers and the resistance/strength of their calves, making them easy prey for predators?	S	N
27675	Unique			WI	Deborah Mielke		1837	5	Wildlife in the area will be severely disrupted as stated in the report, albeit temporarily. I am concerned that the current bat situation makes this population more vulnerable than when the report was generated and their endangered status may need to be verified. I found the statement about air pollution that "some wild life may avoid the area at this time" indicative of not really understanding the implications on all wildlife in the area.	NS	X

29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4087	165	The FEIS also fails to inform the reader of the actual situation regarding moose in Minnesota and the potential impact of this and other projects on moose recovery in the Midwestern United States. Much of this information is provided in a petition to the U.S. Fish and Wildlife Service for federal Endangered Species Act listing of alces alces andersoni, the subspecies of moose found in the Midwest.410 In addition, we are including the report from the MDNR’s 2015 aerial moose survey.411 These documents are in addition to the material submitted with comments to the SDEIS, which are again included with this submission.	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4095	157	The EIS fails to adequately analyze and disclose impacts to federally listed species, and fails to demonstrate compliance with the Endangered Species Act for these species. As acknowledged in the FEIS, the NorthMet mine would impact three federally listed species: the Canada lynx, gray wolf, and northern long-eared bat.347 The mine would result in the long-term destruction of two square miles (1454 acres) of designated critical habitat for the Canada lynx and gray wolf.348 The project may also kill lynx and wolves as result of the significant vehicle traffic within the Mine Site, and the significant vehicle and railroad traffic between the Mine and Plants Sites.349 The project would also impact two of the thirteen remaining wildlife corridors that allow wildlife migration (including for lynx and wolves) from northwest to southeast of the Mesabi Iron Range.350 Moreover, the project would destroy habitat that may be used by the northern long-eared bat at the Mine Site, and would also disrupt the bat’s use of the Plant Site.351 Due to the significance of impacts to these three threatened species that would result from the proposed mine, the FEIS is inadequate in assessing and disclosing the direct, indirect, and cumulative impacts, and fails to demonstrate compliance with the Endangered Species Act (ESA).352	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4096	158	The ESA represents “the most comprehensive legislation for the preservation of endangered species ever enacted by any nation.” Congress enacted this statute “to halt and reverse the trend towards species extinction, whatever the cost.” In enacting the ESA, Congress spoke “in the plainest of words, making it abundantly clear that the balance has been struck in affording endangered species the highest of priorities, thereby adopting a policy which it described as ‘institutionalized caution.’” As the court in Tennessee Valley Authority observed: One would be hard pressed to find a statutory provision whose terms were any plainer than those in [Section] 7 of the Endangered Species Act. Its very words affirmatively command all federal agencies ‘to insure that actions authorized, funded, or carried out by them do not jeopardize the continued existence’ of an endangered species or ‘result in the destruction or modification of habitat of such species...’ This language admits of no exception. Section 7 of the ESA mandates that “federal agencies take no action that will result in the ‘destruction or adverse modification’ of designated critical habitat.” “Destruction or adverse modification” of critical habitat is defined as “a direct or indirect alteration that appreciably diminishes the value of the critical habitat for both the survival and recovery of a listed species. Such alterations include, but are not limited to, alterations adversely modifying any of those physical or biological features that were the basis for determining the habitat to be critical.” The courts have found that this regulatory definition reads the “recovery” goal out of the statutory adverse modification inquiry, “and that agencies must in fact consider impacts that appreciably diminish the value of critical habitat for either survival or recovery. “Thus, the agencies’ assessment of the impacts of a proposed action on a listed species’ critical habitat must address the project’s potential impact on the species’ habitat in terms of the species’ recovery as well as its survival. In addition, agencies are not allowed to characterize as “insignificant” the potential impacts on a species’ critical habitat by considering only the broad scale or long-term impacts. The NorthMet Mine Site is within designated critical habitat for the Canada lynx and gray wolf, and signs of lynx and wolves have been observed near and at the Mine Site. The proposed mine would reduce suitable habitat for lynx and wolves, and fragment their remaining habitat. Significantly, the proposed mine would destroy two square miles (1454 acres) of critical habitat for lynx and wolves for at least 40 years.363 Moreover, the mine would further affect lynx and wolf critical habitat through impacts to two of the remaining wildlife corridors in this region. Because the proposed mine would result in the destruction and adverse modification of critical habitat for both the Canada lynx and gray wolf, the project violates Section 7 of the ESA and cannot proceed. In addition to the direct impacts on lynx and wolf habitat at the Mine Site, an average of 2066 miles per day of vehicular traffic is expected within the site, with an additional 1734 miles of traffic each day between the Mine Site and Plant Site. This does not include additional highway traffic from workers driving to and from work, or truck traffic delivering supplies. The agencies acknowledge that increased vehicle and train traffic could further affect lynx and wolves, including through vehicle collisions.	NS	X

29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4097	159	The consideration and disclosure of cumulative impacts to lynx and wolves in the FEIS is also inadequate, including the cumulative impacts to the few remaining travel corridors in the region. There have been two studies of the few remaining wildlife corridors through the Mesabi Iron Range and Arrowhead Region. In 2006, Emmons and Olivier Resources prepared for the DNR, “Cumulative Effects Analysis on Wildlife Habitat Loss/Fragmentation and Wildlife Travel Corridor Obstruction/Landscape Barriers in the Mesabi Iron Range and Arrowhead Regions of Minnesota.”368 As stated by Emmons & Olivier, wildlife travel through this region is restricted “because of the extensive change to the landscape, including large mine pits, stockpiles, mining infrastructure, regional development associated with the Mesabi Iron Range, and highways.”369 Emmons & Olivier identified only thirteen remaining wildlife corridors across the 100 mile Mesabi Iron Range.370 Moreover, Emmons & Olivier found that any future losses of these relatively small remaining corridors may be considered significant.371 Additionally, due to cumulative effects of past habitat losses in this region for “mammalian species of greatest conservation need,” Emmons & Olivier determined that “any future losses to the habitat requirements for these species could be considered significant.”372 The second study is entitled, “Cumulative Effects Analysis of Wildlife Habitat and Threatened and Endangered Wildlife Species, Keetac Expansion Project,” prepared by Barr Engineering in 2009.373 The Barr Report states that mining features already cover 118,314 acres along the Iron Range, including 36,962 acres of open pit mines, 78,620 acres of stockpiles and tailings basins, and 212 acres of facilities and infrastructure.374 The cumulative impacts of 125 years of mining in this region has fragmented habitat and resulted in a loss of wildlife travel corridors.375 “It is feasible that in the future, mining in the Iron Range could potentially culminate in a 100-mile long landscape barrier that severs wildlife travel corridors, which may have impacts on dispersal, migration, and/or seasonal movements of many species.”376 The Barr Report identified eighteen remaining wildlife corridors.377 Of the eighteen, the Barr Report predicts that “four will likely become completely impassable within the next 25-30 years as a result of planned mining activities,” and an additional four corridors “will retain some functionality, but will be significantly degraded by future mining plans.”378 In addition, “[a]s wildlife are increasingly exposed to mining activity, roads, and urban centers due to the degradation of available corridors, the incidence of wildlife mortality within the corridors is likely to increase.”379 Due to insufficient data, however, the Barr Report was unable to determine whether wide-ranging mammals such as lynx and wolves would be “sensitive” to these cumulative effects.380 As briefly summarized in the FEIS, there are thirteen wildlife travel corridors that remain along the Mesabi Iron Range, ranging from less than 0.1 mile to over 3.2 miles wide.381 “Of the 13 large mammal wildlife crossing corridors . . . two are in the vicinity of the Mine Site or Plant Site.”382 The first is located just a mile from the Plant Site, and the second is located just a half mile from the proposed Mine Site.383 “Operations at the Mine Site would indirectly affect the corridor by reducing its size and acting as a source of noise and activity near the large habitat block southeast of the corridor.”384 Additionally, the proposed mine’s transportation and utility corridor between the Mine Site and Plant Site runs parallel to wildlife corridors and would further affect wildlife use.385 Moreover, other reasonably foreseeable projects are anticipated to adversely affect the remaining wildlife travel corridors in the region, including the complete loss of some of the corridors.386 “These effects may include blocking or encroachment into the mapped wildlife corridors, which affects adjacent habitat that may make the corridor less valuable to wildlife, and increasing traffic along new or existing roads through the corridor.387 “The effects on these corridors include complete loss (depending upon final extent of activities), habitat isolation, fragmentation, and/or minimal effect.”	NS	X
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4103	163	The EIS must disclose the ongoing, acute decline in the moose population, the position of the mine site on the edge of what is now considered moose territory, and the impact of this loss of habitat. The EIS fails to provide the “hard look” at impacts on moose that is required by NEPA. This issue was raised on our comments on the SDEIS.393 Our SDEIS comments are attached to this objection letter, and the referenced pages along with all cited materials are incorporated herein. This issue was not addressed in the FEIS Response to Comments. Although the FEIS has added a small amount of information on moose, it neither includes the factors that we raised in our comments nor explains why they are not included, in violation of 40 C.F.R. § 1503.4(a) (agency must consider and respond to comments) and 40 C.F.R. § 1502.9(b) (agency must discuss in FEIS “any responsible opposing view,” and “shall indicate the agency’s response to the issues raised”). For instance, the FEIS fails to assess the project’s impact on moose due to vehicle and train collisions and the increase in noise and human activity, which were raised in our comments on the SDEIS and supported by scientific literature. The FEIS discloses that 2,785.9 acres of moose habitat would be directly affected by the project, but fails to discuss either indirect impacts on habitat or the actual effects on moose.394 This includes significant impacts to high quality wetlands, which habitat is particularly important to moose due to ongoing and future climate change. In fact, the 2009 Report to the DNR by the Minnesota Moose Advisory Committee recommended the enhancement of the availability of “wetlands and other habitats where moose are most secure from heat stress.”395 The impacts of the proposed mine on heat stress and thermal refugia for moose, however, are not considered or disclosed. More generally, the FEIS fails to assess the impacts to moose and other species dependent on wetland habitat in the context of the current and anticipated impacts of climate change, which will cause the disappearance of wetlands, higher temperatures, increased evapotranspiration, and longer droughts over the same time period of the proposed mine and its impacts.396	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4104	164	As recognized by the CEQ, “[c]limate change is a fundamental environmental issue, and the relation of Federal actions to it falls squarely within NEPA’s focus.”397 Agencies must consider not only a proposed action’s effects on climate change, but also “the implications of climate change for the environmental effects of a proposed action.”398 “Federal agencies, to remain consistent with NEPA, should . . . take into account the ways in which a changing climate over the life of the proposed project may alter the overall environmental implications of such actions.”399 The impacts of climate change are already occurring, are predicted to intensify, and are directly related to the environmental consequences of the proposed NorthMet mine on the state’s sensitive and declining moose population. As recognized by the Moose Advisory Committee, climate change is a long-term threat to the persistence of moose in Minnesota.400 Moreover, “large bodied mammals, such as moose [a]re more likely to rapidly respond to climate change, which indicates a higher extinction risk.”401 As a result of climate change, “[m]oose will lose crucial habitat, experience heat stress and malnutrition, and come into contact with more pathogens and winter ticks as a result of warmer, wetter winters and springs, a reduction in snow depth, and hotter summers.”402 Moreover, boreal species on which moose rely are expected to decline, “and forested wetlands – an incredibly valuable type of habitat for moose – will likely disappear.”403 The adverse impacts of losing over 2,700 acres of important moose habitat as result of the proposed mine simply cannot be considered in isolation of the significant, recognized threats to moose and its habitat in the region resulting from current and predicted climate change. Furthermore, NEPA does not allow the agencies to not address in the FEIS the combined impacts of climate change and the proposed mine on moose just because the exact rate and extent of climate change remains uncertain. NEPA instead requires agencies to engage in reasonable forecasting when preparing EISs, as speculation is implicit in NEPA.404 As stated by the Eighth Circuit, “when the nature of the effect is reasonably foreseeable but its extent is not, . . . the agency may not simply ignore the effect.405 Moreover, as recognized by CEQ, agencies should describe the region that would be affected by a proposal “based on available climate change information, including observations, interpretative assessments, predictive modeling, scenarios, and other empirical evidence.”406 And despite remaining uncertainties, CEQ emphasized that a NEPA analysis “should present a reasonably thorough discussion of probable environmental consequences.”407 The agencies’ failure to consider the implications and impacts of climate change along with the proposed NorthMet mine project on the declining moose population is especially egregious due to the very long-term duration of the proposed mine, and its severe impacts on wetlands and other habitat needs of moose. As highlighted by CEQ, “climate change effects should be considered in the analysis of projects that are designed for long-term utility and involve resources considered vulnerable to specific effects of climate change within the timeframe of the proposed project’s anticipated useful life.”408 Overall, the agencies failure to consider and disclose in the FEIS the combined impacts of climate change and the proposed mine on moose habitat and the remaining declining population violates NEPA.	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4105	166	Moose, which have been observed in the project area,412 are listed by the state as a species of special concern.413 The DNR and Forest Service have been well aware for years that the moose population in the state and on the Superior National Forest is in precipitous decline, a fact that cannot be discerned from the NorthMet FEIS. The FEIS discussion of this issue is a classic example of providing only data that tends to discount the problem in the eye of the reader. What the FEIS tells us is: The overall moose population declined approximately 35 percent from 2012 to 2013. The 2014 winter aerial moose survey estimated the population at 4,350 animals, up from the 2013 estimate of 2,760. However, this is likely due to variability in the survey conditions from year to year and uncertainty inherent in the survey itself. 414 The reader is left with the idea that perhaps the 35 percent change from 2012 to 2013 was an anomaly due to counting methods, and with no understanding as to the actual situation. According to the MDNR, the population estimate for moose in the state was 8,840 in 2006, and in 2015 is estimated at 3,450.415 While the count did go up in 2014, the trend over a ten-year period is a decline of more than 60 percent. The FEIS also fails to recognize the critical importance of northeastern Minnesota for the remaining moose population in the state. Moose also used to be common in northwestern Minnesota, but that population has disappeared over the last twenty years. From a population of 4,000, fewer than 100 remain, with any rebound seen as very unlikely. This leaves northeastern Minnesota, including the Proposed Project area, as the only remaining refuge for the state’s declining moose population. To summarize, the Minnesota moose population is undergoing a rapid decline and may be extirpated from the state of Minnesota within another decade; habitat loss and fragmentation is acknowledged to be a factor in that decline; it is acknowledged that this project will result in a loss of habitat; and with no further information, the FEIS concludes that the project would likely not affect moose at the population level. NEPA prohibits agencies from making such sweeping general statements without providing supporting data or analysis.416 As noted below, the FEIS analysis of the potential impacts to moose is even more deficient and problematic in the cumulative impacts analysis, where moose are not even mentioned. Overall, the FEIS has failed to meaningfully consider and disclose the impacts of the proposed mine on the state’s dramatically declining moose population. The omission of any meaningful consideration of such an important issue “precludes the type of informed decision making mandated by NEPA.”	S	O

Submission ID	Unique or Form Letter	Form Letter ID	Variant or Non-Variant	Issue ¹	Name of Sender	Organization	Database Comment ID	Submission Comment Number	Comment	Substantive/ Non-Substantive	Old/ New
				WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4117-1	176	22.0 The Co-Lead Agencies Fail to Assess Direct and Cumulative Impacts on Wildlife. The FEIS fails to assess the cumulative impacts on sensitive wildlife species, which the FEIS defines to include federal and state-listed species, species of special concern, and Forest Service sensitive species. ⁴⁶³ This issue was raised in our comments on the SDEIS at MCEA 118 and CBD 73-75, which are attached and incorporated herein. We also submitted a supplementary letter to Forest Supervisor Brenda Halter on October 8, 2015, which we incorporate herein. The FEIS neither mentions this issue in its Response to Comments, nor includes material in the text of the FEIS that responds to the issue, in violation of 40 C.F.R. § 1503.4(a) (agency must consider and respond to comments) and 40 C.F.R. § 1502.9(b) (agency must discuss in FEIS “any responsible opposing view,” and “shall indicate the agency’s response to the issues raised”). The FEIS claims that the cumulative effects analysis for wildlife “focuses on potential losses to sensitive wildlife species.” ⁴⁶⁴ In fact, however, the FEIS provides only a few pages of very general information, with the vast majority of sensitive species not even mentioned. There is therefore no scientific support for the agencies’ conclusion that the proposed NorthMet mine, along with all other past, present, and reasonably foreseeable actions, “would not further threaten special status wildlife species.” ⁴⁶⁵ Although Chapters 4 and 5 of the FEIS list many species of concern that either are found at the project site or for which the project site provides habitat, and Chapter 5 at least purports to assess the impacts that the NorthMet project alone would have on these species, Chapter 6 provides no comparable analysis for cumulative impacts. And yet almost all of the species of concern are on the list of Regional Forester Sensitive Species (RFSS) due to current or expected cumulative losses of habitat across their range within the region. ⁴⁶⁶ Without an analysis or explanation of the ultimate impact on these species from cumulative losses and how the NorthMet project would contribute to those losses, the FEIS does not provide the “hard look” at impacts required by NEPA.		
				WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4117-2	176	NEPA requires the Forest Service to consider the potential cumulative effects of proposed actions. ⁴⁶⁷ “To ‘consider’ cumulative effects, some quantified or detailed information is required.” ⁴⁶⁸ “Without such information, neither the courts nor the public, in reviewing the [agency’s] decisions, can be assured that the [agency] provided the hard look that it is required to provide.” ⁴⁶⁹ “General statements about ‘possible’ effects and ‘some risk’ do not constitute a ‘hard look’ absent a justification regarding why more definitive information could not be provided.” ⁴⁷⁰ In its cumulative impacts analysis for wildlife, the FEIS provides only very general statements concerning risks and impacts, which falls far short of the detailed and quantified analysis required by NEPA. The sum of the assessment is found in three statements. First: Cumulative effects on wildlife may include the loss and/or fragmentation of habitat and encroachments into critical wildlife travel corridors... ⁴⁷¹ Second: In addition to habitat fragmentation and loss and effects on wildlife crossing corridors, wildlife species of concern in the Nashwauk Uplands and Laurentian Uplands ecological subsections are subject to other stressors that could result in cumulative effects. Traffic and activity related to mining projects, urban development, forestry, tourism, and road expansions all increase the risk for special status wildlife species and, as such, could result in cumulative effects. ⁴⁷² And finally, in regards to wildlife travel corridors: Wildlife could be affected by the NorthMet Project Proposed Action and other actions through a cumulative disruption of their travel corridors. These actions could pose additional barriers to wildlife movement by increasing the number of isolated patches of suitable habitat, increasing mortality during transit, and physically blocking travel. This may lead to increased population and genetic isolation and decreased meta-population dynamics, which in turn could lead to decreases in overall population stability and persistence. The FEIS provides additional cursory information about the approach it used to reach this “assessment,” including the spatial boundaries; the timeframe; the list of past, present, and foreseeable future actions considered; the causes of habitat changes; the vegetation types of affected habitats; and the list of wildlife corridors and projects affecting them.		
				WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4117-3	176	But aside from a couple of brief paragraphs on federally-listed species (which are addressed below), the three statements quoted above are all the cumulative assessment says about the actual impacts on wildlife. The FEIS provides no information on the status of or impacts to any specific species. As an example of what is missing, the FEIS tells us that loss of wildlife habitat in the Laurentian Uplands will be due primarily to timber harvest and mining, while losses in the Nashwauk Uplands will be due primarily due to mining and urban development. ⁴⁷⁴ But it completely fails to tell us what those losses are expected to be, or how they will impact specific species. Without explaining why more detailed and quantified information cannot be provided, these very general statements are insufficient and fail to comply with NEPA. The U.S. Court of Appeals for the Ninth Circuit rejected a similar cumulative effects analysis for a proposed mining project. In Great Basin Mine Watch v. Hankins, the court struck down the agency’s reliance on the same sort of brief, generalized descriptions of mining impacts in the region. ⁴⁷⁶ The court required the agency to include “mine-specific ... cumulative data.” ⁴⁷⁷ Relying on prior cases, the court highlighted the need for a “quantified assessment of [other projects] combined environmental impacts” and “objective quantification of the impacts.” ⁴⁷⁸ The FEIS for the proposed PolyMet mine similarly fails to provide the required detailed analysis of cumulative impacts. Moreover, the cumulative effects analysis entirely fails to even mention moose, despite the documented presence of moose in the area, its rapidly declining population and designation as a species of special concern, its iconic status to the citizens of Minnesota, and its cultural significance to the Tribes. The agencies’ failure to address such a fundamentally important issue violates NEPA. Chapter 5 of the FEIS acknowledges that the proposed mine by itself “would likely affect moose individuals in the vicinity through habitat loss and fragmentation”; ⁴⁸⁰ cumulative impacts to moose and moose habitat should be obvious.		
				WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4117-4	176	As noted by the Tribal cooperating agencies in their comments on the initial DEIS for this project, the Minnesota advisory committee studying the decline of the moose population in northeastern Minnesota recommended preserving wetlands as sanctuaries for moose from heat stress. ⁴⁸¹ Yet PolyMet is proposing the largest wetland fill ever permitted in this region, and additional losses will follow with other mining activity. Wetland mitigation for the PolyMet project will be located outside of the area that still supports a moose population, as will the largest tract of the replacement lands that the Forest Service will receive in the land exchange. This loss will undoubtedly be joined by other losses of wetlands throughout Minnesota’s remaining moose territory, but the FEIS provides no information on what the extent of those losses is likely to be. The lack of information on the projected cumulative impacts from this and other foreseeable actions is exacerbated by the lack of information on the current status of other sensitive species. This lack of information makes it impossible to guess at the significance of additional loss or fragmentation of habitat as well. For example, the FEIS tells us that “Two northern goshawk territories have been identified at or near the Mine Site.” ⁴⁸² But there is no information anywhere in the FEIS by which to determine whether the loss of these territories is significant in relation to the number of other territories in the state and in the national forest and the threats they may be facing. Because the FEIS fails to provide this information, we turned to AECOM 2011a, which states, “Today, there are 23 known goshawk nest sites in Superior National Forest and 87 in the state of Minnesota.” This cannot be taken as the number of goshawk territories, however, because alternative sites are common: While goshawks do not always use the same nest for more than a year, they typically have two and up to nine alternate nest sites that are usually within a mile of the present nest.		
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4117-5	176	It is important to also protect these alternate nest sites that may be used in subsequent years. ⁴⁸³ Thus 87 nest sites in the state could represent as few as 10 territories, which puts the loss of one or two territories into a perspective that the FEIS utterly fails to provide. The lack of information on northern goshawks stands in contrast to what is found in other recent EISs prepared by the Forest Service. For example, the Glacier Project Biological Evaluation states, Surveys for nesting goshawks have been conducted in several project areas within the Kawishiwi Ranger District over the past 6 years. Three occupied goshawk nesting territories have been found. One of them is within the Glacier project area. Eight survey routes consisting of approximately 60 calling points were conducted in the Glacier area in 2006 and 2007 (survey records in project file). The best potential goshawk habitat is within the large mature upland patches in the Fernberg corridor and south of the Kawishiwi River and southwest of Birch Lake (goshawk map, project record). 2005 Forest-wide survey efforts showed an increase of known breeding pairs over those known in 2003 (Annual Monitoring Report 2006). Based on the 2007 Statewide Goshawk monitoring effort there are 26 known territories on the Superior National Forest. Nine were known to be occupied in 2007. Contrary to recent practice and NEPA and MEPA requirements, the FEIS provides no context on goshawk territories or population.	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4118	177	In addition to its gaps in crucial information, the NorthMet BE minimizes the amount of impacted acres from the project to “158 acres of mature upland forest habitat” that “would be directed affected” and compares it to “625,000 acres of upland forest within the CESA that could now, or in the reasonably foreseeable future, provide habitat for northern goshawk,” concluding that “habitat loss from the Project would have a negligible cumulative effect on northern goshawks in the CESA.” ⁴⁸⁵ But further investigation reveals that the 625,000 acre figure does not take account of any factors that make large portions of that forest unsuitable for goshawks, including fragmentation, age, size of patches, and noises and other disturbances. It is patently false that in the reasonably foreseeable future, this forest will become less fragmented, older, and subject to less noise and disturbance. The Glacier Project BE reveals that forest-wide, the predicted suitable habitat for northern goshawks (large patches of upland mature forest) is about 300,000 acres. ⁴⁸⁶ It is unclear from the FEIS or the BE how many acres of suitable habitat will be directly and indirectly affected by the NorthMet project. This would include acreage that, while not directly impacted, is lost to goshawks because it is no longer contained within a large enough patch of mature upland forest. ⁴⁸⁷ It would also include acreage affected by noise, traffic, and human presence. For the cumulative effects analysis, added to that would be habitat similarly affected by other past, present, and foreseeable future projects. The Glacier Project BE also reveals that “Foraging areas for nesting goshawk can range from 21,000 to 27,200 acres surrounding the nest site,” which again puts the total of 300,000 available acres in perspective. It would appear from these numbers that there is only sufficient habitat for about 15 breeding pairs of northern goshawks within the Superior National Forest, although the Forest Plan provides a goal of 20 to 30 breeding pairs. The loss of even one breeding pair appears significant in this context, and would be even more significant if additional breeding pairs are threatened by other foreseeable projects and activities. But the FEIS gives us none of this information. In sum, due to the failure of the FEIS to provide meaningful and detailed information and analysis, neither the public nor agency decision-makers have any idea what this project means for northern goshawks in Minnesota or the Superior National Forest. The FEIS has not done its job.	S	O
29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4119	178	The FEIS provides even less information on great gray owls, which also use the site. ⁴⁸⁸ The best information we were able to obtain--again, outside of the FEIS--was the last annual wildlife survey report released by the Superior National Forest in 2009. This report indicates that surveys of the “Laurentian Forest Province of Minnesota” observed one great gray owl in 2008 and two in 2009. ⁴⁸⁹ Nesting information from the same report states, MOU records show one nesting record in Lake County. The Biotics database listed two nests in 2004 and four nests as of 2009: the latest two were found and protected, and are annually monitored by FS biologists. NRRI observed one individual during forest breeding bird surveys between 1991 and 2002. There are approximately 36 great gray owl nesting platforms on the SNF since 2007. Platforms have been monitored every year with no detections as of yet. ⁴⁹⁰ This report indicates that the fact that great gray owls have been seen nesting and hunting at the PolyMet site is far more significant than one might suppose from reading the FEIS. The agencies’ failure to analyze and disclose this directly relevant information in the FEIS violates NEPA.	S	O

29745	Unique			WI	Erin Mittag	Minnesota Center for Environmental Advocacy	4120	179	While northern goshawks, great gray owls, and moose are three species that are known to make use of the mine site and the federal lands, the site also provides habitat for a number of other sensitive species, which are listed in the BE and FEIS.491 The FEIS must also provide substantially more information on these species of concern, their habitat, and threats to their habitat throughout the Superior National Forest and the state of Minnesota in order to provide a rational and scientifically supported basis for the agencies’ judgment as to the significance of the loss of habitat from this project in conjunction with other past, present and reasonably foreseeable actions The agencies’ consideration and disclosure of the cumulative impacts to federally-listed lynx, wolves, and the northern long-eared bat in the FEIS is also insufficient. Each of these imperiled species has been identified as present in the affected region, and would admittedly be adversely affected by the proposed mine.492 But the FEIS provides only general and already obvious information that does not satisfy the hard look required by NEPA.493 The FEIS, for instance, discloses that cumulative impacts would result in “additional” habitat fragmentation, “may increase pressures” for lynx and wolves, “would likely result” in additional traffic and potential collisions, and “could affect” northern long-eared bats through habitat destruction and fragmentation.494 Yet the FEIS fails to take the next required step to quantify or estimate the extent and magnitude of these anticipated cumulative impacts in any way, or otherwise explain what these cumulative impacts could mean for these already imperiled populations in the region. This information is critical to allow the public and decision maker to actually weigh the significance of the likely cumulative impacts to these listed species.	S	O
29277	Unique			WI	Jacob Crawford		2485	1	So, I ask you today, how are we protecting this food source - and subsequently these birds - by allowing toxic sulfide mining that, by PolyMet's own admission, will pollute the Lake Superior and St. Louis River watersheds with toxic waste for centuries to come?	NS	X
7393	Form Letter	4	Variant	WI	Jane Beattie		71	2	The mine will destroy two square miles of designated critical habitat for Canada lynx and wolves.	S	O
23978	Form Letter	4	Variant	WI	Jennifer Fort Strietzel		980	1	In addition to those two animals, countless others use the St. Louis River and the St. Louis River watershed and Lake Superior and the Lake Superior watershed, all of which will be affected from runoff and pollution from the mine, are animals which use the waters for drinking, swimming, bathing and food including the American Bald Eagle, River Otters, Black Bears, Whitetail Deer, Osprey, Lynx, Pine Martens, Fishers, Weasels (Mink, Ermine), various Hawks, Mountain Lions, Bobcats, many kinds of birds, other mammals, fish and reptiles not to mention domestic animals/pets, plant life, as well as human beings. I do not want to see these waters, animals, plants or human beings harmed by any possible runoff or pollution that this mine could possibly ever produce. There have always been polluted waters, land and air from sulfide mines and this one will be no different so I say an emphatic, "No!" to the PolyMet Sulfide Copper Metal Mine and do not want it built or even considered because of the very real potential for it to absolutely ruin the St. Louis River and Lake Superior Watersheds and harm and destroy the lives of all the living beings who depend on them.	NS	X
10857	Unique			WI	Johan Baumeister		730	1	In examining the PolyMet EIS, I encountered a statement that I found to be extremely troubling. With regards to wildlife impact, in the Cumulative Effects section of the EIS, the only information provided was, "No Endangered, Threatened or Special Concern (ETSC) animal would be cumulatively affected." I find this hard to believe. The EIS itself recognizes that the loss of wetlands habitat in the two affected watersheds will occur. Additionally, in the Threatened and Endangered Species Section, there is one highly-speculative paragraph with very little information, that does acknowledge something that seems to be directly opposite the above claim. "Some of these protected species (such as Canada lynx or gray wolf) could be directly or indirectly affected by project-related noise, vibration, human activity, and rail and vehicle traffic. More broadly, species populations, individuals, or their habitat(s) could be removed or destroyed as part of clearing, filling, or construction activities. Some plant and animal species could also be indirectly affected by the proposed NorthMet project, for example by changes in water quality and environment, deposition of dust, loss of pollinators, erosion, and invasion of non-native species." So which is it? No ETSC animal would be cumulatively affected, or "some of these protected species... could be directly or indirectly affected." You cannot have it both ways. You say two different things in different sections of the report. The summary section glosses over any negative effects whatsoever, and even this paragraph doesn't seriously take into account the negative effects that could potentially occur due to dust deposition or water quality/environmental changes. This makes the rest of the report automatically suspect, since it isn't even internally consistent.	S	O
10857	Unique			WI	Johan Baumeister		731	2	Furthermore, since I'm typing this response comment on a computer keyboard, it is fairly obvious to me that copper-nickel mining has occurred in other places at other times. In fact, humankind has been taking copper from the ground literally since before the Bronze Age began. (You folks do know what bronze is made of, right?) Why are there no references to the documented effects that other similar mines have recently had on the ETSC animals in their areas of operations? It seems as if this data would not be too difficult to get. For example, in 2010, the metal mining industry in the US was responsible for 41% of all toxic metals released into our environment.	S	O
10857	Unique			WI	Johan Baumeister		732	3	I acknowledge that mining has brought Minnesota jobs and some amount of prosperity, but this expansion of that industry—at the risk of our environmental integrity—gives me serious concern that we are about to make one too many trips to the well. Or mine, as it were. Please, allay my concerns and do a more exhaustive report on the potential impact to ETSC animals (and plants) which includes comparisons to other domestic copper-nickel mining operations and their impacts upon ETSC species in their immediate areas.	S	O
27687	Unique			WI	John Finnegan		2074	3	And of course all the different species of wildlife mentioned in the statement are going to effected. Your decreasing their habitat and corridors for them to be able to move or relocate. But you can just push all that aside because a big mining industry is more economically important than the natural environment.	NS	X
30065	Unique			WI	Jon Schubbe		2780	3	The EIS states no on the ground surveys specific to the project occurred. The area proposed for the mine is in an extremely remote and relatively undeveloped area of the state. It is unlikely comprehensive surveys for T&E species have occurred in these areas and for this reason the list included in the EIS is likely incomplete. The EIS should be modified to include a comprehensive list of state protected species otherwise it is possible the EIS does not consider impacts all T&E species occurring in the project area, regardless if habitat is considered disturbed.	S	O
30065	Unique			WI	Jon Schubbe		2781	4	EIS does not adequately address impacts to northern long eared bat (NLEB). Sudan Mine is located within XX miles of the proposed facility, which is the largest know hibernacula in the state. The mine is within the migratory range of NLEBs hibernating at Sudan mine, which make it likely this species could experience habitat loss as a result of tree clearing associated with the project. Furthermore this species was documented by the EIS as a relatively common in the project area. The EIS should address impacts to the population of NLEB at Sudan Mine. Will the population be imperiled as a result of habitat loss? Do NLEBs which hibernate at Sudan Mine utilize the project area during the maternity season? All tree clearing associated with the project should take place between October 1 and April 31 when this species is likely to be hibernating, unless a qualified biologist confirms the lack of NLEB in the area proposed for clearing. Habitat loss should be mitigated for; most appropriate mitigation would be conservation of privately held mature mixed forest in the vicinity of sudan mine and the project.	S	O
30065	Unique			WI	Jon Schubbe		2786	9	Wood turtles are known to occur downstream from the project. What is this species tolerance level to sulfide pollution. How is reproduction affected by pollution. How will the project protect downstream habitat such as Partridge River.	S	O
30065	Unique			WI	Jon Schubbe		2787	10	The project will fragment lynx habitat and create corridors where snow packing is likely to occur, making them unsuitable for canada lynx, and lead to habitat loss.	S	O
516	Unique			WI	Joshua Bernstein		225	3	The resultant contamination will also likely endanger the habitats and survival of numerous threatened species, such as the Canadian Lynx.	NS	X
7689	Unique			WI	LK Woodruff		564	4	The mine would also destroy two square miles of designated critical habitat for Canada lynx and endangered wolves, which also provides important habitat for Minnesota's already declining moose population.	NS	X
29740	Unique			WI	Lori Andresen	Save Our Sky Blue Waters et. al.	3905	20	The FEIS does not address (cumulative) impacts to federally listed endangered or threatened species or state species of concern. These include the northern goshawk, great gray owl lynx, long-eared bat, wolf, and moose. These impacts include loss of habitat and wildlife corridors, and exposure to 24 hour a day noise and light pollution. The FEIS does not show compliance with the Endangered Species Act.	S	O
29397	Unique			WI	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3771	85	Public access to exercise usufructuary rights has been virtually cut off along the Iron Range. This means that to exercise those rights, Band Members now have to harvest on one side or the other because there simply isn't passage available without driving around the blockages. The analysis did identify land parcels in private ownership that could be purchased by the State or the USFS that would allow that connectivity to fully exercise treaty rights—but still did not treat the entire area as the CEAA. The FEIS contains a profoundly insufficient analysis of cumulative effects.	NS	X
29397	Unique			WI	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3791	84	Wildlife passage from south to north is critical to ensure that as the climate warms species can move north in order to survive. The three examples given by UMD/NRRI were wolf packs, salamanders, and Jack-in-the-Pulpit (plants). Although difficult along the Iron Range, passage is still possible, but could be aided by thoughtful use of culverts big enough to allow wildlife safe passage under roads, and ensuring that the areas still passable are not removed from the landscape. Cumulative wetlands impacts have drastically increased in the past decade, with virtually all of the major destruction occurring along the Iron Range. The one exception occurred where fire had burned the land so intensely north of Iron Range that the top layer of moss and vegetation no longer support wetlands. Because the portion of the Iron Range that is in the 1854 Ceded Territory is all contained within the St. Louis River watershed, there are without a doubt cumulative impacts that would result from this Project that have not been identified or considered.	NS	X

29397	Unique			WI	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3811	99	Also missing is cumulative-impacts analysis of culturally-important plant and animal species that are listed as “Species of Concern.” For example, a substantial moose population has been identified in the mine site area by aerial and ground surveys. Moose are likely to be impacted by the disturbance of two of the few wildlife corridors remaining along the Mesabi Range, not to mention by the massive wetland impacts of this project. The rationale for a comprehensive cumulative impacts analysis for moose is found, again, in the MNDNR’s own statements. This Co-Lead itself, in its Statement of Need And Reasonableness (“SONAR”), related to Minnesota’s List of Endangered, Threatened, and Special Concern Species, in 2012 proposed listing moose as a species of “special concern:” Between 1990 and 2000, the northwestern Minnesota Moose population underwent a substantial decline, and a 2007 Minnesota DNR aerial survey determined that as of that date, fewer than 100 Moose comprised the northwestern population. Aerial surveys currently estimate the northeastern Minnesota population at roughly 4,230 individuals. The northwestern Minnesota Moose population decline occurred in less than a decade. Recent surveys document a slow decline in the northeastern Minnesota Moose population.266 MNDNR directly linked this decline to climate change, land ownership, and forest management practices: Increased temperatures are likely to increase heat stress and lead to increased mortality within the state’s remaining Moose populations. Changes in land ownership and changes in forest management practices within the state’s Moose range may be having a significant adverse effect on the quantity and quality of the species’ habitat within the state, and particularly on thermal refuges in warmer weather. The state’s northeastern Moose population has not shown as rapid a decline, but is very likely to be dramatically impacted by rising temperatures resulting from climate change. This will likely lead to a marked decline in this population within the foreseeable future.267 There is no basis to dispute that the Project will have cumulative effects on the moose herd and Tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should have been done as part of this FEIS.	S	O
29397	Unique			WI	Margaret Watkins	Grand Portage Band of Lake Superior Chippewa	3823	112	The Project will certainly do nothing to aid in the recovery of moose and is likely to reduce available habitat, impact travel corridors, and increase greenhouse gases. Impacts on moose and habitat are impacts on the Band’s cultural resources and should have been analyzed as such in the FEIS.	S	O
26628	Unique			WI	Mary Adams		1383	4	The Canada lynx, gray wolf and long-eared bat could be affected for decades. Human activity, noise and vibration, rail and vehicular traffic, decreased habitat will affect thirteen state-listed species.	NS	X
29319	Unique			WI	Maya Batres	The Nature Conservancy	3662	6	The FEIS fails both of the first two requirements since it has not substantively responded to the comments establishing the need for an Ecological Risk Assessment as an essential element of environmental review;	S	O
N/A	Form Letter Template	4	Non-Variant	WI	Multiple	Center for Biological Diversity	FL25	3	The mine would also destroy two square miles of designated critical habitat for Canada lynx and wolves, which also provides important habitat for Minnesota’s declining moose population.	NS	X
12638	Unique			WI	Nancy Gibson		766	1	One, the impact on moose and the loss of a significant portion of aquatic habitat needs more attention. It does not mention what type of wetlands will be mitigated nor does it take into consideration that the mine disturbance will restrict moose movement around a large buffer of the mine. Moose get 25% of their annual nutrients from aquatic vegetation.	S	O
27901	Unique			WI	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3309	52	The Proposed Project will result in over 4,000 acres of direct habitat effects (i.e., loss). Fond du Lac’s comments on the DEIS regarding the existing wildlife corridors are still applicable: they are fundamentally inadequate to maintain habitat connectivity across the heavily disturbed Mesabi Iron Range. As evidenced from aerial photographs, they’re narrow and often heavily intruded upon by roads, utility corridors, mine pits and urban development. These features serve as barriers to many kinds of wildlife. While the existing corridors may function well enough for large, mobile species like deer or wolves, they are inadequate for smaller, less mobile species.	S	O
27901	Unique			WI	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3337	53	The FEIS concedes that increasing development of urban areas alongside the corridors will render some of the existing corridors “less suitable” for wildlife in the future. Increased urban development and associated transportation and utility infrastructure should be expected if the Project provides even a fraction of the economic benefits claimed in the FEIS. Yet there is no minimization or mitigation proposed or even evaluated in the FEIS for this significant environmental impact. The Band specifically requests that state and federal regulatory agencies work with the tribal agencies to establish dedicated and protected wildlife corridors and enhance reclamation of existing mine lands to mitigate wildlife impacts within the 1854 Ceded Territory.	S	O
27901	Unique			WI	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3338	54	The Band does not agree with this casual dismissal of an issue we consistently brought forward in our comments and in meetings with the Co-lead agencies. The ESA §7 consultation process is intended to determine jeopardy (likelihood of a species’ extinction from the Proposed Action) and address mitigation measures for impacts to endangered species. The ESA §7 process would not address mitigation measures for other species which are not presently endangered but which would be adversely affected by the loss of wildlife corridors. Again, the only reasonable process for fully evaluating likely impacts and then identifying and requiring mitigating actions is through the EIS and then with a fair examination of the impacts and mitigation measures in the EIS, implemented through the MnDNR Permit to Mine. The FEIS here fails to address an important issue, incorrectly leaves it to a process that will not address it, and deprives the public and the MnDNR of the information it should have to address this issue.	S	O
27901	Unique			WI	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3340	55	But, from the Band’s perspective, perhaps the most significant deficiency in the FEIS analysis of wildlife impacts is its failure to critically analyze potential impacts to moose. As to moose, the FEIS states: The moose (Alces americanus) is not federally listed, but was added to the Minnesota ETSC species list as a species of special concern in 2013. Moose, which have been observed in the NorthMet Project area (ENSR 2005), are a species of specific importance to the Bands...The overall moose population in Minnesota declined approximately 35% from 2012 to 2013 (MDNR 2013d). The 2014 winter aerial moose survey estimated the population at 4.350 animals, up from the 2013 estimate of 2,760 (DelGiudice 2014). However, this is likely due to variability in the survey conditions from year to year and uncertainty inherent in the survey itself...Due to decreased population levels in the state of Minnesota and its new state listing as a species of special concerns, the moose hunting season was closed in 2013 and not reopened. In previous years, when moose hunting was open, the NorthMet Project area would have been outside of the hunting zone, though moose zone 30 is located to the south of the Transportation and Utility Corridor. In 2012, two moose were harvested in zone 30 (DelGiudice 2012). The tribal cooperating agencies have consistently raised impacts to moose as an issue of critical importance throughout the DEIS, SDEIS, Section 106 consultation, and ‘sieve list’ meeting processes. We have valid concerns about the Project’s impact on moose habitat at a time when their population is crashing, and they should be addressed immediately. Tribal wildlife biologists have been working alongside DNR biologists and academic researchers to try to understand the relevant factors. Hunting pressure has been ruled out as a major contributing factor to population-level declines, but the appearance of holding a hunt does not sit well with the public, so the DNR, 1854 Treaty Authority and Fond du Lac have all closed their respective moose seasons since 2013. However, the Band’s concern for Project impacts to moose is not simply potential effects to hunting zones and seasons; we are gravely concerned about protecting sustainable moose populations for future generations. In considering the potential causes of the moose population decline, wildlife biologists recognize the importance of thermal refuge for moose when temperatures exceed 70o F.126 Undisturbed, high-quality wetlands and forests - essentially all of the landscape that will be destroyed at the mine site – represent the type of habitat that serves as thermal refuge, along with shelter and forage.	S	O

27901	Unique			WI	Nancy Schuldt	Fond du Lac Band of Lake Superior Chippewa	3374	94	The site for the proposed mine also provides habitat for other species of importance to the Band – in particular moose. As the FEIS recognizes, the key habitat types considered moose habitat include “mature forest, grassland/brushland and aquatic environments,” FEIS 5-439, all of which are present at the proposed mine site. The FEIS further recognizes that moose and their sign (tracks, droppings, browsing evidence etc”) have been observed at the site. FEIS 5-439. The FEIS also recognizes that the population of moose in northeastern Minnesota has seen a severe decline in recent years the causes of which include habitat fragmentation and loss. Id. While measures to prevent that decline from continuing are the subject of on-going study by both the State and the Chippewa Bands, the FEIS simply announces without any supporting basis that the proposed mine (and its destruction of moose habitat at the proposed mine site) “would affect moose individuals in the vicinity through habitat loss and fragmentation, though not likely at the population level.” Id. The FEIS provides no scientific support for its assertion that the loss of several thousand acres of moose habitat will not adversely affect the moose population.	S	O
10464	Form Letter	1	Variant	WI	River Point Resort Outfitting Co.		693	6	3. It would destroy habitat for endangered and threatened species such as the moose and lynx and great gray owl.	S	O
27061	Unique			WI	Tyler Kaspar	1854 Treaty Authority	2973	18	Section 5.2.9.2.2 contains little information on game species such as moose, deer, bear, grouse, waterfowl, and fur bearers. These species are important to the bands for the exercise of treaty rights, and further analysis is needed and should be provided in this section and not just refer to what is provided in Section 5.2.5. In the FEIS as a whole, further information and analysis is needed for deer, bear, grouse, waterfowl, and furbearers.	S	O
27061	Unique			WI	Tyler Kaspar	1854 Treaty Authority	2980	19	This section also contains language about “1854 Treaty Authority-regulated species”. We suggest removing or altering this language. The Fond du Lac Band also exercises treaty rights in the 1854 Ceded Territory, and has their own regulations. Further, the 1854 Treaty Authority maintains seasons and limits on some species, but these are not the only species of importance.	S	O
27061	Unique			WI	Tyler Kaspar	1854 Treaty Authority	2998	25	Even though the proposed land exchange would increase habitat availability to the federal estate, the overall result of the project is permanent impacts, loss, and changes to the resources of northeastern Minnesota and the 1854 Ceded Territory (Section 5.3 .5). This should be clarified in the FEIS. Regarding habitat availability and impacts from the proposed land exchange, there is little mention of effects on game species such as moose, deer, bear, grouse, waterfowl, furbearers, and others in Section 5.3.5.2.5 nor in Section 6.2.3.6 from the cumulative effects analysis. Moose is of particular concern+P101 given the declining population and closure of hunting seasons. Further analysis should be included in both sections for these species as well as any others that may be affected.	S	O
27061	Unique			WI	Tyler Kaspar	1854 Treaty Authority	2999	26	Under the proposed project and land exchange, it is anticipated that Minnesota Biological Survey sites of High Biodiversity Significance would be decreased by 6,025.8 acres on Superior National Forest lands (Table 5.3.4-1, page 5-702). Further, much of this impact will be permanent on the project site. These and other resource values should be taken into account and given greater consideration on lands proposed for exchange.	NS	X
24703	Unique			WI	V Johnson		1089	1	I don't think it such a great idea to go ahead and build this plant because of the environmental impact that it will have. It may create some jobs but I still think the environmental risk is too great and why does so much have to be cleared and bulldozed for corporate profits. Wildlife, birds and everything else suffers because of all the deforestation that is going on in Minnesota.	NS	X
3981	Form Letter	1	Variant	WI	Virgil Sohm		397	2	Endangered, threatened and species of concern, specifically moose and wolf populations have our tribal protection in our legends, tribal history and culture. Because the habitat of the moose is already severely impacted by climate change, human encroachment and wetland reduction, we have opted at the Bois Forte Tribal Council level to suspend our annual moose hunt. We have also declared our 1854 Treaty area as a sanctuary in light of the wolf hunts of 2012 and 2013. Federal court ruling makes killing wolves illegal, effective Dec. 19, 2014, Minnesotans can no longer legally kill a wolf.	NS	X
558	Unique			WILD	Abbie Debiak		251	14	Even if a mining company could provide 100% assurance that there would never be any water quality impacts there is still the glaring fact that mining is an incredibly disruptive industrial process. Both open-pit and underground operations use massive mining equipment with ore trucks running continuously, literally for years on end. A true wilderness never fully recovers from such an onslaught.	S	O
27041	Form Letter	1	Variant	WILD	Ann Santo		1638	3	Plus, the BWCA is one of the last areas in the world where people can have a wilderness experience. PLEASE don't jeopardize this wonderful state!!!	NS	X
29153	Unique			WILD	b4holden@gmail.com		2430	1	The proposed mine is too close to the bwca area to even think about allowing a permit.	NS	X
27698	Unique			WILD	Caree Gordon		2100	2	Thousands of visitors to the Superior National Forest and BWCAW seek solace in the wilderness, as it is one of the last areas in our Nation that is protected from pollution. I want to see ZERO pollution and avoid any possibility of a disaster happening in this area. I have signed numerous petitions to defend our Constitution and the Federal Wilderness Act of 1964. Is it really in Minnesota's best interests to allow a foreign company with no ties, or connections to our pristine wilderness and neighboring communities to jeopardize and possibly destroy what has been protected and maintained for public use?	NS	X
53	Unique			WILD	Cathy A. White		129	3	Northern Minnesota is a jewel in the crown of the state with the Boundary Waters and just the total wildness of the place. We need these wild places to stay as pristine as possible not just for us but for the flora and fauna that thrive there as well as for future generations.	NS	X
27666	Unique			WILD	Cele von Rabenau Lieder		1821	2	The BWCAW is arguably the most priceless guardianship we have. Nothing is worth risking it, especially in the hands of a company -and mine type -with such a questionable environmental record.	NS	X
27347	Unique			WILD	Dan Andree		1697	4	I just strongly feel mining is a big mistake and it will be a tragic thing if allowed in such a rare and beautiful forested region of stunning lakes etc. You just cannot put a dollar sign on it. Once lost it is gone forever and not only MN. but the rest of the world will have lost some thing more valuable than anything taken out of its ground. I am strongly against the NorthMet Mining Project. Places like the BWCA and areas near it offer more to visitors and even nonvisitors who may just read about it or view photography and videos of the area than mining in that region ever could	NS	X
27685	Unique			WILD	Dennis Szymialis		1930	85	Furthermore the existence of an old mine site does not preclude land of park-like character adjacent to it. For example, p.4-359 Lake Vermilion State Park is 16 miles northwest ofthe NorthMet Project area (see Figure 4.2.12-1), on the eastern shores of Lake Vermilion adjacent to Soudan Underground Mine State Park.	S	O
30246	Form Letter	1	Variant	WILD	Ellen Bruner		2742	1	I'm very concerned about saving the Boundary Waters from pollution-b???? Water & noise. It is a unique pristine area where thousands come to enjoy nature and to ref???? + rejuvenate	NS	X
394	Unique			WILD	Erik Maritz		193	1	The BWCA gives us natural beauty, perspective on the important things in life, chances to decompress from the monotony of everyday life, the ability to feel healthy, good, and proud about ourselves, the opportunity to escape from brutal and sometimes violent home-lives, and so much more. It has changed my life and I've watched it change the lives of dozens of campers I've guided through it's pristine waters – what a shame it would be to take that opportunity away from future generations.	NS	X
27678	Unique			WILD	Faye Topliff		1758	2	The BWCA must be protected and we cannot risk losing the pristine quality there.	NS	X
27824	Unique			WILD	George Kluempke		2170	2	The analysis concludes that PolyMet's treatment and mitigation plans will prevent acid mine drainage and will meet all water quality standards. In addition, the studies conclude that groundwater flows from the project will not directly or indirectly affect the BWCA.	NS	X
29839	Unique			WILD	Janice Ann Smith		2652	1	The BWCWA is a priceless, one of a kind, natural resource that must be preserved for generations to come.	NS	X
25519	Unique			WILD	Jessica Ostrov		1195	1	I work at YMCA Camp du Nord, and I am quite concerned about the proposed mines near the BWCAW. I urge you to please consider this global treasure as something future generations need. It would be shameful to disturb and destroy this space, one of few remaining natural areas on the globe.	NS	X
29485	Unique			WILD	John Lundquist		2534	1	As a father of three and long time user of the BWCA and other natural treasures of our state, I feel preserving these areas for future generations of visitors should be our priority. The risks involved with allowing mining in the area are not worth the potential loss of priceless natural resources.	NS	X
30349	Form Letter	1	Variant	WILD	Judith Albertson		2854	1	Do not believe that this project will not pollute the wilderness and rivers!	NS	X
27154	Form Letter	1	Variant	WILD	Justin Roberson		1668	1	The Kawishiwi River is one of the most beautiful and unspoiled rivers in all of the world. It has a perfect Ph balance that provides a nutrient rich environment for the abundant fish, plants, and wildlife that call it home. It's truly a special place and a one of a kind experience. I am so concerned that any kind of contaminates will destroy this amazing water flow. PLEASE, PLEASE, PLEASE keep the Kawisishwi the way it is by not letting mining disrupt it's beauty!!!!	NS	X
439	Unique			WILD	Mary Pavia		211	2	Protecting the BWCA would continue to provide opportunities for outdoor recreation and benefit the local economies that are dependent on this ecotourism industry. The need for outdoor recreation is important, especially as the urbanization of society continues to grow. The protection of wilderness is integral to maintaining biodiversity and preserving something that has a deep, intrinsic value for many people. In the words of Henry David Thoreau, “In wilderness is the preservation of the world.”	NS	X
N/A	Form Letter Template	10	Non-Variant	WILD	Multiple	Building Trades	FL57	5	After careful review, the Final EIS concludes that groundwater flows from the NorthMet project will not directly, indirectly, or cumulatively affect the Boundary Waters Canoe Area Wilderness or Voyageurs National Park.	NS	X
29871	Unique			WILD	Niki Roussopoulos Geisler		2687	1	we urge decision makers to be certain that the following clean water and environmental protection principles can be guaranteed: 1. BWCAW waters and nearby lakes and rivers remain safe and clean	NS	X

27853	Form Letter	1	Variant	WILD	Sophie Nethercut		2207	1	It's absolutely vital to keep mining, especially sulfide mining, away from the Boundary Waters Canoe Area. The Boundary Waters isn't just a sacred ecological place - it also contributes millions of dollars to our state economy. People from all over the world come to visit the Boundary Waters and see first-hand our clear and beautiful lakes and rivers. Tourism along the North Shore generates over \$800 million dollars of revenue for the state annually and employs over 18,000 people. Why would we jeopardize all of this?	NS	X
27853	Form Letter	1	Variant	WILD	Sophie Nethercut		2208	2	I worked for several years at YMCA Camp Menogyn, a camp on the Gunflint Trail that takes kids on canoeing, backpacking, rock climbing, and dog sledding trips around the very landscape that these mines threaten to harm irreparably. Our country made a promise to me, the kids I take on my trips, and all future generations when we signed the Wilderness Act of 1964 and the BWCA Wilderness Act of 1978. We declared that this place would remain untrammled by industry forever. I urge you not to go back on that promise, no matter the political pressures. If not for my sake, don't allow this to mine to be built for the sake of anybody who has never heard a loon call as the sun sets over a pristine Boundary Waters lake, anybody who's never swatted mosquitoes through a muddy, wet, 250 rod portage, or anybody who hasn't yet received what this amazing, uniquely Minnesotan slice of wilderness-perfection has to offer.	NS	X
21976	Form Letter	1	Variant	WILD	Timothy Cameron		851	1	I am a simple man with deep love for the Boundary Waters. Let's keep the Superior National Forrest a forest and not a reservoir for capital.	NS	X
27702	Unique			WILD	Vince Graziano		2106	1	Don't let the BWCA be harmed.	NS	X
